Suchau or **SOOCHOW**. Town of China, the provincial capital of Kiang-su prov. It is situated 54 m. N.W. of Shanghai, with which it is connected by the Shanghai-Nanking rly. and by the Suchau Creek. An important centre of the silk industry, Suchau, on the Grand Canal, is one of the famous cities of China. Its walls are about 30 ft. in height and have a circuit of some 12 m. Without the walls are extensive suburbs, some of which reach as far as the shores of Tai Lake, one of the beauty spots of China. Numerous canals wind through the city, and form the heart of a network of waterways which serve the neighbourhood. Minor industries include the production of carved wares, metal goods, lacquer, and glass. Suchau suffered severely at the hands of the Taipings. It was opened to foreign trade in 1896. Pop. 260,000.

Suchet, Louis Gabriel (1770-1826). French soldier. Born March 2, 1770, the son of a silk merchant at Lyons, he became a soldier on the outbreak of the Revolution. He saw a good deal of service in Italy and elsewhere, and in 1799 was in command of a division, distinguishing himself in the campaign against the Austrians in

Sucking Fish. *Naucrates ductor*, a species of Remora, showing the sucking disk upon its head

Italy. He took part in the campaign of 1805 against Austria and of 1806-07 against Prussia, and was afterwards in Spain, where he had other successes, one being a victory over the British at Sagunto in 1812. Having joined the Bourbons in 1814, he returned to Napoleon during the Hundred Days and was exiled. Returning to France in 1819, he died Jan. 3, 1826. Suchet was made a marshal and duke of Valencia, a province he conquered. He married a lady who was related to Joseph Bonaparte, and left memoirs, parts of which have been published.

Suck. River of Eire, in Connacht prov. It rises in Lough O'Flynn, in the W. of Roscommon, and flows 60 m. S. and S.E. between that county and Galway to the Shannon at Shannonbridge, 8 m. below Ballinasloe.

Volume 10

Sucker. In gardening, term applied to a shoot making growth from the root or ground level of a shrub or tree. Removed in autumn, and replanted, they form a valuable means for increasing stock. See Gardening.

Sucking Fish or **REMORA**. Name popularly applied to several groups of fishes distinguished by the presence of a disk on the upper part of the head, or on the breast, which acts as a sucker and enables the animal to attach itself to any object. They attach themselves to moving objects, such as ships, sharks, and turtles, as well as stones. The back of the remora is light coloured and the underside dark—an aid to concealment when attached by the back of the head to a dark object. See Lumpsucker.

Suckling, Sir JOHN (1609-42). English poet. Son of Sir John Suckling, comptroller of the household to James I, he was born at Whitton, Middlesex, and educated at Trinity College, Cam-

bridge. He was admitted to Gray's Inn, and after inheriting large estates travelled in France and Italy, and served under Gustavus Adolphus. Knighted in 1630, he became conspicuous at court for his wit, prodigality, and addiction to gaming. He raised a troop of horse to aid Charles I against the Scots, and was M.P. for Bramber. Implicated in a Royalist army plot, he escaped to Paris, where he is said to have committed suicide. He wrote a few plays, some happy descriptions of his contemporaries in *The Session of the Poets*, 1637, and a book on Socinianism, but is best remem-

Sir John Suckling, English poet

bered by some lyrics, including *Why so pale and wan, fond lover?*; *When, dearest, I but think of thee*; and *Ballad upon a Wedding*. He is believed to have invented cribbage. He appears in Rose Macaulay's novel, *They Were Defeated*.

Sucre. Small state of Venezuela. Situated on the Caribbean Sea and the Gulf of Paria; the interior is mountainous. Cumana is the capital. It has an area of 4,554 sq. m. Pop. 291,452. Pron. Sookray.

Sucre. Official capital of the republic of Bolivia, formerly called Chuquisaca. It is situated at an alt. of 8,532 ft. on a plateau of the E. Cordillera of the Andes, 45 m. N.E. of Potosí (with which it is con-

Sucker. Diagram illustrating the growth of suckers from the lateral roots of a tree

nected by rly. and road) and 318 m. S.E. of La Paz. Here is the national supreme court. The cathedral (begun 1553), the president's palace, and the university, by repute the oldest in S. America, are the main buildings. Agriculture is the principal industry and mining is also carried on. Founded by Spaniards in 1538, it was originally called Ciudad de la Plata, from the rich silver mines in the neighbourhood. Here Bolivian independence was proclaimed in 1825, and the city took its modern name from the first president of the republic. During the civil wars, though Sucre remained the capital, the sessions of congress were often held at La Paz. Pop. 30,000.

Suction Force. Botanical term. It is applied to the difference between the osmotic pressure of the cell-sap, which tends to cause water to pass into the cell, and the elastic recoil of the wall, which tends to force water out. At one time it was considered an adequate explanation of movement of water into cells, but it is probably assisted by some special secretory activity of the protoplasm.

Suction Gas. Term used for gas used in suction as distinct from direct pressure. It does not in-

dicate any particular kind or quality of gas, but refers only to the manner in which the gas is produced and used.

During the development of the special furnaces or producers and of the gas engine itself, the idea of allowing the gas engine to draw its supply of gas from the producer, that is to say, to suck the gas into its cylinder as required, was evolved. Gas so provided became known as suction gas, as distinguished from gas supplied under pressure.

Sudan or **SOUDAN**, **THE** (Arabic Beled-es-Sudan, land of the Blacks). Region of N. Africa. It stretches from the Atlantic to the Red Sea and the highlands of Abyssinia, and from the Sahara and Egypt in the N. to the central equatorial regions. A dist. of no definite boundaries, but rather a loose geographical expression, the Sudan is divided into three portions—the Western Sudan, containing the basins of the rivers draining into the Atlantic; the Central Sudan, containing the rivers draining into Lake Chad; and the Anglo-Egyptian Sudan. Most of Western and Central Sudan is French territory. Over much of the Sudan the mean monthly temp. exceeds 80° F. in the hot season. At Khartum, in the Anglo-Egyptian Sudan (*q.v.*), the rainfall is 5 ins.; at Lokoja in Nigeria, at the junction of the Niger and the Benue, 50 ins. is recorded between April and Oct.

FRENCH SUDAN. The colony of Upper Senegal-Niger was created in 1904 out of the former territories of Senegambia and Niger, less the Senegal protectorate, which was restored to Senegal. The name of this colony was changed to French Sudan, Dec. 4, 1920. One of the eight territories of French West Africa, it is 479,783 sq. m. in area, with a pop. (1946) of 3,812,000. Many of the inhabitants are nomads whose wealth consists of cattle, horses, asses, sheep and goats, and camels. Settled peoples grow millet, rice, maize, ground nuts, and cotton; the Sansanding barrage is the centre of big irrigation works in the Segon and Mopti dists. on the river Niger. Imports include cotton goods, foodstuffs, motor cars, petrol, sugar, salt, and beer; chief exports are ground nuts, millet, gum, kopak, sisal, cattle and cattle products.

French Sudan is administered by a governor assisted by a privy council and a general council of 50 members (20 French, 30 African). The capital is Bamako (70,492).

A rly. 760 m. long runs from Kulikoro via Bamako and Kayes to the coast at Dakar. Small steamboats ply in the Upper Niger for about seven months in the year from Kulikoro to Timbuktu and Gao-Gao, and from Bamako to Kuru. There is air connexion with Dakar and Brazzaville. *See* West Africa, French.

Sudbury. Mun. borough and market town of Suffolk, England. It stands on the Stour, 59 m. N.E.

Sudbury arms

of London and on the Essex border, with a station on British Rlys. The chief buildings are three old churches, all Perpendicular in style—S. Peter's, S. Gregory's, and All Saints—a grammar school of the 15th century, and the town hall. Moor Hall is one of several old houses. There are manufactures of matting, flour, malt, bricks, etc. Slight remains exist of a monastery of the Dominicans. In the 14th century the Flemings introduced the manufacture of woollens. In 1271 it received a charter, in 1554 a royal charter, and elected 2 M.P.s 1558–1844. Sudbury and Woodbridge is the name of a co. constituency. Market day, Thurs. Gainsborough was born here. Pop. 7,007.

Sudbury. Part of the Middlesex borough of Wembley (*q.v.*), which embraced the older village that gave its name to the district.

Sudbury. Town and county of Ontario, Canada. The town, which lies 260 m. N.N.W. of Toronto, has stations on the C.N.R. and C.P.R. Pop. 32,203. It is the centre of the greatest nickel-producing district in the world, yielding 80 p.c. of the entire supply. *See* Nickel.

Sudd or **SADD** (Arab., to dam). Accumulation of vegetable matter which chokes the channel of the Upper Nile. The sudd is sometimes 20 ft. thick and in parts solid enough to bear the weight of elephants. The channel is kept open.

Sudermann, HERMANN (1857–1928). German dramatist and novelist. Born in East Prussia, Sept. 30, 1857, he studied at Königsberg and Berlin. Success and

fame came in 1888 with his first play, *Die Ehre*, which was followed the same year by a brilliant novel, *Frau Sorge* (Eng. trans. Dame Clare, 1892). This reached its 125th edition in 1912. Sudermann produced a succession of realistic plays and novels, often satirical and always powerful and showing great dramatic tension. His principal dramas are *Sodom's Ende*, 1890; *Haimat*, 1893 (Eng. trans. Magda, 1895); *Es Lebe das Leben*, 1902 (Eng. trans. The Joy of Living); *Der Bettler von Syrakus*, 1911; *Der Tolle Professor*, 1926. His collected stories appeared in 1919, and *Book of My Youth*, in English, in 1924. He died Nov. 21, 1928.

Sudetenland. Name of an area of Czecho-Slovakia lying to the S.E. of the Erzgebirge. Formerly part of the crown lands of the Austro-Hungarian empire, it produces coal, and has wool, cotton, linen, glass, and porcelain industries. Before the Second Great War a majority of its inhabitants were of German stock and retained their

Sudbury, Suffolk. The Perpendicular style parish church of S. Gregory

German speech, though most of them belonged to families settled for generations in the district. Their alleged oppression by the Czecho-Slovak govt. was the excuse used by Hitler for fomenting anti govt. disturbances among them, which led eventually to the German annexation of Czecho-Slovakia, 1939. In accordance with the Potsdam agreement, 1945, most Sudeten Germans were expelled from Czecho-Slovakia during 1945–46, 1,415,000 to the U.S. zone of Germany, 750,000 to the Russian; 311,000 were allowed to remain, among them industrial workers, miners, partners in mixed marriages, persons with anti-Fascist records, and the old and infirm. The expulsion was perhaps politically inevitable; but the number expelled constituted more than a seventh of Czecho-

Slovakia's pre-war pop., and among them were many highly skilled workers whose loss had a serious effect on Czech post-war recovery. See *Czecho-Slovakia*; Henlein, Konrad; Munich Crisis.

Sudeten Mountains. Mt. range of Central Europe. Part of the boundary of the Bohemian plateau, it slopes on the N.E. towards Silesia. Both the Elbe and Oder rise on the S. side and curve round it, the Oder to receive many affluents from the Silesian slopes. The highest points are Schneekoppe, 5,258 ft., Brunnenberg, 5,120 ft., and Hohe Rad, 4,950 ft. See *Riesengebirge*.

Sudra. Fourth or servile class in ancient Hindu society. Described in the Rig Veda as sprung from the feet of Purusha, it was recruited from the indigenous peoples subjugated by Aryan immigration. Menial tasks, such as lower forms of handwork and tillage, became their portion. See *Caste*.

Sue, MARIE JOSEPH EUGÈNE (1804-57). French novelist. Born in Paris, Dec. 10, 1804, he served

Eugène Sue

as a military and naval surgeon, being in Spain in 1823, and at Navarino, 1827. He came into prominence as a writer for *Emile de Gerardin's* paper, *La Presse*. In 1842 his best-known work, *Les Mystères de Paris*, depicting vice and low life and indicting civilization as an agency for driving the innocent into crime and immorality, appeared as a feuilleton in the *Journal des Débats*. Its successor, *Le Juif Errant*, 1845, was an attack on the Jesuits; *Les Mystères du Peuple*, 1849, was condemned as seditious. Deputy for the Seine in 1850, Sue became a political exile in 1851, and died Aug. 3, 1857.

Sueca. Town of Spain, in the prov. of Valencia. It stands on the left bank of the Júcar, 23 m. S. of Valencia city, and separated from the Mediterranean Sea by the Sierra de Cullera. The neighbouring valley lands are fertile and there is a trade in cereals and fruit. Pop. 19,000.

Suetonius (70-140). Roman writer, whose full name was Gaius Suetonius Tranquillus. As private secretary to the emperor Hadrian, he was able to accumulate the material for his *Lives of the Twelve*

Caesars, published in 120, the only one of his voluminous writings which has survived otherwise than in fragments. These biographies do not rank high as literature, but are a mine of information about the emperors of the 1st century A.D.

Suez. Town of Egypt. It is situated at the S. end of the Suez Canal and on the Gulf of Suez, and gives its name to an administrative area. In the neighbourhood are the Wells of Moses, on the E. side of the gulf. Fresh water is obtained from the Nile at Cairo by the Ismailia canal. Rlys. connect the town with Cairo, Port Said, and with Port Ibrahim at the S. entrance to the Canal. Pop. 108,250.

Suez. Gulf of the Red Sea. It lies between the Sinai peninsula and Egypt. It has a length of about 190 m. and an average breadth of 30 m. See *Egypt*; *Sinai*.

Suez Canal. Ship canal cut through the isthmus of Suez to connect the Mediterranean with the Red Sea. A small canal utilising intervening lakes was constructed in the time of Seti I (1380 B.C.), and is referred to in inscriptions in the temple of Karnak; it remained in use until A.D. 770. The first planning of the modern canal dates from Napoleon's expedition to Egypt, 1798. In 1846 the Société d'Études pour le Canal de Suez was founded by Prosper Enfantin, and did much preliminary work in surveying the route and geological strata. On Nov. 30, 1854, Said Pasha, viceroy of Egypt, granted to Ferdinand de Lesseps a concession for the construction of the canal, and the Compagnie Universelle du Canal Maritime de Suez was formed with a capital of £8,000,000 in 400,000 shares of £20 each, but the shares were not well taken up, particularly in England, where the scheme had all along been opposed on both political and technical grounds, and the issue was saved from failure only by Said Pasha himself agreeing to take up the balance of 177,642 shares of a nominal value of £3,552,840.

Work began on April 25, 1859, and, in spite of great difficulties, went on steadily till Said's death in 1863. Before many months his successor, Ismail, found himself involved in disputes with the co. as to the supply of labour, and his withdrawal of various rights or privileges conferred on the co. by his predecessor. He agreed to refer all outstanding questions between him and the co. to the emperor Napoleon III.

The result was that the govt. of Egypt was, in 1864, condemned to pay a total sum of £3,360,000. The canal was opened on Nov. 17, 1869. Total expenditure of the co. is said to have been about £17,000,000, but the result of the first year's working was unsatisfactory. A new loan of £800,000 was urgently required, and to raise funds the dues on shipping were increased by adopting an excessive scale of tonnage measurement, which soon led to litigation. In the end a conference was called at Constantinople on Oct. 6, 1873, at which a temporary surtax of 4 frs. per ton was granted to the co. In 1875 Ismail Pasha sold his shares to the British govt. for £4,000,000, and in 1876 three British directors joined the board that administered the canal.

In 1883 a proposal was made for duplicating the canal, but the scheme fell through, and was replaced by an alternative plan for deepening and widening the original channel. This was duly carried through at a cost which required the raising of a new loan of £4,000,000 sterling. By 1948 the total cost of the canal had reached £29,725,000.

The concession for the canal was for 99 years from its completion; in 1968 it becomes the property of the Egyptian govt.

In 1926 a new town was completed on the Asiatic side of the canal and named Port Fuad, after the then king of Egypt. A swing bridge completed in 1940 crosses the canal to connect Cairo by rail with Beirut, Syria.

The length of the canal is 103 m., including approach channels; 21 m. are in Lakes Balah and

Suez Canal. Map showing course from Port Said to Suez

Suez Canal. Air view of a stretch of the canal, through which a giant floating dock is being navigated by tugs

Timsa, and the Bitter Lakes. As the result of work done since its original construction the general depth is now about 34 ft., and the average width 197 ft. Greatly increased traffic after the Second Great War, particularly of tankers, led in 1949 to the institution of a convoy system, with two convoys daily (about six ships) each way, passing in the lakes. In 1949 also, work was begun on the construction of a 7½ m. by-pass canal near El Balah, 30 m. S. of Port Said, and it was decided to deepen the whole canal by 20 ins. The largest vessel to navigate the canal to that date was a U.S. aircraft carrier, 890 ft. long, in 1948. Tonnages of traffic since the opening of the canal are: in 1870 (first full year of operation) 436,609; in 1880 3,000,000; in 1913 20,000,000; in 1938 34,000,000; in 1948 55,000,000. British vessels in 1948 formed 38 p.c. of the total tonnage, U.S. vessels 15 p.c. The whole canal region being entirely waterless, it is supplied by the Sweetwater canal, which follows the line of Seti's canal, running from the Nile near Cairo to Ismailia, midway along the Suez canal, branching thence to the two terminals.

The Suez canal co. is registered in Egypt, but its offices are at 1, rue d'Astorg, Paris. Management is by a council of 33 administrators, of whom in 1948 10 were British (three representing the British govt. and seven British shipping interests), 18 French, 2 Egyptian, 2 American, and 1 Netherlands. In 1949 a new agreement between the co. and the Egyptian govt. provided that Egyptian representation should be gradually increased from 2 to 7, two to replace French and one British directors as vacancies occur, and two additional to be

appointed, one in 1959 and one in 1964.

Rates of transit vary according to traffic and are fixed annually; in 1948 they were 5s. 9d. per ton for laden vessels and 2s. 10½d. for unladen. In normal years receipts average 1,500,000,000 francs, and the British holdings, increased to 295,026 shares out of a total of 652,932 and valued at £44,000,000, yield an average annual dividend of £1,400,000. Shareholders' dividends are payable in Paris, and the French govt. derives a revenue from a substantial tax on dividends. The French govt. itself is not a shareholder.

By a convention signed on Oct. 29, 1888, the Suez canal is exempted from blockade, and vessels of all nations, whether armed or not, are allowed to pass through it in peace or war. This convention permitted the use of the canal by the Russians in the Russo-Japanese war, and prevented its being closed to Italian warships and transports during the Italo- Abyssinian war of 1935. During and after the Arab-Jewish conflict of 1948, however, the Egyptian govt. confiscated certain cargoes bound for Palestine, and in 1950 introduced regulations to prevent the passage of oil and war materials to Israel.

Suez Canal in Wartime

In both the First and Second Great Wars the canal was closed by the British govt., justifying the action on the ground that Allied control of the canal was essential to the defence of Egypt. At the outbreak of the First Great War the Egyptian govt. handed over to the British military authorities the defence and direction of the Suez canal, which became the route by which Indian, Australian, and New Zealand troops reinforced the

Allied armies in France and the Middle East. Allied warships and garrisons kept the waterway open throughout hostilities, except for a few hours on Feb. 3, 1915, when a Turkish army, after crossing the desert from Damascus, reached the banks only to be defeated.

One of the chief effects of the First Great War on the canal was to increase British influence in its control and management, and to emphasise its importance to British imperial strategy as a route to and from India and the Far East. When the British govt. declared Egypt an independent state in Feb., 1922, it reserved to itself the right to maintain troops in Egypt for the defence of the canal. In 1936 a fresh treaty was drawn up defining a canal zone in which Great Britain was authorised to retain troops and aircraft until the Egyptian army should be capable of ensuring security of the canal. In 1946 a fresh agreement provided for the complete withdrawal of the British canal zone force in 1949.

After the entry of Italy into the Second Great War in June, 1940, the Mediterranean route was closed to merchantmen 1941-43, and products of the E. Mediterranean countries passed through the Suez canal and the Red Sea and round the Cape of Good Hope to reach Britain. All reinforcements for the British forces in Egypt took the Cape route. The canal was frequently, but ineffectually, attacked by Axis aircraft. The Suez canal zone was the only part of Egypt in which British military forces remained after 1947.

Suffocation. Death from asphyxia or deprivation of air caused otherwise than by drowning or by external compression of the neck, i.e. hanging or strangulation. The commonest causes of suffocation are disease, such as obstruction of the air passages by tumours; obstruction of the larynx by foreign bodies, e.g. false teeth, food, coins; pressure on the chest, as may occur in panic-stricken crowds, or after falls of earth on men working in tunnels, sand-pits, etc.; and breathing non-respirable gases, as in mines and sewers.

Suffolk. Maritime county of England. It has a coastline on the E. coast of 62 m. and an area of 1,482 sq. m., being bounded N. by Norfolk, W. by Cambs, S. by Essex. The surface is generally level, but becomes hilly in the N.W. In the N. are Oulton Broad and other sheets of water, parts of the Broads (q.v.). The rivers

include the Waveney, Deben, Orwell, Stour, Blyth, and Lark. Agriculture is the chief industry, but fishing is also important. The county is noted for its horses (Suffolk Punches). Cereals are largely grown; sheep, cattle, and poultry are reared.

Ipswich is the county town, Lowestoft being the next important place. The boroughs also include Aldeburgh, Beccles, Bury St. Edmunds, Eye, Southwold, and Sudbury. Lowestoft, Felixstowe, and Southwold are holiday resorts. Other places are Stowmarket, Woodbridge, and Saxmundham. It has many magnificent churches of flint and stone; hence the phrase "silly Suffolk" (*A.S. selig*, holy, innocent). Along the Essex border is "Constable's country," this artist having delighted to paint the landscape near his native East Bergholt. Another artist, Gainsborough, was born at Sudbury. Suffolk is divided into two administrative counties, east and west. It is in the diocese of St. Edmundsbury and Ipswich. Five M.P.s are returned. Pop. 401,114.

Suffolk, the southern part of the old kingdom of E. Anglia, suffered from Danish inroads. Its king, S. Edmund, was martyred at Hoxne, 870. In the 14th century it became one of the richest parts of England, a centre of the weaving industry. The sea has encroached considerably.

LITERARY ASSOCIATIONS. Perhaps the writer who most fully reflects this county is Crabbe, in whose poems will be found much that is descriptive of Aldeburgh. Sapiston is the scene of Robert

Bloomfield's poem, *The Farmer's Boy*; Bloomfield was born at Honington. Borrow lived for many years in a cottage by Oulton Broad, and died there in 1881. Dickens placed some memorable scenes of *The Pickwick Papers* in Ipswich, making that town, or Sudbury, the original of Eatanswill. Edward FitzGerald's *Letters* discuss Woodbridge, his birthplace, and the neighbourhood.

Bibliography. *Victoria History of Suffolk*, ed. W. Page, 1907-11; *In the Footsteps of Borrow and FitzGerald*, M. Adams, 1914; *Suffolk Scene*, J. Tennyson, 1939.

Suffolk, EARL OF. English title borne by the families of Ufford, Pole, Brandon, Grey, and since 1603 Howard. The first earl was Robert, Lord Ufford, created in 1337. He and his son were soldiers and courtiers; when the 2nd earl died in 1382, the title became extinct. In 1385 Michael de la Pole, chancellor of England, received some of the lands of the Uffords in Suffolk and the title of earl. His descendant, William, 4th earl, was made duke in 1448 and receives a separate entry. John, the 2nd duke, married Elizabeth, sister of Edward IV. Their eldest son, John, earl of Lincoln, was killed at Stoke in 1487, and the second son, Edmund, obtained the earldom only. In 1504 he was attainted; in 1513 he was put to death.

The family of Brandon furnished three dukes, Charles (*v.i.*) receiving the title from Henry VIII in 1514. On the death of another Charles in 1551 the dignity was given to his brother-in-law, Henry Grey, marquess of

Dorset, only to be lost when in 1554 Grey was executed for treason. The dukedom was never revived, but in 1603 the earldom was given to Thomas, a son of Thomas Howard, 4th duke of Norfolk. He became lord high treasurer in 1614. In 1626 his younger son was made earl of Berkshire, and in 1745 the 4th earl of Berkshire inherited the earldom of Suffolk.

Charles Henry George Howard (1906-41), 20th earl of Suffolk and 13th earl of Berkshire, who succeeded to the titles in 1917, had been a seaman, Guards officer, and rancher in Australia before taking up scientific experiment. He was killed in the spring of 1941 while working at his research station in Richmond Park upon unexploded German bombs, and was posthumously awarded the George Cross. The titles of 21st earl of Suffolk and 14th earl of Berkshire fell to his son Michael (b. March 27, 1935). The family seat is Charlton Park, Malmesbury, and an eldest son is called Viscount Andover.

Suffolk, CHARLES BRANDON, DUKE OF (c. 1485-1545). English nobleman. A son of William Brandon, who carried Henry VII's standard at Bosworth, he first appeared as a courtier of Henry VIII. In 1513 he was marshal of the army that invaded France,

Charles Brandon,
Duke of Suffolk

and in 1514 was made duke of Suffolk. He incurred royal displeasure by his secret marriage with Henry's sister Mary, the widowed queen of France, but overcame this and was with the king at the Field of the Cloth of Gold. In 1523 he led an army in France, and he had some share in the overthrow of Wolsey. In 1536 Suffolk was sent against the rebels in the north, and he received some monastic lands. He died Aug. 24, 1545.

Suffolk, WILLIAM DE LA POLE, DUKE OF (1396-1450). English soldier and statesman. Born Oct. 16, 1396, he succeeded his brother as 4th earl of Suffolk in 1415. For some years he served in France, becoming in 1428 commander of the English. He effected a truce with France in 1444, and arranged the marriage between Henry VI and Margaret of Anjou. This policy brought him into

Suffolk. Map of this maritime county of East Anglia

conflict with Humphrey, duke of Gloucester, but the duke's death in 1447 made Suffolk more powerful than ever. When the English met with reverses in Normandy, he was charged with crimes against the state, but the king set him free on condition that he left the country, and he sailed for Calais. On May 2, 1450, he was murdered at sea. Shakespeare in King Henry the Sixth takes an unwarrantably severe view of the duke.

Suffolk Punch. Powerful breed of horse, bred in the co. of Suffolk, England, and used chiefly for agricultural purposes and as a cart-horse. See Horse colour plate.

Suffolk Regiment. Regiment of the British army. It originated in a company of pikemen formed

Suffolk Regiment badge

in 1660 for guard duties at Windsor Palace, and in 1685 formed the nucleus of a body of infantry raised by the duke of Norfolk in support of James II during the Monmouth rebellion. Taken on to the establishment in 1686 as the 12th Foot, it served under William III in Ireland, where it earned distinction at the Boyne. It fought under Marlborough in Flanders, and in 1719 was shipped as marines in Byng's fleet which defeated the Spanish off Messina. The 12th Foot fought at Dettingen and Minden. It took part in the defence of Gibraltar, 1779-83, an event commemorated by the castle and key on the regimental badge.

In 1798 the 12th Foot went to India to reap further honours at the storming of Seringapatam, 1799, and at Travancore, 1808. Honours were gained in the Kaffir War, 1851-53; the New Zealand War, 1863; the second Afghan War, 1878-80; and the Hazara campaign, 1888. From 1881 the 12th Foot was known as the Suffolk Regiment. Serving throughout the S. African War, it suffered heavy casualties in the attack on Colesberg.

Twenty-two battalions were raised for service in the First Great War and earned the honours: Le Cateau; Neuve Chapelle; Ypres, 1915, '17, '18; Somme, 1916, '18; Arras, 1917, '18; Cambrai, 1917, '18; Hindenburg Line; Macedonia, 1915; landing at Suvla; Gaza. In the Second Great War the 1st battalion formed part of the B.E.F. and of Ironside's forces 1940. The 4th

and 5th battalions were at the defence of Singapore; the 7th served with the Royal Armoured Corps in N. Africa and Italy; and the 2nd fought throughout the Burma campaign. The regimental depot is at Bury St. Edmunds.

Suffragan (late Lat. *suffraganeus*, from *suffragari*, to vote for, support). Ecclesiastical term applied to bishops. All bishops are suffragan to the archbishop of their province, but specifically suffragans are bishops consecrated to act as deputies for or assistants to a bishop in a particular part of his diocese. In the Church of England, by 26 Henry VIII, suffragan bishops might be appointed for 25 towns, but few such nominations were made until late in the 19th century. Power to increase the number of suffragans was given by the Suffragans Nomination Act, 1888. In recent years many bishops suffragan have been consecrated in various dioceses. See Bishop; Church of England; Diocese; Ecclesiastical Law.

Suffrage (Lat. *suffragari*, to vote for). The right to vote. The word has much the same significance as franchise, and the extension in Great Britain of the franchise is described under that head. On the "suffragette" movement, see Pankhurst; Women's Suffrage. See also Reform Acts; Vote.

Suffragette. Popular term in the early years of the 20th century, in England, for a female agitator for women's suffrage. The term was especially applied to the militant section of the movement, represented by the Women's Social and Political Union. See Feminism; Pankhurst; Women's Suffrage.

Sufism (Arab. *sufi*, man of wool). Form of Mahomedan mysticism. The woollen dress which occasioned the name was imitated from Christian hermits by early Muslim ascetics, who for a time observed Mahomet's prohibition of celibacy. But a Sufi monastery was founded at Ramleh before A.D. 800, and thereafter celibacy was permitted, although not enjoined.

The form of Sufism best known outside Islam was developed in Persia under Shiah influence. It was attended by a revival of Zoroastrian tenets, influenced by Vedanta, Buddhist, and Neoplatonist teaching. Thence emerged a pantheistic philosophy which taught that religious creeds are matters of indifference, that good and evil are unrealities, that there is no free will, and that mystical absorption into the divine is attainable before

death by ecstatic union. This Sufi teaching pervaded Persian poetry of the schools of Abu Said, Hafiz, Sa'di, and Rumi, met with a sympathetic reception in medieval India, and permeates the prevalent free-thought of modern Persia. See Dervish; Mahomedanism; Omar Khayyam; Persia.

Sugar. Term generally applied to the product of the sugar cane and sugar beet. Chemically the sugar from these sources is identical. In 1946-47 over 9,000,000 tons of beet sugar and nearly 19,000,000 tons of cane sugar were produced in the world.

Chemically the term is used to include the large number of carbohydrates closely related to the sugar obtained from beet and cane. They fall into four classes: Monosaccharides, e.g. glucose, $C_6H_{12}O_6$; Disaccharides, e.g. cane and beet sugars, $C_{12}H_{22}O_{11}$; Trisaccharides, e.g. raffinose, $C_{18}H_{32}O_{16}$; and Polysaccharides, e.g. starch and cellulose ($C_6H_{10}O_5$)_n. The first three classes include the sugars which have a sweet taste and are crystalline. They all contain hydrogen and oxygen in the same molecular proportions as water.

In nature sugars are formed by plants from carbon dioxide and water in the presence of chlorophyll, and are used in the vital processes including the formation of cellulose. A certain amount is converted to starch, which acts as a reserve food, being reconverted to sugar during the period of germination, when the plant is not able to synthesise sugar directly from the atmosphere.

This synthesis has not been carried out in the laboratory but the reverse process—degradation of starch and cellulose to sugars and of di- and trisaccharides to monosaccharides is easily accomplished by heating the saccharide with dilute mineral acid (hydrolysis). The number of sugars which have been chemically identified is enormous. There are about 50 known monosaccharides, of which 10 occur in nature, the rest having been synthesised in the laboratory. The structure and chemical relationships of the sugars was first worked out by Emil Fischer, and later by W. N. Haworth and his colleagues at Birmingham university; they elaborated Fischer's work and brought it into line with modern chemical theory.

Cane sugar was, until Napoleonic times, when the British blockade of the Continent led to the develop-

ment in France of the beet sugar industry, the common form used domestically. It is obtained from the sugar cane (*Saccharum officinarum*), which has been known for at least 3,000 years. The plant grows to a height of about 20 ft. It is propagated from cuttings, and the time required for maturity varies from 12 to 18 months. The sugar is stored in the soft pith, and the process of extracting consists essentially in crushing the canes, dissolving out the sugar with water, purifying the extract, and crystallising the sugar.

The chief cane sugar producing countries are, in order of importance, Cuba, India and Pakistan, Brazil, Puerto Rico, Hawaiian Is., British W. Indies, Argentina, and Australia.

The growth of sugar beet, and the process of refining sugar from it, are described under Beet Sugar.

OTHER SUGARS. Sugars are obtained from other plants, but the amount is small. The sugar maple (*Acer saccharum*) is a forest tree from the trunk of which the sugar-containing sap may be tapped by drilling small holes. The sap contains about 3 p.c. of sugar, and the yield per tree is about 2 lb. a year. As the tree takes about 20 years to reach maturity and is a valuable source of timber, it cannot compete with the annuals, beet and cane; moreover, blended syrups with a maple flavour can be produced more cheaply than the genuine article. Of the numerous species of palm, only nine produce sugar in any quantity. One of these, *Jubena chilensis*, is exploited to some extent on the W. coast of S. America. In India the natives produce sugar from species such as the palmyra, sago, and sago palm. Sorghum (*Andropogon sorghum*), a large grass, yields a syrup which is used to some extent in the U.S.A. The juice contains about 12 p.c. sugar and, when refined, about 24 p.c. crystallisable and 44 p.c. uncrystallisable sugar. Honey contains about 39 p.c. levulose, 34 p.c. dextrose, and 2 p.c. sucrose; it was used for sweetening from very early times.

Glucose or grape sugar is produced by hydrolysing corn starch by heating in dilute hydrochloric acid. The solution is neutralised, filtered, and evaporated in vacuum pans. The product—liquid glucose—contains about 35 p.c. glucose, and 48 p.c. dextrin, and is much used by bakers and confectioners.

Sugar. Four stages in the production of sugar in the W. Indies. 1. Cutting down the cane, and (2) transporting it to a mill. 3. The cane being treated at a crushing house. 4. Giant condensers in a sugar mill

For the manufacture of solid glucose, the conversion to dextrose is more complete and the solution concentrated until it solidifies on cooling. The product contains about 86 p.c. sugars of which 80 p.c. is glucose. It is yellow in colour. For medicinal purposes a glucose over 99.9 p.c. pure is prepared, which can be used among other things as a hypodermic injection when urgently necessary to restore the normal blood-sugar content.

Lactose or milk sugar is present in cows' milk (about 4 p.c.) and is extracted from the whey. It is mainly used in infants' foods, as in the body it produces galactose, a sugar essential during childhood. *Consult* Story of Sugar, G. T. Surface, 1920; Sugar, G. Fairlie, 1925.

T. Hedley Barry, F.R.I.C.

Sugarloaf. Name given to a mass of sugar that is in the form of a truncated cone. Owing to their shape, a number of mts. and hills in Europe and America are known as the Sugarloaf. Two of these are the Great and Little Sugarloaf in co. Wicklow, Eire. There is one at Rio de Janeiro and another near Folkestone. *See* Rio de Janeiro.

Suggestion (Lat. *sub*, under; *gerere*, to carry). The insinuation of a belief or impulse into the mind of another, whereby his thoughts or actions are influenced. The de-

gree of influence will depend upon the extent to which the subject's power of offering more or less resistance to the suggestion and his self-assertion are unimpaired. Such suggestions bring about a diminution of self-assertion, and lead the subject to imagine that what he says or does under the influence of suggestion is really due to his own initiative.

Whereas in normal cases improper suggestions would fail in their purpose, in abnormal cases, when the corrective factors are almost passive, it is almost necessary to adopt an attitude of command. Thus, the ordinary person, when told that a piece of black cloth is white, simply refuses to believe it; but under the influence of hypnotism he is quite ready to do so. Normal suggestion may be instanced by the conjurer's method of "forcing" a card and other tricks of his profession, the object of which is to mislead the subject. *See* Auto-suggestion; Faith Healing; Hypnotism; Psycho-analysis; Stigmata.

Suggia, GUILHERMINA (1888-1950). Portuguese 'cellist. She was born in Oporto, June 27, 1888, of Italian descent. She studied under her father, himself a notable 'cellist, and under Klengel at Leipzig, in the Gewandhaus of which city she made her début in 1905. She played in most of the great

cities of Europe, and was considered one of the finest 'cellists of her day, her interpretation of the

Madame Suggia, Portuguese 'cellist.
Portrait by Augustus John, R.A.

By courtesy of the Directors of the
Tate Gallery

Brahms double concerto for 'cello and violin being noteworthy. She died at Oporto, July 31, 1950. Her portrait by Augustus John is in the Tate Gallery, London.

Suhl. Town of Thuringia, E. Germany. Situated at a height of 1,400 ft. on the S. slopes of the Thuringian forest, it is 32 m. S.W. of Erfurt. Established as a town in the 14th cent., it has three churches of 15th, 17th, and 18th cent. origin, and a 17th cent. town hall. It was for long the home of a small arms industry, and also had factories for the making of cars, bicycles, toys, etc. It belonged to the Saxon dynasties until 1815, and then came under Prussia. After the Second Great War it was in the Russian zone of occupation. Pop. 24,000.

Sui OR HSUGHAV. Town in Szechwan prov., China. It is situated at the junction of the Min-kiang and Yang-tse rivers, 1,650 m. from the mouth of the latter. The walls were built about 1380, but the town dates back to the 6th century. Sui carries on an important trade with Yunnan, and is the centre of the white-wax industry. Pop. 119,818.

Suicide (Lat. *sui*, of one's self; *caedere*, to slay). Intentional self-slaughter. Suicide has not always been considered a disgrace. Among the Greeks and the Romans it was held in certain circumstances to be justifiable. Zeno, Eratosthenes, Cato, and Seneca are on the roll of distinguished men among the ancients who took their own lives. Demosthenes, Mithradates, Hannibal, and Brutus committed suicide to avoid capture by a foe.

With the establishment of Christianity suicide came to be looked upon with abhorrence.

The Samurai of old Japan held it noble to commit suicide in order to expiate a crime, avoid falling into the hands of the enemy, or to demonstrate their loyalty; and suicides of unsuccessful Japanese commanders during the Second Great War were not uncommon. The honour in which suicide is held by the Japanese was demonstrated also by the strength of the Kamikaze corps of suicide pilots who attacked Allied shipping in the last stages of that war in the Pacific. Fanatical suicide from religious motives was exhibited until comparatively recent times in certain Indian sects, and the British govt. in India had difficulty in stopping the voluntary death of wives on the funeral pyre of their husbands (see *Sati*).

In England suicide is a crime. Legally there is no distinction between suicide and *felo-de-se* (murder of one's self). Coroners, however, usually apply the term suicide to self-destruction during insanity, and *felo-de-se* to the taking of his life by a sane person. Suicide formerly involved escheat of the deceased's property to the crown. This penalty was finally abolished in 1870, but long before that date it had ceased to be enforced. It was also the custom, last observed in 1823, to bury the body at crossroads with a stake through it. The R.C. and Anglican Churches refuse Christian burial in cases of *felo-de-se*.

A large proportion of suicides are mentally unsound. Melancholia, alcoholic insanity, and profound neurasthenia are among the causes. In 1945 there were recorded 3,670 deaths from suicide in England and Wales. As a rule the tendency to suicide increases with age. It is most common among the educated classes, in highly civilized countries, and is steadily increasing in Europe and America. See *Hara-Kiri*.

Sui juris (Lat., of his own right). Legal term for a person who is of full legal capacity. Thus a minor is not *sui juris*, nor is a lunatic.

Suint. Compounds of potash on the fleeces of sheep, derived from sweat. In some continental countries the washings from wool are used as a source of potash, being either allowed to soak into the land or collected and evaporated.

Suippe. River of France. Chiefly in the dept. of Marne, it rises in Champagne near Suippes and flows N.W. to join the Aisne 3½ m. S.W. of Neufchâtel.

Suir. River of Eire. It rises in the N. of Tipperary and flows S. past Thurles and Caher to the border of Waterford, where it turns due N. A few miles down it changes its course to E., flows past Clonmel and Carrick-on-Suir, and unites with the Barrow in Waterford Harbour. It forms the N. and part of the W. boundary of Waterford, is 85 m. long, and navigable for barges to Clonmel. It has a salmon fishery. *Pron.* Shure.

Suite (Lat. *sequi*, to follow). Train of followers or attendants. It is also used for a set of rooms which are complementary, and for pieces of furniture made on the same principle.

In music a suite is a set of instrumental compositions grouped as one work. The practice of thus bringing together pieces of contrasted character conceived in dance forms is of very early origin. By the beginning of the 17th century these were almost invariably the moderately fast allemande, the quick courante, the dignified sarabande, and, to wind up with, the lively gigue; but often there was a prelude, praeambulum, overture, or toccata to begin with, while a gavotte, bourrée, minuet, or loupé might also be introduced. All the movements were in the same key. The suite represents the contrapuntal style in dance forms at its best, as seen in the English suites of Bach. In addition to Bach, Purcell, Couperin, and Handel were notable composers of suites.

The term suite is used by modern composers to denote a collection of pieces for divers instruments, or for orchestra, having the same key for the first and last, as a rule, and with varied tonalities for the intermediate movements. See *Harmony*; *Music*.

Suiyuan. Inner Mongolian province in N. China. It contains 18 counties and two administrative bureaux, with Kweisui as its capital. Other important cities are Paotow, terminus of the Peking-Suiyuan railway, Wuyuan, Liangcheng, and Tsining. Highways connect the province with towns in Sinkiang and other N.W. provinces. Farming is mainly confined to the central area where canals connect it with the Yellow river. Main products are wheat, livestock, and coal. The inhabitants are mostly nomad agriculturists and belong to Mongolian banners (clans). Area, 134,181 sq. m. Pop. 2,084,000.

Suk. Nilotic negro tribe in the N. half of Naivasha prov., Kenya Colony. They occupy the up-

lands W. of the Kerio valley and the plains between Lakes Baringo and Rudolf, are agricultural in the hills and pastoral in the plains. They are roundish-headed, and averaging 5 ft. 6 ins. in height.

Suk. JOSEF (1874-1935). Czech composer. Born at Krecovice, Jan. 4, 1874, he studied with Dvorak in Prague, and his work shows the influence of that composer. In 1898 he married Dvorak's daughter. He became professor of composition at the Prague conservatoire in 1922, and was director during 1924-26. He wrote extensively for strings, much of his music being influenced by personal experiences, especially the death of his wife in 1905, whom he commemorated for his son in piano pieces entitled *About Mother*. Other works included the symphonic poems *Prague*, *A Summer Tale*, and *Maturity*, *Serenade* and *Meditation* on a Chorale for string orchestra, chamber music, and songs. He died May 29, 1935.

Sukarno OR SOEKARNO, ACHMED. Indonesian statesman. See Sukarno in N.V.

Sukhum OR SUKHUMI. Capital of Abkhazia A.S.S.R., in Georgia S.S.R. It is on the Black Sea coast, 120 m. N.W. of Batum. A centre of trade in cereals, fruit, wine, tobacco, and honey, it has rly. connexion with Tuapse.

Sukkur. Dist. and town of Pakistan, in Sind. The dist. lies in the N. of Sind, mainly E. of the Indus. Native food grains, rice, and pulses are produced. Area, 5,550 sq. m. Pop. 692,556. The town is on the right bank of the Indus, where it is crossed by the great Lansdowne road and rly. bridge (1889) on the strategic rly. to Baluchistan. It has rly. carriage and wagon works and is a port for considerable river traffic. Pop. 86,466. The Lloyd Barrage (*q.v.*) lies 2 m. W.

Sulaiman Hills. Range of mts. in Pakistan, separating Baluchistan from Punjab. It presents a steep scarp to the valley of the Indus and an easier slope to the plateau which extends W. into Persia. The highest point, the Kaisargarh, reaches 11,295 ft. Fort Monro is a station at 6,300 ft.

Suleiman. Popular alternative spelling of the Arabio-Turkish name Solyman (*q.v.*).

Sulgrave. Village of Northants, England. It is $2\frac{1}{2}$ m. N.W. of Helradon, and is interesting for its connexion with the Washington family, some of whom are buried in the church of S. James. Pop. 364.

Sulgrave Manor, the ancestral home of the Washington family, was purchased in 1539 by Lawrence Washington, ancestor of George Washington, and remained the family home until 1610. In commemoration of the centenary of the peace of Ghent, the manor house, at that time a farm house, was presented to the Sulgrave Institute, which opened it as a Washington museum, 1914. Over the doorway are the Washington arms.

Sulimov. Capital of Cherkess prov., R.S.F.S.R. It is an agricultural centre, and was the centre of heavy fighting during Aug., 1942, when the Germans were advancing towards the Caucasian oilfields. It was recovered by the Russians during Jan., 1943.

Sulina. Seaport of Rumania. It is built on piles at the mouth of the Sulina arm of the Danube, and has a good fairway opening out into the Black Sea. It is about 120 m. N.E. of Constanta, with which it shares the export grain trade of Rumania. Pop. est. 6,000.

Sulla, LUCIUS CORNELIUS (138-78 B.C.). Roman soldier and statesman. Of noble birth, he served

Lucius Sulla,
Roman soldier
Vatican Museum

brilliantly under Marius (*q.v.*) in the war against Jugurtha, 107 B.C. He won fresh distinction in the war with the Teutones, 104-101. Having excited the jealousy of Marius, he

became marked out for the leadership of the aristocratic party.

In the Social War Sulla achieved the most brilliant successes. Then Mithradates, king of Pontus, challenged Rome; the command of the eastern armies was given to Sulla, but when superseded by Marius, he drove him from Rome, 88, and departed to deal with Mithradates.

Defeating him in 84, he returned to Italy, where the Democrats had effected a revolution.

After winning the decisive battle of the Colline Gate before the walls of Rome, in 82 Sulla was appointed dictator, proscribed the Marians, and revolutionised the constitution; he made the senate supreme, reformed the judiciary and executive, but placed no checks on aspirants to military dictatorship. Established at an unparalleled height of power, Sulla resigned all his offices in 79 and retired to his estate to indulge in the debaucheries of which he died. Intellectually above any of his contemporaries, Sulla was a master of war and statecraft, steeped in culture, perfectly self-reliant but absolutely devoid of morality. *Consult History of Rome, T. Mommsen, new ed. 1901; Outlines of Roman History, H. F. Pelham, 5th ed. 1909.*

Sullivan, SIR ARTHUR SEYMOUR (1842-1900). British composer. Born in London, May 13, 1842, he

Arthur Sullivan

entered the Chapel Royal choir in 1854, studied at the Royal Academy of Music and at Leipzig, 1857-61, and first attracted attention by his cantata, *Kenilworth*,

1864. Sullivan is best known by his musical collaboration with Sir W. S. Gilbert in their famous series of light operas. *Thespis*, 1871, was their first joint work, their partnership concluding with *The Grand Duke*, 1896.

Sullivan's dramatic works composed with other librettists include *Cox and Box*, 1867, *Haddon Hall*, 1892, *The Beauty Stone*, 1898, and *The Rose of Persia*, 1900. The perfect blend of Sullivan's melodic gift with Gilbert's genius gave him

lasting fame, but his other compositions were also distinguished. He wrote oratorios, *The Light of the World*, 1873, and *The Golden Legend*, 1886, a grand opera, *Ivanhoe*, 1891, incidental music for several Shakespearean plays, and church music; some of his separate songs, e.g. *The Lost*

Sulgrave, Northamptonshire. The old manor house, formerly occupied by the Washington family, now a museum of relics

Chord, 1877. enjoyed great popularity. Knighted in 1883, he died in London, Nov. 22, 1900. See Gilbert and Sullivan. *Consult* Life, Letters, and Diaries, H. Sullivan and N. Flower, 1935.

Sullivan, BARRY (1821-91). Irish actor. Born at Birmingham, July 5, 1821, he made his début at Cork in 1840, and first appeared in London at the Haymarket Theatre, Feb. 7, 1852, as Hamlet. He toured America, and for six years was an actor-

Barry Sullivan,
Irish actor

manager in Australia. Afterwards, he played many Shakespearian and modern parts in London, managed the Holborn Theatre, 1868-70, and starred at Drury Lane. He died May 3, 1891.

Sullivan, FRANCIS L. (b. 1903). British actor. Born in London, Jan. 6, 1903, he was educated in Switzerland, and made his first stage appearance at the Old Vic in Richard III, 1921. He gave memorable performances as Hercule Poirot in Black Coffee, 1931; Osear

Francis L. Sullivan,
British actor

Wilde in the play of that name, 1939; Mr. Crispin in The Man with Red Hair, 1942. His particular assets were a dominating figure and a deep, richly coloured voice, admirably suited to heavy character parts. He entered films in 1933, and among many rôles portrayed on the screen were three Dickensian studies: Jaggers, in Great Expectations, 1936 and 1946; Jasper, in Edwin Drood, 1937; Bumble, in Oliver Twist, 1948.

Sullivan, JOHN LAWRENCE (1858-1918). American pugilist. He was born at Boston, Mass., Oct. 15, 1858. On Feb. 7, 1882, he knocked out Paddy Ryan in nine rounds. He beat Charlie Mitchell, May 14, 1883, in three rounds at New York, and in 1888 fought a draw with

J. L. Sullivan,
American pugilist

him of 39 rounds at Chantilly, France. In the following year

Sullivan won the heavyweight championship of America by beating Jake Kilrain in 75 rounds at Richburg. He was defeated by Jim Corbett, Sept. 7, 1892, at New Orleans. Sullivan died Feb. 2, 1918.

Sullivan, JOHN WILLIAM NAVIN (1886-1937). British journalist. Born of a poor family, he studied science and mathematics in private, and later at University College, London. He had a varied journalistic career, but eventually made a name as a scientific populariser, writing for The Times and other journals. The first of his books to attract wide attention was Aspects of Science, 1922. Later he wrote Atoms and Electrons, 1924; and Three Men Discuss Relativity, 1926. He then entered a new field to publish a study of Beethoven, 1927, and in 1932 appeared a semi-fictional autobiography, But for the Grace of God. Sullivan died Aug. 12, 1937.

Sully, JAMES (1842-1923). British psychological writer. Born at Bridgwater, March 3, 1842, and educated at Taunton, at Regent's Park College, London, and at Göttingen and Berlin universities, he was professor of philosophy at University College, London, 1892-1903. According to him, psychology is the science which aims at an accurate and systematic description of the various mental phenomena. The feelings have an intellectual and emotional side, and are characterised by quality, intensity, and massiveness or extensivity. His works include Pessimism, 1877; Outlines of Psychology, 1884; The Human Mind, 1892. He died Nov. 1, 1923.

Sully, MAXIMILIEN DE BÉTHUNE, DUKE OF (1560-1641). French statesman. Born at Rosny, near Mantes, Dec. 13, 1560, his father being baron of Rosny, Sully, then called Rosny, joined the court of Henry IV, king of Navarre, about 1571. He studied in Paris, and in civil wars fought on the Protestant side.

In 1597 Sully became superintendent of finances, and henceforward he was Henry's chief adviser. His control over every department of state was real. He did much to improve the wretched condition to which France had been reduced. Taxes were lightened, and the wasteful and corrupt system of

collecting them reformed; roads and bridges were built, and something was done for agriculture, the one industry he valued, while the defences of the country were not neglected. He found time to go on missions abroad and to take part in campaigns. Soon after Henry's death in 1610 he resigned his offices, and the rest of his life was mostly passed in retirement. A marshal from 1634, he died Dec. 22, 1641.

Sully, who was made a duke in 1606, remained throughout life a Protestant. He left some Memoirs which were published in an English translation in 1756 and 1856. The style of these is unpleasant and the tone egotistical, but they are valuable for the light they throw upon one of the great ministers of France.

Sully-Prudhomme, RENÉ FRANÇOIS ARMAND (1839-1907). French poet. He was born in Paris,

R. F. A. Sully-
Prudhomme,
French poet

March 16, 1839, and graduated in science at the Lycée Bonaparte, but devoted himself entirely to literature from 1865. He began as a disciple of Leconte de Lisle, with Stances et Poèmes, but his later work departed widely both by its intense subjectivity, e.g. Les Solitudes, Les Vaines Tendresses, and by its didacticism, e.g. La Justice, Le Bonheur, from the principles of the Parnassian school. In thought he is always pure and noble, and his verse is marked by great tenderness, subtlety, and grace. He was elected to the Academy in 1881, was awarded the Nobel prize for literature in 1901, and died Sept. 6, 1907. *Consult* Philosophie de Sully-Prudhomme, C. Hémon, 1907.

Sulpha Group. The various drugs usually grouped together under this name are described under Sulphonamide.

Sulphates. Name given to certain salts of sulphuric acid. The natural sulphates are of great economic importance and include such sulphates as Epsom salt, gypsum, celestine, barite, and chalcantithite. Sulphate of ammonia is a nitrogenous manure, produced as a by-product of gas-works. It acts rather more slowly than nitrate of soda, but contains more nitrogen, and is of particular value for maling barley, potatoes, and permanent grass. Other sulphates may be made by the interaction of sulphuric acid with a metal or metallic

Duke of Sully,
French statesman

oxide, or by the oxidation of a sulphide. Most sulphates are soluble in water, and are well-formed crystals, containing water of crystallisation. The alums, which contain 12 molecules of water, are double sulphates of aluminium with potassium, chromium, or other elements. See Sulphur; Sulphuric Acid.

Sulphocyanates. Salts of sulphocyanic acid, also known as thiocyanates and rhodanides. Sulphocyanates are prepared by direct union of sulphur with potassium cyanide, or in the case of ammonium sulphocyanate by warming an alcoholic mixture of carbon bisulphide and ammonia. A certain amount of ammonium sulphocyanate is obtained as a by-product in the manufacture of coal gas. Gas liquor contains from 2 to 3 p.c. of ammonium sulphocyanate (NH_4CNS), but Laming's iron oxide used in the purifying of coal gas is a more economical source as this substance contains from 10 to 12 p.c. of ammonium sulphocyanate. The soluble sulphocyanates are used in analytical chemistry as a test for iron in the form of a ferric salt, a blood-red colour being obtained when ammonium or potassium sulphocyanate is added to iron chloride solution. The sulphocyanates are also much used in dyeing. Mercury sulphocyanate is employed in making the toy called Pharaoh's serpent (*q.v.*).

Sulphonal ($\text{C}_7\text{H}_{10}\text{S}_2\text{O}_4$). Colourless crystalline compound made by oxidation of the product of interaction of ethyl mercaptan and acetone. Sulphonal and methylsulphonal were formerly widely used in medicine as hypnotic drugs, but have been superseded by the barbituric acid derivatives.

Sulphonamide. In chemistry, amide of a sulphononic acid. A large number of sulphonamide derivatives have been developed for use in medicine for the treatment of certain infections. The group known as the sulpha group contains as its simplest member sulphanilamide, (para-aminobenzene-sulphonamide), a white, odourless, crystalline compound with a slightly sweet taste, first synthesised by Gelmo in 1908. Interest in the sulpha group from a medical point of view was first aroused in 1935 when the German chemist Domagk while developing aniline dyes announced that the azo-dye prontosil (red) would cure streptococcal septicaemia in mice, an observation later confirmed by French workers. It was noted, moreover, that sulphanilamide was

the essential part of the molecule and was effective by itself. Interest in this new field of bacterial chemotherapy was further stimulated by the work of British investigators who confirmed these findings. The use of the sulpha group was soon extended to the treatment of infections other than those due to haemolytic streptococci, and numerous derivatives were developed. Sulphapyridine (M and B 693) synthesised in Britain by Ewins and Phillips and first reported by Whitby in 1938, was soon shown to have particular value in pneumococcal invasion. Other compounds in the group include sulphacetamide, sulphathiazole, sulphadiazine, and sulphaguanidine. The principal value of the sulpha group lies in the fact that they represent the first chemotherapeutic agents active when taken by mouth with a definite effect against dangerous bacteria, while relatively harmless to the patient. Their action is bacteriostatic, and they prevent multiplication of certain attacking microorganisms; thus the natural defence mechanisms of the body are given the opportunity of destroying the invaders, and the invaders cannot increase in number. In the treatment of serious infection, large initial doses are given in order to raise the concentration of the drug as rapidly as possible in the blood to an effective level.

Much fluid should accompany the taking of the sulpha group, as otherwise ill effects may follow blockage of the kidney tubules. Prolonged courses affect the blood corpuscles adversely. In urinary complaints which are amenable to the substance, relatively small doses are effective.

Sulphonic Acids. Acids containing the sulpha group (SO_2OH), united to carbon. Sulphonic acids of the aliphatic and aromatic hydrocarbons are known, those of the aromatic series being more important. The aliphatic sulphononic acids are made by several processes such as the oxidation of the mercaptans (*q.v.*) with nitric acid. They are thick liquids and readily soluble in water.

Sulphonic acids of the aromatic series are readily obtained by digesting the hydrocarbon with sulphuric acid. Benzene monosulphonic acid, a substance in fine deliquescent needles, is prepared by heating benzene with an equal volume of concentrated sulphuric acid in a vessel fitted with an inverted condenser for 20 to 30 hours. The operation, much em-

ployed in organic chemistry, is known as sulphonation. In the manufacture of aniline dyes it is often found that a soluble dye is obtained by sulphonating.

Sulphur. One of the non-metallic elements. Its symbol is S, atomic number 16, and atomic weight 32.06. It occurs in the free state in volcanic districts, especially in Sicily and in the United States, and in a state of combination with other elements in all parts of the world. It was well known to the Greeks and Romans, who used it as a bleaching agent and a fumigant. Iron pyrites (iron bisulphide, FeS_2), galena (lead sulphide, PbS), blende (zinc sulphide, ZnS), cinnabar (mercury sulphide, HgS) are among the more important sulphide ores; gypsum (calcium sulphate, $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$) and heavy spar (barium sulphate, BaSO_4) typify the naturally occurring sulphates. Proteins, certain essential oils, some mineral oils, and many other animal and vegetable substances contain small amounts of sulphur.

Most of the sulphur of commerce is derived by the Frasch process from the great deposits which are found in Louisiana and Texas, where the deposits have supplanted the mines of Sicily as the world's most important source. In the U.S. almost pure sulphur is obtained by sinking into the earth a pipe system through which circulates superheated water, and hot air under pressure; the sulphur is liquefied and forced to the surface by an air lift. In Sicily, the rough material contains earthy impurities from which it is purified by distillation in an iron retort, whence it passes into a large cooling chamber, where it falls like snow in the form of minute yellow crystals which constitute the sublimed sulphur of commerce; or the vapour is condensed to a liquid which is run into moulds to form on solidification sticks of roll sulphur or brimstone. If sulphur is boiled with lime in water, a solution is formed which, on the addition of hydrochloric acid, yields a precipitate of white amorphous sulphur (milk of sulphur).

Sulphur is remarkable for the many physical changes which it undergoes with rise of temperature. It melts at 115°C ., forming a liquid which is pale yellow and limpid, but it becomes thicker and darker on the further application of heat, until at 200° it is almost black and so thick as to be scarcely pourable: on still stronger heating it becomes much thinner again, also lighter in colour, until at 444.6°C . it boils,

forming a heavy reddish-brown vapour. If this very hot liquid be poured in a thin stream into water, it forms an elastic, rubber-like mass of plastic sulphur.

Ordinary sulphur is a bright yellow crystalline substance, without appreciable taste or odour; sp. gr. 2.05; insoluble in water; soluble in carbon disulphide; heated in air to 260° C., it takes fire and burns with a blue flame, producing sulphur dioxide, SO_2 , together with a little sulphur trioxide, SO_3 . It combines directly with several other elements forming sulphides. The chief applications of sulphur are to the manufacture of sulphuric acid, carbon disulphide, gunpowder, and the vulcanisation of indiarubber. Medicinally, sulphur is used internally as a laxative, externally in an ointment for scabies, etc., sulphur candles are burned for fumigation.

Sulphuretted hydrogen or hydrogen sulphide, H_2S , is the gas possessing the unpleasant smell of rotten eggs, which characterises the waters of sulphur springs. It is a colourless gas used in chemical analysis as a test for many metals. Traces in the air tarnish metals.

Sulphur dioxide or sulphurous anhydride, SO_2 , is formed when sulphur burns in air. It is a colourless gas, having the suffocating odour of burning brimstone, and is very soluble in water, the solution being known as sulphurous acid, H_2SO_3 . Both gas and solution are much used for bleaching, antiseptic and food-preserving purposes.

Sulphur trioxide, SO_3 , is obtained by the oxidation of sulphur dioxide by air in the presence of a catalyst, usually platinum.

Sulphur trioxide reacts violently with water, forming a number of hydrates, the most important of which is sulphuric acid. Sulphur trioxide dissolves in concentrated sulphuric acid in various proportions, and so produces the various grades of fuming sulphuric acid or "oleum," which, as well as the trioxide itself, are widely used in chemical industry.

Sulphuric Acid. Oil of vitriol, H_2SO_4 . The manufacture of this acid is one of the fundamental chemical industries. We are dependent on it for much of our washing soda, spirit of salt, nitric acid, explosives, dyes, etc.

There are two chief processes of sulphuric acid manufacture—the "lead chamber" process and the "contact" process.

The former comprises the following contributory processes. Sulphur dioxide is produced by burn-

ing sulphur or iron pyrites, FeS_2 , in suitable furnaces and conducting the gas into huge leaden chambers, about 100 ft. by 20 ft. by 20 ft. Nitric acid vapour is produced by distilling a mixture of sodium nitrate, NaNO_3 , and sulphuric acid in "nitre pots," and carried into the chamber along with the sulphur dioxide and a current of air. A little steam is also injected, but into other parts of the chamber. The chamber is merely an enclosed space wherein the four vapours may mingle, and by their reaction produce clouds of sulphuric acid which fall to the bottom of the chamber, whence it is drawn off from time to time. The nitric acid vapour merely helps the oxygen of the air to combine with the water and sulphur dioxide, and is used over and over again. This chamber acid, containing 70 p.c. of real acid, is concentrated in leaden pans to produce brown oil of vitriol, or in glass retorts to produce concentrated sulphuric acid, or oil of vitriol. The purest acid is distilled in platinum stills.

The contact process has already been outlined under sulphur trioxide in the article Sulphur. A mixture of sulphur dioxide, SO_2 , and air issues from a kiln in which pyrites, FeS_2 , or zinc blende, ZnS , is burnt, and meets jets of steam in a chamber whereby it is purified from dust, arsenic, and other impurities. The removal of elements such as arsenic, which frequently occur in small quantities, is important, as they may poison the catalyst. The mixture of gases is then perfectly dried by passing it through strong sulphuric acid before it enters the contact-chamber, which is filled with perforated shelves on which platinised asbestos is spread, and kept at a temperature of about 350°. Here the gases combine to form sulphur trioxide, SO_3 , which is received in closed vessels containing water, with which it combines to form the acid.

Concentrated sulphuric acid or oil of vitriol is a heavy, colourless, odourless liquid of oily consistence, sp. gr. 1.84, containing 96 p.c. of the real acid, H_2SO_4 . It boils at 338°, with the formation of exceedingly irritating vapours. When mixed with water it generates a great deal of heat, owing to the intense affinity which the acid has for water. Many of its uses depend on this property, e.g. alcohol, on being heated with it, loses the elements of water and produces ether (g.v.) or ethylene (g.v.), according to the conditions of experiment.

Moist air, or other gas, loses every trace of moisture by being bubbled through the acid. It is very corrosive; it produces painful wounds on the skin and destroys nearly all vegetable and animal substances. Under various circumstances it attacks nearly all the metals, producing their respective sulphates. It reacts with oxides, hydroxides, and carbonates in the production of sulphates.

SULPHURIC ACID, POISONING BY.

Concentrated sulphuric acid is a powerful poison, and is occasionally taken by accident or with suicidal intent. A teaspoonful is likely to prove fatal. Calomel and magnesium is the best antidote, but if this is not available sodium bicarbonate, chalk, whitening, or even ceiling plaster may be given. If none of these substances are at hand, the acid should be diluted by administering quantities of water.

Sulphurous Acid (H_2SO_3).

Acid, known only in solution, formed when sulphur dioxide is dissolved in water. The liquid smells strongly of sulphur dioxide, SO_2 , and forms salts known as sulphites, of which there are two varieties, the normal and acid salts, in the latter of which only one hydrogen atom is replaced by a metal. See Sulphur.

Sulpicians. R.C. society of secular priests. It was founded in 1645 by Jean Jacques Olier, when curé of S. Sulpice, Paris. Its object was to train young men for the priesthood; and the seminary of S. Sulpice was the outcome. Napoleon suppressed the society in 1812; it was re-established at the Restoration, but since the disestablishment of the Church in France has been converted to secular uses.

Sultan. Mahomedan title meaning ruler. It was used for the ruler of the Turkish dominions until 1922, when the national assembly at Ankara abolished the office. It is also applied to other princes, e.g. those of Morocco and Johore. The feminine is sultana. See Turkey.

Sultana. Small seedless raisin.

Sultanas are prepared in a similar way to raisins, from sun-dried white grapes grown in European Turkey and near Izmir.

Sultanpur. Dist. and town of the Uttar union, India, in the Fyzabad division. The dist. is situated on both sides of the Gumti, N. of Allahabad. Rice, wheat, and barley are the chief crops. Area, 1,699 sq. m. Pop. 1,100,368. The town is on the Gumti on the rly. due N. from Allahabad to Fyzabad. Pop. 10,450.

Sulu. Archipelago of more than 400 islands forming the southern.

most group of the Philippine Islands. They extend between Mindanao and Borneo and separate Sulu Sea from Celebes Sea. Their area is 1,560 sq. m. The larger islands are of volcanic formation, the smaller coral. Rice, coffee, indigo, sesame, hemp, and cocoa are produced, and other industries include pearl and shell fishing, cord manufacture, and weaving. Pop. est. 120,000, most of whom are Moros. The largest island, Sulu or Jolo, has an area of 326 sq. m., a mountainous interior (Tumatanguis, 2,940 ft.), and a fertile soil. Pop. est. 45,000. The capital is Sulu or Jolo on the N.W. coast of Sulu Island; it has a good roadstead.

Sumac OR **SUMACH** (*Rhus*). Genus of trees and shrubs of the family Anacardiaceae. Natives of temperate regions, the species are mostly poisonous in varying degree. The alternate leaves may be undivided, divided into three leaflets, or intricately divided by numerous leaflets being again deeply cut. The small flowers usually form dense clusters, the sexes sometimes on separate plants. *R. coriaria* affords the commercial sumac used for tanning, and *R. cotinus* the yellow dye-stuff known as young fustic, old fustic being *Maclura tinctoria*. *R. verniciflua* yields Japanese lacquer and *R. succedanea* red lacquer; the first from the milky sap, the second from the fruits. *R. toxicodendron* (poison ivy) and *R. venenata* (poison elder) are the two most deadly species, it being dangerous even to handle cut branches.

Sumatra. Island of the Malay archipelago. It is the sixth largest island in the world, being 1,115 m. long and 275 m. across at its greatest breadth. Its area is 165,000 sq. m. It lies between the Indian Ocean and the S.W. Pacific, and is separated from the Malay pen. by the narrow Malacca Strait, and from the western tip of Java by the Sunda Strait.

Lying roughly N.W.-S.E., the island extends from 5° 40' N. lat. to 5° 59' S. lat., being bisected by the equator, and from 95° 16' to 106° 3' 45' E. long. Strong squalls, accompanied by thunder, lightning and torrential rain, and called *sumatras*, occur frequently in the Malacca Strait during the period of the S.W. monsoon, i.e. April-Nov. The warm seas and the mountainous nature of this region cause the rainfall to be extremely heavy. Its pop. numbers some 8,000,000, including about 21,000 Europeans.

A high mountain chain, the Bukit Barisan, runs for 1,000 m. along the western coast, with many volcanic peaks rising from 5,000 to over 12,000 ft. Accordingly, though the river system is extensive, the rivers on the W. are mostly unnavigable. On the E., however, they are the best means of communication, and are of great importance. The largest are the Asahan, which drains Lake Toba, one of Sumatra's many lakes, the Rokan, the Kampar, the Jambi, and the Musi.

Sumatra's natural wealth is largely unexploited. There are immense forests, and products other than timber include rice, sugar, coffee, pepper, rubber. Excellent tobacco is grown at Deli, and copra, sisal, and some tea are exported. Minerals include small quantities of gold, silver, sulphur, and lead, with oil deposits near Palembang and at Jambi, and on the E. coast, N. of Medan, and in Achin. There is coal in the basins of the Ambilin and Lematang rivers, and tin mines in the neighbouring E. coast islands of Billiton and Banka, and on the small island of Bintan, in the Riouw Archipelago. Total output of crude oil in 1939 was 5,320,290 tons, and of coal 1,222,406 tons.

The chief ports are Padang in the W., Palembang in the S.E., Belawan in the N.E., and Sabang in the N. Transport is chiefly by water, but there are nearly 16,000 m. of roads. There are also 1,233 m. of rlys. Air services are maintained between Batavia, capital of Java, Palembang, and Medan, and between Batavia, Palembang, and Singapore.

The native peoples are chiefly of Batak, Menangkaban, and other Malayan stocks. The Menangkabans are the most advanced, and are famous for architecture, silversmiths' work, and weaving. They live on the plateaux above Padang, on the west coast.

Civilized first by the Hindus in the 7th century, Sumatra came under Muslim influence six centuries later, and most of its people are Muslims. Known from early times to the traders of India and China the island made its first contact with the West with the arrival in 1508 of the Portuguese explorer Lopez de Figueroa, who was soon followed by other adventurers from Lisbon. They established flourishing trade settlements on the coast, but were ousted by the Dutch towards the end of the 16th century. For later history, see Indonesia.

Sumba (Du. Soemba), TJENDANA, OR SANDALWOOD. Island of Indonesia, sometimes included in the Lesser Sunda group. It lies S. of Flores, from which it is separated by the Sumba Strait, in about lat. 10° S., long. 120° E. With an area of some 4,500 sq. m., it is a plateau rising to about 3,500 ft. Most of the quarter of a million inhabitants are Malays. The chief town is Waingapu. Valuable timber, including sandalwood, cotton, horses, and tortoiseshell are exported. In Japanese occupation 1942-45, Sumba became part of the state of E. Indonesia 1947. See Indonesia.

Sumbawa (Du. Soembawa). Island of Indonesia. It is one of the Lesser Sunda islands and is situated between Lombok and Flores. Of the four mt. ranges which cross the island from N. to W. the N. range (the highest) is volcanic, and rises to 9,042 ft. in Tambora, which had a disastrous eruption in 1815.

The area is 4,300 sq. m. and the pop. some 180,000, of whom 11,000 are foreign traders. In Japanese occupation 1942-45, Sumbawa became part of the state of E. Indonesia 1947. See Indonesia.

Sumer OR **SHUMER**. Ancient name of the lower Euphrates plain afterwards called Babylonia. It is the biblical land of Shinar (Gen. 10). The Sumerians, earliest known inhabitants of Babylonia, gave their name to Sumerian culture and the Sumerian age. By some they are supposed to have lived in the S. of the country, the Akkadians inhabiting the N. See Babylonia; Chaldeans; Cuneiform; Elam; Gudea; Hammurabi Code; Patesi.

Sumer is icumen in (Summer is come). A musical round or rota, the MS. of which is in the British Museum. The composer is unknown, but the transcription (ascribed to John of Fornssete, a monk at Reading Abbey) dates from about 1226. It is beyond doubt the oldest piece of harmonised secular music extant. The melody, which is not modal, but in the key of F, is of folk-song character. The composer treated it in canon (*g.v.*) for four equal voices, either tenors or trebles, placing below it a pes or burden for two basses. The words are in the 13th century Wessex, but there is also a set of Latin words, which were possibly added by the transcriber, of a Hymn to the Saviour, so as to turn it into a motet.

The melody is pleasant and pastoral, and though it has a few crudities, the whole is an eloquent

Summer is iumen in. The round in modern notation and with a modern version of the words

testimony to the advanced state of English contrapuntal music anterior to the 13th century.

Sumi, or **SUMY**. Town of Ukraine S.S.R., capital of the region of the same name. It is situated 90 m. N.W. of Kharkov, on the Psol, a trib. of the Dnieper, and the Kharkov-Glukhov rly. It is a centre for trade in grain and horses. Captured by the Germans during Oct., 1941, Sumi was made by them into a base. The Russians retook it Feb. 23, 1943, but were forced to evacuate it some days later during the new German drive which recaptured Kharkov. It was eventually liberated Sept. 2, 1943. Pop. 63,833.

SUMIDA or **SCUMIDA-GAWA**. River of Honshu, Japan. It flows N., E., and S.E. for nearly 200 m., passing through Tokyo to enter the Bay of Tokyo. It is navigable for 50 m. for medium sized vessels.

Summary Jurisdiction. Jurisdiction of a court to make an order summarily, i.e. forthwith. Thus justices of the peace in petty session have a summary jurisdiction in cases of minor crimes, i.e. they can straightway fine or imprison the offender. But in other cases, e.g. murder, burglary, treason, they have no right to try the alleged offender, but must, if a case is made out, commit him for trial to a higher court.

A court of summary jurisdiction is one of a justice or justices of the peace or of a stipendiary magistrate, or any other court to whom power is given to act under the Summary Jurisdiction Acts. See **Magistrate**.

Summer. Second season of the year. In the N. hemisphere it comprises popularly June, July, and Aug., and the same period is

weather in autumn or early winter. See **Season**.

Summerskill, **EDITH CLARA** (b. 1901). British politician. A Londoner, she was educated at King's College and completed her training as a doctor at Charing Cross hospital. She qualified in 1924, and married a fellow practitioner, E. J. Samuel, in 1925. Joining the Labour party, she was on the Middlesex county council during 1931-41, and became M.P. for W. Fulham in 1938. She was parl. secretary to the ministry of food from 1945 to 1950, when she became minister of national insurance. She published *Babies Without Tears*, 1941.

Summer Time. Method of increasing the hours of daylight activity in summer by advancing, on a specified date in spring, official time one hour compared with Greenwich mean time, which is restored on a date in autumn. Advantages of this practice were first suggested by Benjamin Franklin, but it was William Willett, a London builder, who founded the Waste of Daylight movement, and in 1908 had a Daylight Saving bill introduced into parliament. In 1916 parliament passed as a wartime measure an Act ordaining that during a defined period that year the legal time should be one hour ahead of G.M.T.

The Act was renewed each year until 1925, when it was made permanent, summer time being

adopted by British meteorologists. The word is also applied to summer-like periods, in other seasons, e.g. St. Martin's or St. Martin's little summer, about St. Martin's day, Nov. 11, sometimes used figuratively for prosperity after adversity; St. Luke's or St. Luke's little summer, about St. Luke's day, Oct. 18; and Indian summer, the name given especially in the upper Mississippi Valley to a period of calm rainless, mild, hazy

defined as the period beginning at 2 a.m. G.M.T. on the day following the third Sat. in April—unless that were Easter, in which even summer time would start a week earlier—and ending at 2 a.m. G.M.T. on the day following the first Sat. in Oct. At the outbreak of the Second Great War, summer time for 1939 was extended until Nov. 19, and in 1940 it began on Feb. 25, to last throughout the War. Not until Oct. 7, 1945, was G.M.T. restored. During some years of the Second Great War clocks were advanced two hours instead of one: dates on which double summer time applied are given under that heading.

Summer time was introduced in Germany in 1917, abolished in 1919, and brought back as a wartime measure in 1940. France adopted the system in 1916, and in 1923 fixed the period as from the last Sat. in March until the first Sat. in Oct. The difference for a few weeks between British and French clocks disorganized cross-Channel traffic, and at the outbreak of war French and British summer times were synchronised; but in 1940 France was obliged to adopt German time. In 1917 the scheme was introduced into the Netherlands; it lapsed in 1923, was revived in 1925 to assist the tourist interests, but in 1928 was modified to apply to transport services only. Spain observed summer time only during 1919-23. Denmark tried it in 1917, but ceased to do so after 1919 because of its unpopularity with farmers. In the Second Great War all Axis and occupied countries observed German summer time. In 1946 the Western European countries for the first time advanced clocks an hour on a common date.

There is no general regulation in Canada, an Act of 1918 admitting local option. Most towns observe summer time, but country districts seldom. Local decision also applies in the U.S.A., where New York, Chicago, Boston, and other business centres generally follow British practice; summer time is not generally observed in rural areas. It was introduced nationally as a war measure in 1941. Australia observed summer time in 1916-18 only, but New Zealand has used it since 1929. Argentina started it in 1930, Chile and Brazil the next year.

Summing Up. A statement by a judge to a jury before he calls on them to pronounce a verdict. It normally recapitulates

Edith Summerskill, British politician

the evidence on the facts of which the jury must decide, and declares the law applicable to the case, decision as to which is the judge's alone. *See* Trial.

Summons (Lat. *summonēre*, to give a hint). In law, a request, in the nature of an order, to anyone to appear in a court of justice. In Great Britain a summons to a person charged with an offence must always state the nature of the summons, so that he may be prepared to argue the case and call evidence. The day and hour must also be specified. *See* Writ.

Sumner, CHARLES (1811-74). American politician. Born at Boston, Mass., Jan. 6, 1811, he was

Charles Sumner.
American statesman

educated at Harvard and called to the bar in 1834. In 1851 he was elected senator as a Democrat and Free-soiler, and three times as a Republican in later years.

Throughout his career he was an uncompromising opponent of slavery. In 1856 he was violently assaulted in the senate by P. S. Brooks, a relative of whom had been bitterly attacked by Sumner in one of his speeches. During 1861-71 Sumner was chairman of the committee on foreign relations. He was in favour of giving votes to negroes, and supported the Civil Rights bill for granting them equality of treatment with whites. He died March 11, 1874.

Sumner, JAMES BATCHELLER (b. 1887). American biochemist. He was born at Canton, Mass., Nov. 19, 1887, and educated at Harvard university, afterwards doing research work at Brussels. He joined the staff of Cornell university medical school in 1914, and became professor of biochemistry there in 1929. He did much valuable investigation on enzymes, being the first to isolate one in a pure state. For this work he was awarded half the Nobel prize for chemistry in 1946, the other half being divided between W. M. Stanley and J. H. Northrop.

Sump. Lowest part of the shaft of a mine, into which water drains. By extension, any well to drain land, e.g. before laying foundations, is also called a sump. On internal combustion engines the oil reservoir in the lower part of the crankcase is called the sump. A pump draws oil thence

through a filter, and the oil, after lubricating the bearings, cylinder, and walls runs down the sides of the crankcase back into the sump. In splash lubricating systems the sump carries troughs, one of which is disposed under each of the big end bearings. Many sumps are cast with ridges or fins to assist in keeping the oil cool.

Sumptuary Laws (Lat. *sumptus*, expense). Statutes to repress private extravagance and luxury. They also aim at safeguarding the prestige of privileged classes, directing trade and industry into desired channels, and raising revenue, although such legislation never has purely financial aims.

The laws of Solon at Athens afford an example of early sumptuary legislation, but in Sparta much greater simplicity of manners was enforced. From 215 B.C.

the Roman republic endeavoured to check corruption, spreading with decadent Hellenic culture, by a series of laws, among which the measures taken by Cato the Censor are famous. Women's dress, banquets, and domestic slaves were the chief objects of Roman sumptuary legislation, of which little is heard after the 1st century A.D.

In medieval Europe, sumptuary laws were made by the emperor Frederick II. In England regulations against luxury in food were promulgated under Edward II and subsequently. A series of Acts of parliament, beginning 1363, placed restrictions on expensive apparel, graduated according to rank. Other regulations, relating to such matters as plate and liveried retainers, were made. In 1603 most of these laws, which had already fallen into a beyance, were repealed.

THE SUN: AS SEEN BY MODERN SCIENCE

* A. Hunter, Ph.D., F.R.A.S., Royal Greenwich Observatory

Related articles include those on Astronomy; Planet; Stars. See Light; Relativity; Spectroscopy; Telescope; and the entries on famous astronomers; also colour plate Solar System

The sun is to us by far the most important of the heavenly bodies. Its attractive power keeps the planets circling round it, its light and heat are indispensable for the preservation of animal and vegetable life. From the earliest times men have recognized its beneficent power, but it is only in modern times that its grandeur has been fully realized. The ancient Greeks determined the moon's distance correctly, but estimated the sun's distance as only $4\frac{1}{2}$ million m., this estimate holding the field for 2,000 years. After the invention of the telescope it was found that the true distance is much greater. The now accepted value of the average distance, 93,004,000 m., is probably within 20,000 m. of the truth. The sun, however, is not exactly in the centre of the earth's orbit, and we are 3,000,000 m. nearer to it in Jan. than in July. Once the distance is known, the size is deduced by measuring the angle subtended by the sun, which gives a diameter of 865,400 m., 109 times that of the earth, and a bulk 1,306,000 times that of the earth. The sun's mass or weight is 333,420 times the earth's, so that the density of the sun is $\frac{1}{160}$ that of the earth, or $1\frac{1}{160}$ that of water.

Telescopic study of the sun's surface began with Galileo. He found some dark spots on the sun, which moved across its disk in about a fortnight, from which he correctly inferred that the sun is

rotating in 25 days. Prolonged observations have shown that the rotation period varies in different solar latitudes. The equator takes 25 days; regions in latitude 30° take 27 days, and in latitude 45° 29 days.

Two centuries after the discovery of sunspots Schwabe detected that they wax and wane in size and number in a period that averages 11 years. All forms of solar activity share in the variation, which also synchronises with a variation in terrestrial magnetism. Years of many spots have active magnetic disturbances, and frequent auroral displays and interference with radio communications. Study of the sun with the spectrohelioscope (*q.v.*) has shown that these terrestrial effects are due not directly to the spots but to fleeting bright eruptions near them, called flares. Charged particles, shot out by these flares at speeds up to about 1,000 m. a sec., reach the earth a day later and cause disturbances by electrifying the upper atmosphere.

Sunspots undergo a remarkable shift in latitude during the sunspot cycle. Soon after minimum they break out at distances of 30° , or thereabouts, from the equator, on either side. As the cycle advances they gradually close in on the equator, reaching a limit of about 4° from it when the next minimum is attained. They linger here for a year or two after the next series of

high-latitude spots has appeared, so that the two cycles overlap.

The brilliant surface of the sun, known as the photosphere, presents a mottled aspect in the telescope that has been compared to rice-grains or willow-leaves. Of late years many lines of research have indicated a figure close to $6,000^{\circ}\text{C}$. as the temperature of the sun's radiating surface.

Discoveries during Eclipses

Outside the photosphere there are three appendages, all discovered during total eclipses; the outermost is the corona, an ethereal veil which stretches out to a vast distance, sometimes millions of miles from the sun. Until 1931 study of the corona had to be confined to the fleeting moments of total eclipses, but in that year Lyot devised a coronagraph with which he successfully photographed the inner corona in full sunlight. The bright spectrum lines of the inner corona remained unidentified until in 1942 Edlén proved that they were due to iron, nickel, and calcium at a temperature of about a million degrees C. The light from the outer corona is sunlight diffused by clouds of electrons.

The corona changes markedly in aspect during the sunspot cycle. At minimum it is spread out in two long wings in the equatorial regions, the poles having merely a set of delicate curved plumes. At maximum the corona is distributed evenly round the limb, but there are often signs of special disturbance in the neighbourhood of large sunspots.

The chromosphere is inside the corona, and was discovered during eclipses, but can now be studied at any time with the aid of the spectroscopic. It is bright red, and gives rise to prominences, uprushes of glowing gas, chiefly hydrogen, which is ejected at great speed from the sun's surface, and rises to heights of 200,000 m. The streamers then bend over and descend, forming fantastic shapes. There are also quiescent prominences, resembling our clouds; these are seen even at the poles; the eruptive ones are confined to the spot zones.

Below the chromosphere is the reversing layer, the true solar atmosphere. The solar spectrum is crossed by a vast number of dark lines, which arise from the absorption of sunlight by the gases in this layer. About 60 known elements are present there in a gaseous state, the lines of iron being especially numerous. In total eclipses, when

the sun is just covered, we see the reversing layer without the photosphere, and the spectral lines suddenly change from dark to bright. The degree of excitation in this flash spectrum (*q.v.*) suggests a temperature of about $35,000^{\circ}\text{C}$. The temperature of the sun thus seems to increase outwards, from $6,000^{\circ}$ at the surface, through $35,000^{\circ}$ in the reversing layer and lower chromosphere, to about a million degrees in the corona. No theoretical explanation of this unexpected behaviour is available.

Use of the Spectroheliograph

During the 20th cent. great advances in knowledge of solar physics have been made by the spectroheliograph (*q.v.*). Most spectroheliograph photographs are taken in the lines of calcium and hydrogen. These gases give different results. The calcium pictures show a number of rounded luminous clouds, called flocculi, that define the limits of the sunspot zones. The hydrogen pictures show the disk covered with narrow curved streamers, apparently more disturbed than the calcium formations. Round sunspots they exhibit a spiral formation, indicating that a spot is of the nature of a whirlwind. This discovery inspired the suggestion that the whirling round of electrified particles would produce a magnetic field; the idea was tested by the spectroscopic, and some of the lines in the spot spectrum were observed to be doubled or tripled; laboratory experiments show that a magnetic field produces this effect.

Knowledge of the sun's atmosphere has been rapidly extended by the use of cinematography. Photographs of the chromosphere and prominences, taken every few minutes either with a spectroheliograph or with an extremely selective polarising filter which isolates the desired wavelength optically, are projected at normal film speed. The resulting motion picture shows the movement of solar matter speeded up about a thousandfold.

The light of the sun is about 11,400 million times that of the brightest star, Sirius. This is, however, entirely due to proximity: the sun is intrinsically a star of about average brightness (actually 26 times fainter than Sirius would be at the same distance). Each square inch of its surface shines with a light of over 300,000 candle power. The energy received by the earth each year is enough to melt a layer of ice more than 100 feet thick over its whole surface,

The sun has been radiating at this prodigious rate throughout recorded history, and approximately so throughout geological time. The source of the radiation has been a matter of dispute for a century. It is now believed that at the high temperature (20 million degrees C.) in the interior, violent collisions between the stripped atomic nuclei transmute hydrogen into helium with a small loss of mass. This loss is equivalent, according to relativity theory, to an enormous release of energy, the process being in this respect similar to that occurring in the atomic bomb. If the sun loses about 4.2 million tons of its mass in this way every second, its continued radiation can be accounted for. This rate of loss is entirely insignificant to an object as big as the sun, which can continue to shine for thousands of millions of years yet.

Bibliography. The Sun, C. A. Young, 3rd ed. 1895; The Sun, C. G. Abbot, 1911; The Sun, G. Abetti, 1938; Birth and Death of the Sun, G. Gamow, 1941.

Sun and Planet Gear. System of mechanical gearing in which the gears revolve within a large outer gearwheel, all the gears being epicyclic, *i.e.* their axes revolve round a common centre. The system was invented by Watt in 1781 for the transmission of power in his steam engine. It is used for two-speed gears on bicycles and in types of motor vehicle gearboxes.

Sunart. Sea-loch of Argyllshire, Scotland. It extends for $19\frac{1}{2}$ m. between Ardnamurchan (*q.v.*) and Sunart in the N. and Morven on the S. Its mean breadth is 1 m.

Sun-bathing. Exposure of the body to the direct light of the sun. Sun-bathing was first seriously practised in the Swiss Alps, where the snow accentuates the ultra-violet content of the light. The absence of ultra-violet rays (*q.v.*), especially in the atmosphere of cities, is responsible for much ill-health, and sun-bathing in suitable open-air situations compensates this lack. The body must be exposed to the sun for short periods to begin; when acclimatised and tanning has taken place, the time can be lengthened to some hours. Too quick exposure results in nervous symptoms and generalised burning (*see* Sunburn). Special glass exists which does not keep out (as does ordinary glass) the ultra-violet rays.

Sunbeam. Name of a series of yachts. Sunbeam I belonged to the 1st Earl Brassey. Lord and

Lady Brassey journeyed thousands of miles in the vessel, and Lady Brassey's books, of which the most popular was *A Voyage in the Sunbeam*, 1878, made its name widely familiar. She died on board in 1887. During the First Great War the *Sunbeam* did ambulance work in the Mediterranean. It was bought by Sir W. Runciman in 1922. *Sunbeam II*, also the property of the Runciman family, was on war service under Admiralty orders during the Second Great War. In 1947 it was sold to the Rydbergska Stiftelsen Foundation, of Stockholm, Sweden.

Sun Bear (*Ursus malayanus*). Name popularly applied to the Malayan honey-bear. It is small in size, and has black fur with a large cream-coloured patch across the throat. It is common in the forests of Malay and the islands near, and feeds upon termites and the honey of wild bees. See Bear.

Sun Bird. Popular name for the Nectariniidae. This family of tropical birds occurs only in the E. hemisphere. They are of small size, and have gorgeous plumage glowing with metallic colours in the males, the females being very soberly coloured. They have long curved beaks, comparatively short wings, and long tails. They occur chiefly in Africa; but one handsome species is a native of Australasia. They feed upon the nectar of flowers and upon small insects. One of the most beautiful is the metallic sun bird of Equatorial Africa. The male has brilliant green plumage on the back, violet on the throat, bluish black on the wings and tail, and shining yellow on the breast. Two of the tail feathers are greatly prolonged, with expanded and rounded tips.

Sun-bittern (*Eurypyga helias*). Crane-like bird, native of Guiana and Brazil. It is about 16 ins.

Sun-bittern. Male of *Eurypyga helias* major displaying its plumage during the courting season

long, and has a long beak, and plumage striped and mottled with black, white, and brown. When the male spreads its wings in displaying, or in threatening an intruder, it has a curious resemblance to a large butterfly. The

birds are usually found about rivers, and feed upon insects. A larger sub-species (*E. h. major*), of a different colour, is found in Colombia and Central America.

Sunburn. Mild inflammatory affection of the skin due to exposure to excessive sunlight. The skin becomes bright red, hot, and somewhat swollen, with smarting and tenderness. In a few days this passes off, the cuticle is shed, and the skin shows some degree of pigmentation or bronzing. Sunburn is indeed a burn and should be treated as such.

Sunbury. Borough of Pennsylvania, U.S.A., the co. seat of Northumberland co. It stands on the Susquehanna river, 55 m. N. of Harrisburg, and is served by the Pennsylvania and the Philadelphia and Reading rlys. Its manufactures include silk and planing mills, rly. workshops, foundry and machine shops, and flour mills. Here in 1883 Edison built his first incandescent lighting plant. Sunbury was founded in 1772, and incorporated in 1797. Pop. 15,462.

Sunbury-on-Thames. Urban dist. of Middlesex, England. It stands on the Thames, 4 m. W. of Kingston and 17 m. by rly. S.W. of London. The chief building is S. Mary's church, dating from the 18th century. Sunbury is a boating centre. Within the urban dist. is Sunbury Common, where are reservoirs and works of the Metropolitan Water Board. Here is Kempton Park (q.v.), at one time a royal residence, but now famous for its racecourse. Pop. 21,500.

Sun Cracks. In geology, cracks which are formed during the drying out of wet mud, etc., on its exposure to sun and air. They usually form a polygonal pattern, and may be as much as two ins. across. They are characteristic of deposits laid down in shallow water, e.g. tidal flats or inland desert basins, where the water covering is only sporadic. Sun cracks can be observed in process of formation, and also occur in rocks laid down in the past under similar conditions.

Sundae. Name, of American origin, for ice cream served with nuts, fruit, and syrups. In the U.S.A. ice cream is frequently served as a Sunday dessert. The origin of the word *sundae* is said to be a corruption of the word Sunday. The term became common in Great Britain.

Sunda Islands. Name of the islands in the Malay Archipelago which separate the China Sea from the Indian Ocean. Sumatra, Java,

Borneo, and Celebes are the large Sunda Islands; Bali, Lombok, Sumbawa, Flores, Timor, and neighbouring smaller islands form the Lesser Sunda Islands.

Sundarbans. Region of Bengal, partly in India and partly in Pakistan. It comprises the southernmost portion of the great delta of the Ganges-Brahmaputra at the head of the Bay of Bengal. It includes a strip of 70 m. wide along a 200 m. sea front, with a total area of 6,500 sq. m. E. of the Hooghli, to the Hariabhanga, it lies in the 24 Parganas dist. of W. Bengal, India. E. of the Hariabhanga it lies partly in the Khulna and partly in the Backergunge dist. of E. Bengal, Pakistan. The section consists of jungle-covered islands, a malarial dist., with hundreds of watercourses, some tidal, some sluggish. In the N. dists. dams have been made to keep out the salt water, the jungle has been cleared, and cultivation extended. The predominant tree is the sundri, which yields timber for boat-building.

Sunda Strait. Strait between Java and Sumatra. It is a passage 14 m. at its narrowest, connecting the Indian Ocean with the South China Sea. Within its limits is the island of Krakatoa (q.v.).

Sunday. First day of the week, set aside by Christians for public worship in memory of the resurrection of Christ. In northern Europe it is "the Sun's Day," cf. German *Sonntag*, and among the Latin races "the Lord's Day" (*dies dominica*), cf. French *dimanche*. In the early days of Christianity, both the Sabbath and Sunday were observed as days of worship. In 321 Constantine made Sunday a day of rest in towns. In addition to those named by the Church, there are Sundays with popular names derived from words in the appointed collects, e.g. Refreshment Sunday (mid-Lent), also called Mothering Sunday; Stir up Sunday (next before Advent), etc. See Sabbath; Sunday Observance.

Sunday, WILLIAM ASHLEY (1863-1935). U.S. evangelist. Born at Ames, Iowa, he was during 1883-90 a professional baseball player, and during 1891-95 assistant-secretary of the Y.M.C.A., Chicago. He took up evangelistic work in 1896, and

"Billy" Sunday, American evangelist

become familiar on both sides of the Atlantic as "Billy" Sunday. In 1903 he was ordained as a Presbyterian minister. He died Nov. 6, 1935.

Sunday Chronicle. Manchester newspaper, since 1939 also published in London and Glasgow. It was first published 1885, and in its early days opened its columns to writers of "progressive" views. Robert Blatchford was the first leader writer, and the theatre notes of A. M. Thompson ("Dangle") did much to break down Victorian prejudices against the stage. The Sunday Referee was incorporated in 1939. The paper is owned by Kemsley Newspapers, Ltd., and its circulation in 1947 was over one million.

Sunday Dispatch. A London Sunday newspaper. Originally the Weekly Dispatch, it was founded by Robert Bell and first published Sept. 27, 1801. It has led campaigns against social evils such as flogging and imprisonment for debt, and in 1849 published Dickens's historic protest against public executions. It has also consistently urged a policy of powerful armaments for Great Britain. Acquired by Ashton Dilke in 1875, the paper was later bought by Sir George Newnes. In 1903 it passed to the ownership of Associated Newspapers Limited, and in 1928 changed its name to the Sunday Dispatch. In 1947 the circulation was over two million.

Sunday Express. A London newspaper. Founded in 1918 by Lord Beaverbrook as a Sunday edition of the Daily Express (*q.v.*), it had reached a circulation of over two and a half millions by 1947. Editors have included James Douglas and (from 1928) J. R. Gordon. There is a Manchester edition.

Sunday Graphic. London illustrated newspaper. It was founded in 1915 by Sir E. Hulton, as the Illustrated Sunday Herald, companion to the same proprietor's Daily Sketch. Both papers were purchased in 1923 by the 1st Lord Rothermere, and repurchased the following year by Allied Newspapers, Ltd. (now Kemsley Newspapers). The present name of the Sunday Graphic was adopted 1929, and in 1947 its circulation was over one million. There is a Manchester edition.

Sunday League, NATIONAL. British organization for the promotion of educational and social recreation on Sunday. The society, established in 1855, grew out of a movement which began in the

middle of the 19th century. At first it met with hostility, but in the 'sixties it was able to organize popular Sunday evening lectures. A landmark in the movement was the Sunday opening of Manchester's civic museum and library, 1877, and Birmingham and other centres followed the example. In 1897 the national galleries and museums were thrown open on Sundays. The league then worked for music in the parks, etc. Among its activities were Sunday excursions at cheap fares. The league also organizes popular Sunday evening concerts for charity. Its offices at 34, Red Lion Square, London, W.C.1, were destroyed by bombs in the Second Great War and replaced by a temporary building.

Sunday Observance. Keeping Sunday as a day of rest. The custom followed naturally upon the establishment of Christianity as a state religion of the Roman empire. In England as early as 960, Edgar ordered the Sabbath to be kept holy from 3 p.m. on Sat. until daybreak on Mon. The 17th century brought several enactments on the subject. In 1606 absence from divine worship on Sunday was made punishable by a fine; in 1618 certain sports were allowed after service time. The growth of Puritan ideas imposed restrictions on Sunday amusements in 1625, and an Act of 1677 forbade all work, except what was necessary—this included haircutting and shaving, and selling perishable goods—or had a charitable object.

In England public houses are open on Sunday within certain hours only; in Wales they are closed under an Act of 1881; in Scotland hotels may sell intoxicating liquor to lodgers and travellers. In overseas parts of the British Empire conditions vary, as they do in different states of the U.S.A. By the Bread Act of 1836, making bread or cakes on Sunday, or selling them after 1.30 p.m., is punishable by fine. Fishing is permissible, by an Act of 1861, only for salmon with rod and line. It is an offence to take or kill game on a Sunday, but rabbits are excluded.

Sunday entertainments at which a charge is made for admittance were forbidden by an Act of 1780, but its effect was largely stultified by the device of admitting the public free and charging only for reserved seats or programmes. The Sunday Entertainments Act of 1932 permitted cinema performances, at the option of the local

authority, musical entertainments, lectures, debates, and the opening of museums, picture galleries, and zoological and botanical gardens. Penalties for infringements of Sunday Observance Acts can be claimed by a common informer (*q.v.*). See Early Closing; Licensing Laws; Lord's Day Observance Society.

Sunday Pictorial. London illustrated newspaper, the first of its kind in Great Britain. The first issue, in March, 1915, preceded by one week the first issue of the Illustrated Sunday Herald, later called the Sunday Graphic. Sunday Pictorial was founded by the 1st Viscount Rothermere, then chief owner of the Daily Mirror. It is owned by Sunday Pictorial Newspapers (1920) Ltd., a firm closely allied with that owning the Daily Mirror. The circulation in 1947 was over 3,800,000.

Sunday School. Institution where religious instruction is given to children and others on Sunday. The Sunday school movement was founded in England by Robert Raikes (*q.v.*), who in 1780 started a Sunday school in Gloucester. Other men in other places had previously made fitful experiments in the religious instruction of children, but Raikes originated the Sunday school as now known.

His efforts were strengthened by the Sunday School Society, founded by William Fox, 1785, and by the end of the 18th century schools were established throughout the kingdom.

The greatest impetus to the institution came from the Sunday School Union, an inter-denominational organization formed in London, 1803, which ultimately superseded the Sunday School Society. By the starting of branch unions throughout the land, by the institution of lesson systems, and the issue of explanatory notes, magazines, papers, handbooks, and song books for teachers and scholars; by the organizing of lecture conferences and conventions; and by the promotion of Sunday schools in Europe, India, China, and other lands, the union has throughout its existence led the way in developing the movement.

About the middle of the 19th century the international uniform lesson courses prepared by a committee of American, Canadian, and British Sunday school leaders was adopted in all parts of the world. In 1902 reformed methods were introduced into Great Britain by the Sunday School Union. One

result was the issue of graded lesson material designed for (a) beginners (3 and 4 years); (b) a primary department (5 to 7 years); (c) a junior department (ages 8 to 10); (d) a senior department (up to 13); and (e) young people (up to 16).

Since 1889 world conventions have been held at intervals, and as a result, at the Rome convention in 1907, the World's Sunday School Association was brought into being, having for its aim the development of the Sunday school in those countries most in need of help. In England the National Sunday School Union has its headquarters at Windsor House, Victoria Street, London, S.W.1.

Sunday Times. London newspaper. Founded 1822, it is recognized as one of the two "quality" Sunday journals in the U.K., the other being *The Observer*. To its pages devoted to criticism of literature, drama, music, art, etc., such writers as Desmond McCarthy, James Agate, Ernest Newman, and Ralph Straus have been regular contributors, and the political articles by "Scrutator" (Herbert

engines, could carry 4,000 lb. payload and crew over a normal range of 1,780 m. The heavy armament included three power-operated turrets. See *Aeroplane illus.*, p. 130.

Sunderland. Mun., co., and parl. bor., seaport, and largest town of Durham, England. It

Sunderland arms

stands at the mouth of the Wear, 12 m. S.E. of Newcastle-upon-Tyne, and is served by rly. The chief buildings are the town hall, opened 1890; public library, museum, and art gallery, 1879; and legal buildings, 1907. There are several parks and recreation grounds. The oldest church is S. Peter's, Monkwearmouth (part 7th century). The bor. includes Bishopwearmouth and Monkwearmouth, on either side of the Wear, which is crossed by the Queen Alexandra bridge opened in 1909 and the Wearmouth bridge opened in 1929. Roker is a seaside suburb.

With the development of the Durham coalfield in the 19th century, Sunderland became one of the biggest shipping and shipbuilding towns in the world. The harbour is enclosed by two stone piers and the docks can accommodate the largest vessels. They

cover over 200 acres, and coal is the chief article of export. Other industries are marine engineering, glassmaking, and the production of pit props, furniture, and paper. The oldest parts of Sunderland are Monkwearmouth and Bishopwearmouth; there was a famous Benedictine monastery at the former. Wearmouth, as it was called, became a port, but Sunderland, the name of a third parish, was given to the borough on its incorporation in 1634. Two M.P.s are elected. The worst air raids in the Second Great War were in 1943, on March 14 and 15, May 16 and 24; 267 persons were killed, 1,000 injured, and 34,500 houses damaged. Pop. est. 180,130.

Sunderland, EARL OF. English title granted to the family of Spencer in 1642. His great grandson, the 5th earl, became duke of

Marlborough in 1733; and all succeeding dukes have been also earls of Sunderland. See *Marlborough, Duke of*.

Sunderland, ROBERT SPENCER, 2ND EARL OF (1640-1702). English statesman and courtier. Born

in Paris, Aug. 4, 1640, son of Henry Spencer, 1st earl of Sunderland, who was killed at Newbury, 1643, and educated abroad and at Oxford, Sunderland throughout his career showed himself to be an intriguer, treacherous, profigate, and rapacious. After holding several diplomatic appointments, he became secretary of state, 1679, and one of the small cabal that surrounded Charles II. Sunderland supported James II in his actions, while at the same time maintaining secret relations with William of Orange. On James's fall he went to Amsterdam, but in 1691 declared himself a Protestant, and soon regained his old power. He was lord chamberlain, April, 1697, but resigned in Dec. Sunderland died at Althorp, Sept. 28, 1702.

Sundew (*Drosera rotundifolia*). Perennial insectivorous herb of the family *Droseraceae*. A native of Europe, N. and W. Asia, and N. America, it is a small rosette-plant growing in boggy ground. Its long-stalked leaves have a circular blade studded with crimson threads. Glandular at the tips, they secrete a gummy fluid. The flower spikes are 4 to 6 ins. long, and bear two rows of small white flowers which open only in sunshine, and the leaf-glands are extremely sensitive to the touch of any organic matter. Insects, at-

2nd Earl of Sunderland, English statesman After Carlo Maratta

Sunderland, Durham. The Wearmouth bridge, opened by the duke of York (King George VI) in 1929

Sidebotham) were for many years a strong feature. Lord Camrose (g.v.) was editor-in-chief from 1915 to 1936, during which time he and his brother, Lord Kemsley, were joint proprietors. The former gave up his interests in Jan., 1937.

Sunderland. British flying-boat, designed and built by Short Bros., Ltd. The largest R.A.F. aeroplane in operational service throughout the Second Great War, the Sunderland was developed for general reconnaissance from the commercial Empire or C class boat (used by Imperial Airways, and later by the B.O.A.C.), and itself formed the basis for the 58-ton Shetland and post-war Seaford, Solent, and other notable flying-boats. The standard Sunderland had a wing span of 112 ft. 9½ ins., and, powered by four 1,065-h.p. Bristol Pegasus radial

Sundew. Flower spikes and tentacle-fringed leaves: inset, single leaf

tracted by the dewy appearance of the glands, set up irritation by their efforts to get free from the viscid fluid which holds their feet. The tentacles all converge to the prisoner; the margins of the leaf curve towards the centre, forming a hollow into which a fluid is poured in which the insect is digested and the product absorbed. There are about a hundred species, three British. See Bog Plants.

Sundial. Instrument for measuring time. It makes use of the motion of the sun's shadow which is cast on to a flat surface by an iron style or gnomon arranged to be parallel to the earth's axis. The surface or dial plane, which is

seen most frequently at the same elevation as the sun and lying on or near the ordinary halo ring. There is some doubt as to how the name has arisen, for although the mock sun must follow the real sun as a dog its master, sun dogs persist for only short periods at a time. See Halo; Mock Sun.

Sundsvall. Seaport of Sweden. in the län or co. of Vesternorrland. It is on a sheltered inlet of the Gulf of Bothnia, 29 m. S.W. of Hernösand. It has an extensive timber trade and manufactures wood pulp, iron, and steel. There are shipbuilding yards. The town was rebuilt in stone after a disastrous fire in 1888. Pop. 19,142.

Sunflower. Large flowerheads and leaves of the tall garden plant

which are valuable as poultry food and as a source of oil. They are easily grown in any good garden soil, the seeds being sown in March. The genus *Helianthus* includes 55 species, all American, many of them perennials. Several other species are cultivated in Britain, including *H. tuberosus*, the so-called Jerusalem Artichoke (*q.v.*), which is not an artichoke and has no connexion with Palestine.

Sungar or **DZUNGAR.** Nomad tribe of Kalmuk stock in Central Asia. The left wing of the W. Mongols, they dominated in the 17th century the N. Tian Shan watershed, and established the widespread and powerful Sungarian kingdom.

Sungari. Tributary of the Amur, China. It rises in the White Crested Mountain on the borders of Korea, at an alt. of 8,000 ft., and flows N.W. until it receives the Nonni, which drains N.W. Manchuria, and then N.E. past Harbin. It is navigable to Kirin during half of the year. Length 800 m.

Sungaria. Region of China and Russia between the Tian Shan and Altai Mts., alternatively known as Zungaria (*q.v.*).

Sundial. Examples from English country houses. 1. Pedestal sundial, Ditton Park. 2. Copped Hall, Essex. 3. Wall pattern, Fairlawne, Tonbridge. 4. In yew and box, Easton Lodge, Essex

firmly fixed to a wall or pillar, and which is sometimes horizontal, sometimes vertical, bears marks showing the hours, half-hours, etc., of the day, the observer telling the time by noticing where the shadow falls. A device of great antiquity, it was in general use as a time-keeper before the invention of clocks and watches. Some sundials were very elaborate, notable examples extant being those at Queens' College, Cambridge, and Corpus Christi College, Oxford. Many bear Latin mottoes, referring to the brevity of human life. See Time; consult also Book of Sun Dials, Mrs. A. Patty, 1900.

Sun Dog. Term popularly applied to a mock sun, i.e. the image of the sun, often coloured, which is

Sun Fish (*Mola*). Genus of large fishes. They are notable for their very short and laterally compressed bodies. The depth of the fish is almost equal to the length, so that its outline approaches a circle. The rough sun fish (*M. mola*) occasionally occurs in the British seas, and is sometimes as much as 7 ft. long.

Sunflower (*Helianthus annuus*). Tall annual herb of the family Compositae, native of N. America, whence it was introduced to British gardens in 1596. It has a stout stem, 6 ft. or more in height, with large, rough, alternate oval leaves and huge flower-heads with deep-yellow ray florets and a broad brown disk. Each head produces hundreds of large grey seeds,

Sun Fish. Round marine fish that sometimes attains a length of 7 ft. American Museum of Natural History

Sungkiang. One of China's nine N.E. provinces. It contains 21 counties with Mutankiang as its capital. Other important cities are Acheng, Harbin, and Hohsi. The Changchun rly. runs through the province. Chief products are soya bean, kaoliang, millet, and timber. The province consists of fertile plains in the W., and hilly regions with valuable forests in the E., where it borders the U.S.S.R. Area, 30,703 sq. m. Pop. 4,923,000.

Sun Helmet OR SOLA TOPPE. Head covering formerly worn by Europeans in tropical countries. Constructed of some light insulating material such as sola pith, with the outer surface of a light colour, it was superseded in the Second Great War and after by the bush hat.

Sunium (Gr. *Sounion*). Ancient name of the rocky promontory at the S. end of Attica, Greece. On its highest point (200 ft.) are the ruins of a temple of Poseidon, dating from about 450-400 B.C. The temple of Athena, with which this was formerly identified, was a little distance away to the N.E. The modern name of Sunium is Cape Colonna.

Sunn Hemp (*Crotalaria juncea*). Annual herb of the family Leguminosae. A native of India, it has downy, furrowed stems, and lance-shaped leaves clothed with silvery-white hairs. The yellow flowers resemble those of the broom, and form long sprays at the end of the branches. They are succeeded by pods containing kidney-shaped seeds. The name is due to the valuable fibres derived from the inner bark.

Sunni (Arab., lawful). Name denoting orthodox Mahomedans, because they accept as their rule of faith and law the Sunna and the Koran. The Sunna deduces the standpoint and usage of Mahomet from his hadiths or traditional sayings and doings. Islamic theology and law were founded by Hanifa at Kufa, Malik at Medina, Shafi at Cairo, and Hanbal at Bagdad. All Sunnites, while recognizing the authority of the six collections containing the Sunna, which were compiled in the 9th century, follow one of the above four systems. The Hanifite prevails among Turks, Tartars, Iraq Arabs, and Indian Muslims; the Malikite mostly in Africa; the Shafite in Arabia and Persia; the Hanbalite is local and unimportant.

Acknowledging the first four caliphs after Mahomet as validly elected, Sunnites regard the authority of the caliphate as political

rather than spiritual. This distinguishes them from the Shiahs, mostly in Persia, who maintain that the Prophet's true and divinely appointed successor was his son-in-law, Ali. The Sunnis number some 200,000,000. See Mahomedanism.

Sunningdale. Village of Berkshire, England. It is 27 m. by rly. W. of London, and has excellent golf links. At Sunningdale Park the Civil Defence staff college was opened 1950. Sunninghill near by has an old church and a rly. station (Sunninghill and Ascot). Sunninghill Park, built c. 1770, and bought by the commissioners of crown lands in 1944, was granted Aug. 14, 1947, to Princess Elizabeth by her father George VI as a "grace and favour" residence, but was too seriously damaged by fire Aug. 29 for occupation.

Sun Pillar. Vertical column of light, usually a glittering white but occasionally yellow-orange or red, seen above (and sometimes below) the sun, especially about sunrise or sunset. The phenomenon is attributed to the reflection of sunlight from small snow crystals. Should a sun pillar be visible at the same time as the mock sun ring, the striking phenomenon of the cross may be produced in the sky. See Mock Sun.

Sunshine Recorder. Instrument of the Campbell-Stokes pattern
By courtesy of Negretti & Zambra

Sunshine. Term applied to the radiation from the sun which renders objects visible to the eye. It extends over a range of wavelengths from about 0.4 to 0.8 micron, the former being violet and the latter red light; between these limits are the remaining rainbow colours, viz. indigo, blue, green, yellow, and orange. Outside the earth's atmosphere the violet light is far more intense than the red, but the shorter waves are more readily scattered by the atmosphere than the longer ones; hence at the earth's surface the distribution of

energy is altered, so that when the solar beam has to traverse a long path, e.g. at sunset, through a dusty atmosphere, radiation in the longer wavelengths so predominates that red is the principal colouring. The loss in the solar radiation at wavelengths of less than 0.4 micron, i.e. ultra-violet rays, is even more pronounced, which explains the choice of mountain sanatoriums for therapeutic treatment.

The duration of bright sunshine is an important meteorological element and can be ascertained by the aid of a suitable device such as a sunshine recorder (*vi.*). In Great Britain there is more sunshine on the coasts than inland, and the sunniest month in most places is June; the duller everywhere is Dec. The smoke of industrial areas reduces the sunshine, e.g. in central London the mean daily value is about 3.6 hours, while at Kew and Enfield, on the outskirts, it is 4.0 hours; this deficit is equivalent to about 150 hours over the year. The sunniest region is the S. coast of England, some parts of which record annual totals in excess of 1,800 hours. In contrast, in parts of S. Africa 3,000 hours are frequently registered, e.g. Kimberley (mean 9.4 hours per day) registers 85 p.c. of the possible sunshine in June. See Radiation.

Sunshine Recorder. Instrument for recording the duration of bright sunshine. The one commonly adopted is the Campbell-Stokes. In this instrument an accurately made glass sphere, four inches in diameter, focuses the sun's rays upon a strip of cardboard mounted in a metal bowl, approximately spherical in shape. As the sun passes from E. to W., its focused rays burn a line in the cardboard during the periods of bright sunshine, and as the cardboard is graduated in hours and tenths, the daily duration of sunshine can readily be determined.

In the N. hemisphere the recorder is set to face due S. and so that a line through the centres of the sphere and the metal bowl makes with the horizontal plane an angle equal to the latitude of the place of observation. See Sunshine.

Sunspot. Dark spot which makes its appearance on the sun's photosphere. Many spots may appear at one time on the sun's disk, and are carried round by the sun's rotation. They are not uniformly dark, but consist of an outermost penumbra, a darker inner shade, the umbra, and a central dark

Sunspot. Photograph of a sunspot, taken with a telescopic lens. The white spot in the centre shows the relative size of the earth

spot, the nucleus. Sunspots are chiefly confined to the middle latitudes, are never seen near the poles, rarely on the sun's equator.

Some cover millions of square miles, and last for months; others are visible only by powerful telescopes, and are of short duration. The number and size of sunspots vary cyclically every 11 years. At periods of maximum activity, e.g. 1937, 1947, over one thousandth of the sun's disk is on the average covered by spots, whereas at minimum, e.g. 1933, 1944, the area covered is usually only a small percentage of this. Sunspots or associated disturbances are often responsible for magnetic storms and radio disturbances, but no connexion with the weather has been proved. Experiments with radio waves show, in general, an abnormal increase in the ionisation of the E-layer during magnetic activity. Sunspots appear dark because they are about 2,000° C. cooler than the rest of the photosphere. They are the seat of intense magnetic fields, but their cause is unknown. See Sun.

Sunstone. Form of translucent adularia (var. feldspar), emitting a brilliant red metallic glitter from the background, like hidden fire, caused by the presence of innumerable minute inclusions of ilmenite, limonite, etc. It is classed as a semi-precious gem-stone, and is cut with a flat or slightly convex surface.

Sunstroke OR **HEATSTROKE.** Condition due to high air temperature, particularly when associated with a high degree of humidity of the air. The condition is most frequently seen in India and other tropical regions, but cases also occur in Europe in the summer. Heatstroke is more common among children than among adults. The predisposing causes are physical exhaustion and heavy clothing; hence it is often seen among soldiers during long marches. The

ease is due to the action of heat on the cerebro-spinal nervous system. The earliest indications are usually headache, drowsiness, weakness in the legs, and sometimes nausea. The acute condition begins with a sudden rise of temperature to 104° F. or more, and may often reach 110° F. The patient becomes unconscious and sometimes delirious.

In favourable cases the temperature falls rapidly, and recovery quickly occurs, but sometimes the fever persists for 8 or 10 days. After an attack the individual is particularly susceptible to high temperatures for a long period. The death rate varies from 15 to 25 p.c. Treatment consists in loosening the patient's clothing at once and taking him to a cool place. An ice-bag should be applied to the head, and the body sponged with cold water. When the temperature falls to about 101.6° F., the sponging should be stopped and the patient wrapped up in blankets, heart stimulants being probably necessary.

Sun-Worship. Ritual expression of reverence for the sun as the source of beneficent light and heat. In primitive culture the solar orb is the supreme deity, a coordinate or subordinate member of a pantheon, or a divine symbol or abode. It received direct adoration or was associated with a shrine, sometimes containing perpetual fire, a mirror, a disk, or an image in human form.

The cult of the sun is primeval, and some observances owe their dispersion to early migrations. It appealed especially to peoples practising settled agriculture in non-torrid regions. Sun-worship in early Egypt, perhaps perpetuating Neolithic traditions, became associated with a disk or a bark. Its widespread influence is shown by Bronze-Age rock-carvings and votive objects in Scandinavia. In 1921 the Egyptian Survey disproved the theory that the axis of

heavy topee and spine pad are now no longer used, having been recognized as the cause, not the preventive, of sunstroke. In tropical countries, Europeans are more affected than negroes or Indians, and those of blond colouring are more vulnerable than darker persons. Pathologically, the dis-

ease is due to the action of heat on the cerebro-spinal nervous system. The earliest indications are usually headache, drowsiness, weakness in the legs, and sometimes nausea. The acute condition begins with a sudden rise of temperature to 104° F. or more, and may often reach 110° F. The patient becomes unconscious and sometimes delirious.

In aboriginal America sun-worship is related to the immigrant influences which affected the civilizations of Mexico and the Andean tablelands, where the Inca rulers, the people of the sun, established it as a state religion. Among the Cherokees, as in Japan and ancient Yemen, the sun is a goddess. The annual sun-dance of the plains Indians was attended by the fulfilment of vows.

The sun-god Surya of Vedic India, whose veneration still governs Brahman practice, and the Persian Mithra, are correlated with the Greek Helios. The sun-temples of Konarak, Gaya, and Martand witness to a widespread worship anterior to conventional Hinduism. This Aryan cult may have absorbed pre-Aryan elements, which survive in central Asian shamanism, among the aboriginal tribes of S. India, and in Japan. See Akhnaton; Amen-Ra; Shamash; consult also The Sun and the Serpent, C. F. Oldham, 1905.

Sun Yat-sen (1866-1925). Chinese statesman. Born near Canton, and educated in the American university at Hawaii, he graduated in medicine at Hong Kong. In 1893 he became a political agitator, leading the fruitless Canton rising of 1895. For some years he was a refugee, in Japan, England, and the U.S.A., all the time organizing the revolutionary party which rose to arms in 1911 and deposed the Manchu dynasty. Sun Yat-sen became provisional president of the Chinese republic, but resigned the following year in favour of Yuan Shih-kai whose election brought in the whole of N. China to the republic. His opposition to Yuan's policy brought him into disfavour, however, and he retired to Japan, where he organized the revolts of 1912 and 1915.

In 1917 the S. states of China declared a military government of their own at Canton. Sun Yat-sen was elected president, civil war followed, and on the defeat of his army Sun resigned. In 1921 he made a successful bid for power,

Sun Yat-sen, Chinese statesman

being elected president of the Canton government. Failing in an attack on Peking, he took refuge in Shanghai, 1922, but in 1923 re-established himself at Canton. After his death, March 12, 1925, he became an object of veneration among his fellow countrymen as the "father of his people." He married one of the Soong (*q.v.*) sisters. *Consult* Teachings of Sun Yat-sen, N. Gangulee, 1945.

Superannuation. Form of pension payable to employees in public services, industry, and commerce; generally, contributions are paid by both employee and employer during the whole of the former's service. The pension becomes payable when the employee reaches a prescribed age, usually not less than 60. *See* Pension.

Supercharger. Device for increasing the pressure of air supplied to an internal combustion engine. Normally such engines rely upon the pressure of the atmosphere to force the mixture into the cylinders so that it follows the receding piston during each down or suction stroke. In engines running at high speed, as on racing cars, filling the cylinders becomes difficult owing to the brevity of each induction stroke and the limited force which can be exerted by the ordinary atmospheric pressure of 15 lb. per sq. in. A typical supercharger consists of two figure-of-eight rotors enclosed in a casing and geared to run in opposite directions at the same speed, the power for their movement being derived from the car engine. Air or mixture entering one side of the casing is carried round the curved walls and forced out by the rotors to the cylinders. A positive pumping effect is thus produced and mixture supplied to the engine at a pressure substantially higher than atmospheric. Increase in pressure through superchargers on road vehicles may be 30 lb. per sq. in. High altitude aircraft engines require superchargers because of the lack of oxygen in the air at great heights. *See* Internal Combustion Engine.

Supercooling. In physics, cooling of a liquid to a temp. below its normal freezing point without solidification. If cooling is slow, a temp. is reached when solidification begins, and when the latent heat may be sufficient to raise the temp. back to that of the normal freezing point. The degree of supercooling is markedly influenced by the viscosity of the liquid, and viscous liquids, *e.g.* glass, can be supercooled to such

a degree that normal crystallisation is entirely suppressed. The phenomenon plays an important part in meteorology, hail, rime, and frost all depending upon its occurrence.

Super-Ego (Lat. *super*, above; *ego*, I). Term used by psychoanalysts instead of conscience. The function of the super-ego is to keep in check those primitive impulses which the individual regards as bad. It is held to operate by drenching the mind with anxiety when the ego feels in danger of giving way to one of these impulses. This anxiety may change to remorse and humiliation if the super-ego is defied and the forbidden act performed. Memories of these unpleasant feelings may aid the super-ego in its task when a conflict of the same type again arises. It does not, however, as conscience is supposed to do, tell us what is right or wrong, moral values depending upon moral codes, which are established in various ways, but particularly by what the child believes to be his parents' attitude. This limitation of the functions of the super-ego is one of the reasons which have led psychoanalysts to abandon the word conscience.

Supererogation, WORKS OF (Lat. *supererogare*, to pay beyond what is expected). Theological term of the R.C. Church for such good works as a man may do over and above those required for the health of his soul. These works of supererogation, performed by saints and other godly men and women, help to form the treasury of the Church, already enriched by the superabundant merits of Christ, and from this fund the Church draws for the relief of contrite sinners and of souls in purgatory. *See* Indulgence.

Superfortress. Name given to the B-29, a heavy bomber built by the Boeing Aircraft co. for the U.S.A.A.F. The largest bomber used during the Second Great War, the Superfortress was a development of the B-17 or Flying Fortress (*q.v.*). It was expressly designed for long-range operations over the Pacific, its maximum non-stop range being more than 5,000 m. Maximum bomb load was 20,000 lb., but the aircraft did its deadliest work as the carrier of the two atomic bombs dropped on Hiroshima and Nagasaki, and of the incendiaries that fired Tokyo and other Japanese cities. The wing span was 141 ft. 3 ins., the length 99 ft. The four engines

were: in the B-29, 2,200 h.p. Wright Duplex Cyclone radials; the B-50, a development of the B-29, had 3,350 h.p. Pratt and Whitney Wasp Majors. The commercial transport version of the Superfortress was called the Stratocruiser. *See* Aeroplane illus., p. 131; Stratosphere.

Supergene. Changes in minerals and rocks caused by the influence of descending oxidising surface waters, such solutions being known as supergene solutions. The rich oxidized zones of copper and lead deposits are a result of these processes. *See* Hypogene; Ore Deposit.

Superheater. Device for superheating steam, *i.e.* for raising its temperature after it has left a boiler, or is no longer in contact with water.

The following is a description of one of the most efficient types of superheater applied to rly. locomotives: A number of the ordinary boiler tubes are omitted, their places being taken by 18 to 24 tubes of much larger diameter. The steam pipe from the boiler discharges into a chamber within the smoke-box, whence the steam is conveyed through tubes, contained in the large tubes above referred to, with return bends, and delivered into another pipe in the smoke-box through which it passes to the cylinders. The great heat passing through the big tubes raises the temperature of the steam to 400-600°. *See* Boiler; Steam Engine.

Superheterodyne. Type of radio receiving circuit in which the received radio-frequency voltage is combined with a voltage from a local oscillator and converted into a voltage of a lower or intermediate frequency. This voltage is then suitably amplified and afterwards detected to reproduce the original signal wave. The receiver is regarded as giving a better performance than any other type developed in the 1940s.

Superior (Lat. *super*, above). Upper or higher, something above. It is used as a noun for the head of a religious house or other ecclesiastical society, *e.g.* father superior and mother superior. In Scots law a superior is one who makes a grant of land in return for a fixed yearly payment called a feu duty.

Superior. Largest lake in the world. It is the most westerly of the Great Lakes of N. America, and separates Canada from the U.S.A. Its shores extend 1,500 m., and its area is 31,800 sq. m. It is 354 m. long, 162 m. wide, 601 ft. above sea level, and 1,008

ft. deep, and forms the largest reservoir of the St. Lawrence river and discharges into Lake Huron by the St. Mary. Except for the sand dunes of the S.E. the shores are, in general, bold and rocky. Only the shore waters freeze; during storms waves of 15 to 18 ft. occur. There are deposits of iron, silver, and copper ore close to the lake. See Great Lakes.

Superior. City of Wisconsin, U.S.A., the co. seat of Douglas co. A port of entry, it stands at the mouth of the St. Louis and Nemadji rivers at the W. end of Lake Superior, and is served by the Northern Pacific and other rlys. Superior shares a vast harbour with its neighbour, Duluth, behind which lie great, but diminishing, iron deposits and coal. Ice prevents navigation for about five months of the year. Founded in 1853, Superior became a city in 1889. Pop. 35,136.

Superlattice. Crystal structure of a solid solution in which the atoms of the various elements take up orderly positions in the crystal lattice. An example of superlattice formation occurs in

Superlattice. Plan view of body-centred cubic lattice containing atoms of two elements A and B arranged in disordered (left) and ordered (right) form. Open circles represent atomic centres of element A, and solid circles atomic centres of element B. See text.

copper-zinc alloys containing 39 to 59 p.c. of zinc by weight. These alloys normally contain a crystal-line phase, called β , in which the copper and zinc atoms are arranged in a body-centred cubic lattice. Above a certain temp. (454 to 468° C., depending on the zinc content), the copper and zinc atoms are arranged at random and in a disorderly manner in the body-centred cubic lattice, but below this temp. a superlattice is formed by the copper and zinc atoms ordering themselves so that the body-centred cubic structure consists of interpenetrating simple cubic lattices of either copper or zinc atoms. The diagram shows a plan view of the body-centred cubic lattice in the disordered and ordered, or superlattice, forms. See Lattice; Solid Solution; Solution.

Superman (Lat., *super*, above; Ger. *Übermensch*). Term first

brought into prominence by Nietzsche. It is applied by him to an imaginary superior human being, conscious of his own irresistible strength, and unrestrained by religious, moral, social, or political considerations in the exertion of it to the full.

Supermarine. British aircraft works, from 1928 a branch of the Vickers concern. At first Supermarine concentrated on seaplane design, producing standard R.A.F. flying-boats such as the Southampton and Scapa; amphibians, notably the Walrus (*q.v.*), for naval use; and the S.5, S.6, and S.6B, successful in the races for the Schneider Trophy (*q.v.*). The chief designer of these racing aircraft was R. J. Mitchell (*q.v.*), who afterwards entered landplane designing with the Spitfire (*q.v.*), a first-line fighter throughout the Second Great War. After the war appeared the generally similar Spitfire, as well as several jet-propelled types of military fighter craft.

Superphosphate. Fertiliser for the soil. Phosphates being insoluble are not absorbed by plants, but phosphate deposits treated with sulphuric acid are converted into soluble acid phosphates or superphosphates. The idea originated with Liebig, who recommended the treatment of bone ash, which consists mainly of calcium phosphate, with sulphuric acid to make a soluble phosphate. J. B. Lawes (*q.v.*) in 1842 improved on this by employing mineral phosphates.

Super-saturation. Term used in chemistry. The amount that one substance can contain of another in solution depends upon the substances, temperature, and pressure, and is limited. When the limit is reached, the solution is said to be saturated. A solution is said to be super-saturated when it contains a larger amount of a substance than the normal limit without precipitation. Super-saturated solutions are in unstable equilibrium, and crystallisation may occur suddenly throughout if a suitable nucleus, *e.g.* a small crystal of the solute, is inserted.

Supersonics. Term which formerly meant the study both of phenomena concerned with bodies moving with speeds greater than the velocity of sound, and of the effects of vibrations at frequencies above the limit of audibility, the latter now called ultrasonics (*q.v.*).

When a body is moving with a speed greater than the speed of sound, the air compression created by its motion can be transmitted only in a lateral direction. An interesting result is that if high velocity projectiles are passing overhead or near at hand, the whine of the shell is first of all heard, then its explosion, and lastly the firing of the gun. The order of the last two sounds may be reversed if the explosion occurs at a distant place. As supersonic speeds are approached the medium exhibits compressibility effects; the Mach number then becomes the important factor in such conditions. The Mach number is defined by the ratio v/c where v is the velocity of the body and c that of sound.

Superstition (Lat. *super*, above; *stare*, to stand). Term used for any religious or kindred belief which those not holding it regard as false or silly. The religious practices of primitive races, *e.g.* rain-making, are generally thought to fall under this designation, as are practices such as witchcraft. Some popular modern superstitions, *e.g.* touching wood for luck, sitting thirteen at table, have been traced to more or less remote religious practices, but there is no certainty as to their origin. See Folklore; Magic; Witchcraft.

Super-Tax. A second tax levied in the U.K. on incomes above a certain level. It was originally introduced by Lloyd George in the budget of 1909, and was then imposed only on those whose incomes exceeded £5,000. Later chancellors reduced the level at which it became payable. In 1929 super-tax, which was then levied on a graduated scale on all incomes exceeding £2,000, was replaced by surtax (*q.v.*).

Supertonic (above the tonic). Second degree in a major or a minor scale of music, *e.g.* D in the key of C.

Suppé, FRANZ VON (1820–95). Austrian composer. Really named Francesco Cavaliere Suppé Demelli, he was born at Spalato (Split), April 18, 1820. He began to compose at 15, and settling in Vienna, became conductor of theatre orchestras there. He died May 21, 1895. None of Suppé's 49 operettas is remembered in Great Britain, though *The Country Girl*, 1847, had a success there in the 19th century; but his lively overtures, *Light Cavalry*; *Poet and Peasant*; *Pique Dame*; *Morning, Noon and Night* in Vienna, are very popular.

Supple-Jack. Name applied to certain climbing shrubs on account of their tough and flexible stems. Notable are species of *Paullinia*, also *Cardiospermum grandiflorum* and *Berchemia scandens*.

Supply. Word meaning the provision of anything, e.g. the food of an army or the materials for a factory. In parliamentary speech it refers to the provision of money by the house of commons for the navy, army, and other public services. Early in each year the house becomes a committee of supply, and as such considers the estimates for the various departments. In Scotland officials called commissioners of supply collected the money necessary to carry on the business of the various counties. *See* Parliament.

Supply, MINISTRY OF. British govt. department set up in April, 1939, to direct and coordinate the production of munitions. Its preparatory work made possible the comparatively smooth transition of the nation's industries to military production during the Second Great War. The ministry was originally concerned solely with the purchase of army requirements, but eventually became responsible for supplying munitions, equipment, and clothing to the fighting services. It advised on weapon and vehicle design and placed contracts. After the war it managed industrial controls and was the authority for development of atomic energy in Great Britain.

Supply and Demand. Theory in economics according to which prices are regulated by the amount or number of commodities available for sale, and by the actual demand for such commodities. If the demand appreciably exceeds the supply, buyers will, in competitive conditions, offer higher prices, whereas if there is a considerable over-supply of an article, prices will drop. These changes operate in either direction until comparative stability is reached. The theory is applied by some economists to labour, and the relation of supply and demand certainly influences rates of wages. *See* Economics; Labour.

Supporter (Lat. *sub*, up; *portare*, to carry). In heraldry, supporters are representations of human beings, animals, fabulous creatures, or, rarely, inanimate objects. They are placed on both sides, one side, or at the back of an armorial shield, seeming to guard or uphold it. In English heraldry, supporters are restricted to the sovereign, princes of the blood, peers and their heirs,

those holding special grants, and a few families using them by the prescriptive right of long usage. In Scotland, baronets of Nova Scotia long claimed the right to use supporters, and the heads of clans and feudal lordships commonly do so. In grants of arms to corporations supporters have been generally adopted. *See* Heraldry: col. plate.

Suppository. Conical solid body composed of a basis of oil of theobroma, with an active medication, intended to be introduced into the rectum or vagina. Suppositories of glycerinated gelatine are also in use.

Suppuration (Lat. *sub*, under; *pus*, matter). Formation of matter or pus within the tissues of the body. It is due to infection by micro-organisms. Local treatment is governed by the stage of the inflammation. Penicillin and the sulpha drugs have proved helpful. *See* Abscess; Blood Poisoning; Inflammation; Phagocytosis.

Supra-renal Gland OR **ADRENAL GLAND.** Small ductless gland situated on the upper part of each kidney. It forms a secretion called adrenalin, which is passed into the blood in small quantities, and has a function in maintaining the muscular tone. When adrenalin is injected into animals or applied locally, it causes a powerful contraction of the blood-vessels, and for this reason a solution is used in surgery to arrest haemorrhage, combat shock, or allay itching. Adrenalin also stimulates the liver to discharge more sugar into the blood, and thus increase the sources of muscular energy. Adrenalin for such purposes is usually prepared synthetically.

Adrenalin plays an important part in the defence of an organism. Under the stimulus of the emotions of fear or rage, an abnormal quantity of the secretion is passed into the system. The result is that the body is thrown into a state of defence, or of capacity to flee (the lion is prepared for attack, the deer for flight), the tone of the muscles is increased, and more energy is available for their action. The peripheral vessels are contracted, an effort of nature to provide important organs like the heart and lungs with adequate blood. Tubercle attacking the supra-renal gland leads to the disorder known as Addison's disease (*q.v.*). Nicotine stimulates these glands; hence addiction to the use of tobacco.

Supremacy, ROYAL. Term applied to the prerogative claimed by the crown of England to be "the

only supreme head on earth of the Church of England." By these words the Act of Supremacy, 1534, repudiated the papal claim of spiritual jurisdiction in England. The Act was repealed by Mary, 1554, but came again into force under Elizabeth, who defined the royal supremacy as being the sovereignty over all persons, ecclesiastical or temporal, "so as no other foreign power shall . . . have authority over them." On many appointments to public office in the U.K. an oath of allegiance and acknowledgement of the royal supremacy is required.

Supreme Council. Allied organizations during and after the First Great War. The first was set up after the disaster of Caporetto (*q.v.*) in Nov., 1917, under the name supreme war council, and met at Versailles. Consisting of political and military representatives of the Allied countries, its object was to coordinate their military and other war plans. It disappeared in March, 1918.

The second council grew out of the executive of the Allied delegates at the Paris peace conference, 1919. After the signing of the treaties of Versailles, St. Germain, Sévres, etc., its function was to enforce their terms. Conferences took place at Paris, San Remo, Cannes, and elsewhere. The council's work clashed with the functions of the League of Nations (*q.v.*), and much criticism was directed against the frequency of its meetings, and its inability to restore settled conditions to Europe. It was then an assembly of the British, French, and Italian premiers, foreign ministers, with financial and military advisers.

When the Second Great War broke out, a supreme war council, consisting of the French and British premiers and their military and naval advisers, was set up to coordinate Allied strategy. It held meetings in London and Paris, but ceased to function after the capitulation of France.

Supreme Court of Judicature. Chief court of law for England and Wales. It was established in its present form by an Act of 1873, when various courts of law were united under this name. It is divided into two parts, the high court of justice and the court of appeal. The judges of the high court of justice are the ordinary judges—or justices, their more correct title. Other officials are the masters, who hear cases of minor importance and deal with much preliminary and non-contentious

business, and there are also official referees and a taxing officer. Appeal lies from the high court of justice to the court of appeal, which is composed of the master of the rolls and lords justices; and from these there is a final appeal to the house of lords. The supreme court sits at the royal courts of justice, Strand, London, W.C.2. Canada and other countries have also a supreme court of justice.

The chief court of the U.S.A. is known as the supreme court. Its personnel consists of a chief justice and eight other judges who are appointed by the president with the consent of the senate. Each state also has its supreme court, from which there is an appeal to the supreme court at Washington. In addition to their business this court has original jurisdiction in cases affecting foreign ministers and consuls, and those to which the state is a party.

SURABAYA OR **SOERABAYA** (Du. Soerabaya). City of Java, Indonesia, at the mouth of the Kali Mas, on the N. coast. Strongly fortified and with a good harbour and a shipyard, it is the Netherlands naval and military headquarters in Indonesia. There is extensive trade in rice, coffee, cotton, sugar, tobacco, and copra. Petroleum is found in the vicinity. The main line of the state rlys. connects Surabaya with Jakarta by a single line 540 m. in length.

In the Second Great War, Surabaya was first bombed from the air by the Japanese Feb. 3, 1942, when installations were damaged, 31 were killed, 134 injured. Other raids followed, and air battles over the city between U.S. and Japanese aircraft. By March 7 Japanese land forces were besieging the city, which fell on March 10. Light Allied raids by long-distance aircraft on July 22 and Nov. 14, 1943, and March 15, 1944, were followed on May 17, 1944, by a heavy attack at dawn by British and U.S. carrier-borne planes, when 10 ships in the harbour were believed sunk; aircraft from Australia raided Surabaya again that night. All these raids took the Japanese by surprise, on account of the great distance of the port from Allied bases. The city remained in Japanese hands until the surrender of Japanese forces in the Netherlands Indies at Morotai, Sept. 9, 1945. A small group of British and Indian troops landed at Surabaya on Oct. 25, occupying the town and naval base without opposition. Fighting with nationalist extremists broke out, however, on Oct.

28, Brig. Mallaby, who went out to parley with them, being murdered. For a time Surabaya was in the hands of undisciplined armed nationalist rioters, but control of it was regained by the 5th Indian div., Nov. 29. Pop. est. 250,000. *See* Indonesia.

Suraj-ud-Dowlah (c. 1732–57). Nawab of Bengal. Grandson of Aliverdi Khan, whom he succeeded in 1756,

Suraj-ud-Dowlah,
Nawab of Bengal
From an Indian
miniature

he showed himself a ferocious and debauched tyrant. Indignant with the British for concealing one of his fugitive servants, he attacked Calcutta, June 18, 1756, and, after two days' siege, entered the city. Thereupon occurred the criminal tragedy of the Black Hole of Calcutta. Six months later Clive took Calcutta, Jan. 2, 1757. After his defeat at Plassey, June 23, Suraj-ud-Dowlah took to flight, but was captured and executed by his rival Mir Jafa on July 4. *See* Black Hole.

Surakarta OR **SOERAKARTA**. City of central Java, Indonesia. It is on the Solo river, and has rly. connexion with Semarang and Jokjakarta. In its centre is the fortress of Vastenberg. Pop. est. 100,000. *See* Java.

Surat. Dist. and town of India, in the Northern division, Bombay. The dist. fringes the coast on the E. side of the Gulf of Cambay. Cotton is the chief crop, and rice, native food grains, and pulses are grown. Area, 1,695 sq. m. Pop. 881,058. The town is on a seaport at the mouth of the Tapi, and was once the most populous city in India, the chief trading port, and the pilgrim port of Mecca. It was the first English settlement in 1613, and monopolised the cotton trade. In 1684 the headquarters of the East India co. were moved thence to Bombay, and the decline of Surat began. Pop. 171,443.

Surbiton. Borough of Surrey, England. It is 12 m. by rly. S.W. of Waterloo station. There are pleasant river bank promenades, an open-air swimming pool, recreation grounds, several churches, and a golf club. Pop. est. 60,859.

Surcharging. Literally, overloading and therefore overcharging. The word is specially used for the process by which members of local authorities are compelled to

pay for any illegal expenditure they have authorised. The surcharging is done by the auditors of the ministry of Health, but the liability can be removed by the ministry.

In another sense surcharging is equivalent to falsifying. In the chancery division, when accounts are taken, they may be taken by surcharging and falsifying. Surcharging means that items of credit, such as sums paid on account, have been omitted, thus making the total balance wrong. Falsifying means that particular items are wrong, being falsely or incorrectly charged either wholly or in part.

Surcoat. Outer tunic of a knight. It is said that Crusaders wore surcoats to veil their armour, which would otherwise become unbearably hot, from the intense heat of the sun. *See* Costume.

Surds. In algebra, numbers (roots) which cannot be expressed exactly as integers or as fractions, though they can be calculated as decimals to any desired number of places. The n th root of a quantity is such that when multiplied by itself $n-1$ times in succession it gives that quantity. Thus the fourth root of 16 is 2, since $2 \times 2 \times 2 \times 2$ equals 16. But the fifth root of 16 cannot be expressed as a commensurable number, and the fifth root of 16 is, therefore, a surd. The incommensurable square root, e.g. $\sqrt{5}$, is called a quadratic surd, and these are the most important types of surds. Surds obey the normal laws of algebra, e.g. $\sqrt{2} \times \sqrt{2} = \sqrt{4} = 2$. *See* Algebra.

Surety OR **GUARANTOR**. Person who undertakes to be liable that another shall perform an obligation. A surety may be described as one who promises to answer for the debt, default, or miscarriage of another, and the contract entered into by the surety is called a guarantee. If the surety is called upon to pay under his guarantee he is entitled to be refunded by the debtor whose obligation he has met. He is also entitled to demand from the creditor all securities held by the latter for the debt. Where there are several sureties, as between them and the creditor any one of them may be called upon to pay the debt. But as between themselves they must all contribute. So that if there are three sureties, and one pays the whole debt, he can compel each of the other two to pay one-third. *See* Guarantee.

Surface (Lat. *superficies*, upper side). That which has length and breadth, but no thickness: the

boundary between two regions of space. An infinite cluster of points makes up what is mathematically called a surface. The position of the points can be indicated in Cartesian coordinates (x, y, z); and the nature of the surface is fixed if the relationship of these coordinates to one another can be expressed as an equation. Thus, a general equation of the first degree, such as $lx + my + nz = p$, represents a plane, that is, a surface in which any two points can be joined by a straight line lying wholly in the surface; the equation, $\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1$, represents an ellipsoid, a figure of which any plane section is an ellipse. If in the last equation $a=b=c$, the equation becomes $x^2 + y^2 + z^2 = a^2$, which is the equation of the surface of a sphere. A ruled surface is one through every point of which a straight line can be drawn so as to lie entirely on the surface; the straight lines lying upon it are called generating lines. The cylinder and the cone

Surface Hardening. The processes by which the surface of a soft and tough metal, usually steel or cast iron, is hardened, are described under Carburising; Case-Hardening; Nitriding.

Surface Layer. In physics, the boundary layer of a substance. This may often show a structural form different from that of the main body of the material. For example, when a solid body is polished the surface layer tends to flow and is known as the Beilby layer. This is of molecular dimensions in thickness and has been investigated by means of electron diffraction. There is some evidence that an appreciable surface effect exists in magnetic materials, made evident by an increased hysteresis loss for a given material when in thinner sheets.

Surface Tension. Property of a liquid in consequence of which its free surface tends to contract to a minimum area. It is explicable by the attractive force which molecules exert on one another at

by small floating bodies on the surface of a liquid are due to surface tension. Thus two small pieces of wood floating on water rush together when a short distance apart. This is because the water slightly raises itself upon each piece of wood, so that the two chips when close together form a wide capillary tube, and the pressure in the liquid between the chips is slightly less than outside them. A piece of wood, soaped at one end, will move steadily across the water as though propelled, since, as the soap dissolves, it alters the surface tension at one extremity of the wood. Small fragments of camphor, dissolving on the surface of water, dart about from a similar cause, the camphor, dissolving unequally on one side or the other, producing on alternate sides a liquid, the surface tension of which is less than water. Surface tension of an aqueous salt solution is greater than that of water. See Capillarity.

Surf Bird (*Aphriza virgata*). Species of bird which is found on the Pacific shores of America. It has brown and white plumage, and is related to the turnstones.

Surf-riding. Aquatic pastime. It was originally practised by natives of the Pacific islands, especially the Hawaiians and has become a familiar sport on the Pacific coasts of Australia and the U.S.A., and in a mild form in Great Britain. A flat board is placed on the water, and the surf-rider stands, kneels, or lies on it, and is carried landward on the crest of a breaking wave.

Surgeon. Word, a variant of *chirurgion*, for one who treats disease by manual operations. In the U.K. a surgeon must go through the same course of training as other medical practitioners. See Medicine; Surgery.

Surgeons, ROYAL COLLEGE OF. English surgical corporation founded in 1800. In the 14th century surgery was practised by two bodies, the Barbers' Company (*q.v.*) of London, and the Fellowship or Guild of Surgeons mentioned in the City records in 1369.

Royal College of Surgeons badge

From 1493 these two bodies, long keen rivals, acted together in matters relating to surgery, and were united from 1541 to 1745, when the surgeons were separately incorporated as the Company of Surgeons of London. In 1800 this

Surf-riding. Life-savers riding the waves at an Australian beach carnival

are examples of ruled surfaces. They can be generated by the movement of a straight line. See Ellipsoid; Geometry; Projection; Solid; Sphere. Consult Geometry of Three Dimensions, G. Salmon, 5th ed. 1912.

Surface, CHARLES AND JOSEPH. Characters in Sheridan's comedy, *The School for Scandal* (*q.v.*). They are two brothers. The elder, Joseph, presents himself as a "man of sentiment," deceiving himself and others by his extravagant moralisings, while in reality self-seeking and double dealing; while Charles is frankly a dissolute ne'er-do-well, but possessing great good humour and a heart of gold. It is Charles who sings the well-known song, Here's to the maiden of bashful fifteen. John Gielgud, playing Joseph in 1937, introduced a remarkable subtlety to his reading of the character.

short range. Surface tension is measured in dynes per cm. and ranges from a value of 465 for mercury to 73 for water and 29 for benzene at room temperatures. Surface tension decreases with temperature, and attempts have been made to link this temperature coefficient with the chemical constitution of a liquid. The total work done in increasing the area of a liquid surface by unity at constant temperature is known as the surface energy. This quantity is greater than the surface tension, for a liquid film cools on stretching and therefore energy has to be supplied to maintain the temperature constant.

A wineglass filled to the brim and actually overbrimming the glass, is a familiar example of surface tension. A soap bubble is another example. The apparent attractions or repulsions exhibited

was re-established as the Royal College of Surgeons of England, which received a charter in 1843.

The college possesses a fine building in Lincoln's Inn Fields, erected 1813, with a splendid library and the famous Hunterian Museum, which began with a collection of specimens made by John Hunter, and after his death was bought by parliament for the nation. It now contains specimens illustrating every branch of anatomy and pathology. In conjunction with the Royal College of Physicians, the college forms a conjoint board for the examination of students and the granting of licences to practise medicine, surgery, and midwifery. The college is very active in the field of postgraduate

teaching and also maintains laboratories for surgical research. It includes Faculties of Anaesthetists and of Dental Surgery. There are also royal colleges of surgeons in Edinburgh and Dublin. The charter of the former dates from 1505, and the latter was incorporated in 1786. Both conduct examinations and grant degrees in surgery. In 1920 a new body, known as the Association of Surgeons of Great Britain and Ireland, was formed, and there are societies representative of the various surgical specialties. Consult Plarr's *Lives of the Fellows of the Royal College of Surgeons of England*, rev. ed., Sir D.A. Power, 2 vols., 1930.

Surgeon's Daughter, THE. One of the Waverley novels by Scott, published in 1827. The heroine is Menie Gray, motherless daughter of a Scottish village surgeon, whose two pupils, Richard Middlemas and Adam Hartley, are her suitors.

SURGERY AND ITS PRACTICE

Victor Biddell, M.D. Cantab., F.R.C.S.,
Hunterian Prof., Royal Coll. of Surgeons

This article surveys the various fields of contemporary surgery and deals with diagnosis and equipment. See the article Medicine; also Anaesthesia; Artificial Limbs, etc.; and biographies of Horsley; Hunter; Lister, and other surgeons

The word surgery, or chirurgery, is derived from the Greek *cheir*, hand, and *ergein*, to work. It is the science and art of treating diseased or accidental conditions by manipulation and by the use of the knife. Surgery was practised by the ancient Egyptians, and many examples of their instruments have been preserved. The two great schools of surgery in antiquity were, however, the Indian and the Greek, both of which attained a degree of excellence unequalled until modern times. In Greece the Hippocratic collection of the 5th century B.C. sums up the results of experience hampered by the absence of dissection which, introduced in the Alexandrian age, led to advances in many directions, as shown by the compendium of Celsus.

Ancient surgery culminated in the work of the Byzantine Paul of Aegina (c. A.D. 650) after whom the art fell into a state of increasing decay for nearly 900 years, as the Arabs, who kept alive a knowledge of medicine, were forbidden by their religion to practise anatomy. Paracelsus combining originality with fantastic theories, began to free surgery from the mass of tradition and superstition that encumbered it, but much greater service was rendered by the great

French military surgeon Ambroise Paré. His contemporaries, the Paduan professors, A. Vesalius and G. Fallopius, founded modern anatomy; and with the scientific movement in the 17th century, progress became continuous. The pioneer in England was Richard Wiseman (c. 1622-76). A century later a great advance is marked by the work of John Hunter.

TRAINING. Today there are experienced surgeons in all the great cities of the British Isles. For a surgeon to be able to put the letters F.R.C.S. after his name is a guarantee to the public that he or she has undergone an intensive course of special training and has passed the examination which has enabled him (or her) to be called a fellow of the Royal College of Surgeons (of England, Edinburgh, or Ireland). A wise man, if he has to undergo an operation, will do well to find out first whether the surgeon of his choice holds this qualification.

SPECIALISATION. Plastic surgery, in which the British were pioneers, was developed during the First Great War. During the Second, great strides were made in the various plastic centres formed to restore the disabled. Many thousands of servicemen and civilians owe their useful citizen-

ship to the skill and care they have received from the surgeons and nurses in these hospitals. This trend towards specialisation is not confined to plastic surgery; since 1900 surgeons have increasingly tended to confine their activities to limited areas of the body. The neuro-surgeon confines his operating to the brain and spinal cord, while a urologist deals with the kidneys and bladder, an orthopaedic surgeon with the bones and joints, a thoracic surgeon with the heart and lungs. Great changes have taken place since the days of the barber-surgeons.

DIAGNOSIS. It is important that diagnosis should be accurate. This has been aided enormously by the almost daily improvement in the technique of radiology. X-ray photographs enable the surgeon to discover stones in the kidney and to test the functions of organs such as the gall bladder, by means of swallowed or injected dyes which are opaque to the X-rays; to know with certainty the relative position of fragments of bone in cases of fracture; and to follow by a series of photographs the actual course taken by the passage of food through the alimentary tract after the swallowing by the patient of a barium meal, thus revealing the presence—or absence—of kinks or abnormalities and indicating exactly the site for any necessary surgical interference. Chemical and microscopical tests on the blood, the urine, and the cerebro-spinal fluid have also greatly advanced diagnosis.

PREPARATION FOR OPERATION. Instead of purging the bowel from above and emptying it from below by an enema, efforts are now concentrated rather on attempts to improve the patient's general health by measures designed to fit him better for the anaesthetic. The patient is taught breathing exercises to increase the vital capacity of the lungs, required to limit his smoking and to go to bed early in the period immediately preceding the operation. In other words, he is encouraged to go into training.

EQUIPMENT. The marvellous successes of modern surgery depend upon many things. Most important is knowledge of anatomy, whereby almost every organ in the body can be laid bare, examined, and in many cases remedied where diseased conditions exist, without serious injury to surrounding structures and with little or no loss of blood. There must be safety of anaesthesia, which under skilled

administration allows the surgeon to perform prolonged operations without pain or movement and with a minimum of shock on the part of the patient. Aseptic and antiseptic precautions must be taken. Meticulous attention to detail ensures that the most delicate operations can be undertaken with the almost certain hope that healing will take place by first intention, i.e. without the appearance of pus, or matter, which would indicate the invasion of tissues by deleterious germs. The operating theatre has been so well publicised during the last few years, in books and films, that there can be few people unable to picture it in their mind's eye. It is not universally appreciated, however, how much physical fitness and endurance is needed by surgeons and sisters to stand up to this highly specialised and highly demanding work.

Sterilised Equipment and Clothing

All instruments and appliances are sterilised before use in an adjacent sterilising room furnished with apparatus for boiling with superheated steam. Dressings, towels, rubber gloves, are also included. After a preliminary thorough washing of the hands, sterilised gowns are put on by the surgeons and nurses, sterilised masks are adjusted, covering the whole of the head, face, and neck (except for an aperture for the eyes), sterilised leggings are pulled on over boots and fastened well above the knee; so that apart from eyes and hands, no part of the person or ordinary clothing is left uncovered by surgically clean material. After a further scrubbing of the hands, surgical india-rubber gloves are pulled on and made to overlap the wristbands of the operating gown. The patient is given an injection of morphia or its equivalent a little time before the administration of the anaesthetic. This dulls the senses and promotes a feeling of warmth and comfort and peace of mind. The actual process of going to sleep is often induced by an injection into one of the veins of the elbow, and continued by a mask over the face only after the patient is unconscious, so that there is no longer any need to anticipate the horrors of suffocation.

EARLY DIAGNOSIS. However skilfully a surgical operation may be performed, the permanence of the result obtained is related to one single fact above all others—early diagnosis. Too much emphasis cannot be placed on the vital importance of patients re-

porting to their doctor immediately they notice a lump anywhere or the sudden onset of a discharge or loss of blood from any of the body orifices. If early cancer of the breast is treated by successful operation, 90 p.c. of the patients are alive 10 years later. A wider knowledge of the excellent results of treatment of early cancer would help to remove much fear of the knife, and so result in earlier surgery and longer life.

Bibliography. History of Surgery, Leonardo, 1943; Modern Operative Surgery, G. G. Turner, 1943; British Surgical Practice, Sir E. R. Carling and J. P. Ross, 1948.

Surinam. River of Surinam or Dutch Guiana. It flows in general N. to reach the Atlantic Ocean near Paramaribo after a course of about 400 m. It is navigable by large vessels for 40 m. and by smaller craft for 100 m.

Surinam OR DUTCH GUIANA. Country of S. America, under the constitution of 1922 forming one part of the kingdom of the Netherlands. It lies between British Guiana on the W. and French

descendants of slaves who escaped into the jungle, live a life almost identical with that of their ancestors in 17th cent. Africa.

Surinam is administered by a governor and a council of four nominated by the ruler of the Netherlands. The state has 15 members, 10 elected, five appointed by the governor. Language, laws, and coinage are Dutch. Exports include rice, maize, rum, sugar, molasses, bananas, coffee, and cacao. Much bauxite and some balata go to the U.S.A., but gold production, once large, is declining. Members of Columbus's third expedition landed in Surinam in 1500. The colony was founded in 1650 by Lord Willoughby, then governor of Barbados, and by the peace of Breda, 1667, was exchanged with the Dutch for New Amsterdam (now New York). Great Britain held it again, 1799–1802, and from 1804 until it was finally returned in 1815.

Surinam Toad (*Pipa americana*). A large species of toad indigenous to Guiana and Brazil. It is of distinct form, owing to the triangular shape of the head and the small eyes; the upper side is blackish brown studded with spine-bearing pimples, and the smoother underside whitish. The mouth is deficient in both tongue and teeth. The tips of the fingers of the forelimbs have star-like expansions, whilst the three inner toes of the webbed hind feet are provided with claws—the only toad known to be so furnished. Its entire life is spent in the water.

At the breeding season the skin of the female's back becomes thickened and softened. The eggs first extruded cling to the back and are pushed forward by those following, until the upper side is covered by about 100 (70–120) eggs. The soft skin rises between and around them so that they become entirely embedded in it. Development continues until the tadpole stage has been completed, when the perfectly formed toads emerge from their capsules, the process taking about 12 weeks. The pitted skin of the mother is then shed. During the dry season the Surinam toad aestivates by burying itself in mud.

Surname (Fr. *surnom*, from *sur*, in addition; *nom*, name). Name borne in common by the members of a family and their descendants in the male line. The totem names of primitive races, the Roman *cognomina*, the old Teutonic patronymics in *-ing*, and the clan names of

Surinam Toad. Female of the South American toad, showing young issuing from cavities in her back

Guiana on the E. and is bounded N. by the Atlantic and S. by Parate, Brazil. The Corentyn flows along the W. and the Maroni along the E. frontier; other rivers are the Coppenam and the Surinam, and communications are mainly by river boat. In the S. are impenetrable forests and savannas, culminating in the Acaray range. Topography, climate, and products resemble those of British Guiana (q.v.). Only a tenth of this area of 55,143 sq. m. is settled, most plantations lying along the banks of the river Surinam. Near its mouth stands the capital, Paramaribo (pop. 73,067), which has a fair harbour and an airport. Seven-eighths of the pop. of 203,580 live along the coastal belt. Five tribes of Bush Negroes,

the Celts closely resemble surnames, but many nations, *e.g.* the ancient Greeks and Jews, and Mahomedans, have had none, and some peoples, like the Welsh and Jews, have adopted them within the last two or three centuries. Noble and landed families began in the 12th century to use surnames, generally (*a*) territorial, with a prefix (*de, von, etc.*) which does not always denote nobility, or (*b*) patronymic, *e.g.* Fitz—(son).

English surnames belong mostly to four classes: (1) patronymics, *viz.* Anglo-Saxon tribal names—Harding, Manning; Anglo-Saxon, Norse, French, or common personal names—Godwin, Kenrick, Osborn, Gilbert, Philip; with the suffix *-s* (for son), as in Richards; with *-son*, especially in districts settled by Scandinavians or Flemings, as in Wilson, Dixon; with a diminutive, *e.g.* Hancock, Watkins, Willett, Collins; (2) names indicating the place of residence or origin; general, Dale, Church, Attwood; particular, Walton, Harcourt, Darbshire, French; (3) occupational—Baxter (baker), Webb (weaver), Walker (fuller), Spencer (steward), Knight, Monk; (4) personal descriptions and nicknames, such as Long, Black, Armstrong, Toogood. Many names are fanciful designations of foundlings, or corruptions of foreign names. Cornish names in Tre-, Pol-, and Pen- are place names. Most Welsh surnames are patronymics, often preceded by Ap (*i.e.* map, son) shortened in Prichard, Bevan, etc. The Highland and Irish Mao is cognate. Irish O' represents *Ua*, grandson.

In Scotland a landowner is often known by the name of his estate instead of his surname, or adds it to his surname, *e.g.* Weir of Hermiston. A wife in Scotland retains her maiden name in legal parlance, generally adding her husband's name as an alias. By English law any person is at liberty to change his surname, and in wills the adoption of the testator's surname is often made a condition of a bequest. See Name; Place Names; consult Dictionary of English and Welsh Surnames, C. W. Bardsley, 1901; British Family Names, H. Barber, 2nd ed. 1903; Surnames, E. Weekley, 1916.

Surplice (late Lat. *superpelliceum*, over the fur). Vestment of the Anglican and R.C. Churches. The Anglican surplice is a white linen garment reaching at least to the knees, gathered at the yoke and made with ample sleeves. Its

use is not restricted to priests, but the surplices worn by choristers and readers are usually less full

Surplice as worn in the Anglican Church

than those worn by the clergy. In the R.C. Church the surplice is ornamented with lace and reaches only to the hips. As the word implies, the garment was originally placed over the furs worn by priests when conducting the long services in cold churches. Its recorded use as a vestment dates from the 12th cent.

Surrealism. Art movement. The name was chosen to suggest a quality above and beyond the reality of everyday life. Surrealism may be described as the expression of dreams, both waking and sleeping, their symbols, and deep fantasies of the subconscious. There was nothing essentially new in this form of art; indeed the surrealists claimed for their own such figures as the 16th century Flemish artists Bosch and Breughel, together with Lewis Carroll and Edward Lear. But whereas the older artists linked the subconscious life with the conscious, surrealists chose their subject matter from symbolism provided by the subconscious. As a movement, a "deliberate association"

surrealism may be said to have arisen out of Dadaism (*q.v.*) and the researches of Freud, together with the dream paintings of the Italian Giorgio de Chirico (b. 1888) and the Russian Marc Chagall (b. 1887). The most famous exponent of this essentially romantic movement was Salvador Dali (b. 1904). Most of the significant surrealist painters were not French, for the German Max Ernst (b. 1891), the Swiss Paul Klee (1879-1940), and one aspect of the work of Pablo Picasso (b. 1881), a Spaniard, should be noted.

Surrey. County of England. Its area is 722 sq. m., and it is bounded on the N. by the Thames. The N. Downs stretch across the co., their highest point being Leith Hill (965 ft.). The chief rivers are the Wey and Mole, flowing to the Thames, and the Eden to the Medway. Kingston-upon-Thames is the

co. town; other towns are Guildford, Reigate, and Godalming. Croydon, Richmond, and Wimbledon are boroughs on the outskirts of London.

The county is noted for its many heaths and commons. The soil is not very fertile, but cereals and, around Farnham, hops are grown. Sheep are reared on the Downs. There are many market gardens on the suburban fringe, and paper is made on the banks of the Wandle. This is one of the chief cricketing counties, and has famous racecourses. Places of interest or beauty are Epsom, Woking, Farnham, Dorking, Waverley Abbey, Gatton

Surrealism. Two examples of the influence of this art movement. Ornament of Insomnia, oil painting by Tanguy Ives; and, upper picture, The Last Journey of Captain Cook, a construction by Roland Penrose, 1936

Surrey, England. Map of the home county south of the Thames

House, Newark Priory, Sutton Place, Hindhead, Box Hill, Runnymede, Virginia Water, Friday Street; Kew Gardens, Richmond Park; pretty villages such as Shere, Betchworth, and Chiddingfold. The Pilgrims' Way and Stane Street may be picked up at various points. Ten co. and nine borough M.P.s are elected. The co. is mainly in the dioceses of Guildford and Southwark. There are rly., bus, and Green Line services to London.

The Surrey Iron rly., completed in 1805 for the carriage of goods from Wandsworth to Croydon, had wagons drawn by horses, one horse drawing a load of 55 tons 6 m. in 1½ hrs. The rly. was closed in 1830, but a section with its stone sleepers is preserved in Purley recreation ground.

In early days Surrey was in the kingdom of Mercia, and then in Wessex. Ockley is regarded as the scene of a great Danish defeat by Ethelwulf in 851. After the Norman Conquest glass and iron were made in Surrey. In 1888 Southwark and other districts were taken away to form part of the co. of London. Pop. (1931) 1,180,878.

LITERARY ASSOCIATIONS. Denham's poem, Cooper's Hill, describes the Thames-side hill of that name. Many of Cobbett's Rural Rides were taken near his native Farnham. Jane Austen's Highbury is variously identified as Leatherhead, Dorking, and Esher. Richmond Hill is described in Scott's *Heart of Midlothian*. Meredith wrote much of this county, and in several poems described the country about Box Hill; he is

buried at Dorking. Near here Disraeli wrote *Coningsby*. Sir G. Chesney wrote an account of an imaginary battle of Dorking which had some popularity in 1871. Edna Lyall in her stories presented Farnham as Firdale, while Conan Doyle told of the old-time Waverley Abbey in Sir Nigel. Baring-Gould set the scenes of *The Broom Squire* about Hindhead. Woking and its immediate neighbourhood are utilised in almost photographic detail as the scene of the first landing of the Martians in H. G. Wells's *War of the Worlds*.

Bibliography. Victoria History of Surrey, 4 vols., ed. W. Page, 1905-12; *The Pilgrims' Way*, J. Cartwright, new ed. 1911; *Memorials of Old Surrey*, J. C. Cox, 1911; Surrey, E. Parker, 1947.

Surrey, EARL OF. English title successively granted to several noble families, and since 1483 held by the dukes of Norfolk. William de Warenne, who appears as the first earl of Surrey, was a Norman follower of William I, and received the grant c. 1088. Although the direct line failed with the 3rd earl, 1148, the title passed to Hamelin Plantagenet, who had married the last earl's heiress. Their successors were earls of Surrey until the failure of the male line in 1347, when the title devolved on Richard Fitzalan, earl of Arundel, a nephew of the last earl. On the death of Richard's son, Thomas, 1415, the title reverted to the crown. In 1451 the earldom was granted to John Mowbray, 4th duke of Norfolk and last of the Mowbrays, and it was regranted in 1483 to Thomas Howard. Since then it has been a courtesy title of

the eldest sons of the dukes of Norfolk. See Howard; Mowbray.

Surrey, HENRY HOWARD, EARL OF (c. 1517-47). English courtier and poet. Son of the 3rd duke of Norfolk, his early years were spent at Kenninghall. He became a courtier and fought with distinction in France, being wounded severely at Montreuil. On being defeated by a superior force at St. Étienne while he was governor of Boulogne, he was recalled in 1546. Falsely accused of treason, before hostile judges and packed jury, he was beheaded on Tower Hill, Jan. 19, 1547. He was interred at All Hallows, Barking, and his remains were afterwards removed to Framlingham, Suffolk.

As a poet, following the Italian model of Petrarch, he was co-founder with Wyatt of the English sonnet-form and the first to use in English, in his translation of the *Aeneid* (i and iv), decasyllabic blank verse. His songs and sonnets were first printed in Tottel's *Miscellany* in 1557. His sonnets to the Fair Geraldine were written in accordance with the Petrarchan convention. "Geraldine,"

Henry Howard,
4th Earl of Surrey

Lady Elizabeth FitzGerald, was a child at court when the verses were composed, but Nashe, in his *Jacke Wilton*, built on them a romance which others have copied, and Scott wove into his *Lay of the Last Minstrel*. Surrey paraphrased in verse Psalms 8, 55, 73, and 88, and ch. 1-5 of *Ecclesiastes*. See *Sonnet*; *consult also* Poems, with Life, by A. Chalmers, 1810.

Surrey Commercial Docks. One of the dock systems of the Port of London. They lie between the pool of London and Limehouse Reach, cover 380 acres (160 acres of water), and are largely used for the landing and storage of timber. Incorporating the docks once used for the Greenland whalers, first opened in 1807 and since that date greatly enlarged, one of them is still named Greenland Dock, and from this issues the Surrey Canal, which extends to Camberwell and Peckham.

Surrey Theatre, ROYAL. Former London playhouse. It was in Blackfriars Road, S.E.1. The first theatre erected on the site, almost adjacent to St. George's Circus, was opened, Nov. 7, 1782, under the management of Hughes and Charles Dibdin. Known as the

Royal Circus and Equestrian Philharmonic Establishment, it was burnt down, Aug. 12, 1805. It was rebuilt and reopened, Easter Monday, 1806, under the management of R. W. Elliston, who changed its name to the Surrey. It later acquired some distinction as the home of melodrama and pantomime. This building also was burnt down, 1863. The third theatre, used as such until the late 1920s, continued for a while to function as a cinema. The building was demolished by German bombs during the Second Great War. Sir Arthur Sullivan's father was a violinist in the Surrey theatre, 1845, when the future composer was born in Bolwell Street. In Dickens's *Little Dorrit*, Fanny Dorrit was a dancer at the theatre, and her uncle Frederick played the clarinet in the orchestra.

Surrogate (from *Lat. surrogare*, to elect in place of another). Deputy, substitute, or delegate. In eccles. government a surrogate is the deputy of a bishop or a diocesan chancellor who grants marriage licences.

Surtax. A further income-tax. It is charged on incomes exceeding a figure fixed by the annual Finance Act, and is payable in addition to ordinary income tax. Surtax has taken the place of the former super-tax since 1928-29. Surtax is payable only by individuals and not generally by corporate bodies such as companies. The rate of surtax increases with the amount of income. During and after the Second Great War the combined effect of income tax and surtax was such that, with incomes exceeding £20,000, the amount of the excess bore tax at the rate of 19s. 6d. in the pound.

Surtees, ROBERT (1779-1834). British antiquary. Born at Durham, April 1, 1779, he was the only surviving child of Robert Surtees of Mainsforth. He was educated at Christ Church, Oxford, and in 1802 settled on his paternal estate at Mainsforth. Here he devoted himself

Robert Surtees,
British antiquary
From a silhouette

to compiling local material for his *History and Antiquities of the County Palatine of Durham*, 1816-23, completed by a 4th volume in 1840. Three ballads from his pen, *Barthram's Dirge*, *The Death of Featherstonehaugh*, and *Lord*

Eurie, were unwittingly included as ancient ballads in Scott's *Minstrelsy of the Scottish Border*. He died at Mainsforth, Feb. 11, 1834. The Surtees Society, founded after his death for the publication of historical MSS. concerning northern counties, has published some 150 volumes.

Surtees, ROBERT SMITH (1803-64). British novelist and writer on sport. Second son of Anthony Surtees, and educated at Durham grammar school, he began practice as a solicitor in London, but turned to journalism, writing for the *Sporting Magazine*. In 1831, with

Robert S. Surtees,
British novelist

Rudolph Ackermann, he founded *The New Sporting Magazine*, in which first appeared his celebrated character Mr. John Jorrocks. The Jorrocks episodes were collected together and published as *Jorrocks's Jaunts and Jollities*, in 1838. Jorrocks also figured as the principal character in *Handley Cross* (1843, and an enlarged edition, 1854). The most important of Surtees's other novels were *Mr. Sponge's Sporting Tour*, 1853; *Ask Mamma*, 1858; *Plain or Ringlets?*, 1860; and *Mr. Facey Romford's Hounds*, 1865. For these works Leech produced some of his best work. Surtees died at Brighton, March 10, 1864. A critical study by F. Watson was published in 1933.

Surtout. In heraldry, a small shield, emblazoned with a full coat of arms, and placed in the centre of the paternal coat. It is a method of indicating ownership. Arms of pretension are thus borne.

Suruga Wan. Inlet on the S. coast of Honshu, Japan. It is separated from Sagami Wan by a peninsula forming the prefecture of Izu. On its W. shore in Shizuoka.

Survey, COURT OF. British court of law dealing with appeals concerning unseaworthy ships. Composed of a judge and two nautical assessors, it was formed under the Merchant Shipping Act, 1876. Boards of Survey are bodies of medical officers who examine physically officers and men of the navy.

Surveying (Anglo-Fr. *surveier*, to overlook). Art of ascertaining by measurement the shape and size of any part of the surface of the earth for representation on a reduced scale. Such a survey is necessary in the preparation of maps, par-

ticularly those known as the ordnance survey maps, in many kinds of civil engineering works, as the construction of railways, canals, tunnels, roads, reservoirs, etc.

Broadly speaking, surveying can be said to be practical geometry and trigonometry, for it is concerned with the finding of the distances between objects and their angular relations to one another, from which other factors may be deduced.

The instruments used may be divided into two broad classes, those for measuring lengths, and those for measuring angles. The former include the Gunter's chain, a chain 66 ft. in length, divided into 100 links, nowadays chiefly used only where area or length alone is required. The more usual measuring instrument is the 100 ft. chain or tape, divided into a hundred links or divisions of one foot each. The tape is steel, or more usually the alloy "Invar" the latter having a small coefficient of expansion due to heat. Each foot on the tape is subdivided, and more accurate measurements can be made than with a chain. Smaller and larger tapes are also used according to the character of the work being undertaken. In geodetic surveying, where greater accuracy is required than in plane surveying, special metallic rods, called base bars, are often used in order to measure the necessary base lines.

Instruments for angle measuring include those for ascertaining direction, and also levelling instruments. Such instruments include the prismatic compass, theodolite, level, transit, box sextant, range-finders, etc., separately described. The plane table is an instrument enabling the work of survey to be plotted at the time. It consists of a drawing board mounted on a tripod, which has the necessary screws for levelling attached to it. It is used in conjunction with other surveying instruments recording distances and angles, and these are plotted immediately on the plane table. The plane table enables rapid surveys of a reasonable order of accuracy to be made, and has the advantage that the surveyor can employ less skilled assistants than those required to use and read many of the more complicated surveying instruments.

In plane surveying no account is taken of the curvature due to the shape of the earth, which introduces a fundamental inaccuracy. The inaccuracy increases with the area being surveyed at one time,

but it is small in a large part of the survey work required in engineering. Plane surveying has the advantage of comparative simplicity over the more accurate geodetic survey. In ordinary land surveying the area obtained is that between the vertical planes surrounding the boundary being measured, and is the horizontal projection of the real surface. The area is obtained by triangulation methods, *e.g.* a division of the irregular shape into triangles, or by the use of Cartesian coordinates by which the rectangular distances of points in the area from certain fixed lines are measured.

The points from which lines and angles are measured are called stations, and stations should be so placed with reference to one another that the triangles formed by them do not present any abnormally short or long side. Such uneven sided triangles always lead to difficulties in, if not inaccuracies of, measurement. Traverse is the name given to the survey of a number of stations, the position of each station being of course known with reference to the one previously measured. Figure 2 shows a closed traverse and the method of calculating its area.

ABCD²FGH is the closed traverse, ABC, etc., being the stations. NS, EW are north and south and east and west directions through A, the station at which the surveyor begins his measurements. These measurements are the lengths of the lines AB, BC, CD . . . and their bearings. The latter may be measured from the fixed directions NS, EW, or may be a measure of the angle the line being measured makes with the last one measured. The coordinates of the stations, *e.g.* Bb, Dd, etc., are known as northings and southings, eastings and westings, or latitudes and departures, and can easily be calculated from the lengths and bearings. The coordinates of the stations being known, the area of the figure follows from the usual geometrical considerations. If any boundary of the area is too irregular to be considered a straight line between two stations, as in Axyz B in Fig. 1, a series of perpendiculars or offsets Xx, Yy, Zz, are drawn on the straight line AB and measured. These offsets divide the irregular portion of the area

into triangles and trapezoids whose individual areas can be closely approximated to.

In a topographic survey the same methods are observed, such a survey merely differing from an ordinary land survey in taking account of the physical features. The land survey is concerned with horizontal distances, and makes its own landmarks as it were. The topographical survey makes use of the actual landmarks and also the contour of the land. Such a survey usually follows more closely that of a geodetic survey.

A hydrographic survey is one concerned with charts of the sea-

FIG. 1

FIG. 2

Surveying. Diagrams showing stations and measurement lines of a closed traverse, and, above, those for an irregular boundary. See text

shore or shore of large bodies of water, and with measurement of the velocities of rivers, etc. It is for all practical purposes the preliminary for the preparation of navigation charts.

Mine surveying deals with both surface and underground surveys for mining purposes. The surface survey follows that of an ordinary land survey, and the underground surveys help to form a basis of calculation of the ore being taken from the mine or still in it, the locations of galleries, shafts, etc.

A geodetic survey takes account of the curvature of the earth, and is therefore more accurate than the plane survey. The ordnance surveys carried out by governments are geodetic surveys. Much of the work follows that of plane surveying, but angles are more used than lengths. The preliminary length measured is called the base line, and is obtained with as great accuracy as possible. From the ends of the base line angular measurements of various points are obtained and by triangulation other points and distances.

A type of survey of increasing importance is the aerial survey. A series of overlapping photographs

of the area to be surveyed are taken from the air. All objects within the area are immediately shown in their relative positions. In conjunction with other methods, this process supplies a quick method of obtaining maps of a district, and is invaluable in the charting of dense forest areas, *e.g.* in Central Africa. See Air Photography; Chart; Geodesy; Hydrography; Maps and Mapmaking; Mining; Ordnance Survey; Theodolite.

Surveyor (Anglo-Fr. *surveleur*, overseer). One who measures land or buildings, and may also supervise constructive work. Surveying of land and buildings may be combined with architectural practice, but the tendency is to separate the professions. The measurement of

quantities of materials in buildings is a separate profession (see Quantity Surveyor). The land surveyor's duties vary widely according to the range and purpose of his work. Geodetic surveying is concerned with the figure and area of the earth or large portions of it. In Great Britain this is entrusted to the staff of the ordnance survey office, Southampton. Ordnance survey maps are used by land surveyors and geologists as a basis for their work. Geodetic surveyors usually accompany important expeditions where the survey of large areas of country is a leading object.

Land surveyors in private practice are chiefly concerned with the administration of private property and estates, and the layout of roads and earthworks. Surveyors to local authorities combine land surveying with work on roads, sewerage, housing, and public buildings, and also the administration of building by-laws. The mine surveyor measures and plots underground shafts and workings.

The work of surveyors concerned with the extent and valuation of land, more especially for taxation purposes, is called cadastral surveying. In this work the large-scale ordnance survey maps are widely used.

The Chartered Surveyors' Institution, 12, Great George St., Westminster, London, S.W.1, holds examinations for membership, which is the recognized qualification in all branches of surveying. After a preliminary test in general knowledge, the candidate takes an intermediate examination which comprises surveying and levelling, book-keeping, central and local government, economics, draughts-

manship, mensuration, and trigonometry. In addition, specialist subjects must be taken by would-be land agents, valuers, and building and quantity surveyors. The final examination is concerned with all subjects relating to the selected branch, and a pass carries the designatory letters P.A.S.I. Surveyors over 30 years of age who have held a responsible post for at least five years may qualify for fellowship (F.S.I.) without taking the intermediate examination. The Royal Institute of British Architects holds examinations for the office of district surveyor in London and building surveyor under other local authorities.

Survival. Continued existence after death of the human spirit as an individual entity. Attempts to obtain scientific proof are attended by extreme difficulty. Negative results in no way affect religious belief, as the barrier between the two worlds may be absolute. Apparitions seen hours after death may be due to deferred telepathic impressions. In judging alleged messages conveyed by automatic writing or disinterested mediums, the possibility of telepathy from the living must be considered, although in certain complex cases it seems excluded. *See* Immortality; *Psychical Research*; *Spiritualism*.

Survival of the Fittest. Biological term for a process in evolution (*q.v.*) by which the struggle for existence eliminates the least adapted of a race, thus selecting those most fit to perpetuate their kind. *See* Natural Selection.

Surya. Hindu god representing the sun, and one of the gods still most generally honoured. He is described as riding in a chariot with his head surrounded by rays. *See* Hinduism.

Susa OR **SHUSHAN.** Ancient city of Persia. The capital of the old province of Susiana, it stood on the river Choaspes, the modern Kar Pheh, and was the winter residence of the Persian kings. The ruins include the pilgrim resort known as the tomb of Daniel, and the acropolis. Excavations by Williams, Dieulafoy, and others laid bare the citadel and the imposing remains of the colonnade of the palace built by Darius, and restored, after destruction by fire, by Artaxerxes Mnemon. *See* Shushan.

Susa. City of Piedmont, Italy, in the prov. of Turin. It stands on the Dora Riparia, 32½ m. by rly. W. of Turin city. It contains San Giusto cathedral, rebuilt in

the 13th century, the ruined castle of La Brunetta, and a triumphal arch dedicated in A.D. 8 to Augustus. Strategically situated in relation to the roads over the passes of Mont Cenis and Mont Genève, it was for some time the capital of Piedmont, burnt by Barbarossa in 1174, and dismantled by Napoleon in 1796.

Susa (Fr. Sousse). Seaport of Tunisia. It is situated on the Gulf of Hammamet, 75 m. S. by E. of Tunis by rly. Exports are barley, wheat, phosphates, esparto grass, and olive oil. The old harbour, built by the Romans, is silted up; a modern one has been developed since 1900. S.W. of the town are vast Christian catacombs. Susa is dominated by a citadel, and in the old town is a fortress with seven bastions, the Kasr-er-Ribat. During the Second Great War Susa was occupied by the British 8th army without opposition, April 12, 1943, after an 80 m. advance from Sfax, entered on the 10th. The mixed pop. of Europeans, Jews, and Arabs is 28,465.

Susanna, HISTORY OF. One of the O.T. Apocrypha, an addition to the Book of Daniel, written probably between 80 and 50 B.C. It is the story of a beautiful Jewish exile named Susanna. She was seen bathing and admired by two Jewish elders. When she rejected lustful proposals they charged her with adultery. She was condemned to death, but saved by the interposition of Daniel who was able to prove the falsity of the charge.

Susceptibility. Term referring to the characteristic of a magnetised body which is defined by the ratio of the intensity of magnetisation produced in a substance to the intensity of the magnetic field to which it is subjected. The susceptibility of paramagnetic sub-

stances, *e.g.* oxygen, air, aluminium, platinum, is positive, while that of diamagnetic substances, *e.g.* bismuth, sulphur, graphite, mercury, is negative.

Suslik OR **SOUSLIK** (*Spermophilus*). Genus of rodent mammals, about 40 species, natives of N. Europe, N. Asia, and N. America. They are much like the marmots (*q.v.*) in form and burrowing habits, but are provided with cheek-pouches in which they convey provisions to their stores; hence they are sometimes called pouched marmots. *See* Gopher.

Suspension Bridge. Type of bridge in which a tower is constructed on each bank or on piers, and chains or cables are passed over them and anchored back to provide the actual bridge supports. Suspension bridges provide a clearer waterway for ships generally than other classes of bridge. *See* Bridge illus. pp. 1422, 1424; Clifton.

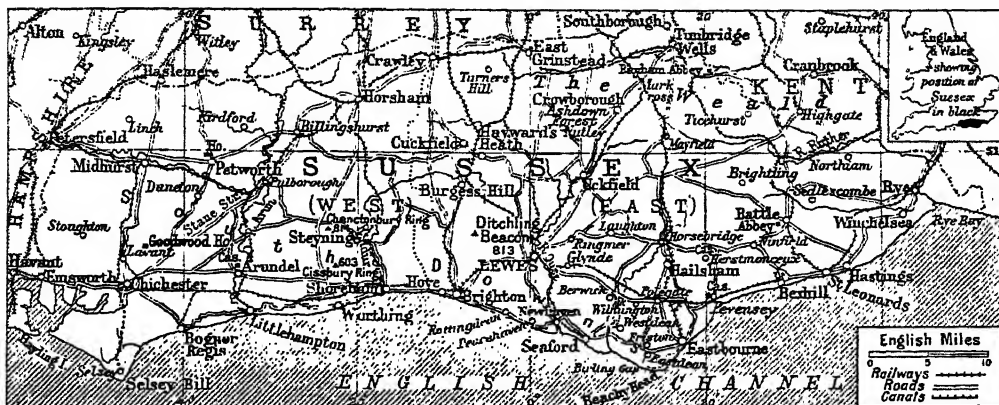

Suspension Current. Current which moves through a surrounding fluid because it is slightly heavier than the latter. The increase in weight is supplied by fine material being carried in suspension. Muddy river water pouring into a clear lake is heavier than the lake water; the velocity of the river water is checked and coarse material is deposited at the river mouth; but fine material in suspension often gives enough additional weight to the river water to cause it to move as a current on its own down the lake floor and through the clear water to the depths. These currents are taken into account in considering the silting up and discharge of reservoirs. They may have been responsible for the formation of submarine canyons.

Susquehanna. River of the U.S.A. Rising in two main branches, the N. branch in Otsego Lake, New York, and the W. branch in the Allegheny Mts., it unites at Sunbury, Pa., and follows a generally S. course to Chesapeake Bay, which it enters at Havre de Grace. It is shallow, swift-flowing, and generally unnavigable, and has a total length, including the N. branch, of nearly 500 m. The main tributaries are the Lackawanna, West Branch, and Juniata.

Sussex. Maritime county of England. Lying along the S. coast, it has a shore of 91 m. on the English Channel. Its area is 1,457 sq. m., and for administrative purposes it is divided into two counties, east and west, each with its council. It is the only county to preserve the

Susa, Italy. Campanile of the 13th century cathedral of S. Giusto

Sussex. Map of the southern maritime county of England, celebrated for its watering-places and beautiful pastoral scenery

Anglo-Saxon division into rapes, of which there are six. In the centre is the plain of the Weald, and crossing from Hampshire to Beachy Head is the range of hills known as the South Downs, rising to 813 ft. in Ditchling Beacon. The chief rivers are the Arun, Adur, Ouse, and Rother.

Sussex is celebrated for its breed of sheep, the Southdown, while horses and cattle are also reared. The soil along the coast produces wheat and there are many market gardens. Hops are grown in the E., and tomatoes near Worthing. The area under wood is considerable, and near Mayfield there was once a prosperous iron industry. Along the coast are large and popular watering-places, Brighton, Eastbourne, Hastings, and Worthing, as well as the smaller Rye, Winchelsea, Shoreham, Bexhill, Littlehampton, and Bognor. Newhaven is a port for France. Lewes is the co. town of E. Sussex, as Chichester is of W. Sussex. Chichester is also the seat of a bishop. Market towns include Horsham and Midhurst.

The county contains the ruins of Pevensey, Bodiam, and Hurstmonceux castles, and of Bayham and Battle abbeys; great houses such as Arundel and Petworth; and Goodwood, famous for races. It has earthworks at Cissbury and Chanetonbury. There are excellent communications with London by road and rly. Six co. and five bor M.P.s are elected. Pop. 769,859.

Sussex was originally the kingdom of the South Saxons, having been conquered by Ella about 477. Much of the county was then and later covered by the great forest of Andredsweald, of which there are remains in Ashdown Forest. In the 7th century the South Saxons were converted to Christianity and in 825 they submitted to Egbert.

Its importance during the Middle Ages was due to its position opposite France, and in it were several of the Cinque Ports.

LITERARY ASSOCIATIONS. Among poets, the earl of Dorset was born at Buckhurst, John Fletcher at Rye, Otway at Trotton, Collins at Chichester, Shelley at Field Place, Horsham. Selden, the antiquary, was a native of Salvington. The Downs and the coast inspired Swinburne, in his lines *To a Seamew*; Kipling, who lived at Rottingdean and Burwash, in his poem *Sussex*, and the tales in Puck of Pook's Hill; and Hilaire Belloc, resident at Shipley, in *The Four Men* and several poems. Storrington is associated with some beautiful poems of Francis Thompson. At Felpham Blake had his vision of faeries. Hastings and Hollington have memories of Lamb, and Rye of Henry James. Cobbett and Jeffries wrote much about Sussex. The neighbourhood of East Grinstead is described by Horace Smith in *Brambletye House*; the Brighton district by Ainsworth in *Ovingdean Grange*, Dickens in *Dombey and Son*, Thackeray in *Vanity Fair*, and in the novels of D. L. Murray. Sheila Kaye-Smith specialised in Sussex stories, especially of the Kent-Sussex border.

Bibliography. History of Sussex, 2 vols., M. A. Lower, 1870; *Highways and Byways in Sussex*, E. V. Lucas, 1904; *Victoria History of Sussex*, 2 vols., ed. W. Page, 1905-07; *The Sussex Coast*, I. C. Hannah, 1912; *Sussex*, H. Belloc, 1936.

Sussex, EARL OF. English title borne by the Radclyffe, Savile, and other families. The earls of Arundel were probably the first earls of Sussex, and after the earldoms of Surrey and Sussex were probably held unitedly by the Warenne family. In 1529 Robert Radclyffe was made earl of Sussex. He and his

successors were men of note until the death of the 6th and last earl in 1641. The greatest of them was Thomas, 3rd earl (d. 1583), lord-lieutenant of Ireland under Elizabeth, and a typical nobleman, courtier, scholar, and soldier of that period.

In 1644 a Yorkshireman, Thomas Savile, was made earl of Sussex. The title became extinct in 1671, but was revived for Thomas Lennox, Baron Dacre, in 1684. Again extinct in 1715, it was held by the Yelverton family from 1717 to 1799. In 1801 George III made his sixth son, Augustus Frederick (1773-1843), duke of Sussex. He contracted a morganatic marriage with Lady Augusta Murray, and their children took the name of d'Este.

Sussex Regiment, ROYAL. Regiment of the British army formed in 1881 by an amalgamation of the 35th and 107th Foot. The 35th was raised in 1701 at Belfast by the earl of Donegal, a strong supporter of the house of Orange. He adopted the orange facings for the regiment which gave it the nickname of Orange Lilies. Embodied as marines,

Thomas Radclyffe, 3rd Earl of Sussex
After Sir A. More

it served in the Cadiz expedition in 1702; won its first battle honour at the siege of Gibraltar, and was at the capture of Barcelona, and the disaster at Almansa. It

Sussex Regiment badge

was with Wolfe at Quebec, where its action against the French regiment of Royal Roussillon is commemorated by the Roussillon plume on its badge. It later fought at Martinique, Havana, and St. Lucia. In 1804 the 35th Foot was affiliated to the county of Sussex. It fought against the French in Italy and Egypt, and in 1809 was part of the force that captured the Ionian islands. The regiment was in India during the Mutiny.

Raised in India in 1854, the 107th Foot was originally the 3rd Bengal European Light Infantry, and was employed in Bengal until after the Mutiny, when it was transferred to British establishment. The 35th and 107th were amalgamated in 1881 as the 1st and 2nd battalions Royal Sussex, which fought in Egypt (1882-85) and in the S. African War.

Twenty-three battalions were raised for service in the First Great War and earned the battle honours: Retreat from Mons; Marne, 1914, '18; Ypres, 1914, '17, '18; Somme, 1916-18; Pilckem; Hindenburg Line; Italy, 1917-18; Gallipoli, 1915; Palestine, 1917-18; N.W. Frontier India, 1915, 1916-17. In the Second Great War, the regiment served in France (1940), E. Africa, and Burma. The depot is at Chichester. A Territorial battalion, the 5th Royal Sussex, is known as the Cinque Ports battalion, and wears as badge the arms of the Cinque Ports.

Sutcliffe, HALLIWELL (1870-1932). British novelist. Coming from Bingley, Yorks, he was a regular contributor to magazines, and wrote novels dealing with the life of the Yorkshire fells. Among these are *A Man of the Moors*, 1897; *By Moor and Fell*, 1900; *Windover Tales*, 1907; *Wildersome*, 1919; *The Winds of March*, 1927. He died Jan. 14, 1932.

Sutcliffe, HERBERT WILLIAM (b. 1894). English professional cricketer. Born at Summerbridge, near Harrogate, Nov. 25, 1894, he served with the Sherwood Foresters in the First Great War, and first played for Yorkshire in 1919.

Herbert Sutcliffe,
English cricketer

He made more than 50,000 runs, more for Yorkshire than any other player. Opening batsman for England, he played in 27 Test matches against Australia between 1924 and 1934, and in his first

two scored 59 and 115, 176 and 127; the century in each innings equalling a record. With J. B. Hobbs (*q.v.*) he shared in 15 three-figure partnerships in all tests. In the rainy season of 1931 he had an average of 96.96, the highest ever by an Englishman; next year brought a total of 3,336, including 14 centuries, his biggest innings of 313, and a world record partnership of 555 with P. Holmes. A master of on-side play and possessed of wonderful patience, Sutcliffe ended his playing career in 1939. He published *For England and Yorkshire*, 1935.

Sutherland, DUKE OF. Scottish title borne by the family of Leveson-Gower since 1833. There appears to have been an earl of Sutherland as far back as the 13th century. This title came to the Gordons by marriage soon after 1500, and John Gordon, 7th earl (d. 1733), was a leading man in Scottish politics at the time of the union and of the rising of 1715. In 1771 the house of lords said the earldom belonged to Elizabeth Gordon, daughter of the earl who died in 1766. In 1785 she married George Granville Leveson-Gower (1758-1833), who became in 1803 marquess of Stafford. Thus the two titles were united, and so were the vast estates of the Scottish countess with the wealth of the English marquess. He was British ambassador in Paris, and was made duke of Sutherland in 1833. An eldest son of a duke of Sutherland is still known by this title.

His descendant is George Granville Sutherland-Leveson-Gower, 5th duke (b. Aug. 29, 1888), who succeeded to the title in 1913, and actively entered politics, being under-secretary for the colonies 1921-22, for air 1922-23, paymaster-general 1925-28, then under-secretary for war for a few months. He was grand prior of the Primrose League from 1922 and president of the Air League of the British Empire 1922-24. The duke owns much of Sutherlandshire, in which is his chief residence, Dunrobin Castle.

Sutherland Falls. Highest waterfalls in the world (1,904 ft.). They are in South Island, N.Z., on the W. coast of Otago, 14 m. S. of Milford Sound, amid some of the most magnificent scenery in the dominion. The water drops down a densely wooded mountain side in two great falls. In Lake Ada, into which the Sutherland Falls empty, there is excellent fishing; the whole district is popular with holidaymakers.

Sutherlandshire. County of Scotland. It is situated in the extreme N.W., and its area is 2,028 sq. m. It has a bold and precipitous coast on the N. and N.W., where is Cape Wrath (523 ft.), and is deeply penetrated by sea lochs, the Kyle of Tongue and Loch Eriboll among them. The surface varies between mountainous moorland and narrow valleys. There are several summits over 3,000 ft. high, Ben More Assynt being the highest. Loch Shin is the largest of

Sutherlandshire. Map of the extreme north-western county of Scotland, famous for its grouse moors and deer forests

many lakes; others include Assynt, Naver, and More. The chief rivers are the Oyckell, Helmsdale, Brora, Shin, and Fleet. Handa, Roan, and other islands belong to the county.

Sutherlandshire is known for its grouse moors and deer forests. The chief industries are the rearing of sheep, and fishing. Much of the land is cultivated by crofters. The soil is poor, although there are one or two fertile spots. Many acres were reclaimed from the sea by the dukes of Sutherland. Dornoch is the county town. Others are Golspie, Tongue, Scourie, and Lochinver. The county has remains showing traces of the Picts, and also of the Scandinavians. Its name, meaning south land, was given by the Norsemen of Caithness, who overran it in the 11th century. It was the home of the Mackays, Macleods, and other clans. With Caithness, it sends one member to parliament. Population 14,400.

Sutlej. River of the Punjab, the largest and most easterly of the five rivers. It rises near the sources of the Indus, Ganges, Gogra, and Brahmaputra, in the sacred Rakas Tal Lake, at the S. foot of Mt. Kailas, in Tibet, at about 15,000 ft. above sea level. At first a raging torrent, it crosses the Himalayas, skirts the Siwalik hills, enters the great alluvial plain at Rupar, and flows in general S.W. to join the Indus after a course of 900 m. Its waters are the source of a considerable irrigation scheme.

Sutras (Skt. *sūtra*, string). In Sanskrit literature, a class of commentaries on the Vedas, composed between the Vedic and classical periods. Consisting usually of strings of brief aphorisms in highly condensed language, they were learnt by heart as aids to memory in matters of ritual, law, philosophy, grammar, prosody, etc. See Sanskrit; Vedas.

Sutri (anc. Sutrium). City of Italy, in the prov. of Rome. It crowns an isolated hill, 950 ft., 29 m. N.W. of Rome, and has a modern cathedral damaged during the Second Great War, when it was captured by the Allied 5th army, June 8, 1944. Its chief interest is in the ancient walls and gates, Etruscan rock tombs, a rock church, and the rock-hewn amphitheatre dating from the time of Augustus. Here in 1046 a synod deposed Popes Sylvester III and Gregory VI on a charge of simony. Pop. est. 3,000.

Sutro, ALFRED (1863-1933). British dramatist. Born in London

August 7, 1863, and educated at the City of London school and in Brussels, he achieved success in 1904 with *The Walls of Jericho*, a comedy dealing with modern society. Among his other plays are *John Glayde's Honour*, and *The Barrier*, 1907; *The Builder of Bridges*, 1908; *The Choice*, 1919; *Far Above Rubies*, 1924; and *The Desperate Lovers*, 1927; *Living Together*, 1929. His reminiscences, *Celebrities and Simple Souls*, appeared shortly before his death, which occurred Sept. 11, 1933.

Alfred Sutro,
British dramatist

Suttee. The 13th century spelling of the Hindu word *sati*, used for the custom of widow-burning. See *Sati*.

Suttner, BERTHA VON (1843-1914). Austrian novelist. Born at Prague, June 9, 1843, she married Baron Arthur G. von Suttner, a successful novelist, in 1876. After serving as secretary to Alfred Nobel (*q.v.*) and writing a series of light novels, she made a reputation as an ardent pacifist with *Die Waffen Nieder!* (*Down with Arms*), 1889. Translated into several languages, the book gave impetus to the pacifist movement throughout the world, and she became vice-president of the international peace office at Berne, as well as president of the Austrian pacifist society, and a prominent member of later peace conferences. Her other novels included *Trente-et-Quarante*, 1893; *Emperor of Europe*, 1898; and *Schach der Qual*, 1898. She was awarded the Nobel peace prize in 1905, and died at Vienna, June 21, 1914.

Sutton, SIR GEORGE AUGUSTUS (1869-1947). British newspaper director. He was born Sept. 21, 1869, and in 1889 joined the secretarial staff of Alfred Harmsworth, who had founded the weekly periodical *Answers* (*q.v.*). By 1902 he had become a director of the Amalgamated Press, becoming vice-chairman, 1913, and chairman in succession to Northcliffe, 1915. He ceased active association with that company in 1927. Managing director, Associated Newspapers Ltd., 1927, he was vice-chairman during 1934-37. For his services as hon. director of publicity to the National War Bond Campaign, 1917-19, he received a baronetcy, 1919. He died Nov. 7, 1947.

Sutton, MARTIN JOHN (1850-1913). British agriculturist. The eldest son of Martin Hope Sutton, who with his brother Alfred founded the firm of Sutton and Sons, at the age of 21 he became a partner, and in 1887 head of the firm. He was made a fellow of the Linnean Society, and was a member of the national agricultural examination board. He died Dec. 14, 1913. His book, *Permanent and Temporary Pastures*, 1886, was based on an essay by his father, and he wrote papers on agricultural subjects.

Sutton and Cheam. Borough of Surrey, England. It is 11 m. S.W. of London, on the Southern Region of British rlys. and, being near the North Downs, is a popular residential "dormitory" for Londoners. It is situated on one of the main London roads to Brighton. Sutton and Cheam were amalgamated as an urban district in 1928 and received a charter of incorporation in 1934. S. Nicholas church, rebuilt in the 19th century, contains some interesting memorials. Sutton was mentioned in *Domesday Book* as being a place of some importance, then possessing two churches. Cheam (then Cheyham) was in 1018 given to the monks of Christ Church, Canterbury. Population 83,000.

Sutton Bridge. Urban dist. and river port of the Holland div. of Lincs, England. It is situated on the Nene, 7 m. N. of Wisbech, and is served by rly. It is 3 m. from the Wash, and stands on land reclaimed from the sea in the 19th century. Docks once erected here collapsed on the entry of the first vessel. Over the disused basin a golf course has been laid out. Pop. 2,837. About 3 m. away is the village of Long Sutton, which possesses a fine church with a Norman nave.

Sutton Coldfield. Mun. bor. of Warwickshire, England. It is 8 m. by rly. N. by E. of Birmingham. The chief building is the church of Holy Trinity; almost entirely rebuilt in the 19th century, it has a Norman font. There is a 16th century grammar school and a modern town hall. Sutton Park is a recreation ground covering 2,400 acres. Near the town is New Hall, a 13th cent. moated residence. The first charter was granted in 1528 to Sutton, and Sutton Coldfield became a borough in 1886, when it was a market town. It gives its name to a co. constituency. A television transmitter here came into operation in 1949. Pop. est. 46,226

Sutton Courtenay. Village of Berkshire, England. It stands on a backwater of the Thames, 2 m. E. of Abingdon. All Saints is an old church, restored in the 19th century. The manor house dates from the time of Edward III. At Sutton Courtenay the 1st Lord Oxford and Asquith made his home. Across the river is Culham, a village with a rly. station.

Sutton Hoo. Site of ship burials in Suffolk, England. It is 10 m. E.N.E. of Ipswich, and stands on the Deben estuary. In 1939 excavation of one of eleven burial mounds revealed the outlines of an Anglo-Saxon rowing boat in which was buried a pagan king of E. Anglia (possibly Raedwald in the 7th century). Many treasures in the grave made it one of the richest archaeological finds in W. Europe. The workmanship of jewelry and gold ornaments is finer than any other known to have been produced in Anglo-Saxon England; there are also silver dishes of Byzantine origin with Christian motifs, weapons, coins, and the remains of a harp. All are in the British Museum. *See* Anglo-Saxon Antiquities. *Consult* Anglo-Saxon England, F. M. Stenton, 1943; Sutton Hoo Ship Burial, British Museum, 1947.

Sutton-in-Ashfield. Largest urban dist. and a market town of Notts, England. It is 13 m. N. by W. of Nottingham, and has two rly. stations. The chief building is the church of S. Mary Magdalene, a 12th century edifice restored in the 19th. There are a town hall and three public libraries. Manufacture of hosiery is the staple industry, and around are coal mines, while light engineering and plastic industries are growing. Market days, Fri. and Sat. Pop. est. 39,880.

Sutton-on-Sea. A watering-place of the Lindsey div. of Lincs, England. It stands on the E. coast, 28 m. N.E. of Boston. Entirely modern, it has a rly. service and became popular towards the end of the 19th century. Pop. 1,000.

Suture (from Lat. *suer*, to sew). In surgery, the closing of injuries of the tissues or of incisions; also the threads which are employed in the operation. The materials most frequently used are silk, nylon, horse-hair, catgut, and fine silver wire. Some sutures must be removed after the tissues have grown together; others are absorbed in the course of time.

Suva. Capital and seaport of Fiji. It occupies a beautiful and

Suture threads in a glass cylinder.

luxuriantly green site on the S. coast of Viti Levu. The rainfall is heavy—26½ ins. having been recorded in one day. The R.C. cathedral is the principal church, and there are missionary schools, grammar schools for Europeans (boys and girls), botanical gardens, and Albert Park. Government House discharges official business. There is a weekly air service to New Zealand. Pop. 11,398.

Suvarov, SUVOROV, OR SUWARROW, ALEXEI VASILIEVITCH (1729–1800). Russian soldier. Born at Moscow, Nov. 24, 1729, he entered the army, fighting against the Swedes and in the Seven Years' War. Against the Poles and later against the Turks, 1775–95, he made a reputation and as a general was constantly in the field and winning victories, securing the capitulation of Warsaw in 1794. In 1799 he came from an enforced retirement to lead an army to aid the Austrians in Italy. Having cleverly defeated the French in several engagements, he took his men across the Alps into Switzerland, but his plans failed and he fell back into Austria. After his death at St. Petersburg, May 18, 1800, he was regarded as the greatest military hero of Russia. *Consult* Life, K. Osipov, Eng. trans. 1944.

Suvla Bay. Bay of Gallipoli, Turkey. It is on the W. side of the Dardanelles between Suvla Burnu (Cape Suvla) and Nibrunesi points. It is also called Anafarta Bay.

Suvla Bay, LANDING AT. British operation in the First Great War, an episode of the Gallipoli campaign of 1915. The object was to gain control for the Allies of the central heights of the Gallipoli peninsula, following their failure to advance against the Turks from the S. in the earlier part of the summer. Reinforcements consisting of four divisions under Gen. Stopford were sent from Great Britain for the landing, which was planned to coincide with an Australian attack on Sari Bair and strong offensives at Krithia and near Bulair.

The Australian attack opened Aug. 6, and during the same evening the first of the new divisions, the 11th, landed at points N. and S.W. of Salt Lake, Suvla Bay,

about 4 m. N. of the Australian position. The 10th division landed early on Aug. 7, and the 53rd division on the night of Aug. 8–9. The initial landings took the Turks by surprise, but thereafter the operations miscarried at every point, even though the Turks were inferior in numbers and had withdrawn their artillery. A British front line was consolidated, and connexion was made with the Anzacs, but the Turks retained the advantage of high ground, overlooking the site of any possible advance, in spite of attacks on Aug. 10, and again on Aug. 21; and the position remained thus until the final evacuation of the Anzac and Suvla positions on Dec. 20. *See* Gallipoli Campaign; *consult* Gallipoli, J. Masfield, 1916; Gallipoli Diary, Sir I. Hamilton, 1920; Official History of the Great War—Military Ops.: Gallipoli, Brig.-Gen. C. F. Aspinall-Oglander, 2 vols., 1929–31.

Suwanee. River of the U.S.A. Rising in the S. of Georgia, it flows 240 m. S. through Florida to the Gulf of Mexico. It has become familiar as Swanee through the song, The Old Folks at Home.

Suzerain (Fr., from Lat. *sursum*, above). In feudalism, a lord paramount or overlord. The king, as ultimate owner of the soil, was suzerain-in-chief, his immediate vassals being the great barons who held their land on condition of rendering military service personally, and also through their own vassals, who in return for protection by their own suzerains were pledged to serve at their call. This system prevailed through all the grades of society, and formed the basis upon which the whole fabric of feudalism was built up. *See* Feudalism.

Sveaborg. Fortress in Finland. Called the Gibraltar of the North, it is situated on the Gulf of Finland, 3 m. S. of Helsinki, of whose harbour it forms the defence. The chief works of the fortress system occupy several islands. Sveaborg was fortified by the Swedes in 1749, and treacherously capitulated to Russia in 1808. During the Crimean War the Anglo-French fleet bombarded it, 1855.

Svealand. Central section of Sweden. With Götaland to the S., and Norrland to the N., it comprises the E. section of the Scandinavian peninsula. The name has become obsolete administratively since the division into läns or counties. Svealand contained the dist. of the central lakes Wener, Wetter, Mälar, and included many of the chief towns in addition to

Stockholm, the capital, as well as the most thickly populated part of the country.

Svedberg, JESPER (1653-1735). Swedish scholar. The father of Emanuel Swedenborg (*q.v.*) he was appointed professor of theology at Uppsala, and was bishop of Skara. His greatest works were a dictionary, 1716, and a grammar, 1722, which established the current Swedish orthography. He also wrote sacred verse. *Consult* Life, J. J. G. Wilkinson, 1889.

Svedberg, THEODOR (b. 1884). Swedish scientist. He was born Aug. 30, 1884, at Valbo, studied at Uppsala, and there was appointed lecturer in physical chemistry in 1907 and professor in 1912. Later he also directed the institute of physical chemistry at Uppsala. For research work and discoveries in the field of colloidal chemistry he received the Nobel prize for chemistry in 1926, and was made a member of the Royal Society and many foreign academies of science. His book on Colloidal Chemistry, 1924, was translated into several languages.

Svendborg. Seaport of Denmark. It is a picturesque old town on Svendborg Sound, on the S.E. coast of the island of Fünen. Some 27 m. by rly. S. of Odense, it occupies a hill-girt valley. There are iron foundries, tanneries, and ship-building yards. Two churches date from the 13th century. Pop. 21,346.

Svendsen, JOHANN SEVERIN (1840-1911). Norwegian composer. Born at Christiania (Oslo), Sept. 30, 1840, he studied music with his father, a bandmaster. As a violinist he joined the orchestra at the Christiania theatre, and was teaching during 1872-77. After visiting London, Paris, and Rome, he became court conductor at Copenhagen, where he died June 14, 1911. A prolific composer of orchestral music, he is best known by four Norwegian rhapsodies, a romance for violin and orchestra, overtures to Romeo and Juliet and Björnson's Sigurd Slembe, a string quartet, and an octet.

Svengali. Character in George Du Maurier's novel, *Trilby*. A German-Jew, whose real name is Adler, he is a gifted musician, but a sinister and repulsive personality. Possessing hypnotic powers, he uses them ruthlessly upon Trilby O'Farrell to make her a great singer, despite her tone-deafness, exploiting her success as such for his own avaricious ends. When he dies of a heart attack as she is about to sing at a concert, the

spell breaks, and she can no longer sing in tune.

Sverdlovsk. City of the R.S.F.S.R. Formerly Ekaterinburg, it lies on the Asiatic side of the E. Urals, on the Isset, 175 m. E.S.E. of Perm. It is the centre of an area extremely rich in minerals, and is noted for many industries, especially the manufacture of armaments, machine tools, and soap. The Sverdlovsk factories for machine construction are among the most extensive in the world. A junction on the Trans-Siberian Rly., it is the chief city of the Ural industrial area; as such it was greatly developed after the Revolution, and gives its name to a region of the republic. It contains a university, other educational and scientific establishments, and is the headquarters of the Ural geological society. Two cathedrals were built in the 18th century. Founded by Peter the Great, it was named Ekaterinburg after his wife Catherine. The last tsar, Nicholas II, and his family were murdered here by Bolsheviks, July 16, 1918. Pop. 425,544.

Sverdrup, JOHANN (1816-92). Norwegian statesman. He was born at Jarlsberg, July 30, 1816. In youth he studied law, and in 1850 was elected a member of the Storting. He became leader of the Left or Radical party, and fought strenuously against the royal prerogative and for the dissolution of the union with Sweden. In 1883, after long struggles, his party came to power, but four years later the more advanced section of it broke away, and in 1889 he resigned. He died at Christiania (Oslo), Feb. 17, 1892.

Sverdrup, OTTO (1854-1930). Norwegian explorer. Born Oct. 31, 1854, he went to sea in youth, and was a master mariner when he took part in Nansen's journey across Greenland in 1888. In 1893 he commanded the Fram in Nansen's polar expedition, and when Nansen made his dash for the Pole

in 1895, Sverdrup was left in charge of the vessel, and by masterly seamanship brought her

safely home. He attempted to circumnavigate Greenland, 1898-1902, but was stopped at Cape Sabine, and turned his attention to exploring Grinnell Land and Greely Fjord. In 1914-15 he undertook a voyage for the relief of missing Arctic explorers, and in 1920 commanded the ice breaker Sviatogor, lent by the British Admiralty to Norway, which went to the rescue of the Russian icebreaker Solovoi, ice-bound in the Kara Sea. He died Nov. 26, 1930.

Sverdrup Islands. Group of islands within the Arctic Circle, W. of Ellesmere Island, in lat. 80° N., long. 100° W., approx. They were discovered by Otto Sverdrup (*v.s.*). The islands were first claimed by Norway, but Canadian sovereignty was recognized in 1931, the Canadian govt. making a grant of money.

Swabia. One of the duchies into which medieval Germany was divided. The duchy lay between Franconia, Bavaria, and the Rhine, was at first called Alamannia, and afterwards Swabia, from the Suevi or Suebi. From the 10th to the 12th centuries it was ruled by dukes, some of whom belonged to the famous family of Hohenstaufen. Broken up in the 13th century, it is now part of Württemberg, Bavaria, and Hesse. The name is still sometimes used generally for the district, and more precisely for part of Bavaria. Under its dukes Swabia was the most civilized part of medieval Germany. One of the circles into which that country was divided in 1512 was called the Swabian circle, this being practically coterminous with the old duchy. *See* Germany.

Swadlincote. Urban dist. of Derbyshire, England. It is 5 m. S.E. of Burton-upon-Trent, and has a rly. station. The chief buildings are the parish church and the town hall. Earthenware is made here and in the vicinity are coal mines. The urban dist. includes, in addition to Swadlincote, Church Gresley, Stanton, and Newhall. Pop. 20,305.

Swaffer, HANNEN (b. 1879). British journalist. He was born at Lindfield, Sussex, Nov. 1, 1879, and educated at Stroud Green grammar school. Joining the Daily Mail in 1902, he was for a time editor of the

Johann Sverdrup,
Norwegian statesman

Otto Sverdrup,
Norwegian explorer

Hannen Swaffer,
British journalist

Weekly Dispatch, and later worked for almost all the London daily papers in turn. As dramatic critic of the Daily Express, 1926-31, he attracted attention by outspoken attacks on "third-rate acting." In 1931 he joined the Daily Herald, brusquely defending and debating on behalf of Socialism and spiritualism.

Swaffham. Urban dist. and market town of Norfolk, England. It is 111 m. N.E. of London, and 15 m. S.E. of King's Lynn, with a rly. station. The chief building is the parish church of SS. Peter and Paul, a Perpendicular edifice with a notable roof. There are a grammar school, a town hall, and a market cross. Cattle and sheep fairs are held, and there is considerable agricultural trade. Market day, Sat. Pop. est. 2,800. Near is Castle Acre, where are the ruins of a Cluniac priory founded in 1078. There are also some remains of a castle and this place also has a Perpendicular church. Swaffham Prior is a village, 8 m. from Cambridge.

Swaging. Process of forging, for reducing the cross-sectional shape and area to the desired

Swaging. Diagrammatic view of swaging blocks for a circular cross-section

dimensions between formers. The workpiece is held on the shaped anvil swage former with the appropriately shaped tup former held in line above it. Hammering or pressure is applied through the formers, and the section is squeezed down to the size given by the formers, the surplus metal causing the workpiece simultaneously to elongate. When one part is reduced as far as possible the work is moved to the next part and the process repeated until the desired length is produced.

Swahili (Arab., coast-people). Hybrid peoples, mostly on the coastlands and islands of Kenya Colony and the Tanganyika Territory. Numbering fewer than 1,000,000, and descended from the Muslimised medieval Zenj population, they represent twenty

centuries of Arab contact with the coast negroes, latterly recruited by slaves brought down from the interior. The most Arabised types, strongly built, and Semitic-looking, averaging 5 ft. 5 ins. in height, are well-educated, enterprising traders in the towns, especially Zanzibar. The lower ranks make good porters and seamen. Kiswahili, an archaic Bantu dialect interfused with Arabic, Persian, Indian, and European words, is the official language of East Africa. See Africa.

Swakopmund. Port in S.W. Africa. Situated in sterile country 25 m. N. of Walvis Bay, the harbour, an open roadstead exposed to S.W. winds, is now closed to commercial shipping. The town is also a popular holiday resort. Maize is grown in small quantity; but owing to the erratic rainfall the crop is unreliable. The town is well planned and lighted by electricity. There is a hospital maintained by a R.C. mission. Swakopmund is connected by rly. with Windhoek, the capital, and thence with Cape Town. It was occupied by the S. African forces on Jan. 14, 1915. Pop. 2,077.

Swale. River of the N. Riding of Yorkshire, England. It rises on the Westmorland border and flows 60 m. E. and S.E. through Swaledale and past Richmond to join the Ure a little below Myton. The two rivers then become the Ouse. Swaledale itself is considered by many to be the most beautiful of the Yorkshire dales, especially the upper part between the villages of Reeth, Gunnerside, Muker, and Keld. The absence of any rly. has kept the district from disfigurement.

Swallow (*Hirundo rustica*). Migratory bird of the family Hirundinidae. It is a native of Europe, Asia, and Africa, visiting Britain in April and staying till late in September. The upper parts

Swallow hovering as about to enter nest. W. S. Burridge, F.Z.S.

are uniformly blue-black, save for a patch of russet red on the forehead. The chin is also red, but the under surface in general is cream-colored, with a deep collar of blue-black across the throat. The bill is broad and flat, and the tail

forked, more deeply in the male than in the female; the wings are very long. The bird is entirely insectivorous, its food being taken on the wing with rare exceptions. The saucer-shaped nest, constructed of mud mixed with grass and straw, is built usually upon a rafter or other shelf in barns or out-houses. It is lined with fine grass and feathers, and contains from 4 to 6 white eggs spotted with reddish brown. There are two broods each year as a rule. See Eggs colour plate.

Swallow Hole. Name given to the cavity resulting from solution of rock by water, and forming, or having formed, the entrance to an underground stream. Such holes are common in limestone regions and are also known locally as pot holes, sinks, etc. See Cave; Karst; Mole; Pot Hole.

Swallow-tail Butterfly (*Papilio machaon*). Large yellow and black butterfly, native of Europe

Swallow-tail Butterfly, found in the English fen country

and Asia. As a British species it is now restricted to the fens of Norfolk and Cambridgeshire. The hind-wings bear a round spot of rust-red at their lower angle, and from this a band of seven blue spots crosses the wing, which ends in a long curved black "tail." The green caterpillar is belted and spotted with black and orange alternating with black tinged with blue. When annoyed, the full-grown caterpillar protrudes a pink V-shaped organ from behind the head, which emits a strong odour, apparently of a protective nature. It feeds upon milk-parsley and other umbelliferous plants. The yellowish chrysalis is attached to the food-plant. See Butterflies colour plate.

Swallow-wort (*Asclepias*). Genus of perennial herbs belonging to the family Asclepiadaceae, natives of America. Other names for them are milkweed and silkweed. They have a milky juice, and the leaves are usually opposite or in whorls. The flowers have the corolla deeply divided into five segments. Attached to the tube of the

stamens are 5 hooded bodies each with a hollow horn. The pollen unites into masses (pollinia) as in the orchids, and these become attached to visiting insects. Several of the species are used medicinally; others yield fibres.

Swammerdam, JAN (1637–80). Dutch naturalist. He was born at Amsterdam, Feb. 12, 1637, and qualified in medicine at Leyden university. Specialising in entomology, his *History of Insects* was the standard work of his day. He died Feb. 15, 1680.

Swan (*Cygnus*). Small genus of large aquatic birds of the family Anatidae. They are natives of

mute swan—the only species that nests in the British Isles—constructs a huge bed of flags and reeds, lining it with down, and lays from five to ten greenish white eggs. The young swans, or cygnets as they are called in their first year, are of a grey-brown colour until they are a year old.

Lord Ilchester's swannery at Abbotsbury, Dorset, is famous as the largest swan community in Great Britain; and there is another in a backwater of the Wey, near Weymouth. The swans on the upper Thames are claimed by the crown and the Dyers' and Vintners' companies of the City of London.

In July representatives of these owners hold a swan-upping ceremony, when the cygnets, or "clear-bills," have their bills cut with distinguishing patterns. The male swan is known as a "cob" and the female as a "pen." Others well-known are the trumpeter (*C. buccinator*) of the Arctic Circle, and the red-billed

black swan (*C. atrata*) of W. Australia. See Bird.

Swan. River of W. Australia. It rises as the Avon and flows N.W. and then S.E., entering the Indian Ocean at Fremantle, 12 m. below Perth. Here, in 1829, was founded the Swan River Colony, from which W. Australia was formed. A swan has been retained as the symbol of W. Australia.

Swan, ANNIE S. (1860–1943). British novelist. She was born at Mountskip, Gorebridge, and educated at Ladies' College, Edinburgh.

After a period of writing for magazines, she achieved her first success with a novel *Aldershyde*, 1893, the prelude to many sentimental tales of domestic life. Her last novel, *The Road to Damascus*, and her autobiography, appeared in 1937. She married Dr. James Burnett Smith, who died in 1927. Annie S. Swan died June 17, 1943.

Annie S. Swan,
British author

Swan, JOHN MACALLAN (1847–1910). British sculptor and painter. Born at Old Brentford, he studied at the Worcester, Lambeth, and R.A. schools, and in Paris under Gérôme and Frémiet. Chiefly a painter and sculptor of animals, he was also an accomplished painter of the human figure. He became A.R.A. in 1894, R.A. in 1905, and died in London, Feb. 14, 1910.

Swan, SIR JOSEPH WILSON (1828–1917). British inventor.

Born in Sunderland, Oct. 31, 1828, and educated privately, he became assistant to a firm of manufacturing chemists in Newcastle. His improvements in methods of photography included, 1862, the carbon

Sir Joseph Swan,
British inventor
Russell

process. It is in electric lighting, however, that he became famous. Although he constructed a carbon filament lamp in 1860, it was not till 1880 that he exhibited the first successful carbon filament vacuum lamp bearing his name. He died May 27, 1917. See Lighting.

Swanage. Urban dist., seaport, and holiday resort of Dorset, England. It stands facing E. on the S. side of Swanage Bay, 24 m. by rly. and half as far by ferry S.S.W. of Bournemouth. There is an ancient church, S. Mary's, with a notable tower. The façade of the town hall was designed by Wren and erected for the Mercers' Hall, London; the clock tower near the pier was first set up at the Surrey end of London Bridge in honour of the duke of Wellington. Several other relics of old London have found a home at Swanage, notably the street

Swan. This graceful bird posed to show off its distinguishing features: the berry, as the base of the bill is called; short, strong legs and broadly webbed feet

many regions, extending from the Arctic to Australia. Closely related to the ducks and geese, they are distinguished by the extremely long necks, short legs, and the absence of feathers on the face from the eye to the bill. Three species visit the British Isles in winter, and of these one known as the mute swan (*Cygnus olor*) has lived in the U.K. in a semi-domesticated state for centuries.

According to tradition, the birds seen in swanneries and on ornamental waters are the descendants of tame swans introduced from Cyprus in the days of Richard I, but there is no evidence of this. The chief distinguishing mark of the mute swan is the prominent black knob at the base of the black-margined orange bill. It also holds its wings slightly raised and its neck arched when swimming. The hooper or wild swan (*C. cygnus*), which has the basal half of the bill yellow and the remainder black, keeps its wings pressed to its body and its neck straight. Bewick's swan (*C. bewickii*) is a smaller bird, with the yellow at the base of its black bill extending no farther than the nostrils. The

Swanage, Dorset. The old cottages near the ancient parish church of S. Mary

lamps. There is a little shipping with regular summer steamer service to Bournemouth, but the main

industry of the district is the quarrying of Purbeck stone. The place has good bathing and yachting facilities. Near are the Tilly Whim caves,

said to have been the resort of smugglers, but actually the result of stone quarrying. Pop. 6,276.

Swan Lake (Fr. *Lac des Cygnes*). Ballet in four acts, with music by Tchaikovsky and choreography by Petipa. It was the composer's first ballet (1876) and the first of its kind produced in Russia, only the ballets in operas being previously known to theatre audiences. It figured in the imperial theatre repertory after 1878, and was made internationally popular by the Diaghilev, de Basil, and Sadler's Wells cos. The prima ballerina has an exacting double rôle as a princess and the leader of the swans.

Swan Mussel (*Anodonta cygnea*). Fresh-water bivalve mollusc of the family Unionidae. It is found in sluggish rivers, canals, and large ponds throughout most of Great Britain. Commonly from four to six inches long, but often much larger, it has a thin shell, oval in shape, except that the hinge uniting the two valves makes a straight line on the upper side. Externally it is greenish-yellow marked with the dark growth lines, but within it is coated with pearl. The greyish animal has a large yellow foot, by the aid of which it moves over the bottom or sinks into the mud. The eggs are retained until they hatch, when the young in a larval form are discharged into the water. At this stage they have a temporary shell with a hook to each valve, which enables them to cling to the fins of fishes and so get distributed. When the permanent shell has formed within the larval valves, the young swan mussel sinks to the bottom. See Mollusca; Mussel.

Swanscombe Skull. Name given to occipital and left parietal bones of a human skull found in a gravel pit by the lower Thames at Swanscombe, Kent, in 1935-36. The

Swansea, Glamorganshire. The Civic Centre. Upper picture, the university building

gravel belongs to the epoch between the 2nd and 3rd glaciations (Mindel and Riss) of the Pleistocene, and flint implements found in it prove that the human remains are those of the Middle Acheulian group of early Palaeolithic man.

Swansea (Welsh, Aber Tawe). County and mun. bor. of Glamorgan, Wales. The seat of a university, it stands on Swansea Bay at

Swansea Ware. Sugar bowl, with cover and stand, decorated with flowers in natural colours

the mouth of the Tawe, 200 m. from London and 45 m. W.N.W. of Cardiff. It is served by rly. The bor. includes the watering-place called the Mumbles, and has an area of 24,241 acres. The buildings include the churches of S. Mary and S. John, both rebuilt in the 19th century, and many other places of worship. Secular edifices are the buildings of the University

College, the Royal Institution of S. Wales with library and museum, art gallery and museum, technical college, and a grammar school founded in 1682. The panels painted by Frank Brangwyn as part of a memorial to members of the house of lords who fell in the First Great War, and intended to adorn the walls of the royal gallery of that house, hang in the new guildhall. Numerous parks and open spaces provide extensive facilities for sport and recreation. Some parts of the castle still stand. Chief industries of Swansea are the manufacture of tinplate and the smelting of copper, zinc, silver, and other metals.

Coal is exported and there is some fishing. Other industries are refining oil, for which there are large storage facilities, the manufacture of patent fuel, engineering works, and flour mills.

Swansea grew up around a castle, one of those built in the peninsula of Gower by its Norman conquerors, and was a borough in the 12th century, and a seaport then or soon after. In the 18th century the smelting of copper was introduced, and about the same time coal began to be exported. Extensions and improvements of the harbour followed, and canals were dug for the conveyance of the coal. Swansea was heavily damaged by German air raids on the nights of Feb. 19, 20, and 21, 1941, much of the principal shopping district being destroyed. Two members are returned to parliament. Pop. 164,797.

Swansea Ware. Porcelain produced at the Cambrian Works, Swansea. It is remarkable for its dark blue and its beautiful paintings of birds, flowers, etc. The mark is a trident with the word Swansea. See Pottery.

Swan Theatre. Former London theatre. Partly owned by Henslowe (q.v.), it stood near the Surrey end of Blackfriars Bridge, and was opened in 1598. One of the largest of the Elizabethan playhouses of London, it was suppressed on the outbreak of the Civil War, and later demolished. See Bankside.

Swanwick, ANNA (1813-99). British translator. Born at Liverpool, June 22, 1813, she was educated at home and in Berlin. In 1843 she published her *Selections* (1st vol.)

Anna Swanwick, British translator

from the Drama of Goethe and Schiller, followed, in 1850, by another volume. Her best-known work is a translation of Faust, the two parts of which appeared in 1878. Her translation of Aeschylus appeared in 1873. She helped to found Girton College, Cambridge, and Somerville College, Oxford, and died Nov. 2, 1899. *Consult* Life, M. L. Bruce, 1903.

Swastika (Skt., well-being). Symbol formed of an equal-armed cross whose extremities are bent

Swastika, an ancient Aryan symbol

uniformly at right angles. One of the oldest of man's symbols, it has been found on rock carvings of the most primitive communities. Although traced in pre-Aryan Europe, it became essentially a symbol of the Aryan sun god. It occurs on Greek, Cyprian, Etruscan, and Roman vessels, on idols on the site of ancient Troy, on the beadwork of N. and S. American Indians, and was used as a tribal device among aboriginals of Australia and Africa.

Often occurring in the Far East, the swastika was a common design for pagoda railings among the Chinese. It was incised on blocks of the Minoan palaces of Phaestus, and on Neolithic pottery of Italy, France, and central Europe. It was a common motif in ancient Hebrew decorations. Under the name of fylfot, the swastika has for centuries been used in heraldry.

Kipling had the swastika embossed on the covers of his publications. Because of its Aryan associ-

ations, the swastika was adopted by Hitler as the symbol of the Nazi party, and after he assumed power it was incorporated in the German flag. Unlike the early (masculine) symbol, the arms of which are generally bent to the left, the Nazi (feminine) form of swastika had its arms turned to the right.

Swat. River and state in the N.W. Frontier prov. of Pakistan. The river (anc. Swastos) rises near the border of Kashmir and flows S. and S.W. to join the Panjkora. Its fertile valley, 70 m. long, yields rice, a system of canals irrigating 250 sq. m. Here dwell the Yusufzai Pathan Swatis. From Chakdara, a military post, a road goes N. into Chitral and S. to the Malakand Pass. The state of Swat acceded to Pakistan in 1947. It covers 4,000 sq. m. and has a pop. of 446,014.

Swathe. Line of grass or corn cut by the scythe. A swathe turner is a machine for lifting and turning over swathes on the hayfield, usually dealing with two at once. It has either blades or prongs which work spirally, or prongs that work over a couple of pulleys. *See* Hay.

Swatow. Former treaty port in Kwangtung prov., China. Situated at the mouth of the Han river, it was opened to foreign trade in 1860. Sugar is the principal product, but the trade has steadily diminished in favour of general merchandise from the southern provs. Swatow has been the centre of a stream of emigration to Malaya, the East Indies, Cochin China, and Siam. Pop. 119,168.

Swaziland. British S. African protectorate. It lies between the Transvaal on the N., W., and S., and Mozambique and Zululand on the E., and has an area of 6,704 sq. m. The country gradually rises from bush-covered malarial ground, with an average alt. of 1,000 ft., to a well-watered plateau at 4,000 ft. It is traversed by the rivers Umbuzi, Komati, and Usutu.

Swaziland is administered by the British high commissioner in S. Africa responsible to the Commonwealth Relations office in London. He is represented by a resident commissioner assisted by an advisory council in matters relating

Swastika. The Nazi version of this ancient emblem on blood-red banners and flags decorating the Unter den Linden, Berlin, in 1933.

to the whites. The native chiefs have limited powers. There is a customs union with the Union of S. Africa. Swaziland is a backward country with a low standard of living for both black and white. There are six European, three Eurafrican, and 198 native schools, but few natives are literate in English. Agricultural products include maize, cotton, tobacco, groundnuts, and beans. The country is believed to contain undeveloped mineral resources; small quantities of gold and tin have been worked, and the production of asbestos at Emlembe has an export value of about £1,000,000 a year. Mbabane, the administrative capital, is situated at an alt. of 4,300 ft., and Bremersdorp, the former capital, is in the middle veld. Pop. 186,880. (2,871 Europeans). *Consult* The Swazi, B. A. Marwick, 1940.

Swearing. Act of making declaration upon oath. Profane swearing or cursing is punishable by fine under the Profane Oaths Act, 1745. The fines, which may be summarily imposed, range from 1s. for a day-labourer, soldier, or seaman, to 5s. for a gentleman. The use of profane language in the streets renders the offender liable to a fine of 40s. *See* Oath; *consult* Lars Porsena; the Future of Swearing, R. Graves, 2nd. edn., 1927.

Sweat. Moisture from the skin. Sweat glands are scattered over the whole surface of the skin and most numerous on the palms and soles. Each consists of a coiled tube, which begins in the deepest part of the skin and passes up to the surface. Their most important function is to assist in the regulation of the temperature of the body by increasing or decreasing the amount of sweat secreted. This evaporates from the surface of the skin, with resulting coolness. By analogy the word has come into use as a synonym for drudgery. *See* Skin.

Swan Theatre, London. Sketch of the interior made by J. de Witt, a Flemish traveller, who visited London in the early 17th century. The arrangement of stage, orchestra, and accommodation for the audience is clearly shown

Sweater. Woollen jersey, as worn by athletes, usually to prevent cold after exertion. The name is due to the fact that the early sweaters were heavy woollen garments worn during training, in order to induce perspiration, and therefore to reduce weight. Men who sweat or reduce the weight of coins are known as sweaters, a name also applied to ruffians of the 18th century who annoyed persons in the street. See Coining.

Sweating. Term applied in the later decades of the 19th century to the practice of getting work done at minimum rates of pay through the medium of middlemen employers. The practice was particularly common in certain occupations, e.g. the clothing and furniture trades. The work was given out by large firms to middlemen, who accepted low prices and made a profit on them by "sweating" the actual workers. Most of the work was done in the homes of the poor under the worst conditions, and a select committee appointed by the house of lords in 1888 revealed a grave and widespread

social evil. Substantial improvement was effected in all sweated trades by the setting up of trade boards, which fixed a minimum wage. See Trade Board; Wages.

Swede or **SWEDISH TURNIP** (*Brassica campestris*, var. *napobrassica*). Root crop, a variety of

Swede. Root of the cultivated tankard variety

turnip. It is hardier and possesses greater feeding value than the ordinary turnip, from which it is distinguished by smooth bluish leaves and the presence of a narrow "neck" at the top of the root. Cultivated forms are the green-top, bronze-top, and purple-top, the last includes those known as tankard, intermediate, and globe. Its cultivation is the same as that of the ordinary turnip (q.v.).

SWEDEN: ITS HISTORY AND RESOURCES

A. D. Innes, M.A., and Edgar Stern-Rubarth, Ph.D.

See the articles on the cities, lakes, rivers, etc., of Sweden; also on her kings, statesmen, scientists, explorers, and men of letters, e.g. Gustavus Adolphus; Hedin; Nobel; Oxenstierna; Strindberg. See Europe; Scandinavia; Thirty Years' War

Sweden comprises the E. and S. parts of the Scandinavian peninsula. It is bounded W. by the

Sweden arms

Sound, the Kattegat, and Norway, N. by Finland, and E. and S. by the Baltic Sea. The islands of Gothland and Öland in the Baltic and Hven in the Sound belong to Sweden. The length of the boundary with Norway is 1,027 m., and with Finland 330 m. The total area of the country is 173,378 sq. m., and its length is 975 m. The coastline, with its numerous indentations, is about 4,700 m. long. Stockholm is the capital. Pop. of country, 6,763,685.

Sweden may be divided physically into three parts, which correspond approximately with the three ancient divisions of the country, Norrland, Svealand, and Götaland (Gothland). The characteristics of these divisions may be summarised: The highland district of the N., which includes all the frontier regions with Norway and Finland, rises from sea level to

over 3,000 ft., and occupies half the area of Sweden. The highest peaks in the country lie near the Norwegian frontier. The country slopes gently towards the Gulf of Bothnia, and there are many long rivers, which are of great value on account of their water-power resources, and also for floating timber to the sea. In this part most of the mineral wealth occurs.

The lowlands of central Sweden stretch across the country, in its widest part, from Norway and the Kattegat to the Baltic. They link

Sweden. National and merchant flag. Blue with yellow cross

the low coast of the highland region to the plains of Scania. Their average elevation is 300 ft.; heights of over 600 ft. are rare. The great lakes of Sweden, Vener (Vänern) (2,140 sq. m.), Wetter (Vättern) (733 sq. m.), Mälaren (444 sq. m.), and Hjelmaren (185 sq. m.), lie in depressions in the central lowlands. The soil is fertile and all conditions are well suited to agriculture.

The climate shows considerable extremes even in the S. There is a short summer and a long, cold winter. The mean temp. of Stockholm in Feb. is 26° F. and in Aug. 62° F. Most Swedish seaports are obstructed by ice from Jan. to March. Ports on the Gulf of Bothnia are entirely closed from about Nov. to April or May; sledges can sometimes pass between Sweden and Finland by sea.

Forests of Scots pine, spruce, and birch cover about half the total area of Sweden. In Scania and along the shores of the Kattegat are beech and oak forests. Valuable peat bogs cover above 15,000 sq. m. Land animals include the bear, lynx, wolverine, wolf, fox, hare, badger, lemming, elk, roe-deer, and ermine, but beasts of prey and fur-bearing animals are rapidly diminishing in numbers. The reindeer thrives in the favourable north. Seals and porpoises occur in the Baltic. Bird life is abundant. Fishes include salmon, trout, pike, and perch. The Baltic waters contain several fresh-water species as well as the cod, some flat-fish, and herring.

CONSTITUTION AND GOVERNMENT.

The constitution, with modifications, dates from 1809. The king is an hereditary monarch and rules in association with the council of state over which he presides. The king has the right of veto and certain powers in initiating legislation. The councillors sit in the Riksdag, and are responsible to king and elected representatives.

The Riksdag consists of two chambers. The first has 150 members, who are returned for a period of eight years by electoral bodies chiefly composed of members of the county and municipal councils. One-eighth of this chamber is elected each year, so that there is never a general election. The second (popular) chamber with its 230 members is elected as a whole by universal suffrage (men and, since 1919, women) for four years. Proportional representation applies. In 1944 115 Social Democrats were returned to the second chamber; the election of 1946 brought Social Democratic membership of the first to 86.

Local administration is carried out by county and municipal councils (landsting and kommunalfullmäktige), the county council (landsting) elected by proportional representation. There are 24 läns or counties. Stockholm forms a separate administrative area.

The state church is Lutheran, to which practically all the popula-

tion belongs. Uppsala has an archbishop. Education is compulsory and free for children from 7 to 14 years of age. There are advanced technical schools at Stockholm and Gothenburg (Göteborg), while universities exist in Uppsala, founded 1477, and Lund, 1668. The army is recruited by compulsory service, and its war strength is about 400,000 men. The navy is for coast defence only, and there is a small air force.

INDUSTRIES AND TRADE. Rapid growth of the big towns since 1930 resulted from widespread industrialisation. Agriculture remains the chief occupation: its relative importance tends to decrease, but it still supports 40 p.c. of the pop. Only about 10 p.c. of the country is under cultivation, principally in Götaland and Svealand, but the forested half is a main source of Sweden's wealth. Crops in order of importance are oats, wheat, rye, barley. Large quantities of grain are used for cattle food. Potatoes, sugar-beet, and hay are grown. The dairy industry is increasing in importance. Cooperative factories produce good butter for export. Poultry farming and bee-keeping are widespread in the S., and many million eggs and much honey are exported annually. The breeding of farm and draught horses is important. Sheep and goat rearing and pig breeding are increasing. Reindeer are bred by the Lapps. Sea-fisheries are of less importance than in Norway, the catch in a normal year being about 120,000 metric tons. Swedish boats fish herring and eels in the Baltic, mackerel, herring, and cod in the Kattegat, and visit the fisheries on the Norwegian coast.

Minerals and Manufactures

The iron-ore deposits are among the most valuable in Europe. They occur principally in central Sweden and in Lapland near Lulea and Kiruna. Both magnetite and haematite are mined at Riddarhyttan, Dannemora, and elsewhere. In Småland there is an important mine at Taberg. Sweden produces about 5 p.c. of the world's total output of iron-ore, and over 85 p.c. of this is exported. The coalfields are small and produce comparatively poor coal. Good copper and zinc ores and manganese and molybdenum ores are worked. Graphite occurs in Lapland. Granite, etc., and marble are quarried.

The timber trade is of great importance in Norrland, where there are some 1,500 sawmills. Metal-working, machine construction, and timber industries flourish. The

principal manufacturing centres are Eskilstuna (steel, tools, machines), Motala (locomotives), Trollhättan (locomotives, engines, electro-metallurgical works), Domnarvret (steel), Jönköping (engines), Norrköping (engines, machines), Stockholm (machines, dairy apparatus, motors, bridges, telephone apparatus, etc.), Malmö, Gothenburg, and Helsingborg. Electrochemical industries are growing. Other manufactures are wood-pulp, paper, cellulose, matches, timber goods, textiles, and earthenware.

Swedish steamships, built at home, ply to all parts of the world. Coasting traffic is important. The mileage of rlys. is about 10,000.

Legislation in 1939 provided for state purchase of all lines. These are mainly in Svealand and Götaland with the exception of the central line to Gällivare, the coast line to Haparanda on the Finnish frontier, the Lapland rly. to Narvik (Norway), and to Trondhjem (Norway). There is a through line to Finland, and train ferries run to Germany and Denmark. Electrification is advanced.

HISTORY. The Scandinavian branch of the Teutonic stock is divided into four principal race sections, Danes, Norwegians, Swedes, and Goths, who drove the pre-Aryan Finns into the far N. of the Scandinavian peninsula, and to the E. of the Baltic. The Swedish nation is formed from the blending of Swedes and Goths. The Swedes, having their seaboard in the Baltic, directed their raiding activities against the lands bordering on the inland sea, whose populations were most remote from Western and Latin influences. Hence they did not prominently attract the attention of the Western chroniclers, and their development was not urged forward by

Sweden. Map of the kingdom occupying the eastern portion of the Scandinavian peninsula

contact with the more advanced peoples. In spite of the efforts of the missionary Ansgar in the 9th century, it was not till the 11th century that Christianity began to take root among the Goths, nor was it fully accepted by the Swedes proper until the reign of S. Eric in the 12th century.

Comparatively early we find a Swedish king, Olaf Skotkonung, first fighting with Sweyn Forkbeard of Denmark (q.v.), then uniting with him to overthrow Olaf Trygvesson of Norway, and finally ejected from the portion of Norway which he had acquired by S. Olaf the Thick, about 1015. The line came to an end in Sweden in 1061, and there ensued a prolonged struggle between Goths and Swedes, who for a time elected the king alternately, the two races representing the old paganism, which died very hard; and the new Christianity.

Christianity triumphed with the reign of S. Eric, who was murdered in 1160. After this the advance of the Church in Sweden was rapid. Eric also, in the desire to spread

Christianity, began the conquest of Finland, which was completed a hundred years later by the great jarl Birger, acting at first as the minister of Eric XI. On Eric's death, Birger, who had married his sister, continued to rule till his own death in 1266, in the name of his son, Eric's nephew Waldemar. Birger is one of the great figures of the 13th century. Under him Swedish commerce advanced greatly, and the old antagonism between Goth and Swede rapidly disappeared.

Waldemar, first of the Folkunger dynasty, proved incapable and had to make way for his brother Magnus, who strengthened the power of the crown against the nobility, whose independence was the persistent disintegrating factor of the Middle Ages, which all strong kings set themselves to curb. Magnus was the protector of the peasantry, though he did not seek to balance the political power of the nobles by fostering that of the commons. During the minority of his son and successor Birger, the government was in the capable hands of the marshal Tyrgils Knutsson; but through the plots of the recalcitrant nobles Knutsson was put to death in 1306.

In 1319, Birger was deposed in favour of his three-year-old nephew Magnus II, who soon afterwards succeeded to the crown of Norway, being, through his mother, the grandson of Haakon V. The crowns were again separated in 1343, when Magnus was compelled to transfer that of Norway to his son Haakon. Twenty years later Magnus was deposed, and the Swedish nobles elected Albert of Mecklenburg king. The country fell into complete disorder, a sort of feudal anarchy, and Margaret of Denmark was called in. That able princess established her own supremacy and procured the union of Kalmar, 1397, which secured the crown of all the three Scandinavian kingdoms to her nephew Eric.

The succession of the house of Oldenburg in Denmark in 1448 resulted in a partial separation, since the Swedes elected one of their peers, Karl Knutsson Bonde, as their king, and the Oldenburgs

succeeded in establishing their own supremacy only during brief intervals, the effective domination of Sweden passing after 1470 to the Sture family, who acted nominally as regents, but actually as representatives of Swedish resistance to Danish domination. In 1520 Christian II of Denmark vanquished the Stures and sought to establish his supremacy by a massacre of nobles and others, known as the Blood-bath of Stockholm. The young Gustavus Vasa then headed a revolt, which resulted in the expulsion of the Danes and his own election as king of Sweden on June 6, 1523. Under Gustavus, who reigned till 1560, the independence of Sweden was established, its monarchy made hereditary, and the Reformation carried through.

Descendants of Gustavus Vasa

Of the three sons who ruled after him in succession, Eric XIV and John were by no means worthy of their father. Eric was deposed by John, who married a Polish princess and favoured a Catholic restoration. In the natural course, his son Sigismund, who became king of Poland in 1587, succeeded also to the throne of Sweden in 1592; but after his attempts to create a Catholic ascendancy, the Swedes in 1595 elected Charles, third son of Gustavus Vasa, to the position of regent or viceroy, and in 1604 he became Charles IX in Sigismund's despite. In 1611 Charles was succeeded by his son Gustavus Adolphus (q.v.).

In the reign of Gustavus Adol-

phus, aided by ministers of first-rate ability, but he chiefly won renown by the redoubtable part he played in the Thirty Years' War.

The close of that war in 1648 left Sweden in possession of Pomerania and extensive territories on the E. shores of the Baltic. Gustavus was succeeded by his favourite daughter Christina, who, having adopted the R.C. religion, resigned her crown in 1654 in favour of her cousin Charles X. That monarch plunged into wars, conducted with extraordinary brilliancy, against Poland and Denmark; but his career was cut short by his early death in 1660. The long minority of his son Charles XI brought disorganization and threatened a collapse of the Swedish power. Then the young king set himself to reorganization with marked success. In 1697 he was followed by his son Charles XII, whose amazing military achievements were nullified by his disastrous defeat at Poltava, and the greatness of Sweden ended with his death at the siege of Frederikshald in 1718. The peace of Nystadt, 1721, which ended the struggle between the Baltic powers, left Sweden with no possessions on the continental side of the Baltic S. of the Gulf of Finland.

Charles XII, dying childless, was succeeded by his sister Ulrica Eleonora, whose husband Frederick of Hesse was crowned king in 1720. Their accession was made conditional upon stringent limitations of the powers of the crown.

Sweden. 1. A peasant farmer from the prosperous agricultural area of Dalecarlia. 2. Peasant girl from the same district in national costume. 3. A north country family in heavy winter dress

phus (1611-23), Sweden entered upon her brief career as a first-class military power. The supremacy of the crown based upon popular support, established by Gustavus Vasa and to a great extent lost under his two immediate successors, had been restored by Charles IX. It was more than confirmed by the genius of Gustavus Adol-

The accession of Gustavus III in 1771 wrought a decisive change. Forestalling his enemies, by a *coup d'état* in 1772 he arrested the chiefs of the nobility, and procured from the national assembly the acceptance of a constitution, which virtually conferred upon him absolute powers, to the satisfaction of the people at large, who had

gained little enough from party struggles of factions like the "Hats" and "Caps."

His son Gustavus IV seized the worst possible moment for defying Napoleon and the tsar of Russia in 1808, and the Swedes, finding themselves in extreme danger, deposed him, set his uncle Charles XIII on the throne, and made terms with their dangerous enemies. In 1810 the French marshal Bernadotte was nominated as crown prince and heir. He actually assumed control of the government, and in 1813 joined the coalition against France. He utilised the fall of Napoleon to wrest Norway from Napoleon's ally Denmark, and from 1814 to 1905 Norway was attached to Sweden, autonomous but not independent, at least as concerned foreign relations. Bernadotte himself became Charles XIV in 1818, and his dynasty still occupies the throne of Sweden, though the union between that country and Norway was repealed in 1905.

In the Two Great Wars

Under Charles XV (1859-72) the legal system and the liberty of economic activity were established and the present constitution with two chambers was inaugurated. Oscar II (1872-1907) tried in vain to prevent the separation of Norway. In 1909 the general electoral rights and the proportional system of elections were introduced, after Gustavus V had begun his long, beneficent rule. Sweden upheld her neutrality in both Great Wars. In 1921 the Aaland Islands in the Gulf of Bothnia were allocated by the League of Nations council to Finland. Sweden was a staunch supporter of the League; but the possibility of menace from Soviet Russia or Germany led to close military cooperation between the Scandinavian countries, a strengthening of their defences, and from 1932 a partial customs union. The question of remilitarising the Aaland Islands, whose people desired union with Sweden, was under discussion between Sweden and Finland when the Second Great War broke out.

During the Second Great War Sweden maintained neutrality, engaging, however, in relief work, e.g. she fed many Norwegian children, gave asylum to some 50,000 war refugees, and assisted in the exchange of wounded prisoners of war between Germany and the Allies. (See also under Skagerrak.) It was a Swedish citizen, Count Folke Bernadotte

(*q.v.*) who transmitted to Great Britain and the U.S.A. Himmler's offer of German capitulation, April 29, 1945. After the cessation of hostilities Sweden welcomed 10,000 forced foreign workers from Germany for rehabilitation.

LANGUAGE, LITERATURE, AND ART. The ancient Nordic literature was common to the peoples later splitting into the different Scandinavian nations, and closely related to the Icelandic and the Anglo-Saxon epics. Though the Swedish language differs in spelling and pronunciation considerably from Danish and Norwegian, and after the Reformation was affected by German elements, the three tongues are mutually intelligible. The oldest documents were transmitted in Runic writing; apart from Latin religious and legal literature, Swedish poetry and prose did not arise before the 13th century. S. Bridget was the first author of lasting importance, in both Latin and Swedish. Bishop Thomas of Strängnäs (c. 1443) first displayed a national spirit. The Reformation affected thought and writing; the university of Uppsala was transformed into a Protestant one in 1595, and Luther's pupils, the brothers Petri, became the historians and poets of Sweden. Gustavus Adolphus and Christina founded universities at Dorpat (Tartu), Åbo (Turku), and Lund, attracted men like Descartes and Grotius to court, and favoured a literature in the Renaissance spirit. Bärbo, Stjernhelm, Dahlstjerna, Lars Johanson, Eurelius, and Rudbeck were poets and authors of the 17th century.

Eighteenth-Century Vigour

An intellectual recovery developed after the end of Charles XII's reign and the period of perpetual war. From the academy of science, founded 1739, came Linnaeus, Celsius, and Swedenborg. French influence made itself felt; Dalin, Gyllenborg, Wallenberg (influenced by Swift), and the gifted lyricist C. M. Bellman (1740-95) represent the period. Under Gustavus III, himself a poet and dramatist and founder of national opera and theatre, Kellgren, af Leopold, Thorild, and the poetess A. M. Lenngren became classics of the country's literature. After 1810 there was rivalry between Romantic and patriotic schools of literature; Esaias Tegnér (1782-1846, *q.v.*), Sweden's greatest poet, belonged to the second, and in Frithjofs Saga, 1820-25, gave expression to the national spirit. The Romantic

Stagnelius, Atterbom, and the historian and lyricist Geijer were his contemporaries; the novelist Cederborg, with humorous realistic stories, an independent figure beside him.

Bourgeois Liberalism prevailed from 1830, in Dahlgren, Almquist, Wennerberg in prose; Strandberg and the great J. L. Runeberg in poetry—the latter became Finland's national bard though he wrote in Swedish; and the protagonist of an ideal humanitarianism, V. Rydberg (1828-95). This rich and world-conscious literature preceded the realism of August Strindberg (1849-1912) and the earlier works of Geijerstam and Heidenstam, who in turn produced a new idealism and romanticism. Per Hallström, E. A. Karlfeldt, Birger Mörner, Sophie Elkan, the dramatist Hedberg, and many more establish a claim to international recognition. Selma Lagerlöf (1858-1940), who won a Nobel prize, ranks among the strongest literary personalities of her time.

Music, Architecture, Painting

There is a great musical tradition in Sweden, based since the 13th century upon folk melodies and ballads. Architecture was late in emancipating itself from Roman, Gothic, Baroque, and neo-classic foreign influence, but from about 1900 it shows in Westman's Stockholm town hall, Ericson's church in Gothenburg, and in many public and private buildings the development of a style. The same applies to sculpture since Carl Milles (b. 1875) turned away from French examples. Painting, however, by the later Middle Ages was showing national peculiarities. In the 17th century Dutch and German masters established in Sweden schools which gained international acclaim. The 18th century brought forth successful Swedish pupils of first the Düsseldorf, then the Paris school. With Prince Eugene, Liljefors, E. Jansson, and others was evolved a national school which, in Carl Larsson (1853-1919) and above all Anders Zorn (1860-1920), reached a standard vying with that of any other European country. French post-Impressionism has today a strong attraction for Swedish artists.

Swedenborg, EMANUEL (1688-1772). Swedish scientist and religious writer. A son of Bishop Svedberg (*q.v.*), he was born at Stockholm, Jan. 29, 1688, and educated at Uppsala university, afterwards studying at Oxford, Utrecht, and Paris. He was appointed in 1716 an assessor in the royal

Emanuel Swedenborg, Swedish religious writer

college of mines. In 1719 the family was ennobled, assuming the name of Swedenborg. In the upper house he promoted many reforms, but devoted himself mainly to mineralogy and engineering. He published a series of works, the most important in 1734, on the general principles of science and philosophy. These studies anticipated a profound change in his views; and in 1744-45 he declared that insight into the spiritual world had been granted him by direct revelation. This was not mystical expression; he claimed to be describing as a reporter what he saw. Swedenborg abandoned his scientific work in 1747, and gave up the rest of his life to meditation and writing, living largely in Amsterdam and London, where he died March 29, 1772.

According to Swedenborg, who believed that in a state of trance he had free intercourse with spirits, there is an exact correspondence between the physical and spiritual worlds. Most books of the Bible have two senses, a literal and a spiritual. Everyone can exist on three planes; the celestial, of love, that of spiritual wisdom, and that of obedience, or the physical. Those who are actuated by love of God and man enter heaven as angels, those whose motive is self-love enter hell. All life flows from God. The Holy Trinity became incarnate in Jesus Christ, who raised humanity to union with God, but there is no atonement in the accepted sense.

Swedenborg claimed to inaugurate a new dispensation, but founded no sect. His teachings are, however, especially revered by the Swedenborgian body called the New Church (*q.v.*). His books include *Heaven and Hell*, *Divine Love and Wisdom*, and *Conjugal*

Love. Many were published in English by the Swedenborg Society, founded in 1810. Consult Documents Concerning Swedenborg, R. L. Tafel, 1875-77; Life, G. Trowbridge, new ed. 1932.

Swedish Drill. System of physical exercise originated in Sweden. It has evolved since the early 19th century. The benefits derived from the system have induced other countries to include it in the curriculum of physical training provided for the naval, military, and police forces. Often designated "free movements," the exercises are practised without apparatus. There are special exercises for the legs, arms, neck, spine, lungs (breathing exercises), balance or maintenance of the body's equilibrium, development of lateral trunk and abdominal muscles, and strengthening of the shoulders and back. See Physical Training.

Swedish Iron. A form of wrought iron produced from Swedish ore pig iron. Its purity has brought it into widespread use for high-grade tool steel manufacture. It is made from the pig iron either by the old Walloon process, in which the oxidation of impurities is accomplished without complete fusion, or by the Swedish Lancashire process, in which the temperature of oxidation is higher.

Sweeney Todd. Melodrama based on the career of a 17th century barber of that name. Known as the "demon barber" of Fleet Street, this character is reputed to have had his shop in an alley behind the Cheshire Cheese tavern. According to popular belief, Todd cut his customers' throats while shaving them, and cast his victims through a trapdoor into a cellar where they were speedily converted into pies and sausages. There were three dramatic versions: (1) *Sweeney Todd*; or *The Fiend of Fleet Street*, by George Dibdin, produced 1847, of which a revised version by Andrew Melville was

given at the Kingsway Theatre, 1927; (2) *The Barber of Fleet Street*, or *The String of Pearls*, by Frederick Hazleton, produced 1862; (3) *Sweeney Todd*, by Matt Wilkinson, produced 1870. The first of these was popularised by Tod Slaughter (b. 1885), who frequently appeared in the title part.

Sweepstake. Form of competing for money or other prizes. The money is contributed in equal proportion by each competitor, or by the owners of the various runners. In another variety of sweepstake, held upon horse races, there is no fixed number of subscribers; two sets of slips of paper are prepared, each in one set bearing a subscriber's name, the other set bearing the names of the horses, and blanks to the number of subscribers. Each set of slips is shuffled together and placed in a hat or box, from which they are drawn one at a time simultaneously from each set. See Gaming; Irish Sweepstake; Lottery.

Sweethread. Term given to certain glands of sheep and cattle when used for human food. The chief is the pancreas, while another is the thymus gland.

Sweet Briar OR **EGLANTINE** (*Rosarubiginosa*). Shrub of the family Rosaceae. A native of Europe

Sweet Briar. Spray of flowers, buds, and sweet-scented leaves

and N. and W. Asia, it forms a small bush with erect prickly stems, clothed also with gland-tipped bristles. The leaves are divided into five or seven roundish leaflets with toothed edges. On the underside they are covered with glands, whose sticky secretion gives off the well-known sweet briar odour. The small rosy flowers are about 1½ ins. across, the scarlet fruits egg- or pear-shaped.

Sweet Flag (*Acorus calamus*). Perennial aromatic waterside herb of the family Araceae. It is a native of Europe, N. Asia, and N. America. It has a thick, creeping rootstock, and sword-shaped leaves

Sweet Flag. Aromatic waterside herb. Inset, top, flower spike; below, root

4 to 6 ft. long. The flowering stem is also sword-shaped, and ends in a flattened envelope (spathe), from which emerges the flower-spike (spadix) with hundreds of yellow-green simple flowers.

Sweet Gale (*Myrica gale*). Shrub of the family Myricaceae, also called bog myrtle (*q.v.*).

Sweetheart Abbey. Ruined Cistercian abbey in Dumfriesshire, Scotland. It was built by Devor-

Sweetheart Abbey, Dumfriesshire. Ruins of the abbey church where the heart of John de Baliol was buried

gilla in 1275 to commemorate her husband, John de Baliol, and at her death she ordained that his heart, enclosed in a casket of ebony and silver, should be buried with her. Thus arose the name Sweetheart Abbey (*Abbatia Dulcis Cordis*). The ruins comprise portions of the church and, $\frac{1}{2}$ m. E., the abbot's tower. Sweetheart Abbey and the village which has grown up around it are now known as New Abbey.

Sweet Lime. Popular name for the fruit of *Citrus limetta* to distinguish it from the *Citrus acida*, the W. Indian lime from which lime juice is obtained. It is a native of E. Asia. See Lime Fruit.

Sweet Pea (*Lathyrus odoratus*). Annual herb of the family Leguminosae. It is a native of S. Europe, whence it was introduced to Great Britain in 1700. Its long, flattened, and winged stem is too weak to stand, and the plant supports itself by numerous tendrils. The fragrant flowers are produced in clusters of two or three at the end of long stalks, and are of various tints—white, pink, and purple. Under cultivation the colour variation, as well as the size, has been increased, chiefly at the expense of the fragrance.

Sweet peas thrive in any garden soil, where they are sown usually from Feb. to April, though stronger and more vigorous plants are obtained by sowing in Oct. Many people prefer to sow in the greenhouse in spring, treating sweet peas as tender or half-hardy annuals—which they are not—and planting out in May. During dry periods they should be watered freely, and when flowering should be mulched with well-decayed manure. See Flower; Pollen.

Sweet Potato (*Ipomoea batatas*). Trailing perennial herb of the family Convolvulaceae. It is a native probably of S. America, but is grown extensively as a food crop in most warm countries. It has a long, slender stem which sometimes climbs by twining, large lobed or angular leaves about 6 ins. long, and funnel-shaped flowers which are white outside and purple within. It forms underground a large spindle-shaped tuber as a reservoir of starchy and saccharin matter. As usually cultivated these tubers weigh from 2 lb. to 12 lb. each, but by being left in the ground for a few years they may become 30 lb. or more.

The name potato for *Solanum tuberosum* is a corruption of *bata-tas*, the native name of the sweet potato. The latter was known in Europe at an earlier date than the common potato, and the two plants were often confused. The sweet potato is frequently cultivated in the U.K. under glass at a temperature of at least 60° F. The most suitable soil is a mixture of loam and leaf-mould, and propagation is effected by division of the tuber. For the table, it may receive treatment similar to that of the common potato (*q.v.*).

Sweets. A word of Anglo-Saxon origin. It is used principally to describe small sweet-tasting objects eaten for pleasure. The "honey of canes," mentioned by early classical writers, is the

Sweet Potato. Trailing stem of leaves and funnel-shaped flowers

sugar-cane, and the earliest sweet-makers, Indians, Chinese, and Persians, used it long before the Christian era. They also used honey, which continued to be the basis of European sweetmeats long after cane-sugar was known. Beet-sugar, maple-sugar, and glucose later became the important ingredients. Gums, gelatine, nuts, fruits, butter, and other fats are also used, with various natural and synthetic flavourings.

The making of sweets is the seventh largest industry in Great Britain; during the 1930s production was valued at £50,000,000 annually. Weekly consumption in the British Isles averaged 7-8 oz. per head of the pop.

Apart from chocolates, in bar or fondant form, sweets are classified as boilings, toffees, marzipans, and gums. Boiled sweets are made by boiling sugar and glucose, with flavouring, in large pans, and then mechanically cutting and shaping the product.

Toffees are similarly made, but contain butter and other fats. Marzipans contain, in addition to sugar, nut-paste; and gums (pastilles, jellies, etc.) are made from gum arabic, gelatine, or starch mixed with sugar or glucose and flavouring matter.

The word sweet is also used for puddings and similar sweet-tasting dishes eaten at lunch and dinner, while legally sweets has the special meaning of a fermented liquor containing fruit or sugar.

Sweet William (*Dianthus barbatus*). Perennial herb of the family Caryophyllaceae. It is a native of S. and E. Europe, when it was introduced to Great Britain about 1573, and became a favourite garden plant. The stiff, jointed stem bears lance-shaped leaves in pairs, and divides at the top into a cluster of flower-stalks. The flowers are naturally pink or white, but as the result of cultiva-

Sweet Pea. Leaves, flattened stem, and cluster of the fragrant flowers

Sweet William. Leaves and clustered flowers of a cultivated variety

tion innumerable varieties exist in all shades of crimson almost to black, zoned with other tints, and the edges variously toothed or fringed. They succeed in any garden soil, and may be propagated by seed, cuttings, layers, or division of the clumps. The last is the best method, and should be carried out in Sept. Otherwise the treatment should be the same as for the carnation (*g.v.*).

Swell. Wave motion in the ocean due to a distant disturbance. As long as the waves travel in deep water the swell may persist, without change in direction, for some time after the cause of the motion has disappeared. The height of the waves diminishes rapidly as they recede from the disturbance, but both length and velocity remain unchanged; hence the characteristic regular undulations. Observations of swell are useful in indicating the direction of the disturbance, *e.g.* a cyclone. *See* Wave.

Swell. In the organ, a set of pipes enclosed in a chamber with Venetian shutters in front which can be operated by means of a pedal, thus producing *crescendo* and *diminuendo*. The swell was invented by Abraham Jordan and his son in 1712, and first applied by them to the organ in St. Magnus church, London Bridge. In this the opening was effected by a sliding shutter, the Venetian shutters being introduced only in 1765. The keyboard from which these enclosed pipes are played is called the swell manual, and stands just above the great manual. Swell pedals are of two kinds, either a simple lever which can be fixed down by a swinging rod, or balanced, which consists of a foot-board so adjusted as to remain in any desired position.

In the reed organ, a swell shutter is actuated by the knee. The principle of the swell was adapted to

the harpsichord about 1750, the lid being raised by a pedal. *See* Organ.

Sweyn (d. 1014). King of Denmark from 986 to 1014. The son of Harold Bluetooth (940-986) and father of Canute the Great, he made various conquests in Sweden and Norway, and several raiding expeditions to the British Isles from 994, exacting tribute from Ethelred the Unready. After Ethelred's massacre of the Danes, 1002, Sweyn invaded Britain again, and had conquered much of the country when he died at Gainsborough.

Swift (*Apus apus*). Bird of the order Apodiformes. A native of Europe, Asia, and Africa, it is

Swift. Summer migrant to the British Isles, with its long narrow wings spread in flight

famed for its rapid, steady flight and wonderful evolutions in the air. Save for a light grey patch under the chin, the plumage is sooty black and glossy; the wings are very long and narrow; and the tail is short and forked.

As a British bird it is a summer migrant, arriving at the end of April and departing in August. Its rather primitive nest, slightly contrived of straw, dry grasses, and feathers, gummed together by the bird's saliva, is built under the eaves of a house, in church towers, and cliff crevices—sometimes the sparrow's nest is requisitioned—and usually two white eggs are laid. The swift never perches, its short feet and hook-like claws enabling it only to cling to walls, etc. It is entirely insectivorous and hunts in companies, filling the air with joyous screams. The swift is unrelated to the swallow; its nearest affinity among British birds is with the nightjar. It is said to exceed 100 m.p.h. in flight. *See* Bird.

Swift, JONATHAN (1667-1745). British satirist. Born in Dublin, Nov. 30, 1667, son of a clergyman of English descent, he was educated at Kilkenny grammar school and Dublin university, where he graduated without distinction in 1686. During 1689-92 he was secretary, at Moor Park, Surrey, to Sir William Temple, whose wife

was a distant relative of Swift's mother; and was tutor to Esther Johnson, the Stella of his *Journal* and *Sonnets*. Through Temple's interest, he went to Oxford and took his M.A. degree at Hart Hall, July 5, 1692.

Ordained priest, 1695, he obtained the living of Kilroot, Belfast Lough, but returned to Moor Park, 1696-98. When Temple died, Jan., 1699, he left his amanuensis a legacy of £100 and the task of editing a collection of his works. While in Temple's service, Swift wrote *The Battle of the Books*, 1697, prompted by the controversy over the *Letters of Phalaris* (*see* Bentley, Richard).

This was published, 1704, with *A Tale of a Tub*, a brilliant satire on the divisions of Christianity, but a work that prejudiced his chances of ecclesiastical preferment.

Returning to Ireland, Swift became chaplain to the earl of Berkeley, rector of Agher, vicar of Laracor and Rathbeggan, and prebend of Dunlavin, 1699-1700. From 1700 to 1713 he was in London, where he met Addison, Pope, Gay, Harley, Ormond, Peterborough, Arbuthnot, Bathurst, Bolingbroke, and others, and engaged in political controversy. During this period he left the

Whigs for the Tories, edited *The Examiner*, and founded the *Brothers'* and the *Scriblerus* clubs. He was made dean of St. Patrick's, Dublin, Feb. 23, 1713.

While in England, which he visited again in 1726 and 1727, he

J. Swift

began his memorable friendship with Stella, whom he is said to have married secretly in Ireland about 1715, and who died Jan. 28, 1728. The friendship with Esther Vanhomrigh (Vanessa) began about 1710, and is related in the poem, *Cadenus and Vanessa*, which before her death in 1723 she entrusted to her executors for publication. Meanwhile he had written *Sentiments of a Church of England Man*, 1708; *Proposal for the Advancement of Religion*, 1709; his ironical *Argument Against Abolishing Christianity*; and his humorous pamphlets, signed Isaac Bickerstaff, on the almanac-maker, Partridge. His *Drapier Letters (q.v.)*, 1724, written to expose an injustice to Ireland in connexion with the coinage, and *Proposal for the Universal Use of Irish Manufactures*, 1720, attest his hatred of oppression. His masterpiece, *Gulliver's Travels*, appeared 1726-27.

The hereditary gloom in Swift's nature, due in part to inherited brain trouble, which began to show itself soon after 1692, increased. The crisis came about 1740, and he died Oct. 19, 1745, being buried by Stella's side in S. Patrick's cathedral, Dublin.

Swift has been much misunderstood. He set his ambition, not on political or literary, but on ecclesiastical preferment, and was disappointed. His political views are summed up in the phrase: "Whoever has a true value for Church and State should avoid the extremes of Whig for the sake of the former and the extremes of Tory on account of the latter." He is one of the great masters of English prose. Juvenal was not a more scathing satirist. The *Journal to Stella*, certainly not written for publication, and published complete, ed. H. Williams, 1948, is proof of his genius for affection, as his break with Vanessa is of his sense of friendship's rightful boundaries. A voluminous writer, nearly all he wrote was issued anonymously; for Gulliver alone did he receive payment. He gave one-third of his income to charity, wrote his own epitaph, and left his remaining property to found a madhouse. See *Gulliver's Travels*; *Satire*; *Stella*.

1896; *Unpublished Letters*, ed. Birkbeck Hill, 1899; *Lives*: L. Stephen, 1889; H. Craik, 1894; S. Gwynn, 1933; W. D. Taylor, 1933; B. Newman, 1937; R. W. Jackson, 1939; B. Acworth, 1948.

Swift Moth (Hepialidae). Family of moths of very primitive structure. Their two pairs of wings are closely alike in form and venation. The caterpillars of the five British species feed below ground at the roots of grasses, low plants, and bracken: the pupae are very mobile, working their way to the surface when

ready to emerge as moths. The glistering white male ghost moth (*Hepialus humuli*) attracts the yellowish female by hovering over one spot at dusk. The male golden swift (*H. hectus*) attracts his mate by diffusing a strong scent.

Swilly, LOUGH. Inlet of the N. coast of co. Donegal, Eire. Its entrance, where it is 4 m. wide, is between Fanad Point and Dunaff Head, and it extends S. for about 25 m.: average width 3 m. It has two lighthouses. Formerly the R.N. had a base here. See Irish Bases.

SWIMMING: HOW THE ART IS ACQUIRED

See the articles *Artificial Respiration*; *Bathing*; *Channel Swimming*; *Diving*; *Drowning*; *Water Polo*, etc.; also biographies of famous swimmers, e.g. Burgess, T. W.; Temme, E. H.; Webb, Matthew

Swimming is the method of moving progressively on or through water, without artificial aid. The first book on swimming was written by Nicolas Winmann, a professor of languages at Ingolstadt, Bavaria, and published in 1538, and the first one in England by Everard Digby in 1587. For a long while the idea that the principles of swimming could be taught on land was ridiculed, but the work of the London schools swimming association, a voluntary organization started in 1893, and like work among school associations in all parts of England, led to appreciation of the idea, and the amateur swimming association now publishes complete instructions as to this form of teaching, as does also the Royal Life Saving society for rescue and release work. The exercises are based as nearly as possible on the actual movements in the water, and experience has proved that the pupils gain confidence, and that as soon as they enter the water the majority swim automatically.

Importance of Breast Stroke

These instructions are for what is called the breast stroke, the most useful of the various methods of progression through the water but slow as compared with the "trudgeon" or the crawl. It is, however, the basis of swimming education, and once mastered it begets confidence never afterwards lost when one is in the water. The great fault with most beginners is hurried action of the arms, which affects respiration and quickly tires the performer. The legs should do most of the work.

In using the breast stroke, the arms should be bent in with the elbows about four ins. from the sides of the body, the hands touch-

ing, palms downwards at the level of the breast bone, the body inclined forward and the head slightly back. When the stroke is made, the arms are pushed forward to their fullest extent, vigorously but not with a jerk, and when fully extended the hands should be turned down, pulled in towards the trunk, and in a circular movement replaced with wrists resting on the breast bone ready to recommence the stroke. During this last portion of the movement, inward breathing should take place, the head being out of the water; exhaling into the water should occur with head down as the arms are pushed forwards at the start of the next stroke. The proper regulation of breathing is the all-important factor in swimming.

While the arms are in motion the legs have to act in unison with them, so as to produce the propelling power. At the time the arms are fully extended in front of the body before pulling towards the trunk, the legs should be in horizontal position, heels touching, just under the surface. As the pull is made they are opened and widened out at the knees, but the knees must not be drawn under the body. They are then kicked out quickly and brought together again as the arms are shot forward, and this combined action of arms and legs carried on in uniform manner constitutes breast-stroke swimming. The back stroke, useful in the saving of life, is in its primary movements merely the breast stroke performed on the back, but there are many variations of it, and the practice of it is useful in learning the art of floating. The "overhand" or "overarm" stroke was formerly considered the fastest, a

Swimming. Diagrams showing positions of the body and limbs in different strokes. 1-6. American crawl: 1. Correct position of body. 2. Preparing to inhale. 3. Left arm being withdrawn from water. 4. Hand entering water. 5. Direction of pull. 6. Left hand ready to enter water. 7. Trudgeon crawl, middle of arm drive. 8. Correct position for trudgeon crawl with left arm ready for drive. 9 and 10. American back crawl, beginning of stroke with left and right arm respectively. 11 and 12. Position in floating, with face upwards and downwards

stroke known as the "trudgeon," introduced to England by J. Trudgeon in 1875, being considered speedy only for short distance. But with the advent of water polo an adaptation of his stroke became popular, and distance swimmers took advantage of it. Then in 1902 R. Cavill, an Australian swimmer, gave an exhibition of the crawl stroke, and this method of progression has since revolutionised speed swimming.

The Australians, Americans, and English all have different styles of this new stroke, which differs in underlying principles from the breast, overarm, and trudgeon strokes. The swimmer lies nearly flat upon the surface of the water, stretches out his arms alternately in front of the head, which is low down in the water, dips his hands in the water and pulls the arms smartly back and sweeps them down the side of his body, with the palms turned slightly outwards. His leg movements are similar to those one would use if walking backward. The legs are kept close together, are swung up to the surface alternately and then thrashed out with a strong downward kick. The stroke is so timed that the right arm and left leg and left arm and right leg work in unison, the leg being ready to make the thrash as the arm is starting for the pull.

Breathing in the crawl stroke is very important, and if incorrect can decrease the speed of the swimmer; the head should be turned either to the left or right side, inhaling as that arm reaches the surface of the water behind the body, and breathing out into the water, with face downwards, as the arm is brought along the surface in front.

The back-crawl is similar to the crawl except that the swimmer is lying on his back on the surface of the water, and it is not necessary to turn the head to either side for breathing; intake of breath can coincide with the flinging back of either arm.

The butterfly breast stroke is more powerful and speedy than breast stroke. With the customary wide, out-and-together breast stroke leg action the swimmer performs with the arms a movement similar to that used in the crawl stroke, but instead of driving alternately, the arms are pulled together and swept back together. The hands enter the water in front of the shoulders, wide apart; the drive is down and back with the arms bent a little at the elbows. The arms are then flung quickly but loosely and without pause over the surface to the point of entry. Inhaling takes place through the mouth as the arms drive down,

and exhaling with the mouth submerged during the remainder of the stroke. The leg drive follows the arm drive.

Swinburne, ALGERNON CHARLES (1837-1909). British poet and dramatist. He was born in London, April 5, 1837, eldest child of Admiral Charles Henry Swinburne and Lady Jane, daughter of the 3rd earl of Ashburnham. In spite of his literary republicanism, Swinburne was always the complete aristocrat. He was educated at Eton, from which he was withdrawn in 1853, after a gradually developing lack of response to discipline. He entered Balliol College, Oxford, in 1856; Jowett was attracted by him and remained a valued friend; but Swinburne did not conform to Oxford traditions, and went down without a degree in 1859. An avid reader from early

childhood, he declared that Lamb's Specimens and the Bible taught him more than anything else.

The second and most important period of his life began in 1861, when he settled in London in close relation with the group of Morris and Rossetti. His first published volume contained the two plays, *The Queen Mother* and *Rosamond*, 1860. Passing over much occasional work, including *Chastelard*, the first of his Mary plays, *Bothwell* and *Mary Stuart* completing the trilogy, we come to the two volumes that placed him among the chief of British lyrical poets, *Atalanta in Calydon*, 1865, and *Poems and Ballads*, 1866.

The latter aroused much protest from conventionally respectable readers, but the youth of England took it to their hearts and chanted its measures in innumerable imitations. Later came *William Blake*, 1868, possibly his best book of prose criticism, and *Songs before Sunrise*, 1871, perhaps his best book of lyrics, some of them inspired by a meeting with Mazzini. Much may be forgiven to the man who wrote *The Eve of Revolution*. Robert Buchanan made himself notorious by a bitter and pseudonymous attack on the Swinburne-Rossetti verse, called *The Fleshly School of Poetry*, and was answered vigorously by Swinburne in *Under the Microscope*, 1872.

Principal Works

Some of Swinburne's numerous publications that must be specially mentioned are the prose study of Chapman, 1874; *Erechtheus*, 1876, a tragedy in Greek form, not one of his most popular inventions, but certainly one of his loftiest, with magnificent choral odes; *Poems and Ballads*, Second Series, 1878, which some would put first among his books; *The Heptalogia*, 1880, a remarkable collection of parodies, the victims being Tennyson, the Brownings, Patmore, Owen Meredith (Lytton), Rossetti, and himself; and *Tristram of Lyonesse*, 1882, a sort of Wagnerian music-drama, monotonous in its long drawn ecstasy, and not guiltless of some artificial emotion. Its handling of the heroic couplet is specially noteworthy.

The year 1879 marks a crisis in his life and initiates what may be called his third period. He had lived an irregular life in London, in which drink and women, among them the notorious Adah Isaacs Menken, had played a large part. His excesses brought on periodic collapses, with epileptic fits. His physical salvation was effected by

Theodore Watts (Watts-Dunton), a Huntingdonshire solicitor, who had taken charge of Swinburne's business affairs.

Watts took possession of the poet and carried him off to Putney, where he recovered and lived in almost unvaried peace, health, and happiness for another thirty years. Few men have been more devotedly cared for. He had a serious illness in 1903, but recovered. In 1909 he took a chill, and died of pneumonia on April 10. He was buried at Bonchurch, among his family. He was unmarried.

Swinburne is one of the most remarkable and original of English poets. In his odd frail

Al Swinburne
Elliott & Fry

body was housed a spirit of indomitable courage and pugnacity. Until age had toned down some of his eccentricity of appearance he seemed not so much real as a character from Poe or Hoffmann come alive; and his works are those that such a person might have written.

The music of his verse was as new to Victorian English ears as its subject matter. He wrote as Tannhäuser might have sung, with the madness of the Venusberg upon him, of strange sins, and exotic passions and mad eroticism. His measures were not new, but they sounded on his lyre as if they had never been heard before. Swinburne represents genius without talent, passion without reason. The cooler facts upon which he touched—Hugo, Mazzini, Italy, France—were all emotions felt wildly, rather than things understood clearly.

All his life he was the victim of his own words, which extended some poems and essays to intoler-

able length. That the bulk of his work will endure is improbable; but his greater lyrics will last as long as English poetry. See Michelangelo.

Lafourcade, 1932; Swinburne's Literary Career and Fame, C. H. Hyder, 1933; *Poems and Prose* ed. with intro. R. Church, 1940.

Swindling OR CHEATING. At common law, a misdemeanor closely allied to the offence of obtaining money or property by false pretences. The offence includes using false weights and measures or false coins or tokens, or otherwise cheating or deceiving "so as people cannot by ordinary care guard against; but not where it is a mere imposition by deception against which common prudence might detect." See *Coining*.

Swindon. Mun. borough and industrial town of Wiltshire, England. It is a rly. junction 77 m. W. of London. Old or Hye Swindon stands on a hill, alt. 480 ft., and has been a market town since the 17th century. Here are an interesting parish church (1851), town hall, and corn exchange. New Swindon grew up after the establishment in 1841 of the works of the former G.W.R., which provide the chief occupation, though there is also an agricultural trade. Buildings include churches, hospitals, library, theatre. The borough charter dates from 1900. In 1946 was opened the first municipally owned arts centre in England. Pop. approx. 68,000.

Swindon arms

Swine Fever. Name given to three separate infectious diseases which attack swine. They are (1) swine plague, a septic gastro-enteritis caused by a bacillus; (2) infectious pneumonia, caused by an ovoid bacterium; (3) the real hog cholera, caused by quite a different form of microbe from either of the former diseases. An animal infected by any one of these three diseases becomes dull, loses its appetite, and seeks a dark corner. Its eyes are affected, and later its flexor muscles. No cure is known. An outbreak

must be immediately notified and the infected animals slaughtered.

Swinemünde (Pol. Swinoujscie). Port, resort, and saline spa on the is. of Usedom, Pomerania. Founded c. 1730, granted urban rights by Frederick II in 1765, it became a Prussian customs control station and fortified port from 1925, also an airport. Steamers and motor vessels plied to neighbouring resorts. There is a fine sandy beach. Industries normally are connected with shipbuilding, fishing, and the timber trade. During the Second Great War Swinemünde was occupied by the Russians May 5, 1945, and later was in the area placed under Polish administration. Pop. 21,152.

Swing. Form of dance music. It may be regarded as a development of jazz (*q.v.*), fostered during the depression years in America, which became prominent from about 1935. The collective improvisations of jazz musicians began to be replaced by harmonisation and written arrangements (or orchestrations), and the traditional folk tunes of jazz were replaced by popular but synthetic "hits." Commercial exploitation of this form of jazz created a vast industry, which catered for millions the world over.

Confusion was created in the public mind, partly as a result of the way in which recording and broadcasting authorities include all jazz and swing under the heading swing. Younger musicians, anxious to appear up-to-date, dismissed the word jazz as old-fashioned. This in turn led the more discriminating jazz-lovers to invent new names to distinguish the original jazz, such as real, hot, true.

Various devices have been fashionable in swing music; the use of string sections; the repetitive short phrase known as a riff which soon becomes monotonous; the glorification of top notes, often unfitted for the register of the instrument concerned; and the use of instruments unsuitable for the idiom.

These, however, are the worst attributes, and many of the best swing bands play with great technical efficiency. Experiments in America and in England show the possibilities of swing in the style of modern music in a more serious vein, the influence of Shostakovich (*q.v.*) being marked. A later variation is sometimes termed Re-bop; this makes use of unusual chord structures, with the melody instruments often playing in unison, and with a great deal of trumpet exhibitionism. The

rhythm section is given a far greater latitude than that assigned to it in jazz or ordinary swing.

Rex Harris

Swing, RAYMOND GRAM (b. 1887). American journalist and broadcaster. Born at Cortland, N.Y., March 25, 1887, he was educated at Oberlin College, Ohio, and became a journalist in Cleveland, working on various Middle West newspapers. He represented the Chicago Daily News in Berlin, 1913-1917; he was London correspondent of the New York Evening Post, 1924-34; New York correspondent of the London News Chronicle, 1936-37. As a commentator on American affairs for the B.B.C., 1935-45, he became known to millions of British listeners, and during the Second Great War his weekly broadcasts from the U.S.A. were equally popular. He published, among other books, *Preview of History*, 1943; *In the Name of Sanity*, 1946.

Raymond Gram Swing, American journalist

Swinerton, FRANK ARTHUR (b. 1884). British novelist and critic. He was born at Wood Green, London, Aug. 12, 1884, and in youth entered a publisher's office. He soon had a name for well constructed novels of English life, of which the first was *The Merry Heart*, 1909, and the best known *Nocturne*, 1917; *The Georgian House*, 1932. Concurrently he became a literary critic, publishing *Studies of Gissing*, 1912, and *Stevenson*, 1914. *The Georgian Literary Scene*, 1935, was a stimulating study of friends and contemporaries, and his autobiography in 1937 won him many new admirers. He wrote for this *Encyclopedia* the article *Novel*.

Frank Swinerton, British novelist

Swinton. Market town and urban dist. of the W. Riding of Yorkshire, England. It lies 10 m. N.N.E. of Sheffield, being a rly. junction. Here the Don navigation joins that of the Dearne and Dove. Iron goods, pottery, and glass are manufactured, and there are coal mines. Market day, Sat. Pop. 13,820.

Swinton, PHILIP CUNLIFFE-LISTER, 1ST VISCOUNT (b. 1884). British politician. He was born May 1, 1884, at Aytton, Yorks, the youngest son of Y. G. Lloyd-Greame, changing his name to Cunliffe-Lister in 1924 when his wife inherited property. He went to Winchester and University College, Oxford, and was called to the bar, 1908. Conservative M.P. for Hendon in 1918, he became parl. secretary to the board of trade two years later, and received a knighthood. From Oct., 1922, to Jan., 1924, Sir Philip was president of the board of trade, and again from Nov., 1924, until 1929. During 1931-35 he was colonial secretary, being raised to the peerage in 1935, and moving to the air ministry until 1938. He was resident minister in W. Africa 1942-44, then minister for Civil Aviation until 1945.

Viscount Swinton, British politician

Swinton, SIR ERNEST DUNLOP (b. 1868). British soldier and writer. He was born Oct. 21, 1868, and educated at Rugby and Cheltenham. In 1888 he entered the army, and won the D.S.O. during the S. African War, 1899-1902. The official "Eye-Witness" of the First Great War, he helped to invent, and commanded the first unit of, tanks. Major-gen. in 1919, he was knighted in 1923. Meanwhile he had made a name as a writer under the pseudonym, Ole-Luk-Oie (taken from Hans Andersen), his best-known work being *The Green Curve*, 1909. Under his own name he wrote books on military history, including *The Study of War*, 1926, and from 1925 to 1939 was Chichele professor of military history at Oxford. During the Second Great War his war commentaries on the B.B.C. attracted wide attention.

Sir Ernest Swinton, British soldier

Swinton and Pendlebury. Mun. bor. of Lancs, England. It is situated 5 m. N.W. of Manchester, with which it has rly. and bus connexion. It has many industries, including coal mining, cotton spinning, engineering, and

the manufacture of electric batteries. S. Peter's church here was designed by Sir Gilbert Scott. Pop. 40,750.

Swiss Cottage. Locality in N.W. London. The name is derived from that of a tavern supposed to be built in the style of a Swiss chalet. A station on the Bakerloo tube rly. is at the junction of Finchley Road with Belsize Road, College Crescent, Avenue Road, and Eton Avenue. Close by are a Congregational training centre, New College; and the Embassy Theatre (*q.v.*).

Swiss Family Robinson. THE. Story recording the adventures of a family wrecked on an uninhabited island; suggested by Defoe's Robinson Crusoe. It was written by a Swiss pastor, J. D. Wyss (1781-1830), and published in 1813.

Swiss Guards. Former regiment of bodyguards to the French throne. Recruited in Switzerland,

the regiment was first raised in 1616. In the Revolution the loyalty of the Swiss Guards made them unpopular and after bravely resisting the mob which invaded the Tuileries, Aug. 10, 1792, they were disarmed and massacred. The Lion of Lucerne (*q.v.*) commemorates their gallantry, as does a famous passage in Carlyle.

Swiss Guards.
Private in the
Papal Guard

Another body of troops called the Swiss Guard, or Papal Guard, is employed by the pope at the Vatican palace. It consists of about 120 officers and men of Swiss nationality. They mount guard at the Vatican, take part in processions and form guards of honour for the pontiff. Their red and yellow uniform is said to have been designed by Michelangelo.

Switch. In electricity, a device for opening and closing a circuit by means of metallic contacts which can be pressed together or separated easily and safely, or for changing the connexions of a circuit or a number of circuits with ease and rapidity. A single-pole switch acts on one conductor only,

and double-pole switches are often used. For three-phase A.C. work, triple-pole switches are used, making and breaking all three conductors simultaneously. A double-throw or changeover switch changes over from one circuit to another. The simplest form of switch is the knife or lever pattern, which consists of a copper blade hinged at one end, and with a handle at the other, by which it is forced into, or removed from, springy copper clip contacts, the whole being mounted on an insulating base. (*See illustration.*)

Switch. Top, single- and double-pole types shown in plan; below, cross-section showing contact made by switch bar at *a*; when handle is raised, as in dotted lines, the switch bar is lifted up and contact is broken

This type, having live metal exposed, is suitable only for use on switchboards which are not accessible to unauthorised persons. Similar patterns are in common use which have the entire switch enclosed in a metal case, and operated by an external handle; they are known as ironclad switches. Smaller varieties are often made with an enclosure of plastic material. Possibly the most commonly met with type is the tumbler switch used on ordinary lighting circuits, where the contacts are enclosed under a cover, through which the handle or dolly projects.

For many years it was thought that the most certain way of breaking a circuit was by the use of a quick-break arrangement, whereby the handle, instead of operating the contacts directly, loads a spring which, in turn, opens the switch, thus rendering it impossible to open the contacts slowly, which often caused destructive arcing. This is still so on D.C., but on A.C. considerable success has been achieved with a micro-break switch, in which the

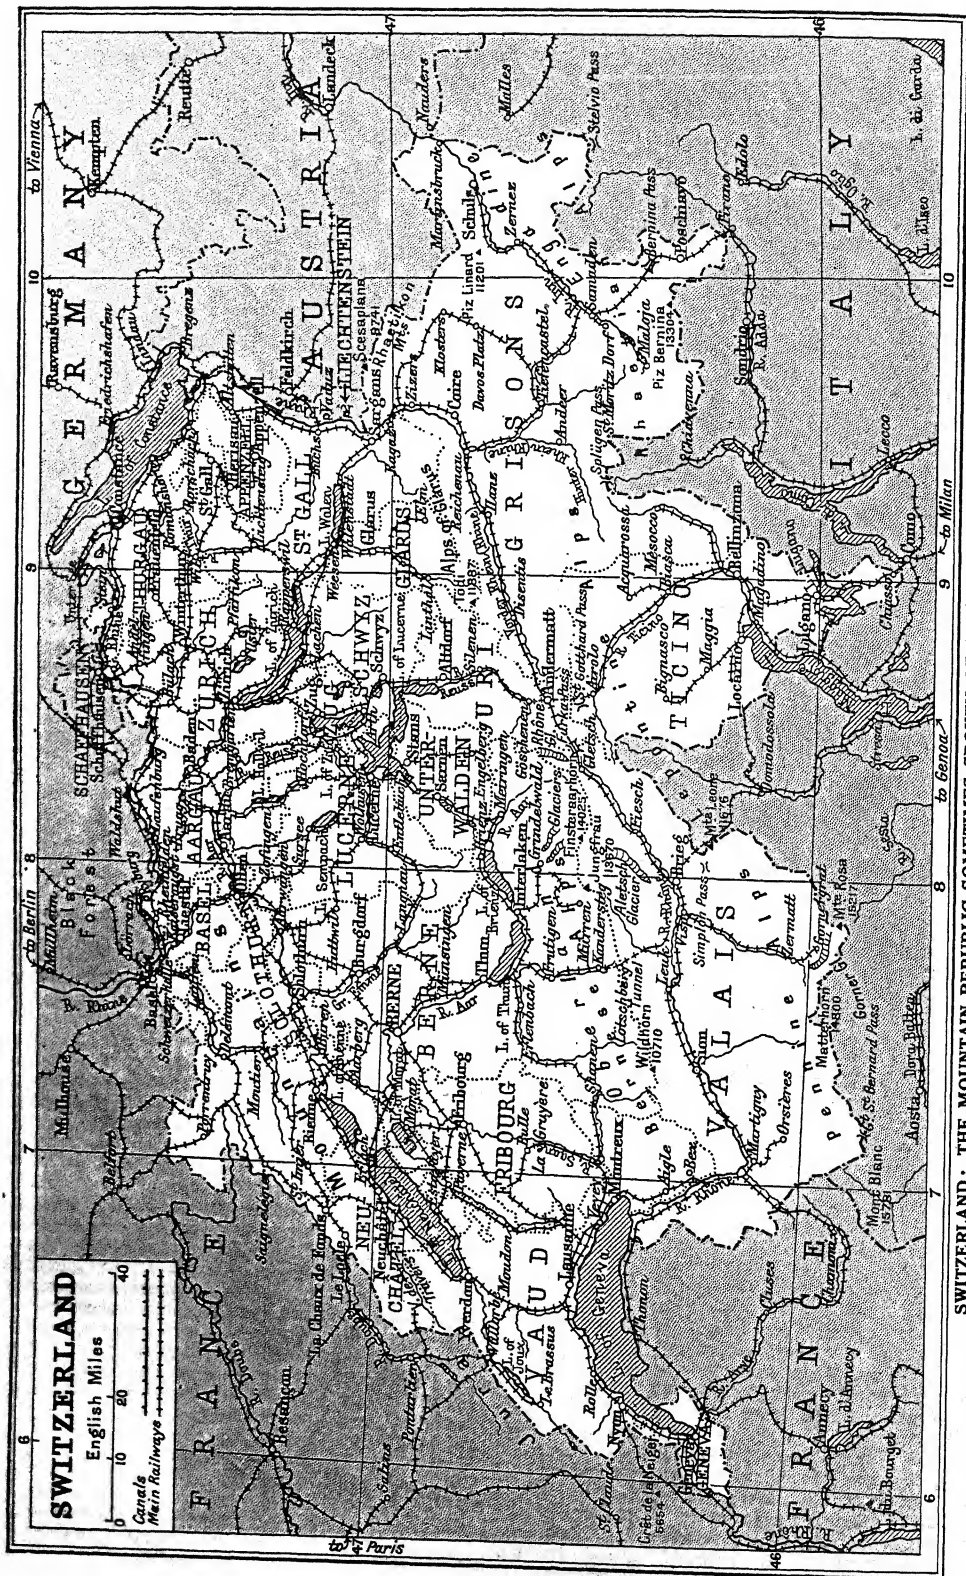

contacts are separated by only a few thousandths of an inch, and several patterns of tumbler switch are now made on those lines.

Switching is a term used in engineering to cover items ranging from the very smallest tumbler switch to the largest oil circuit breakers (*see* Circuit Breaker). In addition to opening and closing circuits, a wide variety of other switches are used. The dial switch, which has a contact arm pivoted like a clock hand, moving round over a circular array of contact studs, is used for circuit changing, or for regulating work cutting in and out amounts of resistance, etc.

Switchback. Term used in rly. engineering to denote a certain arrangement of track whereby a steep mountain-side can be ascended or descended. The track takes a zigzag course, and at each angle there is room for the train to pass beyond the switch, by which it is deflected on to the next arm of the zigzag. Unless provision is made at the turns for enabling the locomotive to transfer itself to the other end of the train, it will alternately push and pull the train. The term is also applied to an undulating rly. sometimes built amid imitation scenery, and generally used for amusement purposes. *See* Railway.

Switchboard. Support of non-conducting, incombustible material, on which are mounted the switches, fuses, indicating instruments, and other apparatus for controlling the generation and distribution of electric current. In a small private installation all the items are usually grouped on one slab; in a generating station or distributing station the switchboard may be sub-divided into a number of panels, each carrying the instruments of one generating or one distributing circuit. *See* Circuit; Lighting, Electric.

Swithin OR SWITHUN (d. 862). English saint and bishop. According to tradition, he was of noble birth and became a priest at Winchester. In 852 Ethelwulf made him bishop of Winchester, where he was famed as a builder of churches. He died at Winchester, and to him the cathedral was dedicated. The popular superstition about rain on S. Swithin's Day (July 15) meaning rain for the forty days following is said to have originated in the fact that the removal of his body to the cathedral in 971 was delayed by heavy rain, but it is most likely an older belief which, by some accident, became associated with the saint. *See* Winchester.

SWITZERLAND: THE MOUNTAIN REPUBLIC SOMETIMES SPOKEN OF AS "THE PLAYGROUND OF EUROPE"

SWITZERLAND: LAND & PEOPLE

* Arnold Latt, Ph.D., Swiss writer and translator

See the articles on the cantons, lakes, rivers, towns, e.g. Geneva; Zürich, etc., of Switzerland, and those on Alps; Bobsleigh; Mountaineering; Ski-ing; Tell, William, etc. See also Europe; Federalism; Sonderbund, etc.

Switzerland is a Federal State of Europe. One of the few entirely inland countries of Europe, it lies between France and Austria and between Italy and Germany, being a buffer state between the four countries. It comprises three

Switzerland arms

bands of country, which curve slightly from S.W. to N.E.; the first, along the French frontier, consists of comparatively minor heights of the limestone Jura Mts.; the second the trough, a fairly level plain between the mts., with the Lake of Geneva in the S.W. and the Lake of Constance in the N.E., the whole gently sloping down towards the Juras, to the lowest level which is close to the inner edge of these mountains along the line of the Lakes of Neuchâtel and Bienne and the lower Aar; the third an extensive central section of the Western Alps. In the N., i.e. in the neighbourhood of Basel, and in the S., in the valley of the Ticino, occur two relatively small areas which do not belong to any of the three bands.

The St. Gotthard district is the commanding portion of the Alpine band. S.E., Canton Ticino slopes S. and drains to Lake Maggiore and Italy. S.W., Canton Valais is the upper Rhône valley between Bernese Oberland and the Pennine Alps. E., Canton Grisons comprises the head valleys of the Rhine between the Alps of Glarus and the Rhaetian Alps, and the Engadine, the valley of the upper Inn within the Rhaetian Alps. N., Canton Uri is the valley of the upper Reuss.

These four cantons are in every way Alpine. Fribourg, S.E. of the Lake of Neuchâtel, Lucerne, Zug, Aargau, Zürich, Thurgau, and Schaffhausen are the cantons of the trough; in all drainage is to the Rhine either directly or through the Aar. Unterwalden, Schwyz, Glarus, St. Gall, and Appenzell belong to the Alpine slopes drain-

ing to the trough. Neuchâtel entirely and Solothurn mainly are cantons of the Jura Mts. Basel belongs to the Rhine valley in the gap between the Jura Mts. and the Black Forest. Geneva similarly belongs to the Rhône valley. Vaud in the S.W. has both Jura and Alpine slopes connected by the end of the trough which slopes away from the Aar to the Lake of Geneva. Berne, the capital canton, alone partakes of the composite character of the country; it extends from the valley of the Doubs, across the Juras, across the trough locally called Lakeland and Middleland, up the Alpine slopes to the crest of the Bernese Oberland, and in the extreme E. to the St. Gotthard dist.

In so far as the spoken language is a test of nationality, Switzerland is mainly and historically German, for 19 cantons are German-speaking, 5 are French-speaking, and Ticino is Italian in speech. Except French Fribourg, the federation was solidly German until 1803, when Vaud (French-speaking) joined; the 1815 additions were all French.

The main rivers, Rhône, Aar, Reuss, Rhine, Inn, and Ticino, radiate from the St. Gotthard centre; numerous tributaries of the Aar and Rhine flow almost N.W. across the trough.

The Large Lakes

The large lakes belong to the trough; Geneva and Constance are at the ends, Neuchâtel and Bienne on one edge, and Thun, Brienz, Lucerne, Zug, Zürich, and Walen where the valleys abut on the plateau. Only small portions of Maggiore and Lugano are Swiss.

The climate varies greatly. The St. Gotthard has an annual rainfall of about 90 ins., while Andermatt, less than 2,000 ft. below, has only half that amount. Geneva, Ticino, and Vaud, with a southerly aspect, are more genial than St. Gall or Schwyz. The snow line varies between 8,500 and 9,500 ft., though the S. wind, warmed by the Föhn effect, removes the snow with great rapidity from favoured valleys. Olives thrive in the warmest valleys, vines, deciduous trees, and cereals, coniferous trees, summer pastures, or true Alps, and mosses follow in sequence up the mountain sides. Cultivation is rarely attempted above 3,500 ft.; 22 p.c.

of the country is forest; 25 p.c. pasture, and 25 p.c. arable.

There are 300,000 peasant proprietors, representing about half the population. Rye, wheat, oats, and potatoes are the principal crops, and considerable attention is paid to fruit-growing. Home-grown food supplies are inadequate to the needs of the population, and wheat, potatoes, and vegetables are imported in considerable quantities. Spirits, such as the cherry brandy of Basel, are made from the fruit, and wine from the grapes grown in the warmer S. The pastoral industry is of considerable importance, for thereby use is made of the rich summer pastures almost to the snow line. Condensed milk and cheese are valuable exports. Beef cattle are imported.

Resources and Industries

Switzerland has few minerals. Asphalt is obtained in the Val de Travers in the Jura. Salt is mined at Bex (Vaud), Schweizerhalle (Basel), Rheinfelden, Ryburg, and Kaiseraugst (Aargau). Small quantities of iron ore are obtained in the Juras, and of coal in Valais, while large quantities are imported, the coal chiefly from the Saar Basin. Manufactures are, despite these drawbacks, of considerable importance; they depend upon large supplies of water power (white coal) and upon domestic industries. Cottons are made on the N.E. German cantons, lace and embroidery in St. Gall, and Appenzell, silk goods in Basel and Zürich, watches in the French towns Geneva, La Chaux de Fonds, and Le Locle. Gruyère cheese and Vevey condensed or Swiss milk and chocolate are known almost all over the world. Aluminium is manufactured in Schaffhausen and Chippis, and aniline dyes in Basel.

The rivers, except the Rhine up to Basel, are not navigable, the lake steamers are mainly devoted to the tourist traffic; imports and exports, the local transport of merchandise, and the tourist traffic require a highly developed railway system, which must obviate the difficulties of the Alpine heights. The main rly. routes are two, both of which are double. In the N. from Basel the first goes via Zürich to Vienna and via Lucerne and the St. Gotthard tunnel to Milan. In the S. the second from the Simplon Tunnel goes via Martigny and Lausanne to Paris and via the Lötschberg tunnel to Berne, Bienne, and London. The N. route connects with the Rhine valley and Berlin from Basel; the S. route connects with Milan and Genoa.

Switzerland flag.
Red with white
cross

The chief cross connexion follows the line of the trough from Lausanne through Berne or Bienne to Olten, Zürich, Winterthur, and St. Gall. Minor connexions cross the trough to the tourist centres. All the main lines are electrified.

Constitution and Government

The Swiss constitution is definitely democratic. The president and vice-president of the federal council are elected annually for one year by the federal assembly. The federal council consists of seven salaried members, each of whom is the chief of a state department; it is elected for four years by the federal assembly. The legislative authority is exercised by a parliament of two houses, a council of states and a national council. The former consists of 44 members, two from each canton. The cantons elect them in the way they think best, not on a uniform plan.

The national council comprises 198 members, elected by the whole population on a ratio of one deputy for 22,000 people; on this basis Berne sends 33 deputies, Zürich 31, St. Gall 13, Vaud 16, and the others similarly in proportion to their population. The general election of deputies is quadrennial and by ballot, and the franchise is enjoyed by all adult male citizens. Legislation may be initiated or vetoed by the popular voice; the referendum, which demands a majority of votes by cantons, is invoked by a petition presented by 30,000 citizens or a demand by eight cantons.

The central govt. (federal council and federal assembly) is supreme in international relations, railways, posts, telegraphs, higher education, and public works of general importance. In other matters each canton or half canton is sovereign. In the smallest cantons these matters are settled by the male adult citizens assembled in the open air; these are the *landsgemeinden*. In the larger cantons a great council, chosen by universal suffrage, controls local government.

Except in the smallest cantons and in the canton of Fribourg, the referendum is applied to local affairs. In Zürich nearly every matter of importance is determined by the referendum. In some cantons a referendum also initiates legislation. Pop. 4,265,703.

HISTORY. In the 13th century the Alpine area which we now call Switzerland lay within the bounds of the Holy Roman Empire. Its population did not form a state, but was divided into a large number of communities, fractions of

the imperial system, of varying races and languages. The beginnings of union were made by the three forest cantons of Schwyz, Uri, and Unterwalden, round about the lake of Lucerne; the historic beginning being the Everlasting League formed between them in 1291, immediately after the death of Rudolph I.

Rudolph of Hapsburg had various claims to lordship in these districts, but the imperial rights were not an apanage of the house of Hapsburg; therefore on his death the people of these three cantons formed a league to maintain their rights, "each for all and all for each," without prejudice to the duty of any community to its own overlord. The saga of William Tell belongs to the days of Rudolph's son Albert, and is not entirely without historical foundation. In 1315 Leopold of Hapsburg endeavoured to assert the family rights over the forest cantons and other communities, but his mail-clad forces were put utterly to rout by the mountaineers at the battle of Morgarten on Nov. 15, which for the time being secured the independence of the forest cantons.

Additions to the League

On Dec. 7, 1332, the fourth forest canton, Lucerne, was added to the League. The free city of Zürich was admitted in 1351; Glarus and Zug followed in 1352, and in 1353 the great city of Berne joined the confederation. Each governed itself after its own fashion, five being pure democracies, one a pure oligarchy, while the other two were mixtures. The character of their alliance was rather indefinite; all were not even formally allied with all; but the general principle bound all to support each in the maintenance of its rights. The urgent cause of alliance was still the Hapsburg menace, most of the states having come in to obtain help in resisting Hapsburg claims. A second Leopold of Hapsburg marched against the confederates, but was killed at the battle of Sempach, July 9, 1386. After the victory at Näfels in 1388 all the claims of the Hapsburgs were formally resigned under the treaty of 1389.

The adhesion of Berne paved the way for the absorption of French-speaking districts into what had hitherto been a confederation of purely German communities. The next great struggle was that with Charles the Bold of Burgundy, in which the Swiss must be regarded as the aggressors, though the ambitions of the duke of Burgundy

almost warranted the argument that to attack was no more than a necessary mode of defence. Again the Swiss displayed their magnificent fighting qualities by defeating Charles at Grandson, March 3, 1476, Morat, June 22, 1476, and Nancy, Jan. 5, 1477, when he was killed. The overthrow of Burgundy secured the Swiss against their last dangerous enemy, but very nearly brought about a dissolution of the Confederacy through internal discords. The danger was averted, however, by the pact of 1481, which was followed by the admission of more cantons and districts into the league. Actually, though not formally, the Confederacy became independent of imperial control in 1499, and in 1513 the confederation of thirteen cantons—the Switzerland of today—was completed.

Swiss Soldiers as Mercenaries

The Burgundian war had established the reputation of the Swiss as soldiers, and the Confederacy sold the services of its troops, to its own advantage, in the confused wars of the early 16th century. Switzerland played a leading part in the Reformation owing to its independence of external control, which allowed its members to follow their own lines. The Zürich school was founded by Zwingli, a dominant figure in the third decade of the century, and in the fifth decade John Calvin reigned supreme at Geneva, the nursery of the sternest and most uncompromising of the creeds which are called Protestant. In the nature of things it inevitably followed from the individual independence of the separate communities in the Confederation that compromise should be forced upon them as a body, each state controlling religion within its own area. In this sense at least, Switzerland was the home of toleration. Almost secured against external attack by the nature of the country, she was enabled to develop on her own lines, practically unperturbed by the wars which shook Europe; and in 1648, in the peace treaty of Westphalia, the Swiss Confederacy was finally recognized as an independent state.

For the next century and a half Switzerland, though she stood apart from the main current of the European struggles, was greatly influenced by France. Her history was replete with internal quarrels. The French Revolution was in part the product of the political gospel of Jean Jacques Rousseau, himself a Swiss born in Geneva. Switzerland was naturally greatly

affected by it, and the country was filled with revolutionary movements. In 1798 France intervened, and in spite of determined but isolated efforts at resistance, created what was named the Helvetic Republic, with a central government which was practically at the orders of the French Republic.

In 1803 Napoleon took matters in hand, and reorganized the constitution. On his fall the Congress of Vienna in 1815 restored to the nineteen cantons of the Act of Mediation districts which had been annexed by France, raising the number to twenty-two, and the Napoleonic system was dissolved. At the same time the Congress guaranteed permanently the neutrality of Switzerland and the inviolability of her territories. The autonomy of the several cantons was restored, and the central government exercised control only in foreign affairs and matters which were of common interest. The instrument establishing the constitution is known as the Federal Pact of 1815.

The democratic movement, which had received its impulse from the French revolution, was checked by the reactionary settlement of 1815, but one after another the several constitutions of the cantons acquired a more democratic character. Religious quarrels, however, led to the formation in 1843 of the *Sonderbund*, a league of the Catholic cantons, which was suppressed in 1847; the intervention of the Powers in its support was dexterously prevented by Lord Palmerston, enabling Switzerland to settle her own affairs for herself. In 1848 the Federal Pact was revised, and a new constitution was created, under which the central government (federal council) acquired further powers conceded to it by the several cantons. A federal government had at last been established, not under foreign pressure but by the Swiss themselves. Further modifications were made in 1874.

Switzerland's policy during both Great Wars was dictated by her permanent neutrality, which did not prevent her from becoming a member of the League of Nations, the international court of justice, and of Unesco, though not of the United Nations.

LANGUAGE AND LITERATURE. Four languages are spoken in Switzerland—German by about 68 p.c., French by 23 p.c., Italian by 7 p.c., and Romansch by 1 p.c. French is the language of N.W. Berne, Neuchâtel, W. Fribourg,

Vaud, Geneva, and Valais W. of Leuk; Italian of Ticino and part of Grisons; Romansch, a language of Latin origin, is spoken in parts of Grisons, and includes the Ladin dialect in the Engadine; German is the language of the rest of the country. German, French, and Italian are the official languages.

German-Swiss literature begins in the late Middle Ages with war-songs and chronicles, followed in the 16th century by the works, in Latin as well as German, of a group of scholars and humanists, of whom the philologist and naturalist Conrad Gesner (1516–65), and the historians of Switzerland, Aegidius Tschudi (1505–72) and Stumpf (1500–76), were among the

The first French Protestant Bible was published at Neuchâtel in 1535. Later writers, when not theologians, were chiefly devoted to the sciences, and to Swiss history and topography. A French refugee, Louis Bourguet (1678–1743), founded *Le Mercure Suisse* in 1732, its literary section, *Le Journal Helvétique*, appearing six years later. Philosophy is represented by J. P. de Crousaz (1663–1750) and Charles Secrétan (1815–95). Émeric de Vattel of Neuchâtel wrote an important work, *The Law of Nations*, in 1758. H. B. de Saussure (1740–99) is a classic in the literature of the Alps, and Philippe C. Bridel (1757–1845) won fame by his descriptions

Switzerland. Peasants in gala costume. Left, cowherds carrying decorated collars and bells to adorn their animals. Right, a bridal couple

chief, while the Reformation produced the satiric Bernese poet Nicholas Manuel (1480–1530). After long decay, letters revived in 1721 at Zürich with J. J. Bodmer and J. J. Breitinger, critics who championed "nature" under the banner of Shakespeare and Milton against French classicism, and powerfully influenced German literature. Albert von Haller (1708–77) was distinguished in poetry as in science. At Basel Isaac Iselin (1728–83) was a prominent philosopher, and Leonhard Euler and the Bernoullis were great mathematicians. In the 19th cent. J. H. Pestalozzi won world fame as an educational reformer, and in fiction Albrecht Bitzias (1797–1854), known as Jeremias Gotthelf, and Gottfried Keller were subtle delineators of Swiss peasant life, while C. F. Meyer, who was both novelist and poet, chose past ages as the setting for his artistic studies of character.

Of French-Swiss literature there is little before the Reformation, of which the W. Cantons were a stronghold and place of refuge.

of Swiss scenery and life in verse and prose. J. H. Merle d'Aubigné (1794–1872) is the historian of the Reformation.

Bibliography. Switzerland, R. Stead and L. Hug, 1890; State and Federal Government in Switzerland, J. M. Vincent, 1891; The Model Republic, Grenfell Baker, 1895; Scenery in Switzerland and Causes to which it is due, Sir J. Lubbock, 1896; A Sovereign People: A Study of Swiss Democracy, H. D. Lloyd, 1907; The Playground of Europe, L. Stephen, new ed. 1909; Government and Politics of Switzerland, R. C. Brooks, 1920; The Government of Switzerland, W. E. Rappard, 1936; La Constitution Fédérale de la Suisse, 1848–1948, W. E. Rappard, 1948; Neutrality of Switzerland, E. Bonjour, 1948; The English and Switzerland, Arnold Lunn, 1948.

Swivel (O.E. *swifan*, to move, turn). Coupling device which permits one portion of itself to rotate about an axis. The word is also used for something which turns about a pivot, e.g. a swivel gun. A loop through which passes a check rein, and the shuttle of a ribbon loom are also called swivels.

Swiveller, RICHARD. Character in Dickens's *The Old Curiosity Shop*, usually remembered as Dick Swiveller. He is an impecunious, irresponsible, sociably disposed young man, possessing a flow of grandiloquence eked out with quotations from popular ballads. As a clerk in the service of Sampson Brass, he befriends and eventually marries the Marchioness (*q.v.*).

Sword. Weapon of offence in fighting. The history of the sword goes so far back, and is so intricate, that it is impossible to do more than mention the

principal types of weapons in use at different periods. The early sword, as used by Asiatic, Greek, and Roman soldiery, was short, often leaf-shaped and pointed. It was more used as a cutting than as a stabbing weapon.

The swords of the 8th and 9th centuries were longer, and at the time of the Norman Conquest assumed a very ill-balanced form with long, wide blade, short pommel, and cross hilt. This weapon was used only for cutting, and was of no use for thrusting. By the 15th century a new type had evolved with blade tapering to a fine point, adapted rather for thrusting, than cutting, and a long grip. From this type branched off the two-hand sword, often 5 ft. long, which was purely a cutting weapon needing a wide swinging space for its use.

With the 16th century we find sword play developing. With it the hilt of the sword changes, and in place of the simple cross hilt we have a series of guards and counter guards, which are to be seen on rapiers and small swords up to the end of the 17th century. The use of these guards was primarily to protect the hand and do away with the need for the gauntlet of steel, but they also served to entangle the adversary's blade. The rapier and its associated type were mainly thrusting swords, but side by side with these weapons the broad sword, hanger, and cutlass also developed with complex

guards of somewhat similar design. At the end of the 17th century we find usually only one cutting edge, and after this date the blade is usually curved. *See* Africa; Anglo-Saxon Antiquities; Armour; Broadsword; Claymore; Fencing; Joan of Arc illus.; Regalia; Sabre; Scabbard; Scimitar.

Sword Bean (*Canavalia ensiformis*). Climbing herb of the family Leguminosae, native of India, Africa, and tropical America. Its leaves are divided into three large oval leaflets, and the purple, pea-like flowers are borne in long sprays. They are succeeded by scimitar-shaped pods a foot long, containing a number of beans.

Sword Dance.

Dance in which use is made of a sword or swords. Such dances are known in many parts of the world. In the Scottish version, two swords are laid crosswise on the ground, the dancer performing his steps between the blades without touching them. *See* Dancing; Morris Dance.

Swordfish.

Torpedo-reconnaissance aeroplane produced for the Royal Navy by the

Fairey Aviation co. The Swordfish, one of the last biplanes to enter squadron service, first flew in 1934. It was the only operational biplane to serve throughout the Second Great War, and proved extremely versatile. It was designed to carry externally one 18-in. torpedo or up to 1,500 lb.

of bombs as main armament; later, rocket projectiles were often added. The engine was the 750-h.p. Bristol Pegasus, and the maximum speed 138 m.p.h. The wheels were interchangeable with twin floats.

Sword-fish

(*Xiphiidae*). Family of fishes. It is distinguished by having the upper jaw greatly prolonged to

form a sword-like weapon. The fishes range in length from 4 to 15 ft., and the sword is sometimes more than 3 ft. long. The common sword-fish (*Xiphus gladius*) is found on both shores of the Atlantic Ocean. It feeds largely on

Sword-fish. *Xiphus gladius*, showing the strong, sword-like elongation of the upper jaw

Sword. 1. Ancient Greek. 2. Roman legionary sword, A.D. 17. 3. English, c. 1380. 4. Left to right, English, c. 1300; German, c. 1200; Scandinavian, c. 900. 5. State sword of Edward V. 6. German, late 15th century. 7. Two Italian swords, 16th cent. 8. Spanish rapier, 1650. 9. French, 1780. 10. Sword of honour presented by the City of London to Gen. Dwight D. Eisenhower to mark the conferring upon him of the freedom of the city, 1945
1, 2, and 5, British Museum; 3, 4, 6-9 Wallace Collection

cod, but pugnacity leads it to attack larger fish and even whales.

Swords. Northern suburb of Dublin, Eire. About 8 m. from the city, it is reached by rly. and bus, and contains Dublin airport. There are remains of an abbey and a castle, while a round tower still stands. See Round Tower illus.

Sybaris. Greek town in Calabria, S. Italy, on the W. side of the Gulf of Tarentum. Founded about 720 B.C. by Achaeans and Troezenians, it became a great and wealthy trading town, whose inhabitants were so notorious for their love of luxury and soft living that the term Sybarite became synonymous with voluptuary. In a war with the neighbouring city of Croton, 501 B.C., Sybaris was completely destroyed.

Sybel, HENRICH VON (1817-95). German historian. Born at Düsseldorf, Dec. 2, 1817, and educated there and at Berlin university, he settled as a teacher at Bonn in 1841. In 1846 he was made professor of history at Marburg; in 1856 at Munich; and in 1861 at Bonn. In 1875 he became director of the Prussian archives. Sybel was a politician, of liberal views, tempered by a desire to see Prussia at the head of a united Germany. When at Marburg he was a member of the diet of Hesse, and when at Bonn he sat in the Prussian assembly as a National Liberal. He died at Marburg, Aug. 1, 1895.

As an historian Sybel was perhaps the ablest pupil of Ranke. His work shows the influence of the master's methods, but unlike Ranke he willingly allowed his historical knowledge to aid current political theories. He began his writings with *The History of the First Crusade*, 1841. Of his longer *History of the Revolutionary Age, 1789-1800*, he issued a revised edition in 1882. For his greatest work, *The Founding of the German Empire by William I* (Eng. trans. 1891), he had access to all the state documents.

Sybil, OR THE TWO NATIONS. Novel by Benjamin Disraeli, published in 1845. It is a political romance, marred by extravagance and unreality, purporting to show the condition of the people during the period of the Chartist.

Sycamore (*Acer pseudoplatanus*). Tree of the family Aceraceae. A native of Europe and W. Asia, it was introduced into England about 1551. It is a hardy, quick-growing tree, which reaches its full growth of 60 to 80 ft. in about 50 years, though it lives for some 200. Its leaves

are five-lobed and irregularly toothed, the flowers yellow-green, growing in long pendulous racemes. The winged fruit, or samaras, enable it to propagate freely. Its sap contains one part in eleven of sugar. The firm, fine-grained timber is used in the making of furniture, dairy utensils, mangle rollers, etc. The sycamore is also sometimes known as the great maple or false plane.

Sycophant (Gr. *sykophantēs*). In ancient Athens, one who laid false accusations before the courts, in the hope of reward. The class was frequently denounced by the comic poets. The word literally means one who shows figs, but its application is uncertain. In modern use the term means a flatterer or toady, probably because ancient sycophants endeavoured to ingratiate themselves with others by base means. *Pron.* sikko-fant.

Sycorax. Witch referred to in Shakespeare's *The Tempest*. The mother of Caliban, she had been banished from Argier (Algiers) to the island scene of the play. Prospero released Ariel, her onetime servant, from the tree in which she had imprisoned him.

Sycosis OR BARBER'S ITCH (Gr. fig-like ulcer). Inflammation of the hair follicles around the beard and moustache. It is due to infection by pus-producing organisms.

Sydenham. Residential suburb of S.E. London. It is in the met. bor. of Lewisham, on the Kent border, and well connected with London by four rly. stations and by bus. The name of Wells Park Road, Upper Sydenham, recalls a medicinal spring discovered in 1640, the site of which is marked by S. Philip's church. Other churches are S. Bartholomew's and All Saints'. The E. of the dist. is known as Lower Sydenham. The Crystal Palace stood at the S. end of Sydenham Hill. Admiral Bligh, Sir George Grove, Shackleton, and J. L. Baird lived in the district. Pop. approx. 30,000.

Sydenham, CHARLES EDWARD POULETT THOMSON, BARON (1799-1841). British statesman. Born at Wimbledon, Sept. 13, 1799, he spent some years in his father's counting-house, and made several visits to Russia. In 1826 he entered parliament for Dover and be-

came vice-president of the board of trade in 1830. M.P. for Manchester in the Reform parliament of 1832, two years later he became president of the board of trade, where he carried through many useful measures. In 1839 he was appointed governor-general of Canada, and was largely instrumental in effecting the union of the provinces as a sequel to the Durham report, and introduced a central government and constitution. Thomson was raised to the peerage in 1840, but after a riding accident he died Sept. 19, 1841.

Sydenham, THOMAS (1624-89). English physician. Born Sept. 10, 1624, at Wynford Eagle, Dorset, he went to Magdalen Hall, Oxford, but his university career was interrupted by the outbreak of the Civil War, in which Sydenham served on the side of the Parliamentarians. In 1647 he entered Wadham College and studied medicine there and in France. About 1656 he began to practise in London, and in 1676 published his *Observationes Medicae* which brought him a European reputation. *Tractatus de Podagra* (Treatise on Gout) appeared in 1683. He died Dec. 29, 1689. One of the great independent medical thinkers of his time, Sydenham carried out a series of observations on epidemic diseases and introduced new treatments of small-pox and fevers.

Sydney. Name of Australian cruisers. Completed in 1912 and commissioned by the Royal Australian Navy in 1913, the first H.M.A.S. Sydney displaced 5,400 tons, had a speed of 25.7 knots, and a main armament of eight 6-in. guns. On Nov. 9, 1914, she surprised and destroyed the German commerce raiding cruiser *Emden* (g.v.) at Cocos Keeling Island. This was the first action ever fought by an Australian warship. Later attached to Beatty's cruiser squadron in the North Sea, she was scrapped in 1927.

In 1936 the Australian govt. took over from the R.N. the light cruiser *Phaeton*, renaming her *Sydney*. Displacing 6,830 tons on a length of 530 ft. and a beam of 56 ft., she was powered by geared turbines developing 72,000 s.h.p. to give a maximum speed of 32.5 knots. Her armament was eight 6-in., eight 4-in., and

Thomas Sydenham,
English physician

Lord Sydenham,
British statesman

a number of smaller guns. She carried a complement of 550. This second H.M.A.S. Sydney joined the British fleet in the Mediterranean in June, 1940, and on July 19 following, destroyed the Italian cruiser Bartolomeo Colleoni (q.v.) in a running fight N.W. of Crete. The Italian ship was more heavily armed and, five knots faster than the Sydney, was then the fastest cruiser in the world. In Sept., 1940, the Sydney formed part of a squadron that bombarded the Dodecanese. On Nov. 19, 1941, she engaged and sank the German raider Kormoran off the N.W. coast of Australia, but was herself torpedoed and lost with all hands. In 1944 the Australian govt. authorised construction of a cruiser to be completed in 1949 and named Sydney.

Sydney. City and port of Cape Breton Island, Nova Scotia, Canada. Its importance is due to its fine harbour, and adjacent coal mines. Situated 276 m. by rly. N.E. of Halifax, it is a terminus of the E. div. of the C.N.R., also of the Sydney and Louisburg rly. The chief industries are connected with coal mining, the iron and steel trades, fishing, and boat building. Coal is exported. It was founded in 1784 to become the capital of the colony, then separated from Nova Scotia, and so it remained until the two were united in 1820. Pop. 28,305.

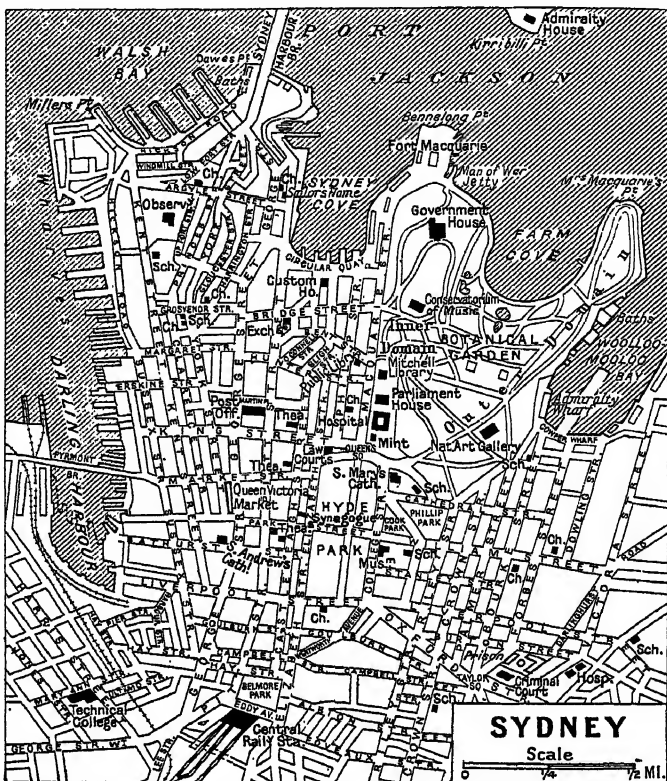

Sydney. Capital of New South Wales, Australia. The principal port and chief fortified naval station of the Australian Commonwealth, commercial and shipping centre for the S. Pacific, and important international airport, it extends 4 m. N. and S. by 3 m. E.

Sydney arms

and W. on the picturesque shores of Port Jackson, one of the finest natural harbours in the world. The mother city of the island continent, it was founded Jan. 26, 1788, by Captain A. Phillip, six days after he had landed at Botany Bay, and was named after Thomas Townshend, 1st Viscount Sydney (1733-1800), who suggested the colonisation of New South Wales, and was colonial secretary when the territory became a British possession. Pop. (1947) 1,484,434.

The site of the old town, 5 m. from the harbour entrance, at the head of Sydney Cove, was chosen because it was near a limpid stream of water, long since covered in, and then or soon after called the Tank

Sydney, New South Wales. Plan of the central districts on the south side of the harbour, showing the principal quays

stream. Its originally irregular and narrow streets are being rapidly replaced by fine buildings, spacious gardens, and wide thoroughfares, the total street mileage of the city proper being over 134 m.; suburbs 2,050 m. The entrance to the harbour, nearly 1 m. in breadth between Middle Head and Inner South Head, faces N.N.E.

The harbour extends 13 m. inland, and covers an area of 13,600 acres, or 21 sq. m., with a coastline of 188 m., so indented that the wharves, 14 m. of them, are close to the heart of the city. Named after Sir George Jackson (1725-1822), secretary to the British admiralty, the harbour is geologically a "drowned valley," has no large rivers bringing down silt, and has a depth of water at the heads of 80 ft., and at the wharves of from 30 ft. to 50 ft. The rise and fall of the tides ranges from 3 ft. to 6 ft., with an average of 3 ft. 4½ ins. In the fairway is a reef running parallel to the direction of incoming and outgoing vessels, leaving two channels of 40 ft. or more at low water. At least fifty vessels the size of the Queen Elizabeth could be com-

fortably accommodated at one time in the harbour. During the Second Great War Sydney was, from Jan., 1945, the h.q. of the British Pacific Fleet. The bridge across the harbour, opened March, 1932, is 2½ m. long, including approaches, with central span of 1,650 ft.; it cost £9,700,000 and contains 52,300 tons of steel. Its deck is 160 ft. wide, and gives a clearance for shipping of 170 ft.

There are several graving docks, including the Captain Cook Graving Dock, opened 1945, which could take the largest vessel afloat; a number of floating docks and patent slips; extensive loading, unloading, and coaling plant; and facilities for storing and loading grain in bulk. The wharves were in private hands until 1901, when the harbour trust was formed. The Sydney harbour authority's annual revenue is £1,380,000. In 1946-47, 3,628 vessels entered, with a net tonnage of 5,836,808; cargo totalling 9,033,487 tons—the heaviest to that date—was handled in the year ending June 30, 1945. The light at the harbour entrance is visible for 30 m.

1. Air view of the main building of the University. 2. Façade of the Mitchell Public Library. 3. Elizabeth Street, looking N. to Circular Quay. 4. Shrine of Remembrance, erected after the First Great War, in Martin Place. 5. Approach to Harbour Bridge from the north. 6. Elizabeth Street, with Hyde Park on left. See also Bridge illus., p. 1424.

Diplomatic service brought more knowledge of the same countries; a book, *Ten Thousand Miles in Persia*, made a success in 1902; and in the First Great War Sykes was sent to Persia to protect British interests. He raised the South Persian Rifles and commanded in the country until the end of the war. His standard *History of Persia* (2 vols.) appeared in 1915, the year in which he was knighted. Other books were *History of Exploration*, 1934; *Quest for Cathay*, 1936; *History of Afghanistan*, 1940. Sir Percy died June 11, 1945.

Syktyka. Capital of Komi-Zyrian (*q.v.*), an autonomous republic of the R.S.F.S.R. It is a centre of the timber and fur trades.

Sylhet. Dist. and town of Pakistan. Since 1947 in the prov. of E. Bengal, the dist. covers roughly the area formerly known as the Sylhet dist. of Assam, some 5,478 sq. m. in the fertile valley of the Surma. Rice is virtually the only crop, since annual rainfall averages over 100 ins. everywhere. Those of the pop. of 3,116,602 who could vote chose to be included in Pakistan in 1947. Sylhet town, on the Surma, has rly. communication with Calcutta and Chittagong. Pop. 19,300.

Syllabus (Lat., list). Literally, an abstract, and therefore a table of contents or a programme. In the R.C. Church the word is specially used for a list of errors officially condemned by the pope. One of the most important was that issued by Pius IX in 1864, which condemned eighty alleged errors or heresies. These covered philosophical speculations, free thought of every kind, Freemasonry and other secret societies, questions relating to the marriage laws, and ethical errors, and liberal ideas generally. Another syllabus, issued by Pius X in 1907, condemned the teaching of modernism under 65 headings. Whether such a pronouncement is to be regarded as an infallible utterance *ex cathedra* by the pope is a matter of dispute among Roman Catholics.

Syllogism (Gr. *syn*, together; *logizesthai*, to reckon). Typical form of deductive reasoning, in which, certain propositions having been laid down, something different from them follows as a necessary consequence: All men are mortal; Socrates is a man; therefore, Socrates is mortal. Every syllogism contains two premises and a conclusion; the major term is the predicate, the minor the subject,

of the conclusion. There are four modes: A (universal affirmative) all men are mortal; E (universal negative: no men are immortal); I (particular affirmative: some men are clever); O (particular negative; some men are not clever). There are also four kinds of figures, depending upon the relation of the middle term to the major and minor. See Deduction; Logic.

Sylph (Fr. *sylphe*, from Gr. *silphē*, a kind of beetle). Fairy-like being holding an intermediate place between the material and the immaterial and inhabiting the air, according to the mythology of the Rosicrucians (*q.v.*).

Sylt. One of the N. Frisian islands. The largest German island in the North Sea, it lies off Slesvig, opposite Denmark and Germany. With an area of 39 sq. m., it consists of a narrow bank 22 m. in length and generally less than a mile wide, with a wider peninsula stretching E. from the middle. Westerland in the middle, the chief village, has rly. connexions with the harbours at the N. and S. ends. Sand dunes fringe the shores, and sea-bathing attracts thousands of visitors normally. After the outbreak of the Second Great War, R.A.F. patrols were maintained over the seaplane bases at Sylt to prevent German aircraft from laying mines in British waters. On the night of March 19, 1940, Sylt was heavily bombed and the Hindenburg Dam, which connects the island to the mainland, was damaged. On May 11, 1945, units of the British 11th armoured division occupied the island.

Sylvester I (d. 335). Pope from 314 to 335. The son of Rufinus, a Roman, many legends have gathered round his name, including the famous forgery, the Donation of Constantine, recording the grants made by Constantine to the pope and his successors in the city of Rome. What is authentic is that the pope was represented by his legates at the council held at Arles against the Donatists in the first year of his pontificate, and that he took part in the council of Nicaea, 325. Sylvester was canonised as a saint, and his feast is kept on Dec. 31, the day of his burial.

Sylvester II (c. 945–1003). Pope from 999 to 1003. The first French pope, his name was Gerbert, and he was born at or near Aurillac (Auvergne), where he received his early education. By the influence of the emperor Otto I he was appointed to the cathedral school at Reims, and was made archbishop of Reims in 991.

Deposed by a synod presided over by the papal legate, Gerbert retired to the court of Otto III, whom he accompanied to Italy. In 998 he was made archbishop of Ravenna by Pope Gregory V, on whose death the following year he was elected pope. Sylvester died in Rome on May 12, 1003. Besides creating a metropolitan seat for Poland at Gnesen, and one for Hungary at Gran, Sylvester is famous for his scientific inventions, which included a pendulum clock and an hydraulic organ. He is also credited with the introduction to the W. of the use of Arabic numerals.

Sylvester, JAMES JOSEPH (1814–97). British mathematician. Born in London, Sept. 3, 1814, he was educated at the Royal Institution school, Liverpool, and S. John's College, Cambridge. Although second wrangler, 1837, he was unable, owing to the fact that he was a Jew, to take his degree at Cambridge until 1872, when religious tests had been removed. He became professor of natural philosophy at University College, London, 1837, professor of mathematics at Virginia university U.S.A., 1841, and professor of mathematics at the Royal Military Academy, Woolwich, 1855. On the foundation of the Johns Hopkins university at Baltimore, U.S.A., he was appointed to the chair of mathematics, 1877. In 1883 he became Savilian professor of geometry at Oxford. He died March 15, 1897.

Sylvine or **SYLVITE**. Native form of potassium chloride obtained from the Stassfurt potash mines. The mineral sylvite, as found naturally, contains about 20 p.c. of potassium chloride. Sylvine has an important use in spectroscopy (infra-red) since it is transparent down to a wavelength of 20 μ except for narrow absorption bands at 3.2 μ and 7.1 μ . See Potassium.

Symbiosis (Gr. *syn*, together; *bios*, life). In biology, term for a kind of partnership between living organisms of unrelated species; taking the form of associated existence for the purposes of mutual nutrition. Plants which live in this manner are dependent in various ways one upon another, and frequently join together in order to attain mutual advantage. One may absorb foodstuffs from earth and air and pass them on to the other; while organic compounds made in the green cells of a plant may be used in addition by the fungus, for example, living on it. Symbiosis is best seen in

the lichens, which are composite plants consisting of algae and fungi. The same phenomenon exists between certain flowering plants and fungi, in which case the fungus supplies water and foodstuffs from the ground, receiving from its partner organic compounds produced in the green leaves. *See* Commensalism; Mycorrhiza.

Symbol. Sign, abbreviation, or conventional mark used to denote an individual or a group, a substance, a process or operation, a relationship, etc. Symbols and symbolism have played an important part in the development of society, of civilization, and of the sciences. Some social symbols, such as crests, flags, seals, etc., were originally identification marks used in an illiterate age; but many of them in primitive communities, and some more recently, acquired a semi-mystical significance, and possessed a special capacity to arouse enthusiasm and to focus social activity. Consider, for example, the immensely wide influence of the Cross as the symbol of Christianity; consider the very different influence during the 20th century of the swastika and of the

hammer and sickle. The study of such social symbols throws a revealing light on problems of social psychology.

Most symbols are not of this social type, but are a specialised kind of shorthand introduced by workers in different fields to facilitate the expression of complicated ideas peculiar to the subject. Thus, in mathematics, chemistry, physics, biology, and social studies such as economics, there is an extensive and ever-growing body of symbols the use of which obviates lengthy verbal statements and enables complex chains of reasoning to be set out briefly, but in a form wholly unintelligible to those who have not mastered the particular notation. The progress of science has been much assisted by these time-saving and distinctive methods of written expression; but the intricacy of such symbolism greatly increases the preparatory study necessary before the non-expert can share their ideas or follow their arguments. Many branches of technology have their own systems of symbols, so that the plans of the technologist or the instruction

sheet of the technician are quite unreadable by the uninitiated.

Scientific symbolism developed first in mathematics; indeed, the progress of mathematics has depended largely on the growth and the aptness of the symbols for expressing either ideas or operations. The Arabic numerals, including the zero, which made possible decimal notation, are of fundamental importance. They gradually came into general use during the period from the 5th to the 16th centuries. The signs + and -, introduced in the 15th century, were not generally adopted until the 17th. The multiplication sign \times was invented by Oughtred in 1631; the division sign \div by Rahn in 1659; the sign of equality = by Recorde in 1557; the symbol $\sqrt{\quad}$ to denote a square root, by Rudolff in 1526; the exponent, to denote a numerical power, such as x^2 , x^3 , by Descartes in 1637; the sign for infinity ∞ by Wallis in 1655. During the 18th, 19th and 20th centuries numerous other new symbols have been introduced, particularly into the specialised applications of mathematics.

SYMBOL. SOME EXAMPLES OF CONVENTIONAL SIGNS USED IN MATHEMATICS AND SCIENCE

Mathematics		Astronomy	
+ (plus)	addition, positive	☉	new moon
− (minus)	subtraction, negative	☾	first quarter
±	plus or minus	☾	full moon
+ve	positive	☾ or ☾	last quarter
−ve	negative	☉	sun
=	equal	☿	Mercury
≠	not equal	♀	Venus
≡	identically equal	⊕	earth
×	multiplied by	♂	Mars
ab	a multiplied by b	♃	Jupiter
b(a+b)	a+b multiplied by b	♄	Saturn
÷	divided by	♅	Uranus
a/b or $\frac{a}{b}$	a divided by b	♆	Neptune
%	per cent	♁	conjunction
‰	per thousand	♂	opposition
√	square root	♂	ascending node
∛	cube root	♂	descending node
a ⁿ	the number a multiplied together n times	Biology	
a ^{−n}	1/a ⁿ	♂ or ♂	male
a ^{1/n}	the n th root of a	♀	female
∴	therefore	♂ ♀	dioecious
∵	because	♂ or ♀	hermaphrodite
∴	divided by	X	hybrid
∴	equals, as	24	perennial
∝	is proportional to, varies as	h	tree
>	greater than	Electricity	
⩾	not greater than	− −	one cell
<	less than	− −−− −	battery of cells
		+	positive, negative poles, etc.

Symbolism (Gr. *symbolon*, a token). Conventional representation of an idea, person, or thing by something else which recalls it by some analogy or association. When employed to represent abstract ideas, or objects which cannot well be portrayed, especially in the religious and moral spheres, symbolism acquires an emotional significance, as with the national flag, the crescent, or the cross.

It is an essential element in primitive, hieratic, and heraldic art. Most of the gods and goddesses in Egyptian, classical, and Indian mythology, and many saints in the calendar, have their appropriate symbols. Early Christian symbolism, of which such examples as the lamb, dolphin, fish, dove, and palm-branch are common in the catacombs, was largely derived from Jewish and pagan sources. Numbers were treated symbolically by many ancient nations, as the Babylonians, Jews, and Greeks; thus to the Jews 7 denoted perfection, 4 the earth, etc. See *The Symbolic Language of Ancient Art and Mythology*, R. P. Knight, new ed. 1902.

Symbolistes. Term applied to the school of French poets, influential in the latter years of the 19th century, who used symbolic methods of expression. In reaction from the Parnassian school of *Hérédia*, *Samain*, etc., who developed a highly finished technique of objective description, the Symbolistes sought to perfect a method of indirect suggestion of ideas. Sources of the movement are found in the work of *Charles Baudelaire* (q.v.), and the master of the school was *Stéphane Mallarmé* (q.v.). See *Parnassians*; *Rimbaud*; *Vers Libre*. Consult *The Heritage of Symbolism*, C. M. Bowra, 1943.

Symington, WILLIAM (1763-1831). Scottish engineer. Born at Leadhills, and educated at Glas-

William Symington,
Scottish engineer
After D. O. Hill

gow and Edinburgh universities, in 1787 he patented an improved form of steam engine, which he applied in conjunction with Patrick Miller to paddle-wheel steamers. In 1802 the *Charlotte Dundas* tug-boat was fitted with a further improved form of Symington's steam engine, which proved highly successful. Although the inventor's ideas were the foundation of modern steamships, he died in poverty in London, March 22, 1831.

Symmachus, QUINTUS AURELIUS (c. A.D. 345-c. 405). Roman orator and author. Educated in Gaul, he became leader of the pagan aristocracy in Rome, was a man of high character, and held several high administrative offices. He pleaded hard against the anti-pagan enactments of the emperor Gratian, urging that "not by one path alone can the great mystery be approached," but was banished for a time from Rome. His extant works comprise panegyrics, epistles, reports on affairs in Rome, and fragments of orations.

Symmetry. In geometry, correspondence of parts with regard to a middle plane, each element of geometrical form having its counterpart on the opposite side of that plane. A sphere is thus symmetrical about any plane passing through its centre, as is an ellipsoid.

In algebra, a function is said to be symmetrical with respect to certain letters, when those letters can be interchanged without changing the form of the expression. Thus $a^2 + 3a^2b + 3ab^2 + b^2$ is symmetrical with respect to a and b , since an interchange of a and b does not alter the expression. Symmetry enables many expressions to be written down at sight in algebra, so tending towards ease of solution of problems, and also enables errors to be detected from want of symmetry.

Symmetry (Gr. *syn*, with; *metron*, a measure). In zoology, correspondence of different parts of an organism about a line or a plane through it. In all the higher animals it will be found that, if the body is divided down the central line of the back, the two halves will be very much alike. If the human body is thus divided, the two halves are exactly alike externally, and mainly alike internally. This is known as bi-lateral symmetry; and in most cases it is indicative of an active life.

In the lower phyla of the animal kingdom this rule no longer prevails. There is no right and left side, but the body is the same all round, being either tubular or more or less globular. See *Anatomy*; *Man*.

Symonds, JOHN ADDINGTON (1840-93). British man of letters. Born at Bristol, Oct. 5, 1840, he was educated at Harrow and Balliol College,

Oxford, where he took the Newdigate prize, and an open fellowship at Magdalen. Severe study led to a breakdown in health, and after settling at Clifton for a time, he had to go abroad. The last 20 years of his life were largely spent at Davos Platz. He wrote under almost constant pain, and often without books of reference, but his output was large, and was remarkable for its picturesque style and for its humanity. He died at Rome, April 9, 1893.

John A. Symonds,
British man of letters

Symonds's first book was *An Introduction to the Study of Dante*, 1872; it appeared in a new edition, as did his last book, *Walt Whitman: a Study*, in the week that he died. His greatest work, *The Renaissance in Italy*, took him 11 years to write, 1875-86; summarised in one vol. by Lieut.-Col. A. Pearson, 1893, it was reissued in 7 vols., 1897-98. His most characteristic effort was the sonnet sequence, *Animi Figura*, 1882. His other books include studies of the Greek poets, *Lives of Shelley*, *Sidney*, *Ben Jonson*, and *Michelangelo*, a volume on Shakespeare's Predecessors in the English Drama, English versions of *Benvenuto Cellini's Autobiography* and *Carlo Gozzi's Memoirs*, and masterly translations of the sonnets of Michelangelo and Campanella. Consult *Life*, H. F. Brown, 1895.

Symond's Yat. Beauty spot on the river Wye in Herefordshire. The Yat, i.e. gate, is a narrow opening, 600 yards across, between two hills at the neck of a meander of the river. Within the river-loop, which is 4 m. long, is a hill, also called Symond's Yat, 740 ft. in height, from which is obtained a magnificent view. See *Wye*.

Symond's Yat. Beauty spot on the river Wye in Herefordshire. The Yat, i.e. gate, is a narrow opening, 600 yards across, between two hills at the neck of a meander of the river. Within the river-loop, which is 4 m. long, is a hill, also called Symond's Yat, 740 ft. in height, from which is obtained a magnificent view. See *Wye*.

Symons, ARTHUR (1865-1945). British poet and critic, born Feb. 28, 1865. One of a London

Arthur Symons,
British poet

group of poets and writers influenced by the French symbolists, he came into prominence with a first volume of poems, *Days and Nights*, 1889. The more widely-

known *London Nights* appeared in 1895. Editor of *The Savoy*, 1896, he became associated with Aubrey Beardsley. As critic, rather than poet his best work was done, e.g. *Studies in Two Literatures*, 1897; *The Symbolist Movement in Literature*, 1899; *Spiritual Adventures*, 1905; *Figures of Several Centuries*, 1916. He wrote also on painting, music, drama, and dancing, and made translations of Hofmannsthal's *Elektra*, and from Baudelaire, Verhaeren, and D'Annunzio. Symons died Jan. 22, 1945.

Sympathy (Gr. *syn*, with; *pathos*, feeling, suffering). The natural, often inexplicable, inclination to share the feelings and sufferings of others, opposed to antipathy. Physiologically, the increase or diminution of the activity of a bodily organ as a result of similar conditions in another bodily organ. The chief connecting links between the two are the nervous and vascular systems. Sympathetic phenomena are common in illness; other instances are the "cracking" of the voice, and sneezing as the effect of light.

Symphony (Gr. *symphonia*, a sounding together). Musical composition, essentially a sonata (*q.v.*) for orchestra. The term was first used to designate the instrumental prelude and interludes in a choral work. The operatic prelude in particular developed into an overture. In the French type there were two slow movements separated by a quick one, but the Italian overture consisted of two quick movements with a slow one between them, and it is from the latter that the symphony developed.

The experiments and searchings after a definite form were gathered up and fixed by Haydn, to whom justly belongs the title of father of the symphony. While in the service of Prince Esterhazy he produced more than a hundred symphonies. Mozart wrote 49, the three greatest being those commonly numbered 39 in E flat,

40 in G minor, 41 in C (the Jupiter). Beethoven composed only nine, but into them he infused a depth of emotion and expression unknown to his predecessors, and perhaps not surpassed by any successor. Other eminent composers of symphonies are Schubert, Schumann, Mendelssohn, Brahms, Bruckner, Mahler, Borodin, Tchaikovsky, Glazounov, Dvorak, Berlioz, Franck, Sibelius, Elgar, Sir A. Bax, R. Vaughan Williams.

A modern development called the symphonic poem owes its origin to Liszt. It differs from the symphony in having for its basis a more or less definite programme, in place of emotional expression or pure thought, its form being modified to suit the programme. The development of both symphony and symphonic poem has been made possible by the improvements in old instruments and the inventions of many new ones. See *Harmony*; *Music*.

Symphoricarpus. North American shrub popularly called snowberry (*q.v.*).

Symposium (Gr. *syn*, together; *pinein*, to drink). Originally in ancient Greece the wine-party that followed a banquet. Plato gave the name to one of his Socratic dialogues represented as having taken place at such a gathering. There is a similar work by Xenophon with the same title. The feature of these works was the expression of opinions by various individuals, and the word symposium has thus come to be applied to any collection of opinions or essays on a particular subject.

Synagogue (Gr. *synagōgē*, a gathering, from *synagein*, to bring together). In the history of Judaism, an assembly of Jews for worship and religious instruction, and hence a building specially set apart for that purpose. Local synagogues were scattered throughout Palestine in early times, but as a focus of national life the institution of the synagogue has been dated from the great exile when the Jews, deprived of the services of the Temple, gathered together for worship and for mutual help.

In time the synagogue was used not only as a place of worship, but also as a court of law by the local sanhedrin or tribunal of elders, and as a school. There was no appointed priest, and the worship, which included prayers and the reading and exposition of the Law and the Prophets, was conducted by the *chazan* or reader with less formality than the Temple services. At the east end was the ark containing the scrolls of the law, the reader's platform, and the perpetually burning lamp.

Modern synagogues retain the essential character of those in the past, though in recent times the tendency has been to restrict them to religious uses. The first synagogue in England was at Oxford in the reign of William II, and as late as the reign of George II there were only two synagogues in the whole of Great Britain. The oldest in England is at Bevis Marks, London, built in 1701 and now scheduled as an ancient monument.

A college of learned elders, known as the Great Synagogue, is

Synagogue. Interior of the Great Synagogue in Aldgate, London, from the west end. This synagogue was destroyed in a German air raid, May, 1941. The chazan in the almemar or pulpit is reading the law at the Sabbath service. All the men in the congregation are wearing tallitot

said to have been founded by Ezra at Jerusalem to secure the codification and exact transmission of the Law and the Prophets with commentaries. As this body is not mentioned in the O.T. or Apocrypha its very existence has been doubted. See Jews; Temple.

Synchrotron. The most complicated and powerful of a number of devices used to accelerate atomic particles to very high energies. One electron or one proton accelerated through 10 million volts would acquire an energy of 10 MeV. Potential differences of this order are, however, unrealizable in practice, and the problem is to achieve the same result by applying a manageable voltage (say 15,000 to 50,000) many times over to the same particle.

LINEAR ACCELERATOR. This consists of a series of electrodes, in the form of metal tubes set in line with short gaps between, and connected alternately to the terminals of a high-frequency oscillator. A source of particles is placed at one end and the whole enclosed in an evacuated cylinder. A positive particle (e.g. a proton or a deuteron) leaving the source when the first electrode is negative is accelerated into it. By the time it emerges the voltage has reversed, the second electrode is now negative, and the particle is again accelerated across the gap. The process continues, so that the particle attains a final energy equal to the voltage of the oscillator (say 50 kV) multiplied by the number of electrodes. Since, however, each electrode has to be considerably longer than the one before, the total number practicable is severely limited.

CYCLOTRON. To overcome this difficulty E. O. Lawrence devised the cyclotron, in which the tubular electrodes are replaced by two flat semicircular boxes or dees (fig. A) set in an evacuated container between the pole-pieces of a powerful electromagnet (fig. B). The vertical magnetic field bends the path of the particles to a semicircle inside each dee; the reversal of the voltage accelerates them across the gap between the dees, and the higher

speed thus attained increases the radius of the semicircle in the next dee. The extra length of the new path exactly balances the higher speed, so that the particles always arrive at the gap just in time for the next reversal of voltage. This condition is known as resonance, and the magnetic field is adjusted till it is reached. "Focusing" the particles in the central plane of the dees is achieved by a slight decrease in the magnetic field towards the edges. The upper limit of energies obtainable is set in the first place by the size of the magnet. With pole-pieces 5 ft. in diam., a field of 10,000 gauss, and an alternating voltage of 50 kV, deuterons make about 160 revolutions and reach an energy of 16 MeV.

SYNCHRO-CYCLOTRON. For higher energies, the decrease in magnetic field required for focusing and the increase in mass of the

particles predicted by the theory of relativity ($q.v.$) as their speed approaches that of light, both lead to an extra lengthening of their semicircular path which is not balanced by a corresponding increase in velocity, so that they arrive late at the gaps and resonance is lost. To meet this the frequency of the oscillating voltage is progressively reduced during the outward spiralling of

Synchrotron. Diagram showing, A, the dees of a cyclotron; B, the electromagnet with the dees box in the lines of force

one batch of particles, then raised again and a new batch brought out. Each batch is collected and held together by an automatic synchronising effect: the particles cross the gaps while the voltage is still rising; any particle slightly ahead of time is therefore subjected to a lower voltage and accelerated less than the average, any particle behind time meets a higher voltage and is hurried on. The Berkeley frequency-modulated (F.M.) or synchro-cyclotron, with pole-pieces 184 inches in diam., a peak voltage of 15 kV, and frequency modulating from 12.6 to 9 Mc/s, can deliver deuterons at 190, protons at 340, and α -particles at 380 MeV.

BETATRON. The cyclotron will not work for electrons, because with their much smaller mass they move much faster and the relativity effect is much greater. In

the betatron or magnetic-induction accelerator a magnetic field is again used to produce a circular path for the electrons (β -particles). The magnet is in the form of an iron yoke with a central bar surrounded by an evacuated glass ring, or doughnut, round which the electrons circulate. Moving electrons are equivalent to a current, and the doughnut acts like the secondary coil of a transformer. The primary coil is wound round the yoke and excited by alternating current. When this is increasing the magnetic flux through the doughnut increases, and induces an increased secondary current, i.e. accelerates the electrons. At the same time the increasing field holds them to a circular (rather than a spiral) course. With a doughnut 74 in. in diam., and a power input of 200 kW at 60 c/s, energies of 100 MeV have been obtained.

SYNCHROTRON. This was first devised for electrons as a combination of betatron and synchro-cyclotron. At the centre is a small betatron which accelerates the electrons to about 1 MeV by magnetic induction. They are then delivered to a wider orbit where they are further accelerated by a frequency-modulated voltage. To prevent them, however, from spiralling rapidly out of the instrument, the current to the electromagnet is made to increase as the acceleration builds up, so that the orbit remains practically circular. The same principle is applied to positive particles in the proton-synchrotron. Here the advantage is that the magnetic field has to be maintained over a narrow circular orbit only (instead of the whole area of the dees). In a proton-synchrotron with an orbit 32 ft. in diam. particles travel in all some 100,000 miles and reach an energy of 1,300 MeV.

Syncline (Gr. *synklinein*, to lean together). In geology, the dipping of the strata inwards towards the axis of an earth fold, producing a trough-shaped or basin-like arrangement of the strata. See Anticline.

Syncope (Gr. *syn*, together; *koptein*, to cut). In music, a temporary alteration of accent effected by prolonging a sound from a normally weak place in the bar over a normally stronger one. The consequent cross accentuation produces a very stimulating effect.

If long applied in all the parts, syncope may result in changing the time, which thus ceases to

be really syncopated though it may look so to the eye. The term, from Gr. *synkopē*, cutting short, originated from an early practice, when black notes were not so much used, of cutting certain of the notes by the bar lines:

Syncope. In language, loss of a vowel or consonant, or even of an entire syllable, in the middle of a word: ev'ry for every, ne'er for never, can't for cannot, since for sithence. *Pron.* sin-ko-pee. *See* Accent.

Syncope. Failure of the heart's action resulting in fainting (*q.v.*).

Syncretism (Gr. *synkretismos*, combination). Union in face of a common enemy, referring to the ancient Cretans who, while continually quarrelling among themselves, resented all outside interference. In theology, it is an attempt to reconcile different religious communions. The Lutheran Calixtus in 1645 formulated a scheme for uniting all Christian parties in a single church.

Syndic (Gr. *syndikos*, one who helps in a court of justice). Word used for an official whose powers and duties vary from place to place. In ancient Greece the syndics were public advocates appointed to represent the state, and in the Roman judicial system they represented corporate bodies in actions at law. In England today the word is used in the university of Cambridge for delegates appointed for certain specific purposes, *e.g.* to look after the university press, etc. In Italy the *sindaco* is the chief official, the mayor, of a town.

Syndicalism (Fr. *syndicat*, organization of workers). Revolutionary movement that originated in France towards the end of the 19th century. It aimed at the transfer of the control of individual industries to the workers engaged in them, this to be brought about by direct action and not parliamentary methods. Syndicalists proposed that the workers should first transform their trade unions into industrial unions by amalgamation; then form a federation of industrial unions and a national federation of trade unions; and finally link these two in a general confederation of labour including all producers and distributors. The general strike, it was thought, would be an all-powerful weapon. A council of representatives from all the unions would administer

national concerns and replace parliament. These ideas underlay the formation of the Confédération Générale du Travail in 1895, and caused a large part of the trade union movement of France to remain aloof from political Socialism. The movement resulted in widespread strikes in 1909; but the outbreak of war in 1914 caused a split, some leaders who had been anti-nationalist now supporting the government. Revolutionary syndicalists in England inspired numerous strikes in 1911; but they made little progress, principally because of the close relationship between the trade unions and the Labour party. Syndicalism expressed itself in the U.S.A., Canada, Australia, etc., through the once famous Industrial Workers of the World. *Consult* Socialism and Syndicalism, P. Snowden, 1913.

Syndicate. A term literally meaning a body of syndics, but now generally applied to a body of persons banded together to carry out some business enterprise, a temporary organization preparatory to a more permanent one. In its more correct signification of a body of syndics, the word is used in the university of Cambridge.

Synecdoche. Figure of speech in which a part is understood to mean a whole. Examples are "hands" for workmen, and "the redcoats are coming," *i.e.* the soldiers. Synecdoche is a special form of metonymy (*q.v.*). *Pron.* sin-ek-dokee.

Syngé, JOHN MILLINGTON (1871-1909). Irish dramatist. Born at Rathfarnham, near Dublin, April 16, 1871, he graduated at Trinity College, Dublin, travelled on the Continent, lived for some time in the Latin quarter, Paris, and went to the Aran Isles and Gal-

J. M. Syngé,
Irish dramatist

way Bay to study the life of the peasants. His work is characterized by great strength and rugged beauty. He combined in his plots extreme realism with intense imagination, and in his dialogue the poetic with the earthy; and achieved great success as a dramatist. The following are his best plays: *The Shadow of the Glen*, 1903; *Riders to the Sea* (one act), 1904; *The Well of the Saints*, 1905; *The Playboy of the Western World*, 1907; *Deirdre of the Sorrows*, 1910. Volumes of poems include

Queens; In Kerry; Beg-Innish; The Passing of the Shee; The Curse; and prose studies, The Aran Isles; In Wicklow; In West Kerry. Syngé died in Dublin, March 24, 1909. *Pron.* Sing.

Syngenesious. Term applied in the description of flowers to the condition in which the anthers of the stamens are united while their filaments are free, as in *Compositae*.

Synod (Gr. *synodos*, assembly). Eccles. term for a meeting of churchmen for deliberation on church affairs. In the early Church a universal synod, to which the bishops of the whole Church were summoned, was usually known as a general or oecumenical council; a national synod was attended by clergy of one nation; a provincial synod was an assembly of the clergy of one province or patriarchate. The convocation of Canterbury is an existing example of the provincial synod. A diocesan synod was convened by the bishop for consultation with his clergy.

Among Presbyterians (*q.v.*) a synod is a court coming between the general assembly and the local presbyteries. Such a synod must include at least three presbyteries, each represented by the minister and one elder. The term has sometimes been applied to assemblies of a more special character, *e.g.* the synod of Dort (*q.v.*). *See* Elder.

Synonym (Gr. *syn*, with; *onyma*, name). Word expressing substantially the same idea as another word. It may have a wider connotation, and coincide with the other word in one of its applications, or it may originally have been identical in meaning, and by the associations it has acquired, or by some other process of differentiation, it may express a slightly different sense. The Teutonic, French, and Latin elements in the English language have made it unusually rich in synonyms; *e.g.* the words kingly, royal, and regal have only slightly different uses. In scientific nomenclature, the term synonym is applied to names of genera, species, etc., which have been rejected in favour of others with better claims. *See* Homonym.

Synovial Membrane. Thin, strong membrane which lines the interior of joints. It secretes a fluid which acts as a lubricant to the joint. Inflammation of the synovial membrane is termed synovitis, and may be due to a sprain or injury to the joint, or to certain constitutional diseases, such as rheumatism or tuberculosis, which must have appropriate treatment. The joint becomes

Synovial Membrane. Diagram of bones and muscles of shoulder joint; the synovial membrane is shown in black

swollen, painful, and hot. Mild attacks are usually relieved by hot fomentations, resting the joint, and applying counter-irritants. In severe cases permanent and extensive changes occur in the joint.

Syntax (Gr. *syn*, together; *tassein*, to put in order). Theory of the proper use and arrangement of words in a sentence. It forms the second great division of grammar, the first dealing with morphology, the theory of word-formation. Syntax may be historical, an investigation of its development in the same language; comparative, the attempt to establish the principles which regulated it in prehistoric times, by the aid of existing languages; descriptive, rules for the proper employment of the individual parts of speech, of cases, moods, and tenses; the theory of simple and compound sentences.

Synthesis (Gr. *syn*, together; *thesis*, placing). Putting of parts together to make a whole; the opposite of analysis. Although used occasionally in the study of language, the word is principally a scientific term, applied to the method of reasoning which starts with elements (axioms, general principles, established truths) and combines them to obtain a new idea or to reveal a fresh relationship or (in chemistry) perhaps to make a new substance. The argument is throughout deductive, applying general propositions to particular cases. Synthesis has been called the method of exposition; analysis, the method of discovery; but synthesis often leads to discovery by indicating the need to correct general principles. See *Analysis*.

Synthetic Material. Product that has been artificially built up from simpler substances, not obtained by extraction from a

natural source. The term is derived from synthesis (Gr., putting together). Synthetic materials are of two kinds: those which in molecular structure are exact chemical duplicates of natural products; and those having properties similar to natural products to which they are chemically dissimilar.

In the first class is quinine, which can be obtained by extraction of the natural substance from cinchona bark, or synthesised from other substances. When analysed, natural and synthetic quinine are chemically identical. Similarly, common salt may be mined from rock salt deposit or evaporated from sea water, or it may be synthesised by reacting hydrochloric acid and caustic soda. Pure sugar from beet or sugar-cane is chemically the same as sugar synthesised from carbon, oxygen, and hydrogen.

On the other hand, neoprene, buna, and other synthetic rubbers, which are basically combinations of lime and coal, closely resemble and for many purposes replace natural rubber; but chemically these products are quite unlike it. Synthetic wool, one variety of which is made from milk, and synthetic leather, bear no chemical relation to fleece or hides. Synthetic silk, from wood cellulose, has a close resemblance to real silk; but chemically bears no relation to the product of the silkworm. The same remark applies to chocolate synthesised from wood, and flour from sawdust.

Coal is one of the chief bases of synthetic materials. From benzol, a distillate of coal tar, is synthesised oil of bitter almonds, used for scenting soap; while toluol, another distillate of coal, yields saccharine, a synthetic sugar. Aniline (*g.v.*), a colourless oily substance, was synthesised from coal tar and yielded dye identical with that derived from the indigo plant. Synthesis of coal tar and its products yields dyes of some 11,000 colours and shades. Cellulose, a fibrous stiffening matter in plant cell walls, provides another basis. Treated with nitric acid, cellulose produces pyroxylin, or cellulose nitrate, from which are synthesised artificial ivory, leather, and sponge. Cotton is synthesised from the fibres constituting the bark of trees, and coal by subjecting plants to intense heat and pressure. Caustic soda can be synthesised from salt and water, and carbon disulphide from sulphur and coke carbon. Most gemstones have been synthesised in the

laboratory, but usually these are more costly than the natural stones.

In some cases the synthetic materials are much more than substitutes; indeed, for certain purposes, they are better wearing and more adaptable than the natural products that they simulate. More than 400,000 new combinations of molecules have been constructed to produce synthetic materials, and millions are theoretically possible. See *Artificial Gem Stones*; *Buna*; *Coal*; *Cellulose*; *Chemistry*; *Neoprene*; *Nylon*; *Plastics*; *Resin*; *Rubber*; *Silk*, *Artificial*; *Wool*, *Artificial*. Consult *Chemistry in the Service of Man*, A. Findlay, 1947; *Synthetic Resin Chemistry*, S. R. W. Martin, 1947.

Syon House or **Sion House**. Seat of the duke of Northumberland. In Middlesex, between Brentford and Isleworth, and facing Kew Gardens, it is a large quadrangular building of three storeys, surmounted since 1874 by the stone lion which once stood on old Northumberland House, near Trafalgar Square. Notable for its gardens, it occupies the site of the monastery of SS. Saviour and Bridget, founded 1415, and suppressed, 1539, by Henry VIII, who used it as a prison for Catherine Howard. The monastery was granted by Edward VI to the protector Somerset, who converted it into a palace and laid out the grounds. In 1604, with the manor of Isleworth, it was granted by James I to the 9th earl of Northumberland and his heirs. The existing structure was attractively remodelled by Robert Adam about 1760.

Syphilis. Contagious disease, formerly called the pox. This disease, most usually acquired during sexual intercourse, is caused by a micro-organism, the *Treponema pallidum* or *Spirochaeta pallida*. Its name is derived from the name Syphilus, an imaginary swineherd in a Latin poem, Syphilus sive Morbus Gallicus, written in 1530 by Hieronymus Frascatorius. There are two schools of thought concerning the origin of the disease in Europe. One thinks that syphilis has developed from the tropical disease yaws, which is caused by an organism indistinguishable from *T. pallidum* and which obtained world-wide distribution with man's earliest migrations from Africa. This school also considers that syphilis has existed for centuries in Europe, being confused with leprosy in early writings. The other postulates that it was

brought from the West Indies by the sailors of Christopher Columbus, after which it was conveyed to the armies of both sides at the siege of Naples in 1495 and, when the army of Charles VIII disbanded, was introduced in rapid succession to most of the European capitals, being taken subsequently to India by Vasco da Gama in 1498 and appearing in Canton in 1505.

The responsible organism, which was discovered by Schaudinn in 1905, is a spirochaete shaped like a corkscrew, which, if a special technique is used, can be seen in material from early lesions. Wassermann in 1906 devised a blood test which is most valuable for diagnosis, though positive results are not obtained in all stages of the disease. Other tests, *e.g.* the Kahn, were evolved subsequently.

The infection is spread by sexual intercourse in the vast majority of acquired cases, though accidental infection may, rarely, arise from kissing or by contact with moist matter from an infected patient. Infection from pipes, drinking vessels, etc., while not unknown, is extremely rare. Infection acquired by tattooing with a contaminated needle, shaving with a contaminated razor, or by blood transfusion are also exceedingly rare, though the entry of the organism through an abrasion (of *e.g.* the finger), if applied to affected parts, or by means of a human bite is less uncommon. Children born of untreated or improperly treated syphilitic mothers may be found to have the disease (congenital syphilis). Subsequent transmission to the third generation, while possible, is very uncommon.

Symptoms of Primary Syphilis

The incubation period, *i.e.* the time from the date of actual infection to the beginning of symptoms, is from 9 to 90 days, usually 3-4 weeks. The first, or primary, stage is the development of a small pimple, which rapidly becomes an ulcer, or chancre, at the site of entry of the organism. The adjacent lymph glands are also characteristically enlarged. The primary chancre is seen on or around the genitalia in 95 p.c. of cases; in extra-genital forms it is usually found on the lips. Sometimes the chancre is apparently absent, or it may be concealed, *e.g.* within the genital passage of the female or about the anus in homosexuals. Diagnosis is achieved by finding the responsible organism in material taken from the sore. The blood test, though helpful, is not absolutely reliable at this

stage, as the blood usually takes a few weeks to become positive and, indeed, about one half of chancres in men are noted while the blood test is still negative.

Even without treatment the chancre will often heal spontaneously and, after a varying period, usually of 4-8 weeks, but possibly as long as six months after the appearance of the sore, the secondary stage is reached. Then there may be a generalised pink or red rash, which usually does not irritate, enlargement of the lymphatic glands, and multiple ulcers, usually smaller than the chancre and sometimes insignificant, on the genitalia and in the mouth. There may occasionally also be headaches, sore throat, hoarseness, loss of hair, painful, red eyes, or pains in the bones. Sometimes the symptoms are so slight as to pass unnoticed by the patient, but the blood test for syphilis is invariably positive in the secondary stage.

Period of Latency

With no or with improper treatment the secondary symptoms will resolve with time and, though in the early years a relapse may occur, the patient enters a period of latency, during which there are no clinical signs of the disease but damage to vital organs may be taking place. This period of latency usually lasts 5-10 years, though it may last only a few months or a lifetime. The next stage is the tertiary, which makes itself apparent in a pattern depending on what structures are affected. Painless lumps (gumata) may develop, which when near a surface may break down into ulcers. These usually affect the skin, but sometimes the mouth or nose is involved with much tissue destruction. Internal organs too are sometimes affected. The main blood vessel leaving the heart (aorta) may be subject to a syphilitic inflammation (aortitis) which may result in angina pectoris or heart failure; while an actual stretching of the weakened aortic wall produces a ballooning of the vessel, which often ruptures, with the instantaneous death of the patient (aortic aneurysm). Sometimes the central nervous system is affected by a syphilitic process of the brain (paresis); general paralysis of the insane or of the spinal cord (locomotor ataxia, *q.v.*). Other forms exist causing blindness (optic atrophy) and deafness.

The congenital form of syphilis is not accompanied by a primary chancre, but the infant develops

symptoms similar to those of secondary syphilis in the first few weeks of life. There is commonly a nasal discharge or signs of nasal obstruction (snuffles), and the bones also may be affected. A latent period follows, and, though the disease may remain latent, tertiary symptoms such as gumata or involvement of the central nervous system may develop after the age of six onwards, usually at puberty, but may be delayed until the patient is in the early twenties or, rarely, the thirties. These late manifestations also include red, painful, sore eyes which may terminate in blindness (interstitial keratitis), deafness, and a swelling of the knees (Clutton's joints). The face is often characteristic and the nostrils may point forward ("opera glass" nose) and the permanent upper central incisors may show notching (Hutchinson's teeth). Affection of the bones (periostitis) is also not uncommon.

Syphilis is usually completely curable in the primary, secondary, and early latent stages, and also in infants. The unborn child may be effectually protected by the treatment of the affected mother. In the later stages a cure is less certain, for though further damage may be prevented, existing tissue destruction cannot always be made good. Much, therefore, depends upon early diagnosis, and a doctor or a venereal diseases clinic (where treatment is free and confidential) should always be consulted whenever any abnormality appears on the genitals.

Methods of Treatment

For centuries prolonged treatment with mercury was used with indifferent results. In 1910 Ehrlich, a German, introduced an organic arsenical compound which he called salvarsan (arsphenamine) and which was injected into the blood-stream with the intention of killing the parasite without injuring the individual. This compound was later improved and rendered less toxic (neo-arsphenamine), and weekly injections of this drug combined with weekly intra-muscular injections of bismuth were, with suitable rest periods, given for at least a year to effect a cure. Penicillin (*q.v.*) was shown in 1943 by Mahoney to be effective against syphilis. This substance is non-toxic, and good results may follow one or more injections daily for one or two weeks. Combinations of penicillin with the older treatment are also used. After the completion of this treatment a

prolonged period of observation, during which repeated blood tests are made, is necessary to exclude relapse. Such a relapse, which might still cause serious after-effects, might be free of symptoms and detectable only by a blood test at a time when prompt action could still effect a cure. Possible involvement of the central nervous system is excluded by an examination of the spinal fluid (lumbar puncture), which should be carried out on all cases before discharge. The period of observation should be not less than two years, though only eight or so visits to the doctor may be necessary in this time.

Congenital forms of syphilis can be almost eliminated by the routine testing of all pregnant women and by adequate treatment before the birth of the child. Premarital examinations are also helpful. The risk of acquiring syphilis increases in proportion to promiscuity, but is reduced by the adoption of prophylactic measures, the most satisfactory for both sexes being the use by the male of a condom during intercourse. In the male the risk may be further reduced by the adequate washing of the genitalia

54 m. by rly. and 32 m. direct S. of Catania, which has superseded it as a seaport. The fine cathedral embodies the remains of a Doric temple; the museum contains a valuable collection of pre-Christian antiquities. Chemicals, salt, wine, and earthenware are the principal articles of trade. Pop. 53,166.

Founded in 734 B.C., Syracuse became the chief Greek colony in Sicily. It grew until the circuit of the city walls was 16 m., and under the tyrant, Gelon, was in 485 B.C. the largest city in Sicily. Hiero defeated the Etruscans in a naval engagement in 474, and the inhabitants repulsed the Athenians who laid siege to the city, 415-413. Dionysius, tyrant after 405, extended his authority over E. Sicily and S. Italy. After a long siege, 214-212, the city was captured by the Romans, and was sacked. Archimedes was killed during the operations. Syracuse was in Gothic possession until 535 A.D., the Saracens destroyed it in 878, and the Normans acquired it in the 11th century. Various ruins attest its great history: 10 m. of the walls, Greek fortifications and a theatre,

Doric temples, a Roman amphitheatre, Roman houses, and Christian catacombs all attract the archaeologist and tourist.

When Allied forces landed in Sicily on July 10, 1943, Syracuse was captured the

first day by units of the 8th army in a combined operation in which glider-borne troops played a part. The Italians offered no resistance, the Germans very little, and the port was secured intact. Though there was scattered damage to churches and palaces, the harbour was found to be free of obstructions.

Syracuse. Third city of New York, U.S.A., the co. seat of Onondaga co. It stands at the head of Onondaga Lake, 150 m. W. by N. of Albany, and is served by several rlys. and the Erie and Oswego canals, which connect it with Lakes Erie and Ontario and the Hudson and St. Lawrence rivers. It is the seat of Syracuse university (1849). Manufactures include motor vehicles, bicycles, typewriters, agricultural implements, foundry and machine-shop products, clothing, chemicals, boots and shoes, furniture, and cement. Once an Iroquois capital, Syracuse was settled in 1805, and known by various names until 1819. In 1825 it was incorporated as a village, and in 1847 became a city. Pop. 205,967.

Syr-Daria (Gr., Lat. Jaxartes; Syr. Sihon). River of Soviet Central Asia. Its headstream, the Naryn, rises W. of the Tien-Shan, in Kirghiz S.S.R., near the Chinese border, and the main river flows 1,500 m., mostly N.W. through Kazakh S.S.R., to fall into the Aral Sea. In parts navigable, it is at other places overgrown and muddy. Before the Revolution it gave its name to a province of Asiatic Russia, which had Tashkent as its capital.

and surrounding parts with soap and water after intercourse, drying on clean linen, and applying a mercury ointment containing 33½ p.c. calomel; but no form of prophylaxis can be guaranteed as certain.

R. E. Willcox, M.B.

Syra or **SYROS**. Island of the Aegean Sea, one of the Greek Cyclades (*q.v.*). It lies S. of Andros and N.W. of Paros. A rocky, mountainous, and barren island with an area of 30 sq. m., it has remains of the old Aegean civilization, and in Syra, or Hermopolis (*q.v.*) one of the chief Greek seaports.

Syracuse (Ital. Siracusa). Seaport of Italy, in S.E. Sicily, capital of the prov. of Syracuse. It is

Syracuse, Sicily. North facade of the cathedral, incorporating the columns of the Doric temple which previously occupied the site. Top, left, remains of the Greek theatre, hewn in the living rock

SYRIA: ANCIENT LAND OF THE LEVANT

Edgar Stern-Rubarth, Ph.D., and Robert Machray

This article first describes the republic of Syria as proclaimed in 1941, and then gives an outline of what Syria has meant historically. See articles on Aleppo; Damascus; Latakia; Orontes, and other towns and physical features of Syria. See also N.V.

Syria (Arab. Esh-Scham) is an independent republic of S.W. Asia. With Lebanon (*q.v.*) it was part of what, from Babylonian days in about the 27th century B.C., was called Suri (the West ?), later Aram by the Hebrews, Retennu by the Egyptians, and later still Suriya by the Turks. Its Arab inhabitants called the area Esh-Scham. This Syria of antiquity comprised the entire land between Asia Minor and the Sinai pen., between the Mediterranean and S. Mesopotamia, embracing N. Mesopotamia.

The Syrian republic covers a territory est. at 54,500 sq. m., a large part of it being desert, El Djésire, and has a pop. of (1943) 2,860,411, including Latakia, with 432,507, and Jebel Druse, with 80,128 inhabitants. Its capital is Damascus, pop. (1943) 286,310; other cities are Aleppo, 320,167, Homs, 100,142, Hama, 71,391, and Latakia, 36,687 inhabitants. More than 80 p.c. of the people are Muslims, of whom the great majority are Sunni Muslims. Druses number c. 160,000; Alawiyya, c. 300,000; Ismailians, c. 25,000. There are some 600,000 Christians.

After the First Great War (*v.i.*), Syria was detached from the Turkish empire and, with Lebanon, was placed under French mandate,

April 25, 1920, by the supreme council of the Allied powers meeting at San Remo, a decision confirmed by the League of Nations. July 24, 1922. At first the two countries were divided into five territories, but in 1925 two of these, Damascus and Aleppo (sanjaks of Hama, Homs, Damascus, Hauran, Aleppo, and Deir ez Zor, and the autonomous sanjak of Alexandretta, *q.v.*), were joined to form Syria. The sanjak of Alexandretta was ceded to Turkey, 1939. The high commissioner, Gen. Dentz (*q.v.*), declared for Vichy in 1940. On June 8, 1941, British and Free French forces invaded Syria, to counteract German influence and infiltration, Vichy forces retiring July 16. Syrian independence was proclaimed by Gen. Catroux, Free French c.-in-c., Sept. 27, and on Dec. 27, 1943, an agreement was signed between the French national committee of liberation and Syria transferring the French powers under mandate to the Syrian govt. from Jan. 1, 1944. The last British and French troops left in April, 1946. Syria was an originating member of the Arab League. (For later history, see N.V.).

The Syrian govt. consists of a president and a cabinet of seven ministers, including the premier, with a parliament elected for four

years. This form of govt. dates from 1930.

The country, bordered on the N. by Turkey, the E. and S.E. by Iraq, in the S. by Transjordan, in the W. by Palestine, Lebanon, and the Mediterranean Sea, is in its western half covered by mts. and hills continuing the Amanus range. These mts. slope steeply to the sea while in the E. they lose themselves slowly in the desert. The Orontes, which crosses the frontier with Turkey, is the chief Syrian river fed by these mts.; those flowing E. ooze away in the desert through which, however, the Euphrates cuts from N. to S.E. The temp. is high in summer, with from four to five months' drought in the W., from eight to nine months in the interior; in winter the temp. is low, and there are rain and snow. Near the coast the vegetation is Mediterranean in type—pines, evergreen oaks, olive trees, fruit-trees, and the vine in the valleys; palms grow only in a few favoured valleys. The fauna is poor, and similar to that of Palestine and Iraq.

People and Products

The pop. is a mixture of many ancient peoples, Sumerian, Phoenician, Hebrew, Druse, etc., with their Arab conquerors; there are Kurds, Armenians, and Turks in the N., Circassians, and, in the E. steppe, pure bred Arab beduins. Though not a good agricultural country (only about 13.5 p.c. of the soil is cultivated), the bulk of the pop. lives on the soil, producing wheat, millet, barley, maize, sesame, and legumes; mulberries, olives, tobacco, citrus fruits, figs, wine, and cane sugar. What little industry there is takes the form for the most part of handicrafts. Silk and embroideries are made in Damascus, some textiles in Aleppo, silk in Latakia. In olden days Damascus was famous for its weaving (whence damask) and its sword-making and cutlery (Damascene blades).

The 450 m. of the Syrian rly. link Aleppo with the Bagdad rly. to the N., and with Damascus and Transjordan to the S. Beirut, capital of Lebanon, serves as Syria's chief port, and is connected by a narrow gauge rly with Damascus. There are some 5,000 m. of roads, usable by motor traffic, and several airports, one of which serves the French Marseilles-Saigon air line.

With its very long history and a prehistoric past producing finds of the early palaeolithic period (caves of Antelias), Syria has long been

Syria. Map of this independent republic of S.W. Asia

studied by archaeologists. Baalbek (Heliopolis), now in the Lebanon republic, Marath, Palmyra, Djerablus (Hieropolis), Zenobia, Rakka, etc. have yielded valuable finds of the many civilizations that followed each other; and Damascus itself that, with an age of 4,000 years, claims the title of the world's oldest city, is rich in traces of its past, though much was lost in 20th cent. bombardments.

HISTORY. A country of the unbalanced geological and geographical nature of historical Syria was unable to develop a unified civilization. Traces of individual, regional prehistoric civilizations are found, however, in what was later Phoenicia—neighbourhood of Beirut—and N. Syria; during the later Palaeolithic period there were frequent exchanges of populations across the land-bridge between Asia and Africa. A population, chiefly Semitic, came under the domination of another ruling race, perhaps the Philistines, who belonged to the Aegean civilization, and from about 2000 B.C. documentary evidence appears, e.g. of the town building empire of the Hyksos. The earliest allusions to Syria, however, are found in the inscriptions of the Sumerian town rulers c. 2500 B.C. Assyrian kings penetrated to the Syrian coast c. 1850 B.C.; Egypt was in trade relations with Syro-Phoenician ports, e.g. Byblos, and after, in the 18th century B.C., the Hittites conquered Syria, Thutmosis I and III gained the whole country to the Euphrates from them, c. 1500.

Emergence of Modern Syria

Present-day Syria became Hittite again 1450 B.C. until, c. 1200, the Aramaeans and, a century later, the Assyrians penetrated into the country. After centuries of fighting, Tiglath-pileser III took Damascus in 732 and turned Syria, similar in size to the present republic, into an Assyrian prov.; Nebuchadrezzar turned it into a prov. of new Babylon; and Cyrus the Elder made it a Persian satrapy. Conquered, in turn, by Alexander the Great, it became the heart of the Seleucid empire with Antioch as capital; and when the Seleucid empire disintegrated, Rome stepped in, and Pompey made Syria a Roman prov., 64 B.C. One of the earliest seats of Christianity, Syria gave its language (Aramaic) and script to many of the oldest Christian documents.

After short interludes during which, e.g., Nabataean and Palmy-

rene kingdoms ruled parts of Syria, and after its last temples, e.g. the great temple to Venus at Baalbek, had been converted into churches by Constantine the Great, Syria was conquered and annexed by the Mahomedan Caliphs in A.D. 636, Damascus in 661 becoming their capital. The crusades, between 1098 and 1268, established several smallish states in Syria, e.g. the principality of Antioch and the county of Tripoli; these gave way to the sultans of Egypt of whom Saladin, 1138-1193, was outstanding. Mameluk and Mongol conquests followed, the latter with terrible devastation, before, in 1516 the Turkish Sultan Selim I conquered Syria. With a short interlude during which Mehemet Ali of Egypt held it, 1831-33, Syria with the other Arab states remained part of the Ottoman empire until 1918.

It was an uneasy possession; the Druse tribes, a Mahomedan sect of their own, fought for their independence in the 17th century and their leader, Prince Fakhreddin, was executed by the Turks in 1635; governing pashas made themselves virtually independent

Syringa. Foliage and flowers of the sweet-scented Mock Orange

of the Sublime Porte; and Christian massacres such as took place in Damascus and in the Lebanon in 1860, provoked intervention by the western powers, giving France a number of special rights in the country. During the First Great War, Syria was the scene of disastrous rearguard battles by the Turkish forces, and was occupied from Oct., 1918, to Sept., 1919, by British and French troops, the latter holding the coastal areas according to the Sykes-Picot treaty of 1916, whereas the British forces, and with them Emir Feisal (see Feisal I) and his adviser, Col. Lawrence, occupied Damascus. An Arab kingdom under Feisal was proclaimed in March, 1920, but French opposi-

tion, leading to armed clashes, forced Feisal to leave Damascus July 25, and the state proclaimed by a Pan-Syrian congress collapsed.

FIRST GREAT WAR. Gen. Allenby, after forcing the Turks out of Palestine in Sept., 1918, advanced through the upper Jordan valley and, after beating down stiff opposition, reached Katana, 12 m. S.W. of Damascus, Sept. 30. Joining there with the Arab army which had captured Hazale, Ezra, and Sheikh Saad, Damascus fell to the combined forces Oct. 1. On the following day, 1,500 Turkish prisoners were taken 17 m. N.E. of Damascus and the remnants of the Turkish army, about 17,000 men, of whom 4,000 were effectives, fled. Rayak, Beirut, Homs, and Tripoli were occupied by Oct. 15. Aleppo by the 26th; Syria was completely occupied before Oct. 31, Turkey signed the armistice under which her troops had to withdraw beyond the Cilician Gates.

Bibliography. Prophets, Priests and Patriarchs, H. Luke, 1927; Nationalist Crusade in Syria, E. P. MacCallum, 1928; Les États de Syrie, Gruvel, 1931; Syria and Lebanon, A. K. Hourani, 1945; Syria, An Historical Appreciation, R. Fedden, 1946; Syrian Pageant 1000 B.C.-A.D. 1945, Castle, 1945.

Syringa. Genus of shrubs of the family Oleaceae, of which the best known is lilac. The mock orange usually known as the syringa belongs to the family Saxifragaceae. A native of the Himalayas, it is a hardy shrub bearing cymes of sweet-scented creamy-white flowers, used as orange blossom. See Lilac.

Syringe (Gr. *syrinx*, pipe). Hand pump for projecting a stream of liquid. It consists in its principal form of a cylindrical barrel in which slides a piston, and which has a nozzle at one end. Syringes for irrigating wounds, etc., comprise a rubber bag, connected with a nozzle by a long tube. See Hypodermic Injections.

Syringomyelia. Disease of the spinal cord. It is characterised by the formation of cavities in the cord and degeneration of the nerves. The most important symptoms are the loss of the capacity to distinguish painful impressions when applied to the skin; progressive wasting of the muscles; and neuralgic pains in the limbs.

Syrinx. In Greek mythology, a nymph of Arcadia of whom the god Pan became enamoured. To escape his violence she prayed the gods to change her into a reed. Her request was granted, and Pan made him-

self a pipe of the reed into which she had been changed.

Syrmia. Dist. of Yugoslavia, comprising the E. portion of Slavonia between the Danube and the Save. Vukovar is the chief town.

Syrup (Arab. *sharab*, beverage; cf. *sherbet*). Term loosely applied to any liquid holding sugar in solution. Sugar syrups are often flavoured with the juice of fruits, and in France and other countries fruit *sirups*, flavoured with raspberries, gooseberries, currants, strawberries, lemons, or oranges, constitute an article of commerce. The syrup used in pharmacy is a more or less saturated solution of refined sugar. See *Shrub*; *Sugar*.

Systole (Gr. *systellein*, to draw together). Phase of the heart-beat during which the heart muscle is in a state of contraction. It is thus the opposite phase to diastole (*q.v.*). Rhythmic contractions of the heart are due to impulses originating in the right auricle. See *Heart*.

Szygy (Gr. *syn*, with; *zygon*, yoke). Point in the moon's orbit when it is in conjunction or in opposition, i.e. when it is in a line with the earth and the sun. The moon is in *szygy* when it is new or full. *Pron.* Sizijy.

Szamos or **SOMESUL**. River of Rumania. It rises in the N.W. of the plateau of Transylvania in two headstreams, the Great and Little Szamos, which unite at Dés (Dej), whence the river flows N.W. to join the Theiss (Tisza) after a total course of about 300 m.

Szarvas. Town of Hungary, in the co. of Bekes. It stands on the left bank of the Körös, 85 m. S.E. of Budapest, and is a market town and agricultural centre on the Alföld. Pop. 29,000.

Szczecin. Polish name for the Baltic port of Stettin (*q.v.*).

Szechwan or **SZICHUAN**. Large inland prov. of China. Its name means four rivers, and these are perhaps the Min, To, Fu, and Kiating, which flow N. to S. into the Yang-tse; but that river also crosses the prov., and in the S.W. are the Yalong and tributaries. The surface of Szechwan is divided into (1) the Red Basin, a plateau with a thick layer of red sandstone in the central and E. portions, forming a fertile area about the Chengtu plain; (2) a series of mountain masses, which reach 16,000 ft. in the W. and are generally above 12,000 ft.

Winter is mild enough for cereals to grow, and the summer monsoon allows of rice cultivation. Tung oil is a leading product, and others are

beans, potatoes, sugar, tobacco, and white wax. Mineral wealth is potentially great but little exploited. Gold, silver, lead, antimony, iron, coal, and salt are mined.

Chengtu is the capital of the prov., while Chungking was the wartime capital of China, 1938-46. Other cities are Wanhhsien, Kiating (Loshan), Kweichow, and Tzeliutzing. Area, 144,996 sq. m. Pop. 45,845,804.

Szeged. Second city of Hungary. It stands on the right bank of the Theiss (Tisza), just below its confluence with the Maros, 118 m. by rly. S.E. of Budapest. The town hall is a fine rococo structure; the Gothic cathedral and the museum are other buildings of importance. There are a university and an appeal court. The Franciscan monastery has a fine library and a museum of antiquities. Iron bridges connect the old town with a new suburb across the river, which carries a large trade by barges. Soap, paprika, paper, salt, and cloth are manufactured.

Szeged is the chief commercial centre of the Alföld. The river bank is lined with quays, and the city is protected from floods by a great dike. In 1879 the old town was mostly destroyed and 2,000 people lost their lives in a disastrous inundation. Rlys. from the Alföld converge on the city, which is the main junction in S.E. Hungary for Rumania and Yugoslavia. It was fortified by the Turks, who held it for 160 years before 1688. The Russians captured Szeged, Oct. 11, 1944, during their advance on Budapest.

Szentes. Town of Hungary, in the co. of Csongrád. It is 28 m. by rly. N. of Szeged on an affluent of the Theiss (Tisza). Formerly frequently damaged by river floods, it is now well protected by dikes. It is an important agricultural centre on the Alföld. Pop. 32,000.

Szent-Györgyi, ALBERT (b. 1893). Hungarian biochemist. Born in Budapest, Sept. 16, 1893, he completed his medical training there before being wounded in the First Great War. Having been an assistant or research worker at several European universities and held a chair at Groningen during 1922-26, he came to Cambridge for four years. Returning to his own country, he was a professor at Szeged until 1938, when he received the chair of biochemistry at Budapest. His research work led to the first production of pure vitamin C, the anti-scorbutic element in many foodstuffs; and knowledge of vitamin H. It also

brought him the Nobel prize for medicine, 1937.

Szeredi, JUSTINIAN GEORGE (1884-1945). Hungarian ecclesiastic and scholar. Son of a stonemason, he was born at Deaki, April 23, 1884, and educated at Rome university. One of the world's leading authorities on canon law, he was on the commission which prepared a codification of that law. In 1927 he became archbishop of Esztergom, and later primate of Hungary and cardinal archbishop. Towards the end of the Second Great War he was interned by the Germans, and died March 29, 1945.

Szigeti, JOSEPH (b. 1892). Hungarian violinist. Born in Budapest, Sept. 5, 1892, he studied under Hubay, and made his début at 13. He toured England with Busoni, Melba, and McCormack, and was professor at Geneva conservatoire, 1917-24. The first of many American tours, 1925, preceded several world tours. A dazzling technique allied to power of dramatic interpretation made him acclaimed one of the world's leading violinists. He published violin transcriptions of many works; also his memoirs, *With Strings Attached*, 1947.

Szolnok. Town of Hungary, capital of the co. of Jasz-Nagykun-Szolnok. It stands at the confluence of the Zagyva with the Theiss (Tisza), 57 m. S.E. of Budapest, and is a rly. junction. It trades in agricultural produce by rly. and steamboat. Troops of Malinovsky's army captured Szolnok, Nov. 4, 1944, during his advance on Budapest. Pop. 29,000.

Szombathely. Town of Hungary, in Vas co., 32 m. S. of Sopron, on several rlys. Its fine cathedral is the seat of an R.C. bishop. On the site of the Romans' capital of Pannonia, the town shows many relics of their occupation. Around it is a district yielding wine and crops; it makes agricultural machinery and textiles, and has flour mills and sawmills. Pop. 34,700.

Szymanowski, KAROL (1883-1937). Polish composer. Born at Timoshovka, Ukraine, Sept. 21, 1883, he studied at Warsaw conservatoire under Noskowski, winning a first prize for composition in 1905. During the First Great War he was imprisoned in Russia; having escaped, he became professor of composition and director of the state conservatoire at Warsaw, 1922. He died at Lausanne, March 29, 1937. He composed a *sinfonia concertante* for piano and orchestra; two violin concertos; two operas, *Hagith*, and *King Roger*; and much piano music.

THE direct ancestor of the modern letter T was the ancient Phoenician and Hebrew *tau*, meaning simply a mark, and therefore the very simplest and to this day the most common form of mark, namely a cross, **X** or **†**. Probably this is the mark referred to in Ezekiel 9, v. 4. The Greeks, who also called the letter *tau*, regularised the vertical and horizontal nature of the two strokes and moved the horizontal to the top, though in the earliest Chaldean inscriptions it is sometimes found at the foot of the vertical,

thus: **└**. The small, or lower case, t reverts **└** to the intersecting cross, and is derived from the minuscule form used in Latin manuscripts. For the sake of speed the cross bar was written first, from right to left, the pen being then taken back in a curve, without leaving the paper, to a point above the centre of the cross bar ready for the downward vertical stroke. This characteristic curve of the pen has been retained in the t of the printed type, as has the curved **└** stroke has modern base.

T Twentieth letter of the English and Latin alphabets. It is a hard dental or teeth-sound, to which the soft *d* corresponds. Its normal sound, that of *t* in *tent*, is considerably modified by the accent. Before long *u*, after an accented vowel, it takes the sound of *ch*, as in *nature*. In *mature*, however, the accent is on the last syllable. Before *ia*, *io* it takes the sound of *sh*, as in *partial*, *cautious*, unless *s* precedes, as in *digestion*, *question*, although here some prefer to pronounce *queschun*. T is frequently silent between two consonants, as in *castle* and *listen*.

In combination with *h* it forms what is really a separate sound with two distinct forms, one hard, the other soft, e.g. *think*, and *smooth*, corresponding to those of the modern Greek *θ* and *δ*. As a rule, *th* is hard at the beginning and end of words, although there are many exceptions, e.g. *the*, *this*, *then*, *booth*, *smooth*. Between the vowels, it is generally soft in words not originally Greek or Latin, e.g. *leather*, *mother*, *together*, but hard in those that are, e.g. *author*, *catholic*. In a few words from the French, e.g. *Thomas*, *thyme*, it is a simple *t*. See Alphabet; Phonetics.

Taal (Dutch, language). Name formerly given to Afrikaans (*q.v.*), the language spoken in S. Africa by Europeans of Dutch origin.

Tabard. Official cloak worn by heralds, and also by trumpeters and drummers of the British household cavalry when in full uniform. A tabard possesses broad front and back parts, with wings covering the shoulders. In the heralds' tabard the back and front parts and shoulder wings are emblazoned in the proper tinctures with the royal arms; in that of the trumpeters and drummers they are embroidered with the royal badge and cipher. See Herald.

Tabard Inn, THE. Ancient hostelry in Southwark, near the S. end of London Bridge. It is famous as the inn from which Chaucer's Canterbury Pilgrims set out on their journey to the shrine of S. Thomas. After the Great Fire of 1666 it was rebuilt as the Talbot, but its last vestiges disappeared in 1873. See Canterbury Tales.

Tabasco. Maritime state of Mexico. Bordered N. by the Gulf of Campeche, it is watered by the Usumacinta and Grijalva rivers,

and covers an area of 9,782 sq. m. Agriculture is the staple industry, rice, maize, sugar, cacao, and vanilla being produced. The capital is Villa Hermosa (San Juan Bautista). Pop. 285,630.

Tabernacle (Lat. *tabernaculum*, a small hut). In Israelite history, the tent set up by Moses at Sinai, and used as a sanctuary during the wanderings. According

Tabard Inn. Courtyard of the old London hostelry, rebuilt and renamed the Talbot after the Great Fire from a drawing about 1780

to the oldest source, the Elohist narrative in Ex. 33, Moses set it up far from the camp, and entered it to commune with the Lord.

Post-exilic writers describe the tabernacle as an elaborate structure constructed of costly materials provided by free-will offerings. According to these documents, Ex. 25-27, 30, 31, 35-40, Num. 3, 4, 7, the tabernacle stood in the midst of the camp, surrounded by a fenced enclosure, containing an altar and laver of bronze. The tent itself, an oblong structure, had three sides boarded, and the E. side hung with curtains, while the top was covered with sheets of various materials. The larger part of the tent, called the Holy Place, contained the golden altar of incense, table of shewbread, and golden candlestick. The inner part, or Holy of Holies, screened by a veil, contained the ark (*q.v.*), and was entered only by the high priest, on the day of atonement. The

Tabernacle. Reconstruction, according to post-exilic writers, of the sanctuary set up by Moses and carried by the Israelites throughout their wanderings in the wilderness

Table. 1. Carved oak refectory table, length 9 ft. 3 ins. 2. Oak octagonal gateleg, 17th century. 3. Circular mahogany, early 18th century. 4. Carved and inlaid walnut, late 17th century. 5. Breakfast table, mahogany, mid-18th century 1. By courtesy of Gill & Raigate; 2-5, Victoria & Albert Museum, S. Kensington

tabernacle was served by priests, and the Levites took it to pieces and carried it when the people journeyed.

In the R.C. church the tabernacle is the name given to the receptacle for the consecrated Host. The name is also applied in cognate senses to a niche for an image, a reliquary, and the abbot's stall. *See* Jews; Monstrance; Temple.

Tabernacles, FEAST OF. Hebrew festival celebrating the completion of the harvest. Also called the feast of ingathering, it was kept for seven days in Oct., during which worshippers lived in booths of green boughs, perhaps in allusion to those used by labourers in vineyards. All males were commanded to keep the feast in Jerusalem, but it was not regularly observed before the exile (Neh. 8, c. 16). Besides the harvest it commemorated the wanderings of Israel in the wilderness. The festival was an occasion of popular merry-making, and is still observed by orthodox Jews (Lev. 23, Num. 29, Deut. 16, 31). *See* Feast.

Tabgha Skull. Human skull found at Tabgha, Palestine. Discovered in 1925, it is that of an adult male and has been estimated to be more than 50,000 years old. It represents the long-headed or dolichocephalic type, the oldest human race in Europe, and is similar to the Neanderthal remains

found near Düsseldorf in 1859. *See* Anthropology.

Tablature. System of musical notation used from the 15th to the early 19th centuries for certain instruments. There were two principal varieties. One, employed for the organ and clavier, chiefly in Germany, indicated by letters the notes to be played, the different octaves and chromatic inflections being shown in various ways. The time values, suggestive of the stems and crooks of our quavers and semiquavers, etc., were placed above the pitch letters. The other kind of tablature, much more generally used, indicated where the finger should be placed on the fret, stop, or key, and its exact signification therefore depended on the number and tuning of the strings on the lute or other instrument.

These strings (or holes in the case of a pipe) were represented by lines, on which were written either numbers 1, 2, 3, etc., or letters a, b, c, etc. Both had the same meaning, and were not the names of notes. Time values were shown as above. Guitar tablature began similarly, but in the early 17th century a kind of shorthand system was introduced, by which whole chords were indicated.

Table (Lat. *tabula*). Smooth, flat, elevated surface on which articles can be placed. The word is used mainly for an article of

furniture, and by extension for the provisions placed thereon. There are various compounds, some, e.g. tablespoon, associated with the furnishing of the table for meals. The altar, or communion table, is sometimes known as the Lord's Table (*see* Altar). Table money is an allowance granted to officers of high rank in the army, navy, and air force to enable them to discharge the duties of hospitality in their official capacity; also the fee paid by a visitor playing at a bridge or other card club. Table is also used for a hard surface on which something is written or engraved to form a permanent record, for instance the Ten Commandments or the Twelve Tables. (*See* Decalogue; Twelve Tables.)

Tables of the Roman patricians were made of precious woods, finely inlaid, or of bronze. English tables were quite narrow at first, people sitting down to meals on one side only. Smaller tables were more solid, occasionally lavishly decorated. In the Jacobean period, tables were of solid oak, with moulded edges and heavily carved legs. Under Charles I wings were added, which gave rise to the gatelegged type. Pier-tables, or consoles supporting mirrors, are side tables, often bowed, with projecting bracket legs, which originated in the Italian Renaissance. Characteristic examples of the Louis

periods had heavily carved brackets in the form of acanthus leaves or human figures. Those of the Empire and of the Adam brothers were of classic style. Later came folding and combination tables. The dining table which could be extended by a screw to take in an extra "leaf" or leaves was characteristic of the 19th century. As with most domestic furniture, the 20th century trend has been towards austere simplicity of design, the only innovation being the sliding extension to the small dining table, and the introduction of steel. On the other hand there have been various adaptations of older models, especially of the Jacobean refectory table. *See Furniture.*

Tableau-Vivant (Fr., living picture). Motionless representation by living persons of scenes from history, mythology, or fiction, or of noted pictures or statuary. It is said to have been invented by Mme. de Genlis (1746-1830).

Table Bay. Bay of the Cape Peninsula, S. Africa. On the N.W. side, it was first visited by Antonio de Saldanha in 1503 and called Saldanha Bay. The first English ships to visit the bay arrived in 1591, and the first Dutch in 1595. From 1620 onwards Table Bay became a port of call for ships proceeding to the E. On the S. side of the bay is Cape Town, and farther S. lies Table Mountain.

Tableland. Elevated stretch of level or flat land. Central Spain, Arabia, Southern India (the Deccan), and the Sahara Desert are all examples of tablelands. *See Plateau.*

Table Mountain. Name of several mts in South Africa. (1) Mt. at the N.W. end of the Cape Peninsula, 3,582 ft. high and 1 m. long. The summit is flat, and was first ascended by Antonio de Saldanha in 1503. Dense white clouds frequently overhang the summit during the summer, forming the so-called "tablecloth." (2) Mt. in Natal, E. of Pietermaritzburg, between the Umgeni and Inanda rivers. (3) Mt. in the Orange Free State, 8,000 ft. high. Also called Platberg and Thaba N'Chu, it is about 3 m. E. of Harrismith. *See Cape Town.*

Tables. Any collection of data arranged in tabulated form for easy reference. Such are the tables in ready reckoners, multiplication tables in arithmetic, and tables of logarithms. Astronomical tables are tabulated data for the prediction of movements of the heavenly bodies. The earliest were the Hakimite Tables of the planets com-

puted by Ibn Junis, of Bagdad (950-1008), and named after the Caliph Hakim. Kepler published in 1627, at Ulm, the Rudolphine Tables, which remained an authority for more than a century, and have in principle never been superseded. Lunar tables are lists of numerical data of the elements of the moon and of the moon's orbit, used for calculating the position of the satellite. *See Nautical Almanac.*

Tablet, THE. London weekly R.C. newspaper and review. It was established, May 16, 1840, under the editorship of Frederick Lucas (1812-55), and was edited 1884-1920 by J. Snead-Cox. Douglas Woodruff became editor in 1936.

Table Talk. Title of several notable volumes of things said on many themes by great men and recorded by their admirers. Such are: Table Talk of Martin Luther, edited by J. Aurifaber, 1566; Table Talk of John Selden, by his amanuensis, Richard Milward, 1689; and Table Talk of Samuel Taylor Coleridge, by his son-in-law, H. N. Coleridge, 1835.

Table Tennis or **PING-PONG.** Indoor game, based on lawn tennis. It is played on a table of standard size, 9 ft. by 5 ft., with a net 6 ins. high. The ball must weigh not less than 2.40 grammes nor more than 2.53 grammes, and must be not less than $4\frac{1}{2}$ ins. nor more than $4\frac{3}{4}$ ins. in circumference. The racket can be of any material, size, or weight, provided it is not white and does not reflect, but the type in popular use is of rubber-covered wood.

In the late 19th century several kinds of indoor tennis were played on tables. A British patent taken out in 1891 by James Gibb refers to cork balls, clamp posts, and wooden rectangular rackets covered with some kind of cloth to give a twist to the ball. The game played with this equipment was completed by the scoring by one player of 21 points, as in table tennis. Gibb also introduced the celluloid ball. It was the sound that this ball made when patted slowly backwards and forwards over the net which led to the name of ping-pong. From 1899 to 1904 ping-pong, played with long-handled, vellum-faced rackets, became a craze in the U.K. There were few homes in England without a set. Then suddenly it died; and apart from a sudden burst of interest in central Europe 1905-10, the game remained dead until 1921, when the Ping Pong Association was revived. In 1922 this became the Table Tennis Asso-

ciation, and in 1926 the English Table Tennis Association. The association favoured the use of the rubber-faced racket, which had been tentatively used towards the end of the earlier craze. In 1926 an International Table Tennis Federation was formed.

Within a year the Hungarian players proved themselves unbeatable with the new type of racket, and maintained their leading position until the Second Great War. The greatest exponent of the game, Viktor Barna, was a Hungarian who became a naturalised British subject. World table tennis championships at Wembley in 1948 received entries from 28 nations, and attracted an audience of 20,000. Players from Czecho-Slovakia established themselves as holders of top place in world ranking, with the U.S.A. second, England third, and Hungary fourth. Individual champions were (women) G. Farkas, Hungary; (men) R. Bergmann, a naturalised British subject. England had not produced a world champion since Fred Perry, lawn tennis player, in 1929. In England in 1948 there were 260 leagues and 5,000 clubs, with a combined membership of 100,000.

In a game each player has the service five times in succession. The ball must not be volleyed, but must bounce both in the server's court and in the receiver's court before being returned. As already stated, the game is won when one player has scored 21 points, but after a score of 20-all the winner must score two clear points. The game has become a strenuous athletic contest.

Table Turning. Practice, sometimes called typtology, formerly common at spiritualist séances, and often pursued as a social amusement. Two or more persons sit round a light table with the tips of their fingers laid on it. The table presently gives spasmodic jerks, spells out sentences by tapping the floor repeatedly, while one of the persons recites the alphabet, and sometimes it turns round or moves about. Faraday demonstrated that it is often due to unconscious muscular action on the part of the sitters. *See Séance; Spiritualism.*

"Tabloid." In the U.K. a proprietary name for a small medicinal tablet or lozenge. In the U.S.A. the word is not proprietary, and has been applied not only to a medicinal tablet, but by analogy to newspapers presenting the news in highly concentrated and stimu-

lating form, the more readily as such papers are almost all of smaller size than the usual.

Taboo or **TABU**. Polynesian word denoting persons, places, things, or acts which are to be shunned. In anthropology, it embraces all prohibitions enforced by magico-religious sanctions, fortified by fear of ill-luck, disease, or death. The primal taboos were essentially totemic in nature and origin.

Taboo came to concern itself with other vital crises, especially childbirth and death, and when kingship and priesthood emerged it was utilised for protecting property and privilege. The violator of a taboo is himself taboo, lest his transgression should become contagious. The principle is encountered in Melanesia, Siberia, Madagascar—where it is called *fady*—and W. Africa. Linked in early Semitic society with religious sanctions, it became the basis of the Mosaic sanitary law. *See* Anthropology; Society; Totemism; *consult also* The Golden Bough, J. G. Frazer, 1907-15; Totem and Taboo, S. Freud, Eng. trans., 1919.

Tabor. Small drum associated in rustic music with the pipe (*q.v.*). It is usually about 6 or 7 ins. deep and about twice that in diameter. Hung on the performer's left wrist, it is struck with a small stick.

Tabor. A town of Czechoslovakia, in Bohemia. It is 65 m. by rly. S. of Prague on the main line to Vienna. In the Ring Platz is a statue of Zizka, on its W. side the gabled Rathaus (1521), and on its N. side one of the stone tables at which the Taborites used to partake of Communion in the open air. Pop. 14,251. *See* Hussites.

Tabor. Mt. of Galilee, the traditional scene of the Transfiguration (*q.v.*). It is 1,840 ft. high, about 6 m. E. of Nazareth, and is known as Jebel et Tor.

Tabora. Town in Tanganyika Territory. It is a junction on the rly. from Dar-es-Salaam, which lies 530 m. E.S.E., to Kigoma on Lake Tanganyika and Mwanza on Lake Victoria. It is an ancient Arab centre, and as the meeting place of seven roads was formerly a great place for caravan traffic. Tabora was an important German settlement before the First Great War, during which it was taken by Belgian troops, Sept. 19, 1916. Pop. approx. 30,000.

Taborites. Extreme section of the Hussites, who were opposed to the Calixtines or moderate section. *See* Bohemia; Bohemian Brethren; Calixtines; Hussites.

Tabouis, GENEVIÈVE. French journalist.

Daughter of the painter Le Quesne, she was educated at the convent of the Assumption, the faculty of letters, Paris, and the archaeological school of the Louvre. In 1916 she married Robert Tabouis, and after the First Great War became a journalist specialising in international politics. In 1924 she was League of Nations correspondent of La Petite Gironde and Le Petit Marseillais, and became chief diplomatic correspondent of these papers and of L'Oeuvre in 1932. Her outspoken comments on the emergence of the Nazis attracted international attention, and upon the defeat of France in 1940 she went to the U.S.A. She wrote mainly on international affairs, but three early historical works were awarded prizes by the French academy.

Tabriz. City of Persia, capital of the province of Azerbaijan. Said to have been built by the wife of Haroun al Raschid in 791, it lies about 350 m. N.W. of Teheran, is a commercial centre, and exports raisins, cotton, the locally made carpets, and matches. Shortly before the First Great War it was connected by rly. with Caucasus, and thus linked with the Russian rly. systems. Its chief building is a fine Persian

mosque, and there is an appeal court. Pop. 214,000.

During the Persian revolution of 1909 the royalists besieged Tabriz for several months, but it was relieved by a Russian force, who occupied the city until the beginning of the Caucasus campaign in 1914. The Turks seized it in Jan., 1915, but evacuated it at the close of the month. Abandoned by the Russians early in 1918, it was again seized by the Turks. In 1922 it fell to Persian insurgents aided by Caucasian Bolsheviks, soon to be recovered by Persian troops. In the Second Great War, Russian troops crossed the Persian frontier Aug. 25, 1941, and occupied Tabriz next day, remaining there until May, 1946. During the revolt of 1945 in Azerbaijan the insurgents seized Tabriz Dec. 15, and held it until govt. troops re-entered the city Dec. 13, 1946. *See* Persia.

Tacanas. Group of S. American Indian tribes on the Madre de Dios river, Bolivia. Their dialects are derived from the Panos (*q.v.*), although they represent a lower culture.

Taché, ALEXANDRE ANTONIN (1823-94). Canadian missionary. Educated at Quebec and Montreal, he became a missionary of the Oblate Fathers and did valuable work among the Indians of the North-West and the Great Lakes. He was enthroned bishop of S. Boniface, Manitoba, in 1853, the see being raised to archiepiscopal rank in 1871. Taché described his experiences in the N.W. in *Esquisse sur le Nord-Ouest de l'Amerique*, 1869.

Táchira. State of Venezuela. It lies S.W. of Mérida, S. of Zulia, and borders on Colombia. It produces coffee, cocoa, sugar, rice, tobacco, and vanilla. Silver, copper, iron, and coal are mined. San Cristóbal is the capital. Area, 4,284 sq. m. Pop. 245,722.

Tachometer (Gr. *tachos*, speed; *metron*, measure). Instrument for registering small variations in the velocities of machines. One such instrument consists of a mercury tube and bulb which is whirled round by the machine. Centrifugal action causes the recession of the mercury in the tube, and the degree of its descent (or ascent) measures variations in the running speed.

Mme. Tabouis,
French journalist

Alexandre Taché,
Canadian missionary

Tabriz, Persia. The ancient citadel, known as the Ark, which commands the city from the south-west

For measuring the angular speed of a revolving shaft there is a device similar to a small Watt governor. The spindle of the governor is horizontal and driven by the shaft. As the weights fly out, their movements are resisted by a spring, and the resistance is read by means of a moving needle round a graduated dial. A speedometer (*g.v.*) is a variety of tachometer.

In the vibrating reed tachometer there is a series of calibrated steel reeds of different lengths having one of their ends fixed in a brass block. When the instrument is subjected to the vibration of a machine one or more reeds show a visible response.

Tachycardia. Excessive rapidity of the heart's action. It may be of nervous origin or occur in the course of organic disease of the heart. See Heart; Neurosis.

Tachylite (Gr. *tachys*, swift; *lyein*, to dissolve). In geology, name given to glassy, basic igneous rocks of basaltic composition. Usually black or very dark in colour, they are generally vesicular and brittle. Tachylites are basalts that have been rapidly cooled and so chilled to form natural glass; and are common in most regions where volcanoes are found. See Basalt; Palagonite; Tuff.

Tacitus, CORNELIUS (c. A.D. 55-c. 119). Roman historian. He was of good family, and, adopting a legal career, passed through the usual offices of state. In 88 he acted as praetor. His first work was a dialogue on oratory written when quite young. When he was about 40 appeared the *Agricola* and the *Germania*. The former deals with the life of his father-in-law, *Agricola*. The *Germania* gives the first detailed account of the manners and customs of the people who inhabited central Europe in the beginning of the Christian era.

But the great work of Tacitus was his history of the Roman Empire from the accession of Tiberius. Though destined to form a homogeneous work, it was not written consecutively; the earlier portions, written last, are called *Annals*; the later, *Histories*. Unfortunately, of the 30 books written by Tacitus only about half have been preserved, but sufficient to give us the author's views concerning the emperors Tiberius, Claudius, Nero, and the events of 69, when three emperors occupied the throne in the course of a year.

To Tacitus, a stern republican, more than any other Roman writer is due the long-standing belief that

the early empire was a mass of iniquity and corruption, both public and private. Researches of modern investigators have found abundant evidence of good government and contented people existing in Rome. Tacitus, whose style is proverbial for brevity, was translated by A. J. Church and W. J. Brodribb, 1864-77.

Tacitus, MARCUS CLAUDIUS (d. 276). Roman emperor from Sept., 275, to April, 276. A man of wealth, aristocratic descent, and unblemished character, he was consul in 273, and at the age of 70 was chosen emperor by the senate, after the murder of Aurelian. During his short reign he endeavoured to restore the power of the senate, and to check extravagance by means of sumptuary laws. He defeated the Goths, who had invaded Asia Minor, but fell victim to a conspiracy. Probus succeeded him.

Tack. Nautical term for manoeuvring a vessel against the wind by changing her course from one direction to another. When tacking, a vessel is said to be making a board, or a leg, as she goes on a straight line in either direction. Tacking may also be described as beating against the wind, as the manoeuvre is resorted to only when the wind is blowing from the direction in which the vessel is going. There are only two tacks—port and starboard.

Tacking. In British parliamentary procedure, the addition of extraneous clauses to a money bill, in order to get them passed into law. The practice became frequent after 1678, when the house of commons established its sole right to introduce and alter money bills, leaving to the lords the mere power of rejection. See Parliament.

Tackle. General name for the combination of rope and blocks on board ship. Tackles generally

are called from the particular us to which they are put, *e.g.* stay tackles, yard tackles, gun tackles. See Rigging; Ship.

Tacloban. Capital of Leyte, in the Philippine Islands. It lies in the N.E. of the island on San Juanico Strait, which separates Leyte from Samar. It has an active trade, especially with Manila 340 m. distant, exporting in particular rice. In Japanese hands from their conquest of the Philippines, 1941-42, it was the point at which U.S. forces made their first landing in those islands, Oct. 20, 1944, Gen. MacArthur (*g.v.*) following his troops immediately and proclaiming from the steps of the govt. building there that he had come back to liberate the Philippines. The landing took the Japanese completely by surprise, and Tacloban was reoccupied virtually without opposition, the airfield near by being taken Oct. 21. A monument marks the spot where MacArthur landed. Pop. est. 12,000.

Tacna. Town of Peru, capital of the department of the same name. Sometimes called San Pedro de Tacna, it is on the Tacna river, 39 m. by rly. N. of Arica in Chile. Near it, in 1880, a Chilean army defeated the joint forces of Peru and Bolivia. Pop. 17,000.

Tacna and the neighbouring province of Arica (*g.v.*) were long in dispute between Chile and Peru. The problem was settled in 1929.

Tacoma. Summit of the Cascade Range, Washington, U.S.A., better known as Mount Rainier. See Rainier, Mount.

Tacoma. City of Washington state, U.S.A., capital of Pierce co. It stands at the head of Commencement Bay, a branch of Puget Sound, 27 m. S. of Seattle, and is served by the Northern Pacific and other rlys., and by ocean-going steamers. This busy Pacific port carries on a flourishing wholesale

Tacoma, U.S.A. View of this Pacific seaport, looking S.E. across the tidal flats at the head of Commencement Bay towards Mt. Rainier

trade. The city's prosperity dates from its selection in 1873 as the W. terminus of the N.P.R., and increased when it became the outfitting base for the Klondike gold rush 20 years later. Founded in 1868, under the name of Commencement City, Tacoma became a town 1874, a city 1883. Pop. 109,408.

Taconic Mountains. Range of the U.S.A., also called Taghkanic Mountains. It extends along the borders of Massachusetts and Vermont, penetrating into Vermont, in which state it attains its maximum alt., Mt. Equinox, 3,816 ft. It gives its name to the Taconic period of mountain-building known to geologists.

Tacora. Volcano of Chile, near the Bolivian boundary. It rises to 19,500 ft. in the prov., and about 50 m. E.N.E., of Tacna: the rly. from Arica to La Paz passes E. of it through Villa Tacora, and over the Tacora Pass.

Tacsonia. Former name for a genus of climbing shrubs of the family Passifloraceae, natives of tropical America, now included in the genus *Passiflora*. The chief difference is found in the greater length of the calyx tube in *Tacsonia*. See *Passifloraceae*.

Tactical Air Force. Operational organization of the R.A.F. established in the Second Great War. Developed by Air Vice Marshal (later Lord) Tedder from the army cooperation group of Fighter Command, its function was to work in liaison with the army. Aircraft and personnel remained under R.A.F. control, but targets were specified by the army and advanced airfields moved up with the forward troops; this was made possible by the development of the prefabricated airstrip. The force had squadrons of light bombers, fighter-bombers, and aircraft armed with rocket guns for attacking armoured vehicles.

The 1st Tactical Air Force, modelled on the lines of the Desert Air Force, was formed shortly before the battle of Alamein, and provided air cover for the army in the advance through Africa, Sicily, and Italy. The 2nd was set up in Great Britain for the invasion of Europe, but before the actual assault it carried out important operations against enemy targets in occupied Europe. On Feb. 18, 1944, a Mosquito wing attacked from roof-top level Amiens prison, enabling hundreds of French partisans to escape. It provided the spearhead of the attack on D-day, and was largely responsible for heavy German

losses in armour throughout the following campaign. At the end of the war in Europe it became responsible for disarming the Luftwaffe. A 3rd Tactical Air Force operated in Burma with the 14th army.

Tactics (Gr. *taktikos*, arrangement). Military term to describe the art of executing an operation after the strategists have brought the opposing fleets or armies within striking distance of each other. Unlike strategy (*g.v.*), which is fixed and explains why a specific operation is feasible, tactics are fluid and may be varied as necessary when the opposing forces are in contact. Again, strategy is confined to operations which are tactically possible, whereas tactics may be opportunist and achieve victory in circumstances considered strategically impossible.

Broadly, the science of tactics consists in the arranging of combinations, the grouping, movements, and methods of employing armies, fleets, or air forces before and during battle. Tactics are mainly a matter of contact; after the line of battle has been drawn up, all operations are tactical until victory has been achieved or defeat sustained, but merge into strategy until this again provides the opportunity for conflict.

Major tactics are concerned with the movement into and employment in battle of large units, *e.g.* corps and divisions; minor tactics concern the operation of smaller bodies, *e.g.* a battalion of infantry. Below these heads come march tactics, supply tactics (or logistics), communication tactics, and combat tactics. These last include disposition of forces, securing controlling positions, utilising cover, retaining reserves, and initiating flanking movements (a typical piece of opportunist tactics).

Whereas strategy is constant, tactics are modified by new weapons and methods of defence. Every improvement in weapon power has altered tactics by decreasing the danger on one side and increasing it on the other; but every improvement in weapons has eventually been met by an improvement in defence which renders the improved weapon less lethal and no longer dominant. Fundamentally, therefore, tactics has always posed the same problem: to range a given number of troops, fighting vehicles, aircraft, or ships in such a manner that they may move and act with the maximum impact upon the enemy.

In battle the main design is to bring the opposing infantrymen into physical contact; the method alters, but the principle remains the same. Thus infantry tactics were altered by the introduction of the bayonet, which enabled infantrymen to combine the functions of musketeer and pikeman. In the First Great War, trench warfare developed the barrage fire to cover advancing infantry; smoke concealed flanking movements; greater fire power was developed by machine-guns. But trench warfare was merely a phase; the fundamental tactical object, defeat of the enemy by physical contact, was achieved only in open warfare. When aircraft and armoured vehicles were developed, thin infantry lines became powerless, but the tactical use of the infantryman in his primary rôle was restored by putting him in mechanised transport and protecting him with close support artillery. The threat of aircraft was reduced by camouflage and dispersal.

To be tactically successful, an army or navy must ensure close cooperation of all arms; one particular arm may be decisive, but only if used as part of a plan embracing all types of weapons. Before the Second Great War some tacticians had developed a theory of absolute warfare in which the bombing aeroplane was considered so dominant and decisive that it must render all other weapons obsolete. Germany rejected this theory, and her close tactical combination of land and air forces was proved correct in her invasions of the Netherlands, France, and Yugoslavia. On the other hand, the Allies' failure to appreciate the tactical union of armies and air power was a major factor contributing to their early disasters. Even when the Allies had developed overwhelming air power and initiated strategical bombing of Germany, they were unable to defeat her without destroying her armies in land fighting.

Basically, naval tactics differ little from those of land warfare. Their object is to bring warships in contact, and their method is mainly a matter of manoeuvring to place the enemy at a disadvantage. The tactics of a modern fleet action approximate to those of the galley period, for steam power, like manual power, makes possible any set combination of ships, and also the keeping of position with reasonable precision. After action has been joined, the

golden rule of naval tactics is to make the minimum changes of formation, so denying the enemy openings for opportunist tactics. Until the Second Great War tactics of supply played a minor rôle in naval warfare, as large forces of ships seldom fought major actions far from base. But during the war against Japan, the vast distances of the Pacific made tactics of supply of supreme importance and led to the establishment of the fleet train.

Conversely, the tactics of air fighting are nearly always opportunist, particularly when aircraft are operating with land forces. In general, the fighter, fighter-bomber, and ground attack aircraft are tactical weapons, and the heavy bomber strategic. *See* Air Fighting; Tactical Air Force.

David Le Roi

Tacuarembó. Dept. of N. Uruguay. It has an area of 8,112 sq. m., and is bounded S. by the Rio Negro. Good pasture lands provide sustenance for large herds of cattle. The city of Tacuarembó is the capital. Pop. 105,939.

Tadcaster. Town of Yorkshire (W.R.), England. It stands on both sides of the Wharfe, 9 m. S.W. of York, with a rly. station. The chief building is S. Mary's church, rebuilt in the 19th century. For centuries the town has been famous for its beer; another industry is the quarrying of limestone. Built on the site of the Roman Calcaria, Tadcaster had a castle and was an important place in the Middle Ages. About 2 m. away is the battlefield of Towton (q.v.). Pop. 3,687.

Tadmor. Ancient city of Syria. Its site, 150 m. N.E. of Damascus, is marked by an Arab village still called Tadmur. The city mentioned in 1 Kings 9, as founded by Solomon, so named in the A.V., and corrected to Tamar in the R.V., may have been in South Palestine.

Tadmor was an Aramaean caravan station between the Persian Gulf and the Mediterranean, and became important during the old Persian kingdom, when its Semitic population handled the luxury trade with the West in Asiatic products. The decay of the Nabataean route through Petra about A.D. 100 greatly increased

the opulence of Tadmor, the Greek name of which was Palmyra. The city furnished auxiliary soldiers to the Roman army. *See* Palmyra.

Tadpole (Eng. *toad-poll*). Popular name for the larval stage of the frog and toad. *See* Frog.

Tadzhik. People of Afghanistan and adjacent areas of the U.S.S.R. They are held to be the survivors of the original possessors of the soil, and speak a form of Persian. Most of them are agriculturists, and in Afghanistan they are organized in village communities under headmen. For the most part Sunnites, they are round-headed people of a primitive type.

Tadzhik OR TADZHIKISTAN. Constituent republic of the U.S.S.R. Situated N. of the Oxus, it is bordered by Uzbek S.S.R. and Kirghiz S.S.R. in the W. and N.; by Chinese Turkistan in the E., and by Afghanistan in the S. It covers 55,700 sq. m., and includes the Badakhshansk-Gorno autonomous region. The capital is Stalinabad (q.v.), formerly Dushambe. Much of the republic comes within the region of the Pamir Mts., the highest points being Stalin Peak (24,600 ft.), and Lenin Peak

other minerals. A rly. connects Stalinabad and Termez, and there are steamer services on the Oxus. Many good roads have also been constructed. About three-quarters of the pop. of 1,485,900 are Tadzhiks (r.s.), the remainder being mostly Uzbeks. The republic, which was originally made up of the regions of Bukhara and Turkistan where the pop. was mainly Tadzhik, was admitted as a constituent republic of the U.S.S.R. in 1929. In 1940 a new alphabet based on the Russian was introduced into the schools.

Tael (Malay *tail*, a weight). Name for the Chinese liang or silver pound weight. It was formerly the uncoined monetary unit of China.

Taenia. Genus of tape worms. For the species which commonly infest the intestines of human beings, *see* Cestodes.

Taff. River of S. Wales. Rising in N.E. Pembrokeshire, it flows 25 m. S. and S.E. through Carmarthenshire to Carmarthen Bay.

Taff. River of S. Wales. Rising in the Brecknock Beacons, it flows 40 m. S.S.E. through Glamorgan-shire, passing Merthyr Tydfil, Pontypridd, and Llandaff, and entering the Bristol Channel at Cardiff. It traverses a coal and iron dist. and its course is followed by the old Taff Vale rly.

Taffeta OR TAFFETY (Pers. *tafia*, woven). Light, thin, glossy silken fabric. The name has been applied to many different materials—at one time to plain woven silks generally. Taffeta was apparently introduced into England in the 14th century. During part of the 16th century it was a thick and costly stuff. Towards the end of the 16th century and into the 17th it seems to have been a very soft, thin material. In the 18th century it was sometimes striped with gold and silver or was ornamented with check or floral designs. There are dress and furnishing taffetas.

Taffrail (Dutch *taferel*, from Lat. *tabula*, table). Name commonly given to the upper part of a ship's stern timbers. *See* Ship.

Taffrail. Pen-name of Henry Taprell Doring (b. 1883), British sailor and author. In 1897 he entered the navy as a cadet in H.M.S. Britannia, and served in South Africa and China, being at the siege of the Peking legations, 1900. Towards the end of the First Great War he was awarded the D.S.O. In 1942-45 he was on the staff of the Mediterranean c.-in-c. Among his books, mostly adven-

Tadcaster, Yorkshire. Parish church of S. Mary

(23,400 ft.). The huge mountain glaciers are the source of many fast-flowing rivers, tributaries of the Amu-Darya which flows along the S. border of the republic.

The chief occupation is agriculture, including cotton-growing. Much of the farm produce is grown on artificially irrigated land, the Hissar and Fergan canals being valuable in this connexion. Much fruit, including apricots, figs, oranges, pomegranates, and lemons, is grown. At the Tadzhik biological station (over 12,000 ft. above sea-level) barley, oats, and wheat have been grown. The mountainous regions have deposits of lead, zinc, arsenic, bismuth, radium, and uranium. In other parts of the republic are mica, emery, corundum, sulphur, and

ture stories of the sea, are Pincher Martin, O.D., 1916; H.M.S. Anonymous, 1919; Pirates, and Men O'War, both 1929; The Man from Scapa Flow, 1933; Swept Channels, 1935; Chenies, 1943. Under his own name Dorling wrote a standard work on Ribbons and Medals, new ed. 1947.

Taff Vale Judgement. Name usually given to a decision of the house of lords in 1901. This decision made the funds of trade unions liable for acts committed by their members; *e.g.* the deterioration of goods held up owing to a strike might be considered the responsibility of the sponsoring trade union. (See Trade Unions.) The judgement was given when considering a dispute between the Taff Vale rly. co. and its employees. This co. controlled 112 m. of line, serving Merthyr and Cardiff, and places in the great industrial area around them, and owned docks at Cardiff and Penarth; it was later incorporated in the G.W.R.

Taffy. Popular name for a Welshman. It is a corruption, from the Welsh pronunciation, of Dafydd or David, the patron saint of Wales.

Taflelt OR **TAFILET.** Oasis of Africa. It comprises a number of separate oases and contains about 300 fortified villages. Situated S.E. of the Atlas Mountains in S.E. Morocco, about 10 days' journey from Fez, it is celebrated for its dates, and was first visited by René Caillie in 1828. Taflelt is the cradle of the reigning dynasty in Morocco. The chief centre of population is Abnam or Bu Am, whence a caravan route runs S. across the Sahara to Timbuktu. Taflelt was occupied by the French in 1916, the native army, about 8,000 strong, being defeated on Nov. 16.

Taft, ROBERT ALPHONSO (b. 1889). American politician. He was born at Cincinnati, Sept. 8, 1889, the son of W. H. Taft (*v.i.*). He graduated from Yale in 1910 and received a law degree at Harvard in 1913. During the First Great War he served as an assistant counsel in the U.S. food ministry, and in 1921 was elected member of the Ohio house of representatives, becoming U.S. senator in 1939. In 1940 and 1944 he was strongly supported as Republican candidate for the presidency, but did not secure nomination, though he became accepted leader of his party in the senate. An avowed isolationist in foreign affairs, Taft also advocated restricting the power of trade

unions, the passing of the Taft-Hartley Labour Act of 1947, directed against the "closed shop" being largely due to his influence.

Taft, WILLIAM HOWARD (1857-1930). American statesman. Born at Cincinnati, Ohio, Sept. 15, 1857, he studied at Yale and the Cincinnati law school, and after a brief period as a legal journalist, practised law in his native state. Judge of the superior court of Ohio, 1887-90, he then became U.S. solicitor-general. As a judge of appeal, 1892-1900, he made a great reputation by his business and political decisions, and his ability was further proved in the Philippines, where he was sent to institute civil government and introduce some degree of order, 1900-04. On his return Taft became secretary of war in Theodore Roosevelt's cabinet, in which capacity he travelled widely. Elected president of the U.S.A., 1908, by a large majority, his term of office was unmarked by any striking events, but his tariff acts of 1910 were unpopular, and the united votes for Roosevelt and Wilson brought about his defeat in the election of 1912. On his retirement Taft became professor of law at Yale. In 1921 he was appointed chief justice of the U.S.A., resigning in Jan., 1930. He died March 8, 1930. A Life by F. C. Hicks appeared in 1946.

Taganrog. Russian seaport, in the Azov-Black Sea area of the R.S.F.S.R. It is on the N. shore of the Gulf of Taganrog, which leads out of the Sea of Azov, and is connected by rly. with Rostov 40 m. to the E. There are three harbours, but they have partly silted up, and trade has been further lost to the rising Rostov. Taganrog is icebound in winter. The exports are grain, butter, linseed, tallow, and caviare; there is some fishing, and manufactures include metal goods, leather goods, and footwear. Russia annexed Taganrog in 1769; it was partly destroyed by Anglo-French bombardment in 1855. During the Second Great War the Russians admitted, Oct. 22, 1941, its evacuation after many days of stubborn fighting. It was recaptured Aug. 30, 1943, a breakthrough by Russian cavalry and tanks behind the city having isolated the Ger-

man garrison, whose rly. communications with the Donetz had already been cut. This victory cleared the Germans from the Rostov Region. A Chekhov museum is maintained, for the dramatist was born here. Pop. 188,808.

Tagliacozzo, BATTLE OF. Victory of Charles I of Naples and Sicily over the imperial army commanded by Conradin, Aug. 23, 1268. After the death of Manfred, imperial nominee to the throne of Sicily, and the assumption by Charles of the crowns of Sicily and Naples, Conradin, the last of the Hohenstaufens and grandson of the emperor Frederick II, invaded Italy, and with a mixed army of Germans, Italians, and Saracens marched S. About 1 m. N. of Tagliacozzo, a village in the Sabine Hills, some 57 m. E. of Rome, he was met by Charles and defeated. Conradin was captured, and executed at Naples, Oct. 29, 1268.

Tagliamento. River of N.E. Italy, in Venetia. It rises in the Carnic Alps and flows S. across Udine to the Gulf of Venice, Adriatic Sea, after a course of 100 m. Heavy fighting took place along the line of the Tagliamento in the First Great War. After the Italian reverse at Caporetto, the armies retreated to the river, where they stood from Oct. 28 to Nov. 5, 1917, before continuing their retreat to the Piave. The Allies reached the Tagliamento in their advance in Oct., 1918. See Caporetto; Italy; Piave. *Pron.* Tahl-yamento.

Taglioni, MARIA (1804-84). Italian dancer. Born at Stockholm, April 23, 1804, daughter of a

Maria Taglioni,
Italian dancer

ballet master, she made her first appearance in Vienna at 18. In 1827 she appeared in Paris and immediately attained enormous popularity, for the next twenty years being the most famous ballet dancer in Europe. Her greatest success was in her father's ballet *La Sylphide*. She retired in 1847, and died in poverty, April 23, 1884. Her life was written by A. Levinson, Eng. trans. 1930. *Pron.* Tahl-yohne.

Tagore, ABANINDRA NATH (b. 1871). Indian artist. Born at Calcutta, and educated at the Sanskrit College there, he became vice-principal of the government school of art, Calcutta, in 1905,

later being appointed professor of fine art at Calcutta university. His own artistic output was largely in connexion with ceremonial decorations and designs, especially noteworthy being a memorial address presented to Lady Curzon during her husband's viceroyalty. But he also illustrated in colour Rabindranath Tagore's *The Crescent Moon* and *Sister Nivedita's Myths and Legends of India*.

Tagore, SIR RABINDRANATH (1861-1941). Indian writer. Of a family distinguished in religion,

Rabindranath Tagore,
Indian writer

letters, and art, he was born in Calcutta, May 6, 1861. Educated at Calcutta and in Europe, he became known as a writer of Bengali verse. In 1901 he founded a reformed school at Bolpur.

Awarded the Nobel prize for literature, he was knighted in 1915. He died Aug. 7, 1941.

He wrote many poems, dramas, and novels in Bengali and English, including *Gitanjali* (*Song Offerings*), 1913; *The Crescent Moon*, 1913; *The King of the Dark Chamber*, 1914; *The Post Office*, 1914; *Home and the World*, 1919. He also wrote *My Reminiscences*, 1917; and *Nationalism*, 1917; *The Religion of Man*, 1931. To a profound religious consciousness Tagore united active sympathy with humanity and a fresh and intimate feeling for nature. His poetry expressed a pure and lofty mysticism in language of simple and serene dignity. *Consult*

Lives, R. Sastri, 1917; E. J. Thompson, 1930; V. Lesny, 1939.

Tagus (Span. Tajo; Port. Tejo). Longest river in the Iberian peninsula. It rises in Spain in the Sierra de Albarracin, curves to the N.W., then flows W.S.W. past Toledo and Alcántara, forms for a few m. the boundary of Spain, and finally crosses Portugal to its estuary near Lisbon after a course of 565 m., of which 192 m. are in Portugal. It is tidal, and navigable by large vessels to Santarém; rapids interfere with navigation in Spain. The chief affluents are the Jarama, Alberche, Tietar, Alagon, and Zezere, all on the right bank.

Taharka or **TIRHAKAH** (c. 722-663 B.C.). Ethiopian king of Napata. As viceroy of Lower Egypt he rendered some support to Hezekiah during the siege of Jerusalem

in 701 by Sennacherib (2 Kings 19; Isaiah 37), and succeeded Shabataka as sole king about 691.

Tahiti or **OTAHETE**. Largest of the Society Islands, a French possession in the South Seas. The two unequal circular mountainous portions joined by a narrow isthmus have an area of 600 sq. m. The highest of many extinct volcanoes rises to 7,688 ft. The slopes are scored by ravines and valleys, and the low coastland consists of volcanic detritus mixed with coral sands from the encircling reefs. Rainfall is abundant, vegetation luxuriant, but only a small area is cultivated. Tropical fruits and the sugar cane grow; pearls, copra, rum, and phosphates are exported. Papeete, the seat of administration of the French colony, is the chief town. It was shelled and damaged by German cruisers in 1914. In the Second Great War Tahiti supported Free France. A plebiscite in Tahiti, the neighbouring Moorea, and the Tuamotu Group gave 5,564 votes for Gen. de Gaulle, 18 for Vichy. Pop. 23,133. *See* Society Islands.

Tahiti Apple (*Spondias dulcis*). Tree of the family Anacardiaceae. It is a native of the Society, Friendly, and Fiji Islands. The leaves are divided into elliptic leaflets arranged featherwise, with rounded teeth. There are clustered, small, yellow-green flowers. The edible fruit, with the flavour of pineapple, is like a large plum, of a

Tahiti Apple. Spray of flowers and foliage of the South Pacific fruit tree. Inset, fruit

golden yellow colour, containing a stone covered with hooked bristles.

Tahpanhes. Ancient fortress at Tell Defneh, 10 m. W. of Kantara, Lower Egypt. The Greek Daphnae, founded by Psammetichus I, 664 B.C., for defending the Asiatic frontier, its Greco-Egyptian jewelry trade flourished until transferred to Naucratis. In 1886 Petrie excavated its

brick fort, still called the castle of the Jew's daughter.

Taiga. Sub-arctic or northern coniferous forest, which spreads almost without interruption across

Tahiti. Man and girl of the Polynesian aborigines who inhabit the Society Islands

the N. of N. America, Europe, Asia. It lies S. of the tundra (*q.v.*), and is one of the most widespread types of natural vegetation in the world. The chief trees are pines, fir, spruce, and larch. Forests of the taiga type are also found in mountainous regions immediately below the upper tree limit.

Taihoku. Japanese name for the capital of Formosa. *See* Taipei.

Tai-hu. Lake of China, in the prov. of Kiangsu. It is 150 m. in circumference, and is dotted with islands on which are temples and villas of the merchants of Hangchow. It is connected with the Grand Canal at Suchow, and is one of the beauty spots of Central China. Many famous poems are still recited and sung, celebrating the glories of the lake.

Tai-kyu. Town of Korea, capital of the dist. of N. Keisho. Situated 190 m. by rly. S.E. of Seoul, and surrounded by ruined walls, it trades in fruit, tobacco, and cereals. Pop. 68,770.

Tail. Prolongation of the backbone in vertebrate animals. It is a portion of the body containing no viscera, but consisting solely of bone and muscle. Tails are organs of locomotion in fishes, serve as grasping organs in monkeys, are weapons of defence in porcupines, and serve as balancers in leaping animals, as kangaroos. *See* Animal.

Taille. Tax levied in France before the Revolution. It was levied by the king in those provinces that were *pays d'élection*, but not in the *pays d'état*. The taille was in the nature of an income-tax. See *Tallage*.

Taillefer (d. 1066). Norman jongleur, who accompanied William the Conqueror to England, and fell at the battle of Hastings. Tra-

Tailoring. Diagram showing the measurements necessary for cutting out men's clothing.

dition says that he asked for the honour of striking the first blow, and went forth singing of the deeds of Charlemagne, and performing juggling feats. He figures in the Bayeux tapestry. See *Jongleur*.

Tailoring (Fr. *tailleur*, to cut). The process of making clothes. In spite of the derivation, tailoring and cutting have become two distinct operations. The present-day cutter designs a garment, measures a customer, cuts the cloth, and fits the coat or suit. The tailor stitches the cloth together into the finished article. Cutters and tailors usually specialise in their own branch of the trade, although knowledge of both branches makes for efficiency.

Entry into the tailoring trade formerly demanded an apprenticeship of several years (though a man could qualify as an inexperienced cutter after a course at one of the

cutting schools recognized by the trade), but, after the Second Great War, when labour was badly needed, several plans allowed for, and encouraged, entry by means of learnership in a shop or by especially planned courses.

It was following the disappearance of the feudal system that the tailor as we know him began to appear. He was originally a bonded man making clothes only for his overlord, but as this system disappeared travelling tailors began to be seen offering their services for little more than their keep. Eating and living with the family, their wages might amount to half-a-crown per day, plus board and lodging. But with the advent of the industrial age and the increase of urban populations a new class of customers made its appearance. With the introduction of the sewing machine, some employers were quick to take advantage of mass production possibilities. Sweating was rife, and the dingy, unhygienic workrooms into which tradesmen and their women crowded to earn a meagre living were typical of the worse side of commerce after the industrial revolution.

At first, the coming of the sewing machine was not accepted favourably. Employers scoffed at it and employees were against it, thinking that its success would mean a great cheapening of labour. The trade went through a painful period of sweating. However, at the end of the 19th and the beginning of the 20th centuries, nationwide insistence that certain trades should be scrutinised brought reforms. Amendments to the Factories and Public Health Acts, the establishment of wages boards,

world's tailors, and England led the way in men's clothes both for style and quality of material.

John Taylor

Tailor Bird (*Orthotomus sutorius*). Species of Asiatic bird, belonging to the Sylviidae. It de-

Tailor Bird of Eastern Asia, which sews leaves together to form its nest

rites its name from its method of nest building. Two large leaves are drawn together, and sewn at the edges with cocoon silk or vegetable fibres; inside the pocket thus formed the birds construct a nest of grass and hair. The birds are common in India and China, are about 6 ins. long, and have greenish plumage.

Taimyr. The most N. peninsula of Asia. In the extreme end of the Krasnoyarsk region of Siberia, R.S.F.S.R., it lies between the mouth of the Yenisei and the Gulf of Khatanga, and terminates in Cape Chelyuskin.

Tain. Royal and mun. burgh and seaport of Ross and Cromarty, Scotland. It stands near the S. side of Dornoch Firth, 44 m. N. by E. of Inverness and has a rly. station. The chief building is the collegiate church of S. Duthus, a Decorated building founded in 1471 and restored in the 19th century. There are ruins of a chapel, and the burgh has a town hall, court house, and academy. The market town for an extensive district, Tain also has a distilling industry. The name Tain comes from the Icelandic word *thing*, meaning a court or assembly. Market days, Tues. and Fri. Pop. 1,551.

Tain borough arms

Tain, Ross and Cromarty. The ancient church of S. Duthus

and the passing of the Trades Boards Acts were all instrumental in general improvements. Eventually London's Savile Row became the accepted headquarters of the

Tainan OR TAI-WAN. Town of Formosa. It stands near the S.W. coast, a few miles S.E. of Anping, its port, and is connected by rly. with the capital, Taipei, in the N. of the island. The chief town of the Dutch in the 17th century, it has remains of Dutch buildings. There is secure anchorage at Anping, except during the S.W. monsoon. In early history Tainan was the seat

of govt. of the island; it gives its name to a prov. Pop. 181,982.

Taine, Hippolyte Adolphe (1828-93). French historian and critic. Born at Vouziers, Ardennes,

Hippolyte Taine,
French historian
After Bonnat

April 21, 1823, and educated in Paris, he early won distinction by his doctor's thesis on La Fontaine, later amplified into a volume entitled *La Fontaine et ses*

Fables, 1853, and a prize essay on Livy. For some years his religious opinions debarred him from an academic career, and he occupied himself with independent work, e.g. *Les Philosophes du XIXe Siècle*, 1856, and *Histoire de la Littérature Anglaise, 1863-64* (Eng. trans. by Van Laun, 1872-74); but in 1864 he was appointed professor of aesthetics in the *École des Beaux Arts*, four volumes on *La Philosophie de l'Art* being a direct result of his academic lectures. He then returned to philosophy, and in his treatise *De l'Intelligence*, 1870, made a noteworthy contribution to the scientific study of mind.

Taine's last twenty years were devoted mainly to a series of works on *Les Origines de la France Contemporaine* (*L'Ancien Régime*, 1875; *La Révolution*, 1878-85; *Le Régime Moderne*, 1890-94—the last unfinished). These panoramic studies of the process and the evils of centralisation in France, by their solidity of learning, impartiality of judgement, and energy of style give Taine a high place among historians. He became a member of the Academy in 1878, and died March 5, 1893.

Bibliography. *Les Maîtres de l'Histoire*, G. Monod, 1894; Taine, A. de Margerie, 1894; Taine, Scherer, Laboulaye, Boutmy, 1901; *Essai sur Taine*, V. Giraud, 1902; *Life and Letters*, Eng. trans. R. L. Devonshire, 1902; Taine et l'Angleterre, F. C. Roe, 1923.

Taipei. Capital city of the island prov. of China called Formosa or Taiwan. It is about one hour's journey by rly. from Kilung, at the N. extremity of the island, in the midst of beautiful scenery. Taipei proper is the ancient walled city, as distinct from that section known as Twatutia which was occupied by European settlers. Nowadays, however, the city and environs are together known as Taipei. The river Tamsuiyei encircles part and adds to the general attractive-

ness of the district. Camphor works occupy most of the employed. From 1895, when the island was ceded by China to Japan, the capital was called Taihoku, and became the h.q. of Japanese administration until the end of the Second Great War, during the latter stages of which it was frequently bombed from the air by the Allies. Pop. 340,114.

Taiping Rebellion. Civil war which raged intermittently in China 1850-64. By 1853 all S. China was in the hands of the usurper, Hung Siu-tsuan, who in Nanking, the old capital, had proclaimed himself first emperor of the Taiping dynasty. Troubles with the British and the French prevented the reigning Manchu dynasty from exerting its full strength against the rebels, but in 1863 an imperial army was organized by Gordon, whom the British government lent to the Chinese. This force won victory after victory, earning for itself the title of Ever Victorious Army. By July, 1864, Nanking had been captured, and the rebellion was at an end, the Taiping usurper ending his life by suicide. See China; Gordon, C. G.

Tait, Archibald Campbell (1811-82). British prelate. Born in Edinburgh, Dec. 22, 1811, he was

Archibald Tait,
British prelate

educated at Glasgow university and Balliol College, Oxford, and was ordained in the Church of England in 1836. In 1842 Tait succeeded Arnold as headmaster of Rugby; in 1849 he was made dean of Carlisle, and in 1856 bishop of London. From 1868 archbishop of Canterbury, he died Dec. 3, 1882. Tait did a great work in organizing the diocese of London, but at Canterbury he was less successful; he had to deal with cases of ritual and was criticised as over-emphasising the connexion of Church and state. Randall Davidson, a later archbishop, married Tait's daughter and wrote his life, published in 1891.

Tait, Peter Guthrie (1831-1901). Scottish physicist. Born at Dalkeith, April 28, 1831, and educated at Edinburgh university and Peterhouse, Cambridge, he was appointed professor of mathematics at Queen's College, Belfast, 1854, and of natural philosophy at Edinburgh, 1860, a post he held almost

until his death, July 4, 1901. In collaboration with Kelvin, then William Thomson, Tait produced the work which made him famous, *Natural Philosophy*. With Balfour Stewart he published anonymously *The Unseen Universe, or Physical Speculation on a Future State*, 1875, a book which caused much controversy. He made important contributions to thermodynamics, to the theory of the dissipation of energy, and to the kinetic theory of gases.

Taiwan. Japanese name for the island described in this Encyclopedia as Formosa.

Tai-Yuan. Capital of Shansi prov., China. Situated on the main high road from Peking to the W., at an alt. of 2,260 ft., it is connected by rly. with Shihchia-chuang, a station on the Peking-Hankow line. The circuit of the walls is 8 m., and the town contains 400 temples, together with a university and an arsenal. Tai-Yuan is in the centre of an important coal and iron area. Pop. 58,711.

Tajik. Constituent republic of the U.S.S.R. The alternative spelling Tadzshik is preferred in this Encyclopedia.

Taj Mahal. An Indo-Muslim mausoleum near Agra, in the Uttar union, India. It was completed in 1650 by the Mogul emperor, Shah Jehan, in memory of his favourite wife, Nour Mahal. The building is mainly constructed of white marble, and the massive tombs of the emperor and his consort are of the same material; over these rises a beautiful dome, flanked by similar domes, while there is a tall minaret at each of the four corners of the structure. This world-famous building occupied 20,000 workmen for over 20 years. See Agra.

Takamatsu. Town of Japan. Standing on the N. coast of Shikoku Island, 82 m. W. by S. of Osaka, it is the capital of Kagawa prefecture, and is the N. terminus of a rly. It exports lacquer goods, silks, cotton crapes, and matches.

Takin (*Budorcas taticolor*). Large ruminant mammal, occupying a rather doubtful position between the goats and the antelopes. It seems to occur only in the N. of Assam, in Bhutan, and in N.W. China. It is a heavy and bulky

P. G. Tait,
Scottish physicist

Takin. Ruminant animal, large and heavily built, that wanders in herds among the Tibetan mountains

animal, about $3\frac{1}{2}$ ft. high at the shoulder, with very stout limbs, and thick black horns which curve at first outwards and then backwards. Takins occur in small herds in the mountains and are very difficult to stalk.

Taking Silk. Term applied colloquially to the appointment of a barrister as king's counsel. The phrase takes its origin from the silk gown worn by these barristers.

Taklamakan. W. region of the Gobi desert in Sinkiang. Situate between the Kwen-lun range and the Tarim curve, and bisected by the Khotan river, its 259,000 sq. m. are covered by arid sand-dunes, ranging up to 350 ft. It was visited by Marco Polo about 1273. Sven Hedin's explorations in 1896, at the sand-buried town of Taklamakan near the Keriya river, yielded many Greco-Buddhist remains. During 1907-08 Sir Aurel Stein traversed the desert from Kucha to Karadong.

Takoradi. Harbour of the Gold Coast. It is 3 m. W. of Sekondi and has rly. communication with the interior and with Accra. Planned in 1921, it was opened in 1928 as the only harbour of consequence on the coast of W. Africa between Dakar and Pointe Noire. Breakwaters, wharves, docks, and equipment to handle 5,000 tons a day cost about £4,000,000. When the Mediterranean route to Egypt was closed to Allied shipping in the Second Great War, Takoradi became a supply base for the Allied armies in Egypt and N. Africa; aircraft in crates were brought there by sea, assembled at an R.A.F. maintenance unit, and flown across Africa to Cairo.

Takow or TAKAO. Seaport on the S.W. coast of the island of Formosa. It is 22 m. by rly. S.

of Tainan. Opened to foreign trade in 1864, it has an export trade in sugar and rice, produced mainly by Chinese immigrants from Kwangtung, and in camphor. Pop. 21,865.

Taku. Village situated at the mouth of the Haiho (Peiho) in Hopei prov., China. Its forts formerly constituted a first line of defence for Tientsin, 47 m. up the river, and for Peking. They were taken by the British and French forces in 1858, in 1860, and during the Boxer

Rising in 1900, when they were demolished. See Boxers; China; Peking. Taku is also the name of a small island off the Solomon Is., under Australian trusteeship.

Talaing. Name for the Mon people of Pegu, Burma, who acquired the culture of the Telingana coast of S. India, upon which all Burmese tradition is based.

Talamanca. American Indian tribes in S. Costa Rica and N. Panama. Extending along both slopes of the Talamanca and Chiriqui cordilleras, they include the Atlantic Tiribri and Bribri and the Pacific Boruca.

Talanti or ATALANTI. Channel in Greece, sometimes called the Gulf of Talanti or Atalanti. It flows between N.W. Euboea and the mainland, and is from 3 to 5 m. wide and 20 m. long. On its W. side is the town of Talanti, about 60 m. N.W. of Athens.

Talari. Former Ethiopian silver coin, also known as the Menelek dollar. Worth nominally about two shillings and first coined in 1894, it was divided into 16 silver piastres, and was coined in other fractional pieces. A new currency, the Ethiopian dollar of 100 cents, was introduced 1945.

Talavera DE LA REINA. Town of Spain, in the province of Toledo. The ancient Caesarobriga, it stands on the Tagus, at its confluence with the Alberche, 83 m. by rly. S.W. of Madrid. Parts of the ancient walls, a Roman gateway, a 10th century Moorish tower, and a Gothic church are of historical interest. A 15th century bridge of 35 arches spans the river. Silk weaving and manufacture of earthenware are the chief industries. Pop. 14,500.

Talavera, BATTLE OF. British victory in the Peninsular War,

July 27-28, 1809. Advancing from Portugal, Wellington had reached the Tagus and lined his forces along the hills which lie N. and W. of the town of Talavera. A Spanish army under Cuesta, composing two-thirds of his allied forces, held the town itself. Early in the morning of July 27 the French attacked the British, forcing back the line; after a violent bombardment the attack was renewed with a fury which threatened the allied armies with disaster. The situation was saved by the arrival of Gen. Hill, who regained the lost ground. The French renewed the assault at dawn next day, but were eventually repulsed by the fire of the British infantry and the cavalry charges. In the afternoon a counter-attack by Wellington decided the issue. The French, with losses of over 7,000, retired to Madrid, but the British, whose losses were heavier in proportion, were unable to pursue.

Talayot. Prehistoric round tower in the Balearic Islands. The typical form is of megalithic blocks, sometimes slightly hewn, in flat, unmortared courses sloping inwards. From the doorway a corridor leads to a round chamber, whose beehive vaulting is sometimes supported by one or more central pillars. The name is occasionally applied loosely to other prehistoric remains.

Talbot. Ancient name for a breed of dogs, apparently the extinct southern-hound, which was a variety of the existing bloodhound (*q.v.*). It is the badge of the Talbot family (earls of Shrewsbury), but whether the hound or the family first held the name is uncertain.

Talbot. Name of an ancient English family of Norman descent. The family proves descent from Richard Talbot, lord of Linton, Herefordshire, who was appointed custodian of Ludlow Castle by Richard I. The manor of Linton was confirmed by Edward III to Gilbert, who sat as Baron Talbot in the parliament of 1331. The head of the family under Henry V was Gilbert, a distinguished soldier, upon whose death the title descended to his brother John, first earl of Shrewsbury (*q.v.*), his descendants retaining it.

Talbot, EDWARD STUART (1844-1934). British prelate. Born Feb. 19, 1844, he was educated at Charterhouse and Christ Church, Oxford. Upon ordination he became the first warden of Keble College in 1870, going to Leeds as vicar in 1889.

In 1895 he was bishop of Rochester, in 1905 of Southwark, and of Winchester during 1911-23.

Edward S. Talbot,
British prelate

He wrote many books on religious questions; his memoirs were published in 1924. Talbot died Jan. 30, 1934. A Life, by G. Stephenson, appeared in 1936.

His son Gilbert (1891-1915), who was killed in action in the First Great War, gave his name to Talbot House, commonly called Toe H (*q.v.*), the original house being at Poperinghe.

Talbot, WILLIAM HENRY FOX (1800-77). British inventor. He was born Feb. 11, 1800, and educated at Harrow and Trinity College, Cambridge. A mathematician of distinction, he gave much time to scientific study, and in 1833 made the discovery on which photography (*q.v.*) ultimately rests, although he did not publish the fact until 1839. Improvements were made by him, and the process he invented is known as the calotype or talbotype. Also an archaeologist, he wrote *The Pencil of Nature* and other books. Talbot died Sept. 17, 1877.

W. H. Fox Talbot,
British inventor

Talc (Arab. *talq*). Hydrated magnesium silicate, $3\text{MgO} \cdot 4\text{SiO}_2 \cdot \text{H}_2\text{O}$. It is found as foliaceous or compact masses resulting from the hydration of magnesium-bearing rocks, such as pyroxenites, gabbros, dolomites, etc. Talc is extremely soft and greasy to the touch, varying from white to dark green. Varieties include steatite or soapstone (massive); pot-stone (impure massive); French chalk, a steatite used by tailors for marking cloth; indurated talc, an impure slaty variety. Talc is a filler for paper, rubber, paints, etc.; is used in powder for toilet and for the treatment of certain skin irritations; as an absorbent for nitroglycerine; in slabs for insulation or acid-resisting purposes; as an ingredient in soap; and is sometimes carved into ornaments.

Talca. Prov. and town of Central Chile. The prov. lies between Curico and Linares, the E. boundary being amid the Andes. It pro-

duces wheat and rears cattle. Its area is 3,721 sq. m. Pop. 157,141.

The town, capital of the prov., is on the river Claro, and is a rly. junction 140 m. S. of Santiago. Ponchos are manufactured here. The town was considerably damaged by earthquake, Jan. 24, 1939. Pop. 56,735.

Talcahuano. Seaport of Chile, in the prov. of Concepción. It is 9 m. by rly. N.W. of Concepción, of which it is the port. Founded in 1780, it has an excellent harbour with government dockyards and arsenals. There is considerable trade in wheat. In 1835 it was almost entirely destroyed by an earthquake and was again damaged by an earthquake in 1928, being completely rebuilt. It is now an important industrial city with a wide range of factories of many types. Pop. 41,536.

Talent (Gr. *talanton*, weight for measuring gold and silver). Unit of weight and monetary denomination used by many ancient countries. It was introduced by the Babylonians, and is frequently mentioned in the O.T. The Babylonian talent of weight, or common talent, was equivalent to 57½ lb. avdp., and the monetary unit, or royal talent, varied in value between 310 and 400 gold sovereigns. The Greek talent was normally of 10 p.c. less value than the Babylonian, but its worth varied with the supply of gold and silver. The great Roman talent was worth 100 gold sovereigns and the small one 75. Until the fall of the Roman empire, Babylonian, Assyrian, Hebrew, Greek, and Roman talents remained legal denominations. See Shekel.

Tale of a Tub. A. Prose satire by Swift. Written in 1696, it was first published anonymously in 1704. The satire, which is directed against church divisions, concerns three brothers and their inheritance—Peter (the Church of Rome), Martin (Luther), and Jack (Calvin). Remarkable for its witty presentation, its authorship undoubtedly prevented Swift's preferment to a bishopric. The same title was given by Jonson to one of his comedies in 1633.

Tale of Two Cities. A. Novel by Dickens, published in *All the Year Round*, April 30-Nov. 26, 1859, and concurrently in eight monthly parts, with engravings by Phiz (marking the end of the long collaboration between the author and this artist). The plot moves between Paris and London during the French Revolution, and the central character, Sydney Carton,

the dissipated barrister, who gives his life that Charles Darnay, his successful rival to the hand of Lucie Manette, may live, is one of the most moving of the novelist's creations. Watts Phillips's drama, *The Dead Heart*, with a similar plot, came out on Nov. 10, 1859. Dickens's novel was dramatised by Tom Taylor in 1860, and by Freeman Wills and F. Langbridge as *The Only Way* in 1899. Sir J. Martin-Harvey's Sydney Carton remaining for many years one of his most notable impersonations. See Carton, S.

Talesman. Person from among the bystanders in court (*tales de circumstantibus*) who may be required to serve on a jury in the event of there not being sufficient jurors present. In *The Pickwick Papers*, Sergeant Buzfuz prayed a *tales* to take the place of two special jurymen who were not present.

Tales of a Grandfather. Stories on Scottish and French history, written by Scott for his grandson, John Hugh Lockhart (d. 1831). The four series were published, 1828-30. Inspired by J. W. Croker's *Stories for Children* from English History, 1817, the first three series cover Scottish history to the quelling of the '45 rising.

Tales of Hoffmann (Fr. Les Contes d'Hoffmann). Opera by Offenbach. The libretto by Barbier consists of a prologue introducing Wilhelm Hoffmann (1776-1822), a German romantic writer, and three acts (presenting ideal types of women) which recount separate episodes: that of the doll, the Venetian courtesan, and the story of Antonia. Offenbach, who worked on the score for many years, did not live to see it produced. It was revised and partly orchestrated by Guiraud, and staged at the Opéra Comique, Paris, Feb. 10, 1881, where it ran for 101 performances. First performed in London (in German) at the Adelphi, April 17, 1907, it became popular in its English version, first conducted by (Sir) Thomas Beecham at His Majesty's, May 12, 1910. Its most famous airs include the doll's song, and the trio for women's voices, commonly called the barcarolle.

Tales of My Landlord. The general title under which Scott included his stories *The Black Dwarf* and *Old Mortality* (First Series), *The Heart of Midlothian* (Second Series), *The Bride of Lammermoor* and *A Legend of Montrose* (Third Series), and *Count Robert of Paris and Castle*

Dangerous (Fourth Series). The Tales are represented as having been left in MS. by one Peter Pattieson, "collected and reported" to defray his funeral expenses, by his "learned friend and patron" Jedediah Cleishbotham, schoolmaster and parish clerk of Ganderclough. The "landlord" is the host of the Wallace Inn, Pattieson's headquarters.

Talgai Skull. Fossil human cranium found in 1884 in the Darling Downs squatting district near Talgai, S. Queensland. It attracted no attention until the Sydney meeting of the British Association in 1914. A report presented by Dr. S. A. Smith of Sydney to the Royal Society in 1918 showed the skull to be that of a lad about 16 years old, who was contemporary with Pleistocene marsupials now extinct. His brain capacity was larger than that of modern Australian aborigines, and his enormous palate, while resembling that of the anthropoids more closely than any human jaw existing, finds its nearest affinity in the palate of the recently extinct Tasmanians.

Tali. Town in Yunnan prov., China. It is situated at a height of 6,700 ft., on the bank of the Erhhai Lake. Tali lies on the road connecting Peiping with Burma, in a fertile district amid hills rich in minerals. It was the capital of a native kingdom which was conquered by the Mongols in 1253. The walls were constructed under the Ming dynasty in 1382. In 1873 the town was laid waste after the Panthay revolt. Pop. 12,851.

Taliesin. Traditional 6th century bard of the Cymri, credited with the authorship of a number of tales of contemporary heroes, and prophetic and other verses, many of which are certainly of a later date. Much of the legend of Taliesin's life is given in Lady Charlotte Guest's *Mabinogion*, 1902, and the poems of the Book of Taliesin are included in W. F. Skene's *Four Ancient Books of Wales*, 1868.

Talipot Palm (*Corypha umbraculifera*). Tree of the family Palmae, native of S. India and Ceylon. The trunk is about 80 ft. high. The leaves are circular, about 12 ft. in diameter, thrown into plaits, and the margin cut into points; the leaf stalk about 6 ft. long, armed with tooth-like spines. The leaves are used as fans and umbrellas. Strips are used as paper, and for weaving into baskets and mats.

Talisman. Word of Arabic origin meaning a charm. It refers usually to an inanimate object that possesses supernatural powers, generally in the direction of keeping off evil. Talismans often consisted of precious stones engraved with mystic symbols and lettering. See Abraxas; Amulet; Magic.

Talisman, THE. Second of Sir Walter Scott's Tales of the Crusaders. Published with *The Betrothed* in June, 1825, it is a story of the adventures of Richard I in the Holy Land and is characterised by the masterly development of its plot and the brilliancy of its scenic colouring.

Talboy in walnut, Queen Anne period : height, 6 ft. 2 ins.; width, 3 ft. 3 ins.

By courtesy of Gill & Reigate, Ltd., London

Tallage (Fr. *tailleur*, to cut). Tax levied on English boroughs. It appears to have been introduced in the 12th century. It was a tax levied by the king on the land in his own demesne, and became in practice a tax on all English boroughs. The barons were allowed for a time to levy tallages. Gradually, however, this method of taxation fell into disfavour, as grants of money were made by parliament, and in 1340 tallages were forbidden except by consent of parliament.

Tallahassee. State capital of Florida, U.S.A., the co. seat of Leon co. It is 20 m. N. of the Gulf of Mexico, and is situated on a hill in a region of lakes and streams. Its streets are spacious and shady. Here is the centre of Florida govt., the Florida State College for women, and an industrial school for negroes. The city is a centre for

trade in cotton, tobacco, cereals, fruit, and vegetables, and there are rly. shops. It has a municipal airport and is served by the Georgia, Florida, and Alabama, and the seaboard Airline rlys. In 1818 the area was cleared of Indians, and in 1824 Tallahassee was made capital of the then territory of Florida. Pop. est. 18,000.

Tallard, CAMILLE D'HOSTUN, DUKE OF (1652-1728). French soldier and diplomatist. He was born Feb. 14, 1652, and had a brilliant military career, being a general at 40 and winning a victory at Spire in 1693; but was defeated by Marlborough at Höchstädt or Blenheim, Aug 2 (O.S.), 1704 (at which battle, however, he did not hold supreme command). Tallard was sent to England, where he had previously been French ambassador to William III at the time of the Spanish treaties, and successfully adopted the rôle of a country squire near Nottingham. Here he introduced the cultivation of celery. He died in Paris, having been restored to his honours, March 30, 1728.

Talboy. Double chest of drawers, placed one above the other, the upper usually being narrower and recessed. High-boys (Fr. *hautebois*) are much the same, but have taller top sections. Low-boys are small chests of drawers placed on tall legs, usually of the cabriole type. These were all popular in the Queen Anne period, and good specimens were produced well into the Georgian period, after which they were largely replaced by the wardrobe.

Talleyrand-Périgord, CHARLES MAURICE DE (1754-1838). French statesman. Born in Paris Feb. 13,

1754, he was the son of a count. An accident in childhood lamed him, precluding him from military service, and transferred the succession to a

C. M. de Talleyrand
After Gérard

younger brother. Talleyrand consequently entered the Church, becoming a priest in 1778. Preferment followed, and in 1789 he was made bishop of Autun, representing his diocese when the states-general assembled that year.

He was quick to range himself on the side of safety and the Revolution, acquired a position of distinction in the national assembly,

and attacked the privileges of the Church. Accepting the civil constitution of the clergy, he relinquished his orders in 1791, and was excommunicated. Next year he went to England on an unofficial political mission, the French monarchy not having as yet been formally ended. To the extremists, however, he was suspect, and, being denounced by that party while he was in England, did not return to France until 1795, when the Terror was past. Through the friendship of Mme. de Staël he gained that of Barras, drew his attention to the genius of Bonaparte, and became the foreign minister of the Directory in 1797. A temporary retirement was followed by a return to the same office after the establishment of the Consulate.

Talleyrand was foreign minister to Napoleon from 1799 until the treaty of Tilsit, 1807, after which he retired with the title of prince of Benevento. There was then a breach, which gradually widened, between them. Talleyrand had supported the emperor's largely beneficial organization of the German and Italian principalities, but had opposed the breach with England, and now objected to aggressive policy against Russia and in the Peninsula. Talleyrand accordingly took the lead in the faction which worked against the emperor, and on the latter's deposition in 1814 was rewarded by becoming foreign minister to Louis XVIII.

His extraordinary diplomatic talents enabled him to play a part of immense value to France at the congress of Vienna, to secure her recognition on an equal footing with the four Great Powers. He was lord chamberlain from 1815; supported Louis Philippe's assump-

Tallinn, Estonia, S.S.R. The castle with its 700-year-old tower. Above, the Market Square

tion of the throne, 1830; and as ambassador in London he established friendly relations between Great Britain and the Orléans monarchy. He retired finally in 1834, and died May 17, 1838. Talleyrand was a man of great charm, intellect, and adaptability, who, though obviously ill-suited to the ecclesiastical profession, notably served France whether she was governed by revolutionaries, Napoleon, or the Bourbons. His *Mémoires* were edited by the duc de Broglie, Eng. trans. 1891-92; and A. Duff Cooper's biography, 1932, superseded earlier ones in English.

Tallien, JEAN LAMBERT (c. 1767-1820). French revolutionary.

Born in Paris, he became a notary's clerk engaged in Jacobin politics, and in 1792 entered the national convention, where he was noted for his violent attacks on the king. He defended Marat, 1793, and in 1794 was sent to suppress an insurrection in Bordeaux, where he proved a sound Terrorist. His career makes the most distasteful reading, for as president of the convention he engineered the overthrow of Robespierre;

Jean L. Tallien, French revolutionary

then entered the committee of public safety and suppressed the Jacobins; worked for the Thermidor reactionaries; and was one of the council of Five Hundred, 1795-98. He died in obscurity in Paris, Nov. 16, 1820.

Tallinn. Capital of Estonia S.S.R. and a Baltic seaport. The former Reval, it is built on a small bay on the S. of the Gulf of Finland, opposite Helsinki, and 232 m. W.S.W. of Leningrad by rly. The fine sheltered harbour is ice-free for nine months. Rising from the shore to high rocky land whereon are ancient fortifications and govt. buildings, Tallinn presents a grand appearance from the sea. Divided into upper and lower towns, it contains a cathedral and castle, medieval guild houses, museums, and a palace built by Peter the Great. Among its churches, S. Olai has a tower 463

ft. high. The technical faculty of the Estonian university at Tartu moved here as an independent university, 1936. There is the largest factory for making textile fibre from glass in the R.S.F.S.R. Some of the world's finest veneer and three-ply fabric is made from the Estonian birch forests. Shipbuilding, distilling, and pulp and paper making flourish. Pop. 146,400.

Founded by Waldemar II of Denmark in 1219, Reval was a prosperous Hanseatic town during the Middle Ages, and was long held by the Livonian knights. Made over to Sweden, 1561, it was besieged by Peter the Great, and annexed to Russia, 1710. It was seized by the Germans on Feb. 25, 1918. With the setting up of Estonia as an independent state, Tallinn developed as a seaport and an industrial and educational centre. Within the U.S.S.R. from 1940 (see Estonia), it became a Russian naval base. It was captured by the Germans, Aug. 28, 1941, after desperate fighting, and remained in their hands until liberated by the Russians, Sept. 22, 1944, after a 50 m. advance in one day.

Tallis, THOMAS (c. 1505-85). Composer regarded as the father of English church music. He was organist of Waltham Abbey until its dissolution in 1540, and was later a gentleman of the Chapel Royal and organist there with his pupil

William Byrd (*q.v.*). In 1575 they published their 34 motets, 16 of which were by Tallis. He wrote a

Thomas Tallis,
English composer
British Museum

large amount of church music, much of it still in MS., and notably the fine service in the Dorian mode which was published in 1641.

Tallis's canon is an adaptation of his eighth

"tune," while his ninth is still sung as a hymn. He died at Greenwich, Nov. 23, 1585.

Tallith. Ritual garment worn by all male Jews at the synagogue. A large square of fine linen, ornamented with a fringe, and with tassels attached by blue thread to the four corners, it is thrown round the shoulders like a shawl during prayer, or can be worn to cover the head. During the medieval Jewish persecutions a small tallith, worn as an under-garment was introduced, and is still worn continuously by pious Jews. *See* Jews; Synagogue.

Tallow. Clarified animal fat consisting chiefly of stearin, palmitin, and olein. Tallow is usually obtained from mutton or beef fat by melting and separating by pressure. Suet is a natural form of tallow. The latter, when pure, is white, almost tasteless, and insoluble in water. It is used in the manufacture of soap, candles, and as a lubricant. *See* Fat; Soap.

Tallow Chandlers' Company. London city livery company. Founded 1426, it was granted arms in 1456, obtaining its first charter six years later. The hall in Dowgate Hill was destroyed by the Great Fire, rebuilt 1672, and restored 1871. Severe damage was caused by a German bomb on May 10, 1941. The company had special privileges in the city and suburbs with regard to tallow, oils, etc.

Tallow Tree (*Sapimum sebiferum*). Tree of the family Euphorbiaceae, native of China. It has alternate, oval leaves with a pair of prominent glands at the top of the leaf-stalk, and the rudimentary greenish flowers are massed in catkin-like spikes. Rather large capsules contain three seeds coated with a substance like tallow, used by the Chinese for candle-making. The seeds yield oil by pressure, the leaves a black dye, and the hard wood is used for engraving printing blocks. The name is also applied to *Pentadesma butyracea*, a tropical African tree of the family Guttiferae, whose juice is yellow and greasy. Its edible fruit is buttery.

Tallow Tree. Leaves and fruit of the tree from which the Chinese extract tallow

ferae, whose juice is yellow and greasy. Its edible fruit is buttery.

Tally (Fr. *tailler*, to cut). Device formerly used for recording payments, consisting of a stick, which was marked with cross notches of various sizes and then split, each party to the transaction retaining a half. Names, dates, etc., were written on the stick. The accounts of the royal exchequer in England were kept by tallies until 1826, although account books were also used. The tallies were stored in a room which had been the star chamber, and in 1834 it was ordered that they should be used for fuel, with the result that the houses of parliament were burnt down in Oct. In some rural districts in England, notably in the Kentish hop fields, and on the Continent, accounts are still kept with tallies. The verb to tally, in the sense of agree or correspond, is derived from the use of tallies.

The name is given to a system of buying and selling goods in which payment is made by instalments. A tallyman visits his customers periodically to collect payments. This must be distinguished from the hire purchase system (*q.v.*). *See* Exchequer.

Talma, FRANÇOIS JOSEPH (1763-1826). French actor. Born in Paris,

F. J. Talma,
French actor

Jan. 15, 1763, he made his début in 1787 at the Comédie Française, where two years later he created a furore in Chénier's Charles IX. Founding the new Théâtre de

la République, he achieved a series of successes which made him the greatest tragedian of his time. Napoleon was his friend and patron and in 1808 took him to Erfurt, where he acted *La Mort de César* before an audience of kings, and to Dresden, 1813. Talma died Oct. 19, 1826.

Talmadge. Name of two American film actresses. The elder, Norma, was born at Niagara Falls, N.Y., May 2, 1897, and began to act at 14 in pictures made by the Vitagraph Co. She was one of the first to evolve a distinctive technique of emotional acting in such silent films as *Salome*, *The Criminal*, *Smilin' Through*, and *Secrets*. During 1917-34 she was married to the director Joseph Schenck. Her sister Constance, born at Brooklyn, April 19, 1900, was given a big part by Griffith as early as 1915 in the film *Intolerance*, and made many successes.

Talmud, THE. Compilation which incorporates the labours of the Jewish schools during several centuries. Its basis is the Mishna (repetition), a work which gathered

Tally. Top, the two halves of an ancient tally; below, modern Kentish hop tally before halves are separated

By courtesy of the Trustees, British Museum

up for the most part the traditional legal discussions (called the *Torah*) of the scholars known as Tannaim, repeaters or reciters, who lived between 500 B.C. and A.D. 200. The discussions were committed to writing about 200. The Mishna itself then became the text for further discussions by the scholars, who were active in the schools of Palestine and Babylonia from 220 to 500, and are known as Amoraim, speakers or interpreters. These discussions were called Gemara (lit. completion), and were added to the Mishna to form the Talmud.

There are two works, the Jerusalem Talmud or Talmud of Palestine, completed towards the end of the 4th century or during the 5th century, and the Babylonian Talmud, completed about 500. An edition of the Babylonian Talmud, with English translation by M. L. Rodkinson, was published 1890-1903. There have been many translations of selections, but the first complete and unabridged

translation of the Babylonian Talmud into English appeared in 1949; the work of 31 scholars during 18 years, it was in 34 vols. See *Jews*; consult *Literary Remains*, E. Deutsch, 1874; Introduction to the Talmud, M. Mielsziner, 1894; Short History of Jewish Literature, I. Abrahams, 1906.

Talos. In Greek mythology, a man of brass made by Hephaestus or Vulcan, and presented to Minos, king of Crete. He was destroyed by Jason with the help of the enchantress Medea.

Talos. In Greek mythology, a nephew of Daedalus, the inventor. Talos was credited with the invention of the saw, compasses, the potter's wheel, and other tools. His skill aroused the envy of Daedalus, who murdered him.

Taltal. Seaport of N. Chile, in Antofagasta prov. It ships nitrate and ores from the Atacama desert. Rlys. connect the port with the nitrate works and with the branch railway line at Catalina, 50 m. E.N.E.; and there is a motor road to Antofagasta. Pop. 7,835.

Talus (Lat., ankle-bone). In geology, term applied to the accumulation of rock fragments found at the bases of cliffs and precipices. In architecture the word is used to indicate the slope of a retaining wall.

Talwar or **TULWAR.** Type of Oriental sword. Used in Pakistan, e.g. by the Sikhs and Pathans, and also in Persia, it is especially a horseman's weapon, being a curved sabre well adapted for a sweeping cutting stroke.

Tal-y-Llyn. Lake of Wales, in Merionethshire. Situated at the S. foot of Cader Idris, and sometimes known as Mwyngil, or the peaceful retreat, it is 2 m. long and $\frac{1}{2}$ m. wide, and is drained by the Dysynni, which flows into Cardigan Bay. See Cader Idris.

Tamacoari, BALSAM OF. Purple, oily substance obtained from *Caraipa fasciculata*. The latter is a tree of the family Guttiferae. A native of tropical America, it has alternate leaves and sweet-scented, white flowers.

Tamai, BATTLE OF. British engagement during the campaign in the Sudan in 1884. On March 11 Sir Gerald Graham located an Arab force, part of Osman Digna's levies, in a ravine at Tamai, a village near Suakin. In an attack on these tribesmen on the 13th, the first British square was broken. The village was captured, however, with a British loss of about 200 killed and wounded. Tamai was afterwards abandoned, but finally re-

captured, Oct. 7, 1886, with great stores of rifles and ammunition.

Tamar. River of England. Rising in the extreme N. of Cornwall, and flowing S. by E., it forms for the greater part of its length the boundary between that county and Devon. It enters the English Channel after a course of 60 m. through Plymouth Sound by a many-branched estuary called the Hamoaze. It is navigable to Launceston. See *Saltash*.

Tamaricaceae. A family of shrubs and a few trees, natives of temperate and warm regions. They have small alternate leaves, sometimes scale-like, and fleshy, regular flowers. The seed-capsules are leathery, and the plants bitter and astringent. Best known of the few genera constituting the order is *Tamarix*, of which the tamarisk (*T. gallica*) is familiar.

Tamarind (*Tamarindus indica*). Tree of the family Leguminosae, a native of the tropics. It attains a height of 50 or 60 ft., and has long leaves divided into 20-40 oblong leaflets in two rows. The fragrant, small, red-striped, yellow flowers are in loose sprays, and are succeeded by beanlike pods, 3-6 ins. long; these are brittle, but filled with acid pulp in which the hard seeds are embedded. The outer skin of these pods is removed before they are preserved in syrup to form a gentle laxative medicine. The wood of the tree is valuable for building and for charcoal, and the bark is administered in dysentery and as a tonic. A yellow dye is extracted from the leaves.

Tamarisk (*Tamarix*). Genus of shrubs and small trees of the family Tamaricaceae. Of the

Tamarisk. Feathery leaves and dense spike of blossoms

is an evergreen tree, 6 ft. to 20 ft. in height, with minute, scale-like foliage and dense spikes of white or rosy flowers in late summer. *T. mannifera* exudes manna (q.v.).

Tamatave (Malagasy, Toamasina). Port of Madagascar, formerly capital of the island. It

lies on the E. coast 229 m. by rly. from Antananarivo; it is connected by rly. also with Lake Alaotra in the N. It has a roadstead almost encircled by coral reefs, and from it the greater part of the produce of the island is exported. Here also are meat-preserving factories. Pop. 24,860 (4,282 Europeans). The town gives its name to a prov.

During the Allied occupation of Madagascar in the Second Great War Tamatave was occupied by British troops, which landed Sept. 18, 1942, after a token resistance.

Tamaulipas. Maritime state of Mexico. It has a flat coast on the Gulf of Mexico, touching Texas on the N., and covers an area of 30,731 sq. m. Bordered by the Rio Grande, Panuco, and watered by other rivers, its soil is fertile in the valleys and where irri-

Tamarind. Spray of flowers and foliage of the tree. Inset, pod from which a medicine is extracted

gated. Agriculture and stock rearing are important, and trade is carried on in hides, cattle, fruit, and rubber. Oil is obtained in the S. The capital is Ciudad Victoria. Pop. 458,832.

Tambo. Small river of S. Peru. In the dept. of Moquegua, it rises in several headstreams on the W. slopes of the Andes, and flows N.W. and then S.W. through Arequipa dept. for about 100 m. to the Pacific, near Mejico Point. The village of Tambo, on its banks, is 25 m. E. of Mollendo.

Tambourine. Percussion instrument of Oriental origin. On one side only of a circular wooden hoop is stretched a vellum head, the tension of which is regulated by means of rods with fly-nuts. It is beaten by the hand, or occasionally rubbed by the fingers of the performer. Round the hoop are attached loosely several pairs of light metal plates called jingles.

Tambov. Town of Russia, capital of the region of the same name. It is on the Tsna and is a

ry. junction, 300 m. S.E. of Moscow. Being in the fertile black-earth zone, it does trade in grain, also cattle, tallow, and wool. Industrialisation proceeded rapidly under the five-year plans. Pop. 121,285.

Tame. River of England. It rises near Walsall, Staffs, and flows 30 m. through Warwickshire, passing into the former county again to join the Trent about 7 m. below Tamworth, where it picks up the Anker.

Tamerlane, TAMBURLAINE, OR TIMUR (1336-1405). Tartar conqueror. *Timur i leng*, Timur the lame, was born, son of the ruler of the Berlas tribe, near Samarkand. In 1358 he began his military career by invading Khorassan, and was soon appointed governor of Kesh. Bravery and cunning made him a powerful chieftain, and in 1369 he was crowned king of Samarkand. Declaring himself sole ruler of Turkistan, he began the series of conquests which made his name famous in the medieval world. His victorious armies reached the Caspian, subdued most of Persia, and routed the Golden Horde (*q.v.*). In 1398 he invaded India and sacked Delhi, carrying back to his favourite city of Samarkand enormous booty. His victorious war against the Turks and Egyptians resulted in the seizure of Damascus and Aleppo, and culminated in the defeat and capture of Bayazid I, 1402. Tamerlane then planned the invasion of China, but died in the midst of his preparations, Feb. 17, 1405. With his death his empire fell to pieces. He must not be thought of merely as a bloodthirsty conqueror, for he had intervals in which a cultured and scholarly court was established. Marlowe's tragedy, *Tamburlaine the Great*, fairly portrays his character.

Tamil. Agglutinative speech of the Dravidian language-family, spoken in S. Madras, N. Ceylon, and by the Indo-China Klings. Its six dialects are spoken by perhaps 20 millions. It has given to English such words as cheroot, curry, pariah, mulligatawny. The Tamil-speaking peoples are the most virile element in the S. Indian population. Many have emigrated to Ceylon, Mauritius, and the E. and W. Indies.

Tamil literature developed under the Jains during the 9th-13th centuries. The first important work is the *Naladiyar*, a collection of moral sayings. The masterpiece of Tamil literature is generally

acknowledged to be the *Kural*, written by Tiruvalluvar; this is a didactic poem dealing with the moral aims of man and embodying the philosophy of Buddha. His sister is supposed to be the author of the best poems in the language. The Jain period was followed by a Siva period of the 14th and 15th centuries. After two centuries of stagnation, literature revived under one of the kings, himself a poet, under whom many imitations and translations of Sanskrit were produced. The 17th century is known for the Sittar, a religious sect to whom numerous mystical poems are due. Later literature is modified by English influence. *See* Ceylon; Dravidian Languages; India; Nose Ornament.

Taming of the Shrew, THE. Comedy by Shakespeare. Christopher Sly, a drunken tinker, is put to bed and treated, on waking, as a man of quality, newly cured of madness. Before him is presented the play, which concerns the wooing of Katharina, the shrew, by Petruchio (*q.v.*) and that of her sister Bianca by Lucentio. The comedy, indebted to an old play of 1594, *The Taming of a Shrew*, and to *The Supposes*, a play adapted by Gascoigne from Ariosto's *I Suppositi*, was first printed in the 1623 folio, and is conjectured to have been partly written by another hand. The induction recalls *The Sleeper Awakened* of *The Arabian Nights*. In the most familiar passage of the play, Katharina pronounces at last that obedience is the duty of a wife. The play has 2,671 lines, including 516 of prose, 1,971 blank verse, and 169 pentametric rhymes. It was revived several times by the Bensons, and played in modern dress at the Court Theatre, 1928, and New Theatre, 1937.

Tammany Hall. Organization in New York. Properly designating the building in which is housed a political organization, the term has come to be applied to the organization itself. The genesis of the movement is to be found in the Society of S. Tammany (the name being a corruption of Tamanend, a reputed Indian sage), formed May 12, 1789, by William Mooney. This society concerned itself at the outset with social and benevolent objects, but before long it assumed a political cast, and from 1800 onwards it has identified itself with the National Democratic party; a fact which does not necessarily imply that the National Democratic party identifies itself with Tammany. The institution has

also devoted much of its activities to municipal politics, and since 1834 a majority of the mayors of New York have been the nominees of Tammany.

All the districts of New York have their leaders, who, together with representatives elected by the district, form the central general committee which is the governing body of the institution.

Much of the real power of Tammany is in the hands of its head for the time being, known as the boss. The first of these was William M. Tweed, and his successors included Richard Croker and Charles F. Murphy. Tweed—and not he alone—left an unenviable reputation, having been proved in 1869-71 to have robbed the city of millions of pounds by systematic corruption. The methods of Tammany again came in for severe criticism in 1890 at the hands of the state committee on cities, and from other similar bodies in 1894, 1899, and 1931.

Tammerfors. Town of Finland described under Tampere.

Tammuz. Fourth month of the Jewish sacred, and tenth of the civil, year. It is not mentioned in the Bible; but the fast for the Taking of Jerusalem is now observed on its 17th day. *See* Calendar.

Tam o' Shanter. A poem by Burns. It tells how Tam, after drinking late at Ayr, rode home through a storm past Alloway's haunted kirk, where he saw a dance of witches who pursued him. It is a masterpiece of the humorous and the eerie. The photograph MS. by the poet was offered for sale at Christie's in 1921. Tam o' Shanter has given his name to a loose cap of Scottish origin, with a knob or tassel.

Tampa. City of Florida, U.S.A., the co. seat of Hillsboro co. A port of entry on the W. coast, it stands at the mouth of Hillsboro river on Tampa Bay, and is served by the Seaboard Air Line and other rlys. Tampa leads the world in the output of hand-made cigars, though the industry is also mechanised. An extensive trade is carried on in phosphates, vegetables, grape fruit, cattle, lumber, and fish. Also manufactured here are foundry and machine-shop products, wagons, motor vehicle bodies, furniture,

Tam o' shanter, the Scottish cap

Tamworth, Staffordshire. Gateway of the 17th century castle, now used as a museum

safes, bricks, and tiles. Tampa was chartered as a city in 1886. Pop. est. 124,476.

Tampa Bay. Arm of the Gulf of Mexico. On the W. coast of Florida, U.S.A., it extends inland for about 20 m., and has a mean breadth of 7 m. and a maximum depth of 24 ft.

Tampere OR TAMMERFORS. Principal manufacturing city of Finland. It lies 85 m. by rly. N.N.E. of Turku, being a junction, on both sides of the Tammerkoski; rapids join the lakes Näsijärvi and Pyhäjärvi. The industries are concerned with all kinds of textiles, paper, leather goods, and there are several ironworks. During 1918 Finnish Bolsheviks and constitutionalists and Germans were all involved in fighting. Pop. 87,123.

Tampico. Seaport of Mexico, in the state of Tamaulipas. Once the world's greatest oil port, it stands on the river Panuco, near its entrance to the Gulf of Mexico, 206 m. N.N.E. of Mexico City, with which it is linked by highway, rly., and air service. It carries on an active trade, the chief articles of export being rubber, sugar, maize, asphalt, and oil from the near-by oilfields. Pop. 84,037.

Tamping. Technical term designating (1) the operation of packing or stemming an explosive into a borehole or other cavity preparatory to firing a shot; and (2) the material such as clay, sand, or a steel or wooden plug placed above the explosive in a borehole to confine it. Tamping, to be efficient, must be tightly packed round the fuse and no air space left between it and the explosive charge, otherwise the effect of the shot will be reduced owing to escape of gas.

Tamsui. Seaport of Formosa. It stands at the mouth of the river Tamsui, on the N.W. coast, and is the port for Taipei, the capital of the island, with which it has rly. communication. A flourishing trade is done in rice, sugar, tea, camphor, coal. Pop. 18,562.

Tamworth. Mun. borough and market town of Staffs, England. It stands on the Tame at its junction with the Anker, 15 m. N.N.E. of Birmingham, and has rly. services. When Tamworth was the capital of Mercia, the chief Saxon kingdom, Offahad a palace here.

Ethelfleda, daughter of Alfred, in 913 raised the artificial mound on which the present castle stands and erected a fortress. The Norman tower and keep date from the reign of William the Conqueror; the banqueting hall from that of Henry VIII. The castle belongs to the corporation and contains a museum. Other buildings include the parish church of S. Editha, rebuilt in the 14th century; town hall, given by Thomas Guy in 1701;

Tanagra. Terra-cotta figures of the type of pottery made at Tanagra

Moat House, an Elizabethan mansion; and Guy's almshouses. Tamworth had two M.P.s 1562-1885, and thereafter one until the gen. election of 1945, when it was divided between Solihull and Sutton Coldfield; from 1950 the borough voted with Lichfield and the rural dist. in Sutton Coldfield. Peel issued his Tamworth manifesto while he was its M.P. (1833-50); his statue is in the market place. The town gives its name to a hardy breed of pig (*q.v.*). Paper, clothing, terra-cotta, and textiles are made, while the N. Warwickshire coalfield adjoins the town. Pop. 13,000.

Tamworth. Town of New South Wales, Australia. On Peel river, 281 m. by rly. N. of Sydney, it is a pastoral and farming centre. The dist. also produces gold and diamonds. Pop. 12,071.

Tan. Bark of oak, beech, birch, and other trees, and the leaves and nuts of some, shredded and steeped in water for the preparation of leather (*q.v.*). See Tannin.

Tana. A river of Lapland. Formed from the Anar and Karas, it flows N.N.E. to reach Tana Fjord in the Arctic Ocean after a course of 220 m. For much of its course it divides Norway from Finland. There is a salmon fishery.

Tanager. Large family of finch-like birds, inhabiting tropical America. There are numerous

Tanager. The blue species of tropical America, *Tanagra episcopus*

genera and some 400 species, remarkable for their gaudy plumage. They feed mainly on fruit and insects, and some are songsters.

Tanagra. Town of ancient Greece, in Boeotia, near the frontier of Attica. It was the scene of a great defeat of the Athenians by the Spartans in 457 B.C. Excavations on the site yielded terra-cotta figurines, which have thrown light on ancient Greek costumes.

Tanaland. Prov. of Kenya Colony. It includes the dists. of Lamu and Kipini, and extends on both sides of the Tana river. Its capital is Lamu, long the headquarters of Arab civilization on the coast. The Tana river rises from the snows of Mount Kenya and flows at first N. and then S.E. It is about 450 m. long and rather turbulent in the upper reaches, but can be navigated by small launches for about 20 m. The prov. is sparsely populated by Arabs, Swahilis, and Gallas.

Tananarive. French form of the name of the capital of Madagascar, Antananarivo (*q.v.*).

Tanaro. River of N.W. Italy, in Piedmont. It rises in the Maritime Alps and flows N. and N.E. past Asti and Alessandria to join the Po below Valenza after a course of 125 m. Its chief affluents are the Stura and Bormida.

Tancred (c. 1050-1112). Leader of the First Crusade. Accompanying his uncle, Bohemond, prince of Tarentum, to Constantinople, in 1096, he entered the service of the emperor Alexis and set out for the Holy Land. On his way he seized Tarsus, but, driven out by his rival, Baldwin of Lorraine, he joined the army of Crusaders

before the walls of Antioch. There and later in the siege of Jerusalem Tancred performed prodigies of valour, and after the battle of Ascalon was made prince of Galilee, 1099. Unable to prevent Baldwin's assumption of the crown of Jerusalem, he retired to Antioch, of which town he became prince in 1111, and there he died the following year. *See* Crusades.

Tandem (Lat., at length). Term used for the driving of two horses, one in front of the other. Hence the term came to be used for a tandem bicycle, a machine for two riders, seated one in front of the other, the driving power being derived from two sets of pedals at the same time. *See* Driving; Rein.

Tandy, JAMES NAPPER (1740–1803). An Irish patriot. Born in Dublin, he was the first secretary of the United Irishmen, 1791. He was an ardent sympathiser with the French Revolution and organized an armed force similar to the Parisian National Guard. He was forced to take refuge in America, remaining there until 1798, when he went to Paris. There he joined Wolfe Tone (*q.v.*). He made an abortive landing in the Donegal island of Aran, Sept. 16, 1798. He afterwards set sail for Hamburg, where he was handed over to the British government. Although found guilty of treason he was reprieved, and died in France, Aug. 24, 1803.

Tanga. Port of Tanganyika Territory. Tanga is situated on a beautiful land-locked harbour opposite the island of Pemba, and is the coastal terminus of the Usambara rly. to Moshi on the S. slopes of Mt. Kilima-Njaro. There are rly. workshops. Most of the livestock sent to Zanzibar is from Tanga. Population about 18,000, including 300 Europeans. *See* East Africa, Conquest of.

Tanganyika. Lake of south-central Africa. It lies between Tanganyika Territory and the Belgian Congo, and extends 450 m. from N. to S. and into Rhodesia. It is the longest fresh-water lake in the world and has an area of about 13,000 sq. m. For most of its length it is 40 to 50 m. wide. It lies 2,550 ft. above sea level. The waters are more than 1,000 ft. deep (greatest depth 4,708 ft.), the lake forming part of the Great Rift Valley of central Africa. The shores generally, except S. of Ujiji, are mountainous, especially on the Congo side. The best harbours are situated on the E. littoral and include Kigoma, terminus of the

rly. from Dar-es-Salaam, Ujiji, Karema, Kirando, Kasanga, and Kituta, the last being at the extreme S. Albertville is the principal harbour on the Belgian side and is the terminus of the rly. to Kabalo on the Lualaba-Congo river.

Tanganyika was discovered by Burton and Speke in 1858, and was subsequently explored by Livingstone, Stanley, and others.

Tanganyika Territory. Area in E. Central Africa. With the dist. of Ruanda and Urundi in the N.W., which were joined to the Belgian Congo, and a small dist. S. of the Rovuma river, now part of Mozambique, the territory until

is a narrow coastal plain with palms and mangroves. The capital is Dar-es-Salaam (*q.v.*).

The topographical character of the country varies from the low-lying swampy ground near the coast to the highest mts. in Africa, notably Kilima-Njaro, 19,325 ft. The coast belt varies in width from 10 to 40 m. Behind this plain the country rises gradually to the great central plateau which comprises the major portion of the Territory. It has an average height of about 4,000 ft., and is covered with jungle forests and impenetrable bush.

The principal rivers flowing into the Indian Ocean are: the Pangani,

which rises in the snows of Kilima-Njaro, the Rufji, which is navigable by small vessels for about 60 m., the Rovuma, 500 m. long, the Matandu, and the Wami. Rivers flowing into the Great Lakes include the Mori, Mara, and Kagera to Lake Victoria, the Mlagarasi to Lake Tanganyika, and the Songue and Ruhuhu to Lake Nyasa.

The land now called Tanganyika is believed to have possessed a civilization before the Christian era. In 1498 Vasco da Gama sailed along its coast on his way to India, and the first Portuguese settlement, at Kilwa, followed in 1500. The Portuguese were prevented from spreading by the Arabs of Oman and Zanzibar, who grew rich upon the profits of the slave trade. About the middle of the 19th cent. the Germans became interested in the country and, chiefly through the efforts of Karl Peters, it was proclaimed a German protectorate in 1885. For a time there were many minor clashes with the natives, and in 1905 there was a serious rising at Maji Maji, ruthlessly suppressed by the Germans. In 18 months more than 120,000 natives lost their lives. In 1917, after clashes between German and British forces, the Germans were driven over the river Rovuma into Mozambique (*see* East Africa, German) and Great Britain became

Tanganyika Territory. Map of a part of East Africa administered by the U.K. under United Nations trusteeship

the First Great War comprised German E. Africa.

Administered by Great Britain from 1920 under mandate from the League of Nations, the territory, still under U.K. administration, was placed under United Nations trusteeship in 1946.

It has a coastline, lined with mangrove swamps, 470 m. long on the Indian Ocean, and reaches Lake Victoria in the N.W., Lake Tanganyika in the W., and Lake Nyasa in the S.W. It adjoins Mozambique on the S., Belgian Congo on the W., and forms a British connexion between Northern Rhodesia and Nyasaland on the S.W. and Uganda and Kenya Colony on the N. Its area is about 360,000 sq. m., including 20,000 sq. m. of water. Off the coast lie the islands of Zanzibar and Pemba, and the low coralline island of Mafia. Behind the coral reefs

responsible for the administration of the country.

In 1920 an order in council established administration by a governor assisted by an executive council of 10, of whom four are unofficial members. A legislative council of 30, including the governor, was set up in 1926; in 1948 it had as unofficial members seven Europeans, four Africans, and three Indians.

The est. pop. consisted (1946) of 5,648,015 Africans, 57,765 Asiatics (of whom 23,422 were Indians), and 245 Europeans. The majority of the Africans are Bantus, but more than 120 different tribes have been distinguished; in the N.W. there is much Hamitic blood. Many dialects are spoken, but Swahili is understood all over Tanganyika.

The density of pop. varies from 1.7 per sq. m. in the Masai dist. on the Kenya border to 111.5 per sq. m. in the Rungwe dist. in the S.; the average is 13.7 per sq. m. Two-thirds of the country is uninhabitable because of the presence in some areas of the tsetse fly, and in others the absence of water.

The Africans grow their own food, maize, millet, yams, bananas, and coconut palms. Most of the Asiatics are engaged in retail trade; Asiatics also act as merchants and middlemen. Most of the Europeans are in govt. service or engaged in the production of commodities for export, chief of which are sisal, diamonds, coffee, gold, and cotton. Tea, ground-nuts, sugar, and tobacco are also exported. The development of ground-nut cultivation begun by the British govt. in 1947 envisaged bringing under cultivation 5,000 sq. m. of scrub (two-thirds of the area in Tanganyika) by the use of mechanised land-clearing and other agricultural implements. The scheme involved also clearance of the tsetse fly from the area chosen; the settlement of some 60,000 Africans; the creation of a deep-water harbour at Mikindani; and the construction of a rly. from there 135 m. inland to Nachingwea. (See Ground Nut Scheme in N.V.).

The territory is served by the Central rly. from Dar-es-Salaam to Kigoma on Lake Tanganyika, with a branch to Lake Victoria, and the Tanga line from Tanga to Arusha, linking with the Kenya and Uganda rlys. with which the Tanganyika rlys. were amalgamated, 1948. In the East African rlys. and harbours administration. Steamers connected with the rly. service ply on the three lakes.

Motor traffic is possible over 21,000 m. of roads in the dry season. The Great North Road is a first-class all-weather highway.

The govt. maintains primary schools for European and a small proportion of African children and aids most of the Indian schools (80 out of 83 in 1946). There is no secondary education for European children, but bursaries are granted for their education in Kenya and S. Africa. See Kilima-Njaro. Consult Handbook of Tanganyika, G. F. Sayers, 1930; My Tanganyika Service, D. Cameron, 1936; East Africa and Its Invaders, R. Coupland, 1939; Tanganyika Territory, C. Leubuscher, 1943.

Tangent (Lat. *tangere*, to touch). In geometry, a straight line touching a curve or a surface, i.e. cutting it in two consecutive points. If a line be drawn through any two points of the curve's path, and then while the one remains fixed the other is brought into coincidence with it, the line in its final position is a tangent at that point, which is called the point of contact of the tangent. The slope or gradient of the tangent indicates the direction of the curve at the point of contact. The slope of the tangent at any point of the curve is given by the differential coefficient of the function of the curve. The tangent of an angle B is the ratio of the side AC to the side BC of a right-angled triangle ABC, right-angled at C. It is written $\tan B$. See Calculus; Geometry; Trigonometry.

Tangier. Seaport of Morocco. Situated on a bay of the Strait of Gibraltar it is 36 m. S.W. of Gibraltar, and is the diplomatic h.q. and largest commercial centre of Morocco. Tangier was taken from the Moors in 1471 by the Portuguese, from whom it passed to the English in 1662 as part of the dowry of Catherine of Braganza on her marriage to Charles II. It remained in English possession until 1684. Later the h.q. of Moorish pirates, it interested the Mediterranean powers and Great Britain because of its strategic position and potential commercial value; and in 1912 the British, French, and Spanish govts. agreed to set up an international zone to include the port and some 225 sq. m. of the hinterland. The First Great War prevented the agreement from being implemented, but in 1923 Tangier was internationalised under a convention signed by the three countries, although Moroccan sovereignty was recognized.

In 1928 a revised statute of Tangier signed in Paris gave Spain a more privileged status and brought Italy into the administration. The convention provided for complete international administration of the zone, except that native affairs were reserved to the Moroccan authorities. The zone, demilitarised and neutral, was policed by Spain. Legislative power was vested in an international assembly of 27 members; a committee of the consuls-general of the signatory powers had the right of veto; and administration was

Tangier, Morocco. View showing the lofty minaret of the Great Mosque

entrusted to a French head with assistants. A Muslim mendoub was ex-officio president of the assembly.

In June, 1940, Spain took over administration by military force, with the alleged object of maintaining the zone's neutrality in the Second Great War; and on Nov. 4 the Spanish commander deposed the French administrator and dissolved the legislative assembly. Next year Spain ejected the mendoub and installed the German consul in his stead, but in 1944 Allied pressure obliged the Spanish govt. to expel the latter. A conference on Aug. 31, 1945, of representatives of France, Great Britain, the U.S.S.R., and the U.S.A. called upon Spain to vacate the Tangier zone, restore the rights of the sultan of Morocco, and replace international administration on the basis of the convention of 1923 but with the U.S.A. and U.S.S.R. represented. On Oct. 11 the last Spanish troops withdrew, and in Dec. a Belgian military mission arrived to reorganize the police.

Besides an extensive shipping trade, Tangier has some popularity as a holiday resort. A rly., 200 m. long, to link the port with Fez was completed in 1947. Pop. 100,000, including many Spanish Jews. See Morocco.

Tangle Seaweed OR SEA GIRDLES (*Laminaria digitata*). Large olive seaweed of the family

Tangle Seaweed. Long fronds growing upon rocks uncovered by the tide

Laminariaceae. Attached to northern maritime rocks below ordinary low tides, it has a solid stem, as much as six feet in length and from an inch to two inches thick. The thick, leathery frond is six or eight feet long and is cut into broad segments. Like all the other Laminarias, the tangle annually throws off the frond. See Algae.

Tangmere. Village of Sussex, England, situated 6 m. E.N.E. of Chichester. Its aerodrome was a station of Fighter Command in the Second Great War, heavily bombed in July, 1940, and prominent in the battle of Britain. In 1942 it was the scene of a serious accident when several officers lost their lives during a demonstration with mustard gas. The small church of Tangmere has Saxon work and a 10th century yew in the churchyard.

Tango. Modern dance founded on an old gipsy dance of Moorish origin imported into Argentina from Spain. It was much performed by American negroes, and in the 20th century acquired popularity in the ballroom, being introduced into England in 1912. It has hardly been displaced as one of the standard dances, though calling for a different technique from the others. See Dancing, Ballroom.

Tangut. People of Tibetan stock and speech. They live on the N.E. Tibet borderland and in the Kansu prov. of China. Estimated at 500,000, these squat, dark-brown people are predatory tent-dwelling pastoral nomads or hut-dwelling husbandmen.

Tanis. Ancient city near San, 13 m. S.W. of Port Said, Lower Egypt. It is the biblical Zoan (Num. 13), on the Tanitic arm of the Nile. Here in 1884 Petrie inaugurated the scientific exploration of an-

cient Egypt. The city has yielded fine sphinxes, notably of Amenemhat III. In 1940 Montet discovered the tomb of Pharaoh Psuennes, and six years later that of the captain of his bodyguard. The funerary chamber contained a magnificent collection of gold and other ornaments, which contradicted the theory that the XXIIst dynasty was a period of artistic degeneracy.

Tanit. Phoenician goddess. A temple at Carthage originally founded in her honour was preserved by the Romans after the fall of the city, the temple being at that time consecrated to the goddess Astarte. Of vast dimen-

sions, it was one of the glories of Roman Africa, and the Christians transformed it into a church. About 400 it disappeared. The site, first discovered in 1885, was excavated in 1921-22. See Carthage.

Tanjore OR TANJUR. Dist. and town of Madras state, India. The dist. is S. of the Cauvery, of which the delta comprises a fertile area sometimes called the garden of S. India. It is highly irrigated. Under the rule of the Cholas during the whole of their supremacy (907-1310), Tanjore was conquered in the 14th cent. by the brother of Sivaji, the great Mahratta ruler, who set up a dynasty. In 1749 the British restored a deposed raja and thirty years later the territory was ceded to the British by treaty with Raja Sarfoji, the latter retaining only the capital and a small tract of country. The state lapsed entirely to the British govt. in 1853. Tanjore contains many monuments of Hindu art and early civilization. The buildings include the great temple or pagoda of

Tanjore, Madras state, India. The Tower Gate

Brihadi-Swara, the foundation of which is attributed to Raja Chola (985-1014). There is also the palace, built in the middle of the 16th cent., which has a library containing more than 18,000 manuscripts in Sanskrit, Tamil, and other Indian languages. A remarkable building is the church, named after C. F. Schwartz, who founded the Tranquebar mission; begun in 1779, this contains a white marble group of figures representing the death of Schwartz. Tanjore is a rly. junction and its industries include manufactures of silk, carpets, jewelry, repoussé work, copper ware, and models in pith. Dist. area 3,727 sq. m., dist. pop. 2,563,375; town pop. 68,702.

Tank. Receptacle for the storage of fluids. The petroleum industry, in particular, uses tanks of various designs and of sizes varying from 100 barrels (3,500 gall.) to 200,000 barrels (7,000,000 gall.). Wooden tanks with capacities up to 2,000 barrels are sometimes used for very corrosive crude oils, but steel is a more usual material. Galvanised, corrugated-iron tanks with riveted and soldered joints are made in sizes up to 2,500 barrels. Another pattern (up to 10,000 barrels) is built up from drilled steel plates, bolted together on the site. Larger tanks are assembled on the spot where they are to be used, and the plates welded or riveted together. The liquids thus stored are crude oils and refined products of all types, and their volatility varies widely.

Tanks for non-volatile liquids have a fixed, slightly conical roof and present no special problems in design. The storage of volatile liquids is complicated by the need to minimise evaporation losses due to temp. changes and to emptying and filling. When the contents of the tank are frequently changed, a roof which floats on the oil is used. When the oil remains a long time without change a tank with a flexible roof which can bell out or sag, according to atmospheric temp., is suitable, or the vapour space of a fixed roof tank is connected with a gasometer. Liquefied gases with high vapour pressures are stored in spherical tanks.

The collection of tanks at pipeline termini, ports, and refineries is called a tank farm. Tanks should be as far apart as possible and surrounded by a bank or wall to retain any escaping oil. Such tanks should be coated with aluminium paint to reflect the sun's heat, and full fire-fighting equipment is essential.

TANKS AND TANK WARFARE

Lt.-Gen. Sir Gifford Le Q. Martel, Commander, R.A.C., 1940-42

This article, by one who was associated from the beginning with the development of the armoured vehicle called for secrecy a tank, gives its history and explains its use in warfare. See also Amphibious Craft; Armoured Vehicles; Blitzkrieg; Caterpillar Track; Churchill Tank; Fortification; Landing Craft; Matilda Tank; Panzer; Royal Armoured Corps; Royal Tank Regiment

The name tank was given Dec., 1915, as a blind to a bullet-proof, armed vehicle constructed secretly in the U.K. which was driven by mechanical power and fitted with caterpillar tracks that made it possible to drive across obstacles. The name continued to be used after the machine had appeared in the field. To the British is thus due the conception and introduction of a weapon destined to exert a great influence on warfare.

From the earliest times, men have attempted to find methods whereby they might move under some form of protection while they delivered blows at the enemy. Vehicles constructed with a view to solving this problem were forerunners of the tank. They were propelled by man or horse, and timber or leather was generally used to protect the crew. With the invention of gunpowder, it was found impossible to provide protection against the bullet: the great weight of armour protection required made impossible propulsion by man or horse.

Armoured Vehicles Proposed

At the beginning of the 20th century the invention of the caterpillar track and of the high speed internal combustion engine made it possible once more to use fighting vehicles on the battlefield. Several suggestions were made before the First Great War that tractors should be adapted to carry armour plate and weapons so as to produce fighting vehicles, but no official action was taken.

Contrary to expectations, the First Great War very soon developed into trench warfare, in which the defences, with their machine-guns protected by barbed wire obstacles, proved impregnable to attack except with the most prodigious loss of life. In Oct., 1914, an officer of the Royal Engineers, Lt.-Col. (later Maj.-Gen.) E. D. Swinton, who had suggested the development of some form of power-driven vehicle on caterpillar tracks and fitted with armour and weapons to assist in overcoming the power of the defence, explained his proposal to Col. Hankey, secretary of the committee of imperial defence, who put the idea before the prime

minister. Some trials were carried out, but little progress was made. The idea, however, reached Winston Churchill, who was first lord of the Admiralty and already experimenting with armoured cars for the naval force in Belgium. He took up the proposal with enthusiasm, and formed a committee under Sir Tennyson d'Eyncourt. At the same time, Lt.-Col. Swinton took his proposals to the c.-in-c. in France, with the result that a specification of the type of machine required was sent to the War office. The first machine constructed, called Little Willie (the popular nickname for the German crown prince, to distinguish him from his father, the emperor William II), just failed to meet the specification, but a slightly larger machine named Big Willie, completed a little later, passed all the tests. The design, prepared by Lt.-Col. W. G. Wilson, working in conjunction with Sir William Tritton, was the prototype of all British machines used in the First Great War. The ministry of Munitions formed a tank supply committee under Sir Albert Stern and a hundred tanks were ordered to this design.

The Mark I tank had a total length of 26 ft. and weighed 28 tons. There were two types, male and female. The male tank had two low velocity 6-pdr. guns and three Hotchkiss machine-guns. The female type had four Vickers machine-guns and one Hotchkiss. The tank was driven by a 100-h.p. Daimler engine and had a crew of eight men. The early models had a pair of wheels at the back to assist steering and to help in crossing wide trenches. These wheels were omitted in later models. In March, 1916, a unit, called for secrecy the heavy branch machine-gun corps, was formed under the command of Col. Swinton to man these tanks.

First Tank Attack

On Sept. 15, 1916, the first tank attack took place on the Somme, 50 tanks advancing in small packets in front of the infantry in the attack on the 4th army front. This form of attack came as a complete surprise to the Germans. In some cases, and notably at

Flers, marked success was achieved; but as a whole the result was disappointing. The tanks had been designed to cross rough ground and obstacles, but the continuous small craters and shell-torn ground which had resulted from weeks of heavy bombardment had rendered the terrain almost impassable. Small numbers of tanks were used on Sept. 25 and 26 and Nov. 13. On each occasion most of the tanks were unable to reach their objective, but those that did so rendered invaluable help to the infantry.

Views on the Use of Tanks

The use of tanks in Sept., 1916, was contrary to the views of those who had originated them. The originators considered that the tank should have been kept secret and used in large numbers as a surprise on a new portion of the front so as to give the chance of achieving a decisive success. The trial did, however, show that the tank was an answer to defence by machine-guns and barbed wire. It was decided to raise several tank bns. under the command of Col. H. J. Elles, and 1,000 tanks were ordered.

The Mark I tank had certain weak features and a crude system of steering, effected by changing the gear on each side of the tank. The ministry of Munitions produced a new model, but owing to delay by the general staff in approving it, production was continued of the existing type with minor improvements. These improved tanks were known as Marks II and III; they were provided with armour proof only against ordinary bullets. After the secret had been given away, it was assumed that the enemy would use armour-piercing ammunition, and the Mark IV tank was therefore made proof against every form of small arms fire.

In April, 1917, tanks were again used at the battle of Arras and in June at Messines. In both battles a heavy artillery bombardment was the main support for the infantry, the tanks being used in an auxiliary rôle. In July, the third battle of Ypres began. In this low-lying area, torn up by shell fire, tanks proved of little value.

The officers responsible for this new arm had been pressing for the use of tanks ahead of infantry in a surprise attack on a wide front without preliminary bombardment, which destroyed all chance of surprise. This proposal was finally approved and the battle of Cambrai was launched on Nov.

1. Flash eliminator. 2. Barrel of 17-pdr. gun. 3. 76 mm. armour. 4. Sight for 17-pdr. gun. 5. Commander's periscope. 6. Commander's observation louvre. 7. Commander's intercom. speaker. 8. Commander's turret. 9. Two-way radio. 10 and 11. Radio antennae. 12. Counterweight for gun. 13. Smoke signal apparatus. 14. Air intake. 15. 450 h.p. V engine. 16. Driving sprocket. 17. Caterpillar track. 18. Track idler. 19. Track idler. 20. Magazine for 17-pdr. shells. 21. Idler. 22. Suspension gear. 23. Gunner's padded shock absorber. 24. Gunner's seat. 25. Gun elevating gear. 26. Suspension gear. 27. Bowden control trigger for gun. 28. Shell magazine. 29. Idler. 30. Driver's seat. 31. Driver's periscope. 32. Driver's louvre. 33. Rear box and lever. 34. Steering brake. 35. Clutch. 36. Lamp. 37. Front sprocket idler. 38. Armour covering track. This vehicle weighed 28 tons, carried a crew of five, and was armed with one 75-mm. 17-pdr. gun and one machine-gun.

TANK : SECTIONAL DIAGRAM SHOWING THE INTERIOR OF A BRITISH CROMWELL CRUISER TANK

20, 1917. This was the turning point in the history of the Tank corps. The attack was carried out by the 3rd army using the 3rd and 4th corps with a total of six divs.; nine tank bns. with 378 tanks and organized in three bdes. were used. At dawn tanks led the forces on the whole front, Gen. Elles advancing in the leading tank in the centre of the line. Complete success was achieved on the first day, the infantry advancing 5 m. on a 6-m. front, taking 8,000 prisoners, and inflicting heavy casualties. British casualties were less than 4,000. As a raid the operations had been perfect; but the Allies had not the resources to continue to press forward, and eventually the Germans delivered a successful counter-attack.

In March, 1918, the Germans delivered their great counter-offensive. The Tank corps was built up to five bdes. with a total of 13 bns. The Mark V tank, now introduced, had a more powerful engine and was far more manoeuvrable. The British Mark IV and V tanks took a leading part in all the concluding battles of the war, the Germans attributing their failure in the main to the part played by these tanks.

French Invention

The French invented a tank independently in the early stages of the First Great War, and when this was discovered the British and French authorities met together in June, 1916, to compare plans. The French went in chiefly for a small, light tank intended to keep the warfare mobile after a breakthrough, though they made some heavier tanks for trench warfare. The Renault light tank met with great success in the battle of Soissons, July 18, 1918, and in the subsequent Allied offensive. The British counterpart of this French tank was the Medium A (or whip-pet). When the U.S.A. entered the war, an Anglo-American design of heavy tank, Mark VIII, was produced. This was generally similar to the British Mark V tank, but longer, and it had a more powerful engine. Plans were in hand to produce very large numbers of this type if the war had continued into 1919. British tank corps h.q., formed Aug., 1916, initiated proposals for introducing large-scale mechanical warfare. Col. Elles was the commander, with Capt. Martel on the general staff.

After the First Great War, light and fast tanks, suitable for small scale colonial warfare, were produced. The first Vickers tank,

1921, weighed 12 tons and had a speed of 20 m.p.h. with an armament of one 3-pdr. gun and two machine-guns. It had a revolving turret, providing all-round fire.

As a result of discussions on the use of mechanical instead of man power, the C.I.G.S., Gen. (later F.-M.) Milne, formed a mechanised force for trials on Salisbury plain. It consisted of a bn. of tanks, a mechanised artillery bde., and a machine-gun bn. carried in cross-country lorries, with engineer and signal units. Armoured cars and other small vehicles were used for reconnaissance. The idea was that such a formation, or a number of such formations working together, should be used in the mobile rôle carried out in the past by cavalry. Satisfactory field trials were made in 1927 and 1928.

In the meantime a new idea was introduced. The Vickers tank, though smaller than the war tank, was still a fairly large and expensive affair. At this period no nation was prepared to spend any great sums on equipping an army. The proposal was therefore made that quite small light tanks should be used in large numbers for this mobile rôle. The first model of such a tank was made privately by Major G. Le Q. Martel, who had initiated these ideas. These simple light tanks were to be supported by mechanised artillery and a limited strength in infantry carried in lorries. The machines made for this purpose were developed on two different lines. Along one line they became a very good, three-man light tank weighing 5 tons. On the other line they developed into the machine-gun carrier which eventually became the Bren carrier. These machines were developed by Sir John Carden, who joined Vickers. A new design for fighting, the 16-tonner, was prepared, but it was expensive, and only a few were ordered.

As an alternative to a mobile force of all arms, the all-armoured force, consisting almost entirely of tanks, was proposed in 1929; necessary artillery and infantry support was to be taken from normal formations when required. Trials and training on these lines were carried out during 1930-33. Great Britain developed a technique for the handling and control of these tank bdes. by the use of wireless telephone which was closely watched and copied by other nations.

Germany equipped large numbers of armoured formations with light tanks, and built a small

number of medium tanks. The Germans were also interested in the British all-armoured force, but after large-scale trials decided that this was a mistaken policy, and they were right. It was the universal experience during the Second Great War that an armoured formation intended for a mobile rôle had to be a properly balanced force of all arms.

Dual Rôle of Tanks

It was realized by Great Britain that, apart from light tanks for use in a mobile rôle, more powerful but slower tanks would be needed to assist the infantryman in close and heavy fighting. In 1935 the British therefore carried out trials with tanks which would have armour sufficiently thick to keep out shell fire as well as bullets. In 1936 Col. Martel, who was in charge of the tank dept. at the War office, visited Russia to see the manoeuvres there. The policy of having two types of tank for the two rôles was discussed with the Russians; complete agreement was reached and, except for a short period, both countries maintained this policy throughout the Second Great War. At the Russian manoeuvres was a tank designed by an American named Christie which had some very valuable features. Arrangements were at once made to incorporate these ideas in a British medium tank. In the Christie tank, thickness of armour and other features had been sacrificed to produce a spectacular performance. The whole tank had therefore to be redesigned to make it battleworthy, but many of its valuable features, particularly the type of suspension, were retained. The first pilot model of the new tank was completed in 1938. Large numbers were ordered; the tank was named the Crusader, and such tanks for mobile use became known as cruiser tanks. As there had not been time to carry out extensive tests and trials before production, a number of weak features of the Crusader came to light only later.

In the meantime work had been progressing on an infantry tank, the design for one called the Matilda being prepared in 1937. This had armour up to 90 mm. thick, and proof against the shells of the German 37-mm. anti-tank gun. It was armed with one 2-pdr. and one machine-gun. Speed and radius of action were reduced to enable the other features to be attained. The design proved remarkably successful for the first model of a tank incorporating entirely new ideas.

An armoured division was formed in Great Britain in 1938, but little training could be carried out for lack of cruiser tanks. A tank brigade was also formed equipped with Matilda tanks for cooperation with infantry. During the last year before the outbreak of the Second Great War in Sept., 1939, great efforts were made to raise additional armoured forces, but lack of equipment rendered this almost impossible.

Germany overwhelmed Poland with very superior forces, mostly armoured divs., equipped with light tanks, and backed up by motorized units. In the following spring, the German armoured forces met with similar success in France. The German adoption of the British proposals to equip and train armoured divs. with light tanks in peace time had paid. Great Britain, however, had never put her proposals into effect, and had virtually no armoured forces at her disposal. The Germans used a certain number of their Mark III and IV cruiser tanks to assist the light tank, and at the outbreak of war all German tank factories were turned on to the maximum output of this type of tank. At this stage the Germans had produced no heavy infantry tanks at all; they had pinned their faith on *blitzkrieg* methods, and slow infantry tanks could play no part in that type of warfare.

The French had built tanks which were a cross between the British infantry and cruiser tanks, but they had little understanding of the use of armour in defence, and failed to hold the forward sweep of the German armoured forces. During this German drive through France the British fought one small but important battle at Arras. In this battle the 1st British tank bde., equipped with Matilda infantry tanks and working with the 50th div., attacked German forces under the command of Rommel. The Matildas were immune to the fire of the German anti-tank guns, and for a time they dominated the battlefield. The value of this type of tank for close fighting was clearly proved. In the end the British were forced back by the great German superiority in strength; but the delay caused to the German advance was of great assistance to the evacuation from Dunkirk. The one and only armoured div. the British possessed was sent to France to assist the B.E.F., but it arrived only half equipped, and had no chance against the immense forces it met.

After Dunkirk the British had to start from nothing to build up their armoured forces. What little equipment they had was lost in France. A h.q. was established to raise the armoured forces required and to develop a technique for armoured warfare; Lt.-Gen. G. Le Q. Martel was appointed commander of the Royal Armoured corps. Two types of armoured forces were to be raised: the armoured div. using the faster type of tank for the mobile rôle, and the army tank bde. equipped with heavy infantry tanks to work with infantry in close fighting. By this time both the Germans and British considered that a proportion of infantry and artillery units was needed in the armoured div. The British armoured div. had two armoured bdes. and a support group of one infantry bn., one field regt. of artillery, one anti-tank and one A.A. regt., and two field squadrons of engineers. The armoured bde. had three armoured regts. each of three squadrons and a motor bn. The German Panzer div. was similarly organized. The British army tank bde. was organized in three armoured regts. or bns. At first five armoured divs. and eight army tank bdes. were raised; later these numbers were greatly increased. The technique for armoured warfare was built up by holding indoor and outdoor exercises and devising schemes.

British Policy Successful

In the defence of Egypt against the Italians, 1940-41, the British policy of using two types of tanks met with great success. At each stage the armoured div. advanced, felt for the enemy's flank, and attacked him in flank or rear, while the tank bn. with its heavier machines advanced more slowly and assisted in the attack on strong positions. The withdrawal of British forces to Greece, and the arrival in N. Africa of German armoured and mechanical forces under Rommel, made it possible for the Axis armies to drive the British back to the Egyptian frontier in the summer of 1941. The British tanks were then greatly handicapped by the fact that the Germans re-equipped their tanks in 1941 with a 50-mm. gun, replacing their 37-mm. gun; the new gun fired a 4½-pdr. shell. The British had prepared a new tank gun before the war which fired a 6-pdr. shell but it was a long time before this was manufactured and fitted to British tanks. The 50-mm. gun could penetrate the British cruiser tanks at 1,400 yds. whereas the

British, with their 2-pdr. gun, had to close to 800 yds. to penetrate the German tanks.

The weak mechanical features of the British cruiser tanks were eventually rectified, and they were equipped with 6-pdr. guns. The Cromwell, incorporating the best features of the Crusader, became the most reliable and successful cruiser tank used in the war. It mounted a 75-mm. medium velocity gun. The Churchill, an infantry tank, which had many mechanical failures for some months, eventually gave splendid service.

Armoured and Unarmoured Troops

At the end of 1941 British armoured forces, little superior in strength to those of the Axis and definitely inferior in gun power and in the reliability of their tanks, drove Rommel's forces back to Benghazi. Experience showed that the armoured div. needed a larger proportion of unarmoured troops, and it was now organized with one armoured bde., one infantry bde. carried in lorries, the former retaining the motor bn., and one armoured car regt. for reconnaissance; the divisional artillery contained two field regts., one anti-tank and an A.A. regt.; the divisional engineers had two field squadrons. This organization was retained till the end of the war and came to be accepted as standard, other nations also adopting it. The British made little alteration to their organization of the army tank brigade.

When the 8th army began to prepare for the battle of Alamein, it included armoured forces which arrived in the Middle East fully trained in the technique of armoured warfare, and equipped with reliable tanks mounting 6-pdr. guns. H.Q. armoured forces had always stated that it would need 18 months to reach this standard, and that time had now elapsed. From that moment British armoured divs. were consistently victorious. At the end of 1942 H.Q. armoured forces was abolished as having accomplished its task.

The technique which had been developed was as follows: While armoured divs. exist on one side, the commander on the other cannot move his normal formations freely. The first object of a commander will therefore often be the elimination of the opposing mobile armoured forces. This may take the form of a clash between the tank forces of the two sides; but if one side can use its armoured forces to seize ground which is vital to the opponent, it may force him

to attack on ground of its own choosing and thus be able to weaken or even destroy his armoured forces. The normal process is therefore for the armoured forces to advance and for the unarmoured troops to secure pivots of manoeuvre round which the armoured forces may operate. This process can be continued until a position is taken which the opposing commander must recapture. To do so without delay he must attack with his armoured forces, and this provides the opportunity for the destruction of these forces by the defensive action of the unarmoured troops combined with offensive action by the armoured troops.

Organization of Reconnaissance

Certain reconnaissances must be carried out in front of the advance of the armoured divs. All possible information must be obtained from the air. After that armoured cars drive ahead to carry out medium distance reconnaissance which gives early information of the movements and location of opposing forces. In the open desert no other form of reconnaissance was needed (other than battle reconnaissance), but in European country an advance guard was required to sweep aside minor opposition and to provide protection for the main body of the tanks. The h.q. of an armoured regt. usually runs this advanced guard, which consists of one or two squadrons of tanks and some infantry and artillery attached as required. In addition to this advance guard each armoured regt. has 18 small vehicles for close reconnaissance and intercommunication. Finally, there is battle reconnaissance. Before launching an armoured attack it is usually necessary to "tap in" with tanks to force the opponent to disclose his defensive lay-out.

The order in which an armoured div. advances depends on circumstances. If a rapid move is possible to secure some position and opposition during the move is unlikely, the motorised infantry bde. leads, as it moves more rapidly than the armoured bde., and can seize and secure the position at once. If the armoured div. is advancing through open and suitable tank country, and some opposition is expected, the armoured bde. leads so that any opposition can be overcome without delay. Having secured the objective, however, the armour must at once be relieved by the infantry bde., so that the tank crews can carry out the necessary maintenance work on their tanks

and then remain ready for armoured action. If the armoured div. has to move through enclosed country where opposition is likely, then it usually pays to let the infantry bde. take the lead, for tank units can move only slowly through country where anti-tank weapons can be easily concealed. Close co-operation with air forces is essential at every stage. When a tank attack is launched the maximum possible support must be given from artillery and the air.

AMERICAN TANKS. The U.S.A. adopted the policy of using only one type of tank, of which the chief example was the Grant, a very reliable machine halfway between the British cruiser and infantry tanks in mechanical performance, but defective because its guns had a limited traverse. This was put right in the Sherman, which gave splendid service in N. Africa. It was not as good, however, as the Cromwell in mobile warfare or the Churchill in close warfare.

SPECIAL TANKS. Special R.E. tanks were made to assist in overcoming the obstacles on the Normandy beaches. Devices mounted on Churchill tanks made it possible to place bridges over gaps and to overcome obstacles without exposing men to fire. Mortars to throw heavy charges were mounted on other tanks. Proposals for special R.E. tanks had been made towards the end of the First Great War and the prototypes of most of these devices were suggested and tried then. Special swimming tanks were also provided to assist in the landings.

A number of fighting tanks called kangaroos, fitted to carry a section of infantry behind bullet-proof armour, were used very effectively. (A similar tank made in 1918 was finished too late to be used in the First Great War.) A Churchill tank with flame thrower in the front was used with success for mopping up tanks and in street fighting in Europe, Asia, and the Pacific; the maximum range was just under 100 yds.

ANTI-TANK DEFENCE. The Germans did little to develop anti-tank defence during the First Great War. They used anti-tank mines in small numbers, and made a heavy anti-tank rifle, but neither was very effective. They trusted to field guns, dug in and carefully concealed in the forward area, which reserved their fire till the British tanks were within close range. They used as much

as 30 p.c. of their field artillery in this rôle and at times they caused heavy casualties to the tanks; but the loss in strength of artillery fire for the defensive barrage was a serious handicap.

Between the two Great Wars, anti-tank mines and rifles were developed and special high velocity anti-tank guns. The heavy anti-tank rifles proved of little value, but the mines were a very serious factor. The British engaged in research to discover methods of sweeping a way through mine-fields. Rollers and ploughs pushed in front of the tanks were tried with some success. Eventually the flail tank was evolved: chains on a revolving drum in front of the tank beat the ground like a flail and exploded the mines; this apparatus was used successfully in the later stages of the Second Great War. The early models of British infantry tanks of that war were proof against the shells of the existing German anti-tank guns; but a new anti-tank weapon was introduced, rocket propelled and firing a high explosive hollow charge. Easily carried and fired by infantrymen, it was very effective even against the most powerful tank at short range. This weapon, the British P.I.A.T. (*q.v.*), had an American counterpart in the bazooka (*q.v.*), and a German in the Panzerfaust. The Allies had less use for such weapons during the final stages of the war as they possessed a great superiority in tanks. At times tanks were used dug in, or standing behind a small rise in the ground, and waiting in defence for a tank attack. If opposing tanks can be lured on to attack stationary and semi-concealed tanks in this way heavy casualties may be inflicted on them. Tanks should not be used in this way, except temporarily during mobile warfare. For a more permanent defensive rôle, anti-tank guns must be used and the tanks kept mobile.

Tanker. Ship designed to carry liquids in bulk. Since the 3rd cent. B.C. the Chinese have used 50-ton junks fitted with internal divisions for the carriage of oil and water. The first European tanker, a 500-ton sailing ship with tanks for whale oil, was built in 1795. Similar vessels were used in the mid-19th cent. for the coastwise transport of Scottish shale oil. Ocean-going tankers built at Newcastle-upon-Tyne in 1886 for importing American oil into Europe could carry 800 tons. In 1950 several tankers each of 28,000 deadweight tons were under construction in British shipyards, while four of 30,000 d.w.t. were then the largest built in the U.S.A.

To prevent the oil from surging and so threatening the stability of the ship, the free surface of the liquid cargo is broken up by partitions. All tankers are self-discharging; between the tanks are pumps to force the oil along continuous pipe-lines on either side of the ship and then by vertical pipes to deck level, where other pumps discharge it into shore storage tanks. Oil being subject to extreme variations in volume according to temp., to allow for expansion of the cargo the main tanks are connected to an additional tank space, which can receive the overflow. Tankers' propelling machinery is always installed aft; this reduces fire risk, leaves the maximum hull space available for cargo, and simplifies the lay-out of the pumping installation.

The ships seldom remain serviceable more than 10 years. This, and the fact that one cargo must pay the costs of the outward and homeward voyages, compel tankers to spend the maximum time at sea. They are seldom in port more than two days, for a cargo of 15,000 tons can be lifted or discharged in less than 24 hours. In 1949, the world's total deadweight tonnage of tankers over 500 gross registered tons was approx. 25 million (including under the U.S. flag 8.5 m.; British 5.8 m.; Norwegian 3 m.; Panama 2.3 m.).

Tankerton. Seaside resort of Kent, England. It is an E. extension of Whitstable (q.v.).

Tankerville, EARL OF. British title borne by the family of Bennet since 1714, and before then by the family of Grey. In 1695 Forde Grey of Werk, Northumberland, was created earl. He had no sons, but a daughter Mary married Charles Bennet, Baron

Ossulston, a title dating from 1682. The earl died in 1701, and his son-in-law was made earl of Tankerville in 1714. From him the line is descended. Charles, 6th earl (1810-99), was M.P. for N. Northumberland, 1832-59, and lord steward, 1867-68. Charles, 8th earl, was born Aug. 16, 1897, and in 1931 succeeded his father. The earl's eldest son is known as Lord Ossulston.

Tannenberg (Pol. Stebark). Village of Poland, until 1945 in the German prov. of E. Prussia. About 75 m. S. of Kaliningrad (Königsberg), it was the scene of a victory of Lithuanians and Poles over the Teutonic knights in 1410, and of a Russian defeat by Hindenburg

of taking command, Hindenburg established himself on the rly. and road from Osterode to the frontier, Soldau being retaken by him on Aug. 26. When next day Samsonov tried hard to recapture it, he was swept back E. to Neidenburg, thus having his left flank turned, and losing his main line of supply and retreat by the Soldau-Mlava rly. Evacuating Allenstein, the Russians retired on Hohenstein, where they made a determined stand, the fighting lasting from the 26th to 28th, but they were compelled to retreat.

Hindenburg extended his left flank far beyond Allenstein, with a view to turning the Russian right, and at the same time driving

Tannenberg, Poland. The German memorial, erected on the battlefield at Tannenberg, to commemorate Hindenburg's defeat of the Russians in 1914

in 1914 (v.v.). To commemorate the latter victory the Germans erected a memorial on the battlefield, and held a military parade on each anniversary. Hindenburg was buried here. In the Second Great War troops of the 2nd White Russian army occupied Tannenberg on Jan. 21, 1945.

Tannenberg, BATTLE OF. German victory over the Russians, Aug. 25-31, 1914. After their defeat of Aug. 24, 1914, the Germans fell back on Osterode, where large forces were being concentrated, consisting of about 160,000 men, under Hindenburg. The Russians, under Samsonov, were at least 50,000 men stronger.

Hindenburg took up his quarters at Marienburg on Aug. 23, with Ludendorff as chief of staff. His problem was to drive the Russians out of E. Prussia, in which he had Rennenkampf's army as well as Samsonov's to face and defeat. His first move was against the latter. He quickly got his forces into position on a front that reached from Osterode on the N. to a point near Soldau on the S. Thrusting towards the former, the Russians discovered that the Germans had been strengthened, and were not to be driven out. Within three days

in a wedge between it and Rennenkampf's army on the N. This move succeeded. Having taken Wartenburg on the rly., the Germans of this wing marched on to Passenheim, which they captured on Aug. 29. The Russians then were surrounded on the W., N., and E., and Hindenburg's heavy guns played havoc among them. Their only way of retreat was by the S., over a tract of lake and marsh, which was crossed by a narrow defile of firm ground by Ortelsburg and Johannsburg to the frontier. By the 30th the Russians were withdrawing everywhere, losing many men and guns in the swamps and shallow miry lakes. Hindenburg's knowledge of the terrain enabled him to place his guns on solid spots, and the Russians were mercilessly shelled.

On Aug. 31 Samsonov made a last desperate attempt to rally his men, but he and his chief of staff were killed, and the effort came to nothing. Only about 60,000 men escaped across the frontier into Russia. In this battle the Germans took 90,000 prisoners, and captured hundreds of guns. This victory ranks among the most decisive of the First Great War. *Consult* My Life, P. von Hindenburg, 1920.

1. Crocodile flame-throwing tank, Western Front, Nov., 1944. 2. Amphibious Buffalo troop and store carrying tank at Beveland, Oct., 1945. 3. U.S. Sherman tank armed with sixty 4.5-in. rocket projectors, Western Front, March, 1945. 4. Churchill flail tank clearing minefields,

Normandy, July, 1944. 5. Churchill 38-ton "scissors" tank for bridging small rivers and canals, introduced 1944; the hydraulic ram is seen lifting "scissors" bridge preparatory to placing it in position. 6. Churchill "scissors" tank placing a double-ramp bridge across a narrow stream

Tannhäuser. Hero of a medieval German legend, whose story has been described as symbolising the hankering after old heathenism and the protest against the harshness of the Christian clergy. He visits the Venusberg (*q.v.*), and afterwards seeks pardon of the pope, who declares that he will never be forgiven unless the staff he holds breaks into blossom. Tannhäuser returns to the sensual fascinations of the Venusberg, and after his departure the pope's staff blossoms. He was popularly identified with a 13th century minnesinger of that name, who wandered about Germany and composed erotic poems, some of which are extant. Wagner used the story in his opera, *Tannhäuser*, 1845.

Tannin OR **TANNIC ACID.** Astringent substance obtained from galls and known also as digallic acid. The name is also applied to a series of plant constituents which possess the properties associated with tannic acid, viz. tanning animal skins, possessing an astringent taste, and giving black-blue or dark green compounds with iron salts.

The best known form of tannic acid is obtained from nut-galls, of which there are two varieties, the ordinary Turkish or Levant kind, produced by the puncture of the gall-fly in the young shoots of a kind of oak tree, and the Japanese or Chinese variety, produced by a plant louse on the leaves and leaf stalks of *Rhus semialata*. Galls contain from 60 to 80 p.c. of tannin, which is separated by digesting powdered gall-nuts with ether containing a small proportion of alcohol and water. The liquid is then filtered through cotton-wool and separates into two layers, the upper one containing gallic acid and colouring matter, and the lower layer consisting of a solution of tannic acid, which is separated and evaporated to dryness.

Tannic acid is a light yellowish powder, with a characteristic odour, acid reaction, and astringent taste. It is soluble in water, alcohol, and glycerine. The salts of tannic acid are known as tannates. The acid is used in medicine as an astringent, many substances containing it being also valued because of the astringency which the particular form of tannin possesses. The use of solutions of tannic acid in the local treatment of burns was introduced in 1925 and became the standard remedy for some years. Application resulted in the formation of a scab which protected the skin from pain, diminished the loss of fluid, and prevented the ab-

sorption of toxic substances. Tannic acid is used for making ink and clarifying wine and beer, while many substances containing it, e.g. oak bark, sumach, divi-divi, and myrobalans, are used in making leather. Tannin is present in long-brewed tea and is a frequent cause of dyspepsia in tea-drinkers.

Tanning. Preparation of natural skins and their conversion into leather. It is carried out chiefly by vegetable tanning, chrome tanning, alum tanning, and oil tanning or chamoising. The first depends upon the use of tannin, the second on chromium compounds, the third on alum, and the last on an oil which produces the well-known chamois leather. See *Leather*.

Tansa. Small river of India, in Salsette Island, Bombay prov. It is 60 m. N.E. of Bombay city, and a large dam built in 1892 has turned the valley into a reservoir which supplies the city.

Tansillo, LUIGI (1510-68). Italian poet and soldier. He was born at Venosa in Lucania, and served with distinction under the viceroy of Naples, Don Pedro de Toledo, against the Turks, and also in Charles V's expedition against Tunis. Later he became a judge at Gaeta, and won fame by his lyrics and satirical writings. His work, *Il Vendemmiatore* (The Grape Gatherer), 1534, owing to its improprieties, incurred the condemnation of the Inquisition, but by way of amendment he began an epic, *The Tears of S. Peter*, 1539, which caused his name to be removed from the Index. Author of many fine lyrics, he is especially notable for two prophetic sonnets on the sensation of flying.

Tansy (*Tanacetum vulgare*). Perennial strong-scented herb of the family Compositae. It is a native of Europe, Siberia, and N.W. America. It has grooved, angular, leafy stems about 3 ft. in height. The large leaves are deeply cut from the edges feather-wise, and are fragrant when touched, and the dull yellow flower-heads are grouped in large flat clusters. Tansy was formerly much used as a domestic tonic and vermifuge, and also as a flavouring in cookery and to garnish dishes.

Tanta OR **TANTAH.** Chief town of the division of Gharbia in Egypt. It is an important rly. junction between Alexandria and Cairo, being 75 m. S.E. from the former. Three large animal fairs have been held here in Jan., April, and Aug. Pop. 139,816.

Tantalite. Ore mineral of tantalum (*v.i.*), iron manganese tantalate; end member of the columbite-tantalite isomorphous series, which ranges from columbite, $(\text{FeMn})\text{Nb}_2\text{O}_6$, to tantalite, $(\text{FeMn})\text{Ta}_2\text{O}_6$. The percentage of iron and manganese are also variable, manganotantalite being a deep translucent red, while ferrotantalite is black and opaque. The mineral occurs as masses or crystals in pegmatitic dikes or in association with veins of tin and tungsten; also in associated residual deposits. The principal sources are in Western Australia and the Belgian Congo; it is also found in Uganda, S.W. Africa, and Brazil.

Tantallon Castle. Ruined building of East Lothian, Scotland. It stands 3 m. E. of North Berwick, and almost due S. of Bass Rock. Built probably in the 14th century, it was a stronghold of the Douglases. It withstood attack by James V in 1528, but was captured and partially destroyed by the Covenanters in 1639. Twenty years later it sustained further damage at the hands of Monk. The castle was the birthplace of Gawin Douglas, and is described by Scott in *Marmion*. See *North Berwick*.

Tantalum. One of the metallic elements. Its chemical symbol is Ta; atomic number 73; atomic weight 180.88; specific gravity 16.6; melting point 2,850° C. It was discovered in Sweden in 1802 by Ekeberg, who suggested the name tantalum from the Greek Tantalus, since the substance "when placed in the midst of acids is incapable of taking any of them up." The element is most commonly found in conjunction with niobium in tantalite (*v.s.*). Other tantalum minerals

Tansy. Leaves and flowers of this strong-scented herb

are microlite and samarskite. It is commonly associated with tin, particularly in pegmatitic veins and dikes.

The commercial method of extracting niobium and tantalum is by fusion with caustic soda; after acid extraction the niobic and tantalic acids are dissolved in hydrofluoric acid. Sufficient potassium fluoride is then added to produce $K_2NiOF_6 \cdot H_2O$ and K_2TaF_7 , which may be separated by fractional crystallisation. The pure metal is made by the electrolysis of fused K_2TaF_7 to which some Ta_2O_5 is added. The powder thus obtained is processed by heating in a vacuum. The pure metal is very ductile, possesses great toughness, and has a high tensile strength.

Tantalum forms two oxides, reacts directly with the halogens (except iodine) and also with nitrogen and sulphur. When heated with carbon at $2,200^\circ C$. tantalum carbide (TaC) is formed, and this is nearly as hard as diamond and is very refractory. It is used for cutting tools and wire dies. One of the earliest uses of the metal was as a replacement for the carbon filament in incandescent lamps, but it has now itself been replaced by tungsten. Its addition to steel increases the hardness, and when alloyed with tungsten and other metals it gives very hard cast alloys which can be used for dies and cutting. Owing to the chemical inertness of the metal it is sometimes used, either by itself or as tantalum covered steel, for chemical plant, e.g. for hydrochloric acid production.

Tantalus. In Greek mythology, son of Zeus and father of Pelops. He was a favourite of the gods, but betrayed the confidence reposed in him by divulging the secrets of Zeus. For this he was punished by being condemned to stand in Hades with water all round him and rich fruits above his head; both receded whenever he tried to drink the water or reach the fruit. Another legend was to the effect that his crime consisted in killing his own son Pelops and setting his flesh before the gods to eat at a banquet. From Tantalus is derived the English word tantalise. A lockable stand for spirit bottles is called a *tantalus*.

Tantra (Skt., web). Indian religious book. Partly derived from, partly independent of, the Puranas, the titles of 64 Tantras are recorded, but few have been

identified. They usually comprise dialogues between Siva and his *sakti* or female counterpart, worshipped especially as Mahadevi, Kali, or Durga. Like the Puranas, they professedly treat of the world's creation and destruction, divine worship, the attainment of supernatural powers, and final union with the Supreme. The Saktas, who worship the female energy in divine manifestations, comprise those of the right hand, Dakshinacharis, whose ritual is open, and Puranic, and those of the left hand, whose ritual is secret and Tantric. The mystical and magical elements in these textbooks, derived from early paganism, pervade much modern Hindu practice, sometimes leading to gross licentiousness.

Tantum Ergo. Name applied to the two last verses of the Latin hymn *Pange Lingua*. The opening lines of these verses are:

Tantum ergo Sacramentum
Veneremur cernui;

translated as:

Down in adoration falling,
Lo! the Sacred Host we hail.

The *Tantum ergo* is sung in the R.C. Church at the service of Benediction (*q.v.*) and immediately precedes the actual benediction of the congregation.

Taoism. One of the great doctrinal systems of China. Its earliest explicit presentation occurs in the *Tao-Teh King*, the Canon of Reason and Virtue. This introspective treatise of about 5,000 characters is traditionally ascribed to the sage Lao-tse. Some Western scholars hold that he wrote nothing, but that his teaching was handed down and in part embodied in the *King*, three or four centuries after his death. About 150 B.C. the canon became, by imperial decree, a school classic.

Lao-tse taught that the universe is based upon a formative principle, *Tao*—the Way—whence all reality, *Teh*, is derived. This metaphysical idea of a First Cause, lacking personality, or consciousness, was vaguely current before his day, but owed its coherence to his teaching, which is a philosophy rather than a religion. Other early writers of a Taoist cast were Lieh-tse, Han Fei, and Hwainan-tse. The most brilliant was Chwang-tse, 4th cent. B.C., who brought Taoism into line with orthodoxy by regarding Tien, Heaven, as the First Cause, and *Tao* as the divine manifestation.

Already before our era there was engrafted upon the old speculative Taoism a mass of superstition,

derived partly from primitive shamanism, partly from the alchemy—with its search for the elixir and the philosopher's stone—which reached China through Hellenistic Bactria. Of this later Taoism Chang Tao-ling, a sorcerer of the 1st century A.D., is regarded as the first exponent. From him are reputed to have descended the line, numbering 62 in all, of so-called Taoist popes. About the same time Buddhism began to pervade China, and its growing activity led the Taoist priesthood of the 2nd century to absorb much of its organization and ritual, and to copy its monasteries and temples. These are distinguishable from Buddhist shrines by the images of the Taoist Trinity, Lao-tse, P'an-ku, the uncreated Adam, and Shang-Ti, the Pearly Emperor. The trend of Confucianism being ethical, the grosser elements of belief, indigenous and imported, found refuge in Taoism, which as a consequence became little more than a medley of primitive superstitions. See China; Confucius; Lao-tse.

Tap. Term used by engineers for a tool for cutting an internal thread, as in a nut. It comprises a hardened steel male screw having long grooves to provide cutting edges, and a square head for engagement by a wrench or its equivalent, by which the tap is rotated. In tapping a hole by hand, more than one tap is commonly used, e.g. a taper tap, a plug tap, and a bottoming tap in the order given. Hand tapping is used only for small or occasional jobs. Screwing machines are used extensively, with a single tap which cuts a finished thread in one operation. Internal threads are also cut on a lathe or a special machine of a similar kind adapted for this purpose. (See Screw.)

A tap is also a faucet or cock; a plug to open or close an opening in a cask or vessel; and the quantity of molten metal run out from a cupola at any one time. The drawing of latex from *Hevea brasiliensis*, and of sugar from the maple, is also termed tapping. See Rubber Sugar.

Tapajos. River of Brazil, affluent to the Amazon. From its headstreams, the Arinos and Juruena, in Matto Grosso, it flows in general N.N.E. to join the Amazon near Santarem after a course of 1,150 m. Its upper course is obstructed by rapids, and near the mouth it forms a lake expansion 70 m. long by 12 m. wide. It is navigable for the lower 200 m.

Tap Dancing. Form of dancing consisting of tapping rhythms with the feet, with or without music. The dancer's hips, ankles, and knees must be flexed, the arms relaxed, and the body moved in rhythm with the feet.

The tap itself is a short, sharp movement of the foot from the ankle, making one sound and finishing off the floor. There are six taps: the forward, a sharp beat with the ball of the foot in the forward direction; the back, a similar beat in the back direction; the straight, in which the foot is raised slightly, striking the ground vertically; the toe, in which the toe strikes the ground sharply to the rear; the heel, when the ball of the foot remains on the ground with the heel raised, then the heel strikes the ground sharply; the ball, with the heel on the ground and the toe raised, the ground being struck sharply with the ball of the foot. All these taps finish off the floor by lifting the foot after the tap.

The three beats in tap dancing are toe, heel, and ball; these are the same as taps but finish on the floor. Of the various movements the principal are: the hop, a spring on one foot; the spring, or jump from one foot to the other; the jump, a spring on both feet; the step, transference of the weight of the body from the heel to the ball of the foot; the walk, transference of the weight of the body from the heel to the flat of the foot; the brush, a forward or backward movement, similar to the forward or back tap, but made from the hip and knee instead of from the ankle; the skuff, a stamp of the foot carried forward and finished off the floor; the stomp, the foot pushed forward on the ball and the movement finished with a heel beat; the skuffle, forward-back tap to a count of less than two; the flap, a forward tap culminating in a relaxed step; the plain pick-up, with the heel on the floor, the toe being slapped sharply to the rear; the pick-up step, with the heel on the floor, the toe being jerked sharply backwards to complete a step to the rear; pick-up hop, a plain pick-up followed by a hop; pick-up spring, a plain pick-up followed by a spring; pick-up on one foot, a series of plain pick-ups on the same foot; pick-up change, series of plain pick-ups on alternate feet; pull-back, series of pick-ups on both feet simultaneously; ball and heel digs, pick-up foot, the floor being struck sharply

with either heel or ball; ball change, transfer of the weight of body from ball of one foot to ball of another; wing, a hop, but at same time a slide outwards on foot during the jump and a beat back on the inside of feet when returning to floor.

All tap-dancing consists of various combinations of taps, beats, and steps, and apart from its expression and spectacle as an art, provides valuable exercise for the leg and foot muscles.

Cherry Marsh

Tape Machine. This special form of telegraphic instrument is described under Telegraphy.

Tapestry. Hand-made fabric of ribbed surface, in which a picture or design is woven by weft threads passing alternately before and behind warpstrings, which become completely hidden by the process. It may be woven upon an upright loom or *haute lisse*, or upon a horizontal loom or *basse lisse*, but the resulting fabric is the same.

Tapestry-weaving is but a step removed from simple shuttle-weaving, and in its rudest form was practised by many primitive races. In Egypt it was in a high state of excellence about 14 centuries B.C., as may be seen from some dated examples in the Cairo Museum. Beautiful fragments in the Hermitage, Leningrad, show the high standard of Greek weaving nearly 1,000 years later. Tapestry was not only used as interior decoration, but on ceremonial occasions it was displayed in the streets. It illustrated all kinds of subjects—sacred, historical, legendary, and sporting.

In the 14th century London, Paris, and Arras were the three great centres of tapestry production. A fine series of tapestries from the Paris workshops, representing the visions of the Apocalypse, still exists in Angers cathedral. The workshops of Arras, thanks to the patronage of the dukes of Burgundy, achieved such fame that the name of the town became a synonym for tapestry. Prosperity declined about the middle of the 15th century, and in 1477 it was extinguished on the eviction of the inhabitants by Louis XI. Many weavers had gone to Italy and other countries, and the fame of Arras was inherited by Brussels. The quantity of precious tapestries in wool, silk, and gold produced there seems almost incredible. The famous tapestries after Raphael's cartoons of the Acts of the Apostles were woven in Brussels.

Besides Brussels, many Netherlandish towns, such as Oudenarde, Antwerp, and Enghien, were famous for tapestries. During the 17th century the output increased, but the quality deteriorated, while the best weavers were enticed away to work in foreign countries. A few workshops lasted until the 18th century, but the last closed down in Brussels in 1794.

During the 17th century several great factories were established. There had existed at Barcheaston, Warwickshire, a weaving establishment to which we owe the Tapestry Maps at York and elsewhere, and in 1619 James I, inspired by the success of Flemish workshops instituted in Paris by Henry IV, procured many weavers from the Netherlands and set them to work at Mortlake under the direction of Sir Francis Crane. The chief series of tapestries woven there were Vulcan and Venus, the Acts of the Apostles, Hero and Leander, and Children Playing.

In 1662 Louis XIV consolidated the various royal tapestry workshops in Paris and lodged them in the Gobelins, a building belonging to the descendants of a famous family of dyers of that name. The excellence of the work produced caused the word Gobelin to become a synonym for tapestry on the Continent. Tapestry-weaving at the Gobelins has always been under state management, and the output is the property of the state. Instituted a little later than the Gobelins, the national factories at Beauvais and Aubusson had the additional privilege of selling tapestries, and the pastoral subjects by Boucher with the magnificent furniture coverings show Beauvais tapestry at its best. The horizontal loom is now exclusively used at Beauvais, the upright loom at the Gobelins.

Much might be written of the 18th century factories in Spain, Italy, and England. The last were mostly offshoots of the Mortlake factory, e.g. at Lambeth. At Soho John Vanderbank made a speciality of Chinese scenes. On looms set up at Merton Abbey in 1880 William Morris carried out several sets of tapestry after designs by Burne-Jones and others. See Bayeux Tapestry colour plate; Gobelin. **W. G. Thomson**

Bibliography. History of Tapestry, W. G. Thomson, 1906; Tapestries, their Origin, History, and Renaissance, G. L. Hunter, 1912; The Tapestry Book, H. C. Candee, 1913; Tapestry Weaving in England from the Earliest Time to the End of the 18th Century, W. G.

Thomson, 1915; The Spanish Royal Tapestries, Calvert, 1921; French Tapestry, ed. A. Lejard, 1947.

Tapeworm. Parasite widely distributed throughout the animal kingdom, found in the adult stage in vertebrates. The common species (*Taenia solium*), attacking man, is a long chain of oblong joints produced by budding from the "head," which is at the narrow extremity, attached to its host by suckers and hooks. See Cestodes.

Tapioca (*Manihot utilisissima*). Perennial herb of the family Euphorbiaceae, a native of S.

Tapioca. Palm-like leaves and clusters of flowers of the herb which yields tapioca

America. It has a thick, fleshy, spindle-shaped rootstock, from which arise knotted stems bearing alternate leaves which are deeply divided, finger-fashion, into seven lance-shaped lobes. It has yellowish flowers; the sexes are separate. The root is the important part of the plant, but its flesh is permeated with a bitter, highly poisonous juice, which is got rid of by grating the flesh and pressing it into cakes, which are subjected to heat. The expressed juice also deposits much starch, which is dried on hot plates and becomes the tapioca of commerce. The juice is also concentrated by evaporation and boiling to form cassareep, used as a sauce and meat preservative.

Tapir (*Tapirus*). Genus of odd-toed ungulate mammals. They are natives of S. and Central America, the Malay Peninsula, Java, Borneo, and Sumatra. The nose and upper lip are united to form a short, movable trunk, and there are four toes on the front and three on the hind feet. The thick skin is entirely covered with hair, usually of a brownish-black tint, but in the young spotted or striped with white. The Malayan tapir has a broad band of white around the centre of the body. Tapirs are all vegetarians, and are one of the oldest existing types

of mammal, their remains being found in the Miocene deposits of Europe and more abundantly in the Pliocene. See Ice Age.

Tapiro. Tribe of negrito pygmies on the S. Nassau slopes in the heart of Netherlands New Guinea. Discovered in 1910 by Rawling, they are woolly-haired, straight-nosed, and yellowish in colour. They wear rough bone or shell necklaces, bone nose-sticks, and plaited bags, hunt forest game with nooses and arrows, and use flint knives and bone daggers. Their pile-dwellings betray Melanesian contact.

Tapley, MARK. Character in Dickens's novel Martin Chuzzlewit. A jovial young ostler, he accompanies Martin Chuzzlewit as his servant to America, where he nurses him through an illness and has ample opportunity of living up to his great aim in life, of being "jolly" in adverse circumstances, sometimes to the point of weariness in the reader. His name has become a synonym for a cheerful, determined optimist.

Taplow. A village of Bucks, England. It stands on the Thames, 4 m. by rly. W. Slough. Across the river is Maidenhead. The church has some old brasses. Taplow is a popular boating centre, and has paper mills. Taplow Court, once the seat of the soldier earl of Orkney (1666-1737), passed into the possession of Lord Desborough. Pop. 1,031.

Taplow Terrace. In geology, a well marked terrace in the Thames valley, about 50 ft. above the river level at Taplow. It gives rise to the levels of Hyde Park and Kensington Gardens and many of the London commons. Its gravels have yielded Palaeolithic implements and fossils of mammoth, musk ox, rhinoceros, etc.

Tapir. The Malayan species of this mammal with its young

Tappet. Engineering term signifying a projection from a moving shaft which strikes some other moving piece periodically. In motor construction it stands for a short shaft between the foot of a valve and a cam on the cam-shaft operating the valves.

Tapping. In surgery, an operation resorted to in order to remove dangerous accumulations of fluid. It is chiefly used when fluid has collected in the pleura or peritoneum. The operation is performed by putting one end of a small tube in the cavity and withdrawing the fluid by suction. See Aspirator; Dropsy; Pleurisy.

Tap-root. Name given to the primary root of most dicotyledonous plants. It is the continuation of the stem below the cotyledons, and from it the secondary or lateral roots arise. In many plants it acts as a storehouse of food, becoming thickened and round, as in the turnip, or conical as in the carrot. See Root.

Tapti. River of India. It rises in the Central Provinces, and flows W. between the Gawilgarh and Satpura ranges to the Gulf of Cambay and the Arabian Sea. The silting up of its lowest reaches has interfered with the development of Surat, the chief town on its banks. Its length is 450 m.

Taquary OR **TACUARY.** River of Brazil, affluent to the Paraguay. It is entirely within the state of Matto Grosso, and flows W.S.W. for 450 m. to the Paraguay near Bahia Negra.

Tar. Black oily liquid with characteristic odour obtained by the destructive distillation of coal, wood, and bituminous minerals. Tar varies in composition according to its source, but all kinds consist largely of hydrocarbons and contain suspended carbon, caus-

ing the black colour. By distilling coal tar various constituents are separated, and become the raw material for making dyes, drugs, synthetic resins, and plastics. The solid and brittle mass left is known as pitch.

The distillation of wood yields (a) a watery liquid containing acetic acid, acetone methyl alcohol (wood naphtha); (b) a mixture of

light hydrocarbons; (c) a tar which distills between about 130° and 230° C.; (d) a residue of pitch. Distillation can be continued until a charcoal remains. Wood tar contains phenolic bodies such as carbolic acid and cresol and is used as a protective coating for fences and wooden structures. Stockholm or Archangel tar is obtained by distillation—usually by crude methods of the charcoal-burning type—from the pines of N. Europe. Wood tar has medicinal application in the treatment of skin diseases.

Shale tar is an oily liquid obtained in the S. of Scotland by the destructive distillation of bituminous shale. By distillation and chemical treatment, burning oil, lubricating oil, and paraffin wax are obtained. Blast-furnace tar is produced by cooling the waste gases from blast furnaces in which iron is smelted. This variety contains little or no benzene, naphthalene, or anthracene, but considerable paraffin. Blast-furnace tar and similar tar obtained from coke-ovens are valued for their phenolic contents. Water-gas tar is a by-product in the manufacture of carburetted water-gas. The most familiar use of tar is still as a dust-preventing agent in road-making. See Coal; Shale.

Tara, TARO, or KALO. Name given to the tuberous roots of certain herbs and shrubs of the genus *Colocasia*. Natives of the Pacific islands, the plants, especially *C. macrorrhiza*, are cultivated for their edible leaves and starchy, edible tubers. The tara-fern (*Pteris esculenta*), common in Australia and New Zealand, is allied to bracken. The rootstock is roasted and eaten by natives.

Tara. Village of Meath, Eire. It stands on the Boyne, 6 m. S. of Navan, and is famous for its historic associations. On the Hill of Tara, 507 ft. high, the kings of Ireland had a palace, and there are other remains of what was once an important centre of early Irish life and culture. S. Patrick preached on the hill, on which the kings were crowned and to which the people were summoned for national assemblies. The place was abandoned, it is said, because of a curse passed upon it by S. Ruadan in the 6th century. In 980 the Danes were defeated here, and in 1798 a like fate befell the insurgent Irish.

Taranaki. Provincial district of N. Island, New Zealand. It was at one time covered with forests, but the greater portion has now been

Taranto, Italy. Entrance to the harbour showing, left, the 16th century castle, and, right, naval buildings

cleared, and settled. The industries are dairying, cattle-raising, and sheep-farming; the exports, cheese, butter, meat, and wool. The shores have large deposits of iron sand. New Plymouth is the chief town. Area 3,750 sq. m. Pop. 80,000.

Tarantella. Neapolitan dance. A dance in triple time for two people, it commences slowly and gradually increases in speed until it becomes very rapid. The violin is used as an accompaniment, but tambourine and castanets are played by the dancers. The perspiration it induced was supposed to cure the bite of the tarantula.

Tarantism OR **TARANTULISM.** Form of hysteria prevalent in Europe in the 13th and 14th centuries. It continued up to and during the 17th century. The disorder was formerly believed to be due to the bite of the tarantula. The dancing mania, as it was also termed, occurred in epidemic form. Those affected were seized with convulsions in which they screamed, foamed at the mouth, and executed frantic leaps into the air or danced wildly until exhausted.

Taranto. Seaport of S. Italy. In the prov. of Taranto, Apulia, it is the ancient Taras or Tarentum, and is 44 m. by rly. W.S.W. of Brindisi, on an island at the head of a deep inlet of the Gulf of Taranto. The fortified harbour is one of the safest in the country and an important naval base. There are shipyards, docks for battleships, nautical school, and commercial harbour; also the 11th century cathedral of S. Cataldo, castle, museum, and bishop's palace. The industries include fishing and oil refining. Chemicals, wheat, and fruit are exported. Pop. 180,852.

Founded by Sparta in the 8th century B.C., Tarentum became the wealthiest city of Magna Graecia, largely owing to its trade in woollen fabrics. Attacked by Rome, 281 B.C., it called in Pyrrhus, but was taken by the Romans, 272. In the second Punic War it re-

volted, 212, but was taken and severely treated, 209. It then decayed, and the inhabitants became notorious for luxury and effeminacy. After passing to the Goths and Byzantines, Taranto was destroyed by the Saracens in A.D. 927, rebuilt 967, and captured by the Norman Guiscard, 1063. The British aerial attack on the naval base in 1940 is described below. On Sept. 9, 1943, British troops of the 1st Airborne div. were landed by the R.N. without opposition, the Germans having withdrawn. The port was found to be little damaged, and became one of the chief bases for the Allied armies.

Taranto, ATTACK ON. Spectacular and successful action of the Fleet Air Arm in the Second Great War, Nov. 12, 1940. A large part of the Italian fleet was concentrated at Taranto to cover the passage of reinforcements and supplies to the hard-pressed Italian armies in Albania. British air reconnaissance showed six battleships, including the new 35,000-ton Littorio and Vittorio Veneto, in the outer, and 10 cruisers, 18 destroyers, a seaplane carrier, and 10 submarines in the inner harbour.

On the evening of Nov. 11, ten Maryland bombers and eleven Swordfish torpedo aircraft took off from the carriers *Illustrious* and *Eagle* well out to sea. The Marylands arrived over Taranto shortly after midnight to drop flares. Immediately afterwards the Swordfish came in at 5,000 ft. and then glided to 50 ft. to drop their torpedoes. The confined space of the harbours and low altitude of the attacking aircraft prevented the full weight of the A.A. artillery from being brought to bear on the attackers and only two machines were lost. Next morning photographic reconnaissance revealed one battleship sunk, the Littorio beached with her fore-castle under water, two cruisers listing, and two smaller warships with their sterns under water. The surviving vessels soon withdrew to the safer base at Cagliari.

Not only did the attack on Taranto do much to redress in British favour the balance of naval power in the Mediterranean; it emphasised the potentialities of air torpedo attack against even heavily defended ships, and stressed the vulnerability of warships to such attacks when at anchor.

Taranto, GULF OF. Indentation of Italy on the Mediterranean Sea. It is 70 m. wide, and lies between the heel and toe of Italy.

Tarantula (Ital. *tarantola*). Name properly given to wolf-spiders of the genus *Lycosa*, and in

Tarantula. The wolf-spider found in southern Italy

particular to the species *L. tarantula*, common near Taranto, whence its name. These spiders pursue their prey by running. Many form no retreat; others burrow in the ground.

Tarapacá. Large province in N. Chile. Its E. boundary with Bolivia lies amid the Andes, and on the N. lies Peru. Tarapacá is mainly an arid desert with immense deposits of nitrate. Guano, silver, copper, gold, and nickel are mined. Sheep and alpacas are reared; cotton and fruits are grown near the few watercourses. The volcano Isluga rises to 18,140 ft. in the N.E. The Longitudinal rly. runs S. from Pisagua. Iquique is the capital. Area of dept., 21,340 sq. m. Pop. 104,097.

Ta-ra-ra Boom-de-ay. Popular chorus song. Based on an American negro ditty, it was originally sung, with words by R. Sayers, in a U.S. minstrel show called Tuxedo. An English version, with words by B. M. Batchelor, was first introduced as a song and high-kick dance by a music-hall artist, Lottie Collins, at the London

Tivoli in Oct., 1890, and proved so popular that it swept the country. Introduced to the Continent, it was accepted there as the English song *par excellence*, and remained so until superseded by Tipperary during and after the First Great War.

Tarare. Town of France. In the dept. of Rhône, it stands on the Turdine, 21 m. W.N.W. of Lyons. It is a centre of the weaving industry, silks and other textiles, including muslins and velvets, being manufactured. There is an agricultural trade. Mt. Tarare overlooks it. Pop. 10,142.

Tarascon. Town of France. In the dept. of Bouches-du-Rhône, it stands on the left bank of the Rhône, 62 m. N.W. of Marseilles. The chief building is the church of S. Martha, with the tomb of the saint. The legend is that Martha, sister of Lazarus, arrived here, and delivered the people from a dragon. An annual fête long commemorated the supposed event. There is a castle, once the residence of the rulers of Provence, and a town hall, dating from the 17th century. On the other side of the Rhône is Beaucaire. The industries include the manufacture of glass and hats. Tarascon was built on the site of a Roman city, and in the Middle Ages was one of the most important places in Provence. Mt. Tarascon is a hill near the town. Tartarin (g.v.) de Tarascon is the hero of a series of stories by Daudet. Pop. approx. 9,000.

Tarawera. Active volcano in New Zealand, in the Rotarua Hot Springs dist. of Auckland prov.; 90 m. N.N.W. of Napier. The region of the famous hot springs, which includes volcanoes, has been more or less extinct since the Tertiary period, from which dated that amazing natural phenomenon, the pink and white sinter terraces of Rotomahana. On June 10, 1886, Tarawera erupted and split in two,

leaving a fissure 8 m. across and twenty new craters, and when the ash storms cleared from the 4,000 sq. m. of country obscured by them, the famous terraces had vanished.

Tarazona. City of Spain, the ancient Turiaso. In Saragossa prov., it stands on the Queiles, a tributary of the Ebro, 14 m. by branch rly. S.W. of Tudela. The 12th century cathedral has finely ornamented 16th century cloisters, and the Romanesque church of La Magdalena has a splendid steeple. Pop. 9,500.

Tarbell, IDA MINERVA (1857-1944). American biographer. Born Nov. 5, 1857, in Erie co., Pa., she went from Allegheny College, Meadville, to study history and political science at the Sorbonne. From 1894 to 1915 she held editorial posts with McClure's and the American Magazines. Thereafter she devoted her life to biographical and historical research, and though her literary output was large, her standard was high. Lives that may be mentioned are of Napoleon, 1895; Madame Roland, 1896; Lincoln, 2 vols., 1900; and she wrote a History of the Standard Oil Company, 1904; The Rising Tide, 1919; Nationalisation of Business, 1936; and the autobiographical All in a Day's Work, 1939. She died Jan. 6, 1944.

Ida M. Tarbell, American biographer

Tarbert. Village of Argyllshire, Scotland. It stands on the E. side of the Mull of Kintyre, on the neck of land that just prevents the Mull from becoming an island, 30 m. N. of Campbeltown. It has remains of a castle associated with Robert Bruce. The chief industry is the herring fishery, and there is a good harbour. Pop. 1,983. Tarbert

is not to be confused with Tarbet, on Loch Lomond.

Tarbert. Two sea-lochs of Argyllshire, Scotland, known as East and West. They are situated at the N. end and on either side of Kintyre peninsula, and extend inland to within a mile of each other, almost severing the peninsula from Knapdale.

Tarascon, France. The Gothic castle dating from the 14th-15th centuries

Tarbes. Town of France. The chief town of the dept. of Hautes-Pyrénées, it stands on the Adour, 98 m. W.S.W. of Toulouse. The chief church is Notre Dame, once a cathedral; parts of it date from the 12th century. The town is also a Protestant stronghold. There is a Carmelite church, and in the Jardin Massey is a museum. The town is a centre of horse-breeding, and has fairs; tanning is another industry. Tarbes originated as a Roman station, and was afterwards the capital of the county of Bigorre, the counts having a castle here. It was in possession of the English, 1360-1406, and in 1814, during the Peninsular War, the English defeated the French here. The revolutionary Barère de Vieuzac was born here. Pop. 44,854.

Tarbolton. Village of Ayrshire, Scotland. It stands on Fail Water, 5 m. E. of Prestwick Airport, and has associations with Burns. Near here on Oct. 21, 1948, a Dutch air-liner crashed with the loss of 40 lives. Pop. 5,131.

Tardieu, ANDRÉ PIERRE GABRIEL AMÉDÉE (1876-1945). French statesman. Born in Paris, Sept. 22, 1876, he was educated at the École Normale, and entering the diplomatic service, acted as attaché at Berlin, 1897. Secretary to the council of ministers, 1899-1902, he entered the chamber of deputies, 1914, and was high commissioner for France in the U.S.A., 1917-19. A collaborator with Clemenceau, with whom he founded the Echo National, he represented his country at the Versailles peace conference, 1919-20, and later came forward as a leading Right-wing politician opposing any revision of the treaty. He was minister of public works in 1926, and three times prime minister: Oct., 1929-Feb., 1930; March-Dec., 1930; Feb.-May, 1932. His last public office was that of minister without portfolio under Doumergue, 1934. Tardieu, who had a severe nervous breakdown in 1939, died Sept. 15, 1945.

Tardigrada OR BEAR-ANIMALCULES. Minute animals from one-third to 1 mm. in length, of doubtful position, but apparently more nearly related to the arthropods (*q.v.*) than to other groups. They are segmented, more or less worm-like, but have four pairs of rudimentary legs ending in claws. The head is furnished with a pair of minute eyes, and the mouth is suctorial. They are found on moss, the bark of trees, in ditches and house-gutters. One species, *Macrobatus macronyx*, is restricted

Tarbes, France. General view of the town in which the 12th century church of Notre Dame is seen, centre

to fresh water, several are exclusively marine, but most species are terrestrial, inhabiting damp places.

Tare and Tret (Fr. *tare*, loss, waste; Old Fr. *traite*, draught, transportation). Commercial term for allowances made in weighing goods. Tare is the amount deducted from the gross weight for the packing or vehicle in which the goods are weighed, and is reckoned as real, customary, or average, according to whether the wrappings or vehicle are actually weighed, or a specified rate allowed, or an average struck between several examples. Tret is an allowance of extra weight to cover possible waste in transport.

Tarentum. Name of a Roman city, now called Taranto (*q.v.*).

Tares. Leguminous forage crop, also known as vetch (*q.v.*).

Target. Mark at which to shoot. It is derived from the Old French *targete*, a shield, which the early targets resembled. In modern use the word target indicates any object fired at; and, by extension, any figure of industrial production aimed at, or any sum which collectors hope to raise. Rifle practice targets were all of the bull's-eye pattern until after the S. African War; they are now silhouette figures and show the rough outline of a man lying down to fire, in neutral brown on a ground that is blue-grey above and dull green below. See Bisley; Musketry.

Targoviste OR TARGOVISHTA. Town of Rumania. On the W. border of the important oil-fields, it is situated in Wallachia, at the foot of the Carpathians, about 50 m. N.W. of Bukarest. It has an ancient cathedral and a small arsenal. Before the First Great War a thriving place, it was much damaged when the Austro-Germans took it in Dec., 1916.

Targum. Aramaic versions of the Hebrew Scriptures. In course of time Hebrew as a language understood by the mass of the Jewish people was supplanted by Aramaic. Consequently, when the Hebrew Scriptures were read in the synagogues, the services of a translator were required. This official was called the *methurgeman* or *targeman* (mod. *dragoman*, interpreter); and when later the translations were committed to writing, they were called Targums.

Tarifa. Maritime and most southerly town of Spain. It is in the prov. of Cadiz, 21 m. by rly. S.W. of Gibraltar. Its Moorish walls and an ancient citadel still stand. It has fisheries and trades in fish, fruit, especially oranges, cattle, and leather. Known to Strabo as Julia Joza, and to Ptolemy as Julia Transducta, it was named Tarifa after a Moorish captain Tarif ibn Malik. It was unsuccessfully attacked by the French in 1811, when it was defended by General Gough. Population 13,000.

Tariff (Span. *tarifu*, book of rates). List of rates or charges or prices; particularly, the official list of goods on which duty is payable to the govt. of a country and the rates at which the duties are chargeable when the goods are imported or exported (customs duties), or manufactured (excise duties). Such tariffs tend to be altered frequently, according to the economic policy of the govt. and the circumstances of international trade. During the 1930s the tariffs of most countries became both more extensive and more complicated as countries endeavoured to protect their own production or to discourage the import of certain commodities in order to conserve their foreign

exchange. The international trade organization of the U.N. advocated an all-round lowering of tariffs. The customs and excise tariff of the U.K. is published annually by H.M.S.O., and embodies changes made by Act of parliament or statutory order under previous Acts. *See* Free Trade; Protection.

Tariff Reform. Political term applied particularly to proposals put forward in the first decade of the 20th century for the introduction of a tariff of duties on goods imported into the U.K., accompanied by preference within the British Empire. The proposals therefore opposed the system of free trade which had been virtually in force in the U.K. for 50 years. In 1902 a duty of 1s. a quarter was imposed on imported corn, and Joseph Chamberlain, colonial secretary, counted upon the remission of tax in respect of corn from the colonies. But during Chamberlain's absence in S. Africa in 1903, the chancellor of the exchequer, Ritchie, a free trader, abolished the tax.

In a speech at Glasgow, Oct. 6, 1903, Chamberlain laid down the outlines of his tariff reform policy, and retired from the govt. to prosecute a campaign. He founded a propagandist Tariff Reform league, and before the end of the year had established a tariff commission of influential individualists and agriculturists. The proposals had the general support of the Unionist party, but did not receive that of the public, which returned the Liberals to power by an overwhelming majority at the general election of 1906. Tariff reform was a plank in the Unionist party platform in the two general elections of 1910, but free trade remained in force until 1914. Changed economic conditions after the First Great War led to the gradual abandonment of the principle, but the measures of protection, safeguarding, and imperial preference then introduced were outside the more theoretical scope of the original agitation, the whole subject being attacked afresh from a more practical standpoint. *See* Empire Free Trade; Protection; Safeguarding of Industries.

Tarija. Prov. and town of S. Bolivia. The prov. adjoins Argentina on the S., is mountainous on the W., flat in the E., and is drained by the Pilcomayo. The Tarija Valley has yielded fossil remains of prehistoric animals. There are extensive forests and

pasture lands. The E. forms part of El Gran Chaco. Area of prov., 9,570 sq. m. Pop. 131,900.

The town, also known as San Bernardo de Tarija, is on the river Tarija, an affluent of the Bermejo, 180 m. S.E. of Sucre, to which there is an air service. Pop. 17,000.

Tarim. A river of Sinkiang. Rising in the Karakoram glaciers, its headwaters fall 13,000 ft. in 200 m. to the Yarkand plain, whence it flows for about 1,000 m. into the Lop-nor marshes. It was once the home of the Issedones, Yueh-chi, Tocharians, Uigur, and other peoples. The ancient civilization of the Tarim basin, developed under less arid conditions, and fostered by irrigation, stands revealed by exploration, notably by Sir Aurel Stein in 1907 and 1914.

Tarkhan. Site of an ancient necropolis near Kefr Ahmar, on the left Nile bank, 37 m. S. of Cairo, Upper Egypt. Petrie's excavations in 1912-13 revealed closely packed graves along a mile of desert, and a thousand graves in the valley below, ranging from predynastic to the pyramid times.

Tarkington, (NEWTON) BOOTH (1869-1946). American novelist. He was born at Indianapolis, July 20, 1869, and educated at Purdue university, Lafayette, and at Princeton. He sat for two years in the Indiana house of representatives, but soon gave up politics and devoted himself to writing. His first novel, *The Gentleman from Indiana*, 1899, was an immediate success, as was *Monsieur Beaucaire*, 1900, a sentimental romance which was widely popular as a novel, a play (1901), and many years later as a film. He wrote many other books of varied types, but almost all centred around his

native state. Penrod, 1914, and Seventeen, 1916, were gently ironical studies of boyhood. The Mag-

nificent Ambersons, 1918, was awarded the Pulitzer prize, and in 1921, when he won it again for *Alice Adams*, Tarkington secured an honour among American novelists. He also wrote many plays successful in New York and London. He died May 19, 1946.

Tarkwa OR **TARQUAH.** Gold-mining centre of the Gold Coast Colony, W. Africa. It is 39 m. by rly. N.W. of Sekondi. A branch line runs to Prestea and Broomassie.

Tarlatan. Thin open muslin. It was originally made in India, and may derive its name from the Indian fabric *tarnatan*. It is used as a dress material, and for widows' caps, etc., and is white, dyed, or printed. *See* Muslin.

Tarn. Small mt. lake, especially one having no visible feeders. Tarns are found at high elevations, and in comparison with their size are usually deeper than the large valley lakes of lower levels. Sty Head Tarn, near the head of Sty Head Pass, and Hard Tarn, near Helvellyn, are examples of tarns in the Lake District of England. *See* Lake.

Tarn. River of France. Rising in the Cévennes, it flows for 220 m. past Albi and Montauban (*q.v.*) into the Garonne. Among its tributaries are the Agout and Aveyron.

Tarn. Dept. of France. Adjacent to the depts. of Tarn-et-Garonne, Haute-Garonne, Aude, Hérault, and Aveyron, it was for-

See over]

merly part of the prov. of Languedoc. Generally mountainous and with picturesque gorges, the E. and S.E. of the dept. are high, stony, plateau lands, of granite and schist formations, and to the W. are flat and fertile plains. The Tarn river traverses the dept. from E. to W., with its chief tributary, the Agout, other streams being the Dadou, Thoré, and Vère. Chiefly agricultural, Tarn is noted for its cereals; cattle and sheep are important in the S., and there are forests of beech and chestnut. The capital is Albi, and other towns are Castres, Gaillac, Lavaur, Carmaux, Graulhet, and Mazamet. Its area is 2,231 sq. m. Pop. 298,117.

Tarn-et-Garonne. Dept. of France. Adjacent to the depts. of Haute-Garonne, Tarn, Aveyron, Lot, Lot-et-Garonne, and Gers, it was formed in 1808 of portions of surrounding depts. The low hills of the S.E. and the N. and N.W. enclose a broad alluvial and fertile plain. The rivers Tarn, Garonne, and Aveyron all meet in the dept. Wheat, maize, oats, rye, and flax are grown. Montauban is the capital, other towns being Castelsarrasin, Moissac, Caussade, Nègrepelisse, and Grisolles. Its area is 1,440 sq. m. Pop. 167,664.

Tarnopol. Town of Ukraine S.S.R. On the Seret, 87 m. E.S.E. of Lvov by rly., it was founded in the 16th cent. by John Tarnowski, lord of Cracow. Before the First Great War Tarnopol lay in Austria-Hungary, after it in the new state of Poland, in the area occupied by Russia in 1939 and ceded to her by the Russo-Polish agreement of Aug., 1945. In the 1930s it had 31,000 inhabitants, half of them Jewish. It had manufactures of cloths and linens, and a trade in honey, wax, leather, and brandy.

Occupied by the Russians after several days' fighting about Aug. 27, 1914, Tarnopol was the centre of heavy fighting Sept. 6-16, 1915, but remained in Russian possession. On July 19, 1917, a div. stationed there deserted in a mass, leaving a gap of 25 m. in the Russian line. Panic spread throughout the Russian army, and by the 22nd the town was in Austro-German hands. British armoured cars stationed at Kozova attempted to hold up the Austro-German advance without success, the Russian infantry all along the front leaving their trenches and retiring. The Austro-Germans reached the then Russian frontier at Husiatyn by the end of the month.

During the Second Great War Tarnopol was overrun by the Ger-

mans by July 6, 1941, and remained in their hands until 1944, when by March 12 there was violent fighting in and around the town. Owing to the efforts required to liquidate large German forces encircled at Skala some 20 m. to the S.E., the Russians did not succeed in regaining control of Tarnopol until April 15, after several days of desperate street fighting reminiscent of the battle of Stalingrad; only 2,400 of the German garrison of 16,000 surrendered.

Tarnow (Russ. Tarnov). Town of Poland, in Galicia. It is 50 m. E. of Cracow, being situated on the E. bank of the Dunajetz near its junction with the Biala, and manu-

factures agricultural implements and leather. The 15th century cathedral contains monuments of the Tarnowski family. It was prominent in the fighting in Galicia (*q.v.*) in the First Great War. In the part of Poland occupied by the Germans in 1939, it remained in their hands until taken by the Russians, Aug. 6, 1944, who did not advance farther in S. Poland until Jan., 1945. Pop. 36,000.

Tarnow or **POPRÁD PASS.** Pass in the E. Beskid section of the Carpathian mts. It has a height of 2,630 ft. and carries the rly. from Kosice (Kassa) to Nowy Sącz (Neu Sandec) and Tarnow. Here the Poprád, an affluent of the Dunajetz, cuts its way through the mts. on the frontier between Czecho-Slovakia and Poland.

Taro (*Colocasia antiquorum*). Herb of the family Araceae. It is a native of the East Indies, but is extensively cultivated throughout the tropics and in S. Europe, as a food crop. It has a large tuberous rootstock from which the large oval heart-shaped leaves spring direct. The entire plant is very acid, but the acidity is got rid of by boiling, and the naturally poisonous leaves may be eaten like spinach. The rootstocks are rich in starchy matters, which also become available as food when boiled in two or more waters. See Eddo.

Tarpaulin. Heavy weather-proof cloth used for protecting goods on docks and rlys., for van covers, seamen's hats, and other purposes. It is made of hemp, flax, cotton, or jute, treated with tar or some similar preparation, and is manufactured chiefly in Scotland.

Tarpeia. In ancient Roman legend, daughter of Spurius Tarpeius, the governor of the citadel on the Capitoline Hill. Bribe by the besieging Sabines with gold bracelets and collars, she betrayed the garrison by opening a gate, but the Sabines as they entered crushed the traitress to death with their shields. The memory of her baseness was perpetuated in the name of the cliff on the Capitoline hill, the Tarpeian rock from which traitors were hurled to death. See Capitol; Olympus; Rome.

Tarpon (*Megalops atlanticus*). Huge fish of the order Teleostei. It is a native of the S. Atlantic, whence it enters several of the

Tarpon. The South Atlantic fish which affords good sport for anglers off the coast of Florida.

rivers in pursuit of mullet. Much resembling a huge herring in form and colour, it is seven feet in length and weighs 2 cwt. From the hinder part of the dorsal fin there is a long streaming thread-like extension; and the silvery scales are four inches across. It leaves the egg in the larval stage, when it is not unlike the corresponding stage of the eels, colourless and scaleless, and temporarily is reduced in size when it assumes the adult form. It is considered a game fish, and affords good sport with rod and line in the Gulf of Florida.

Tarquinius (mod. Corneto Tarquinia). Ancient city on the W. coast of Etruria, Italy. Situated on the Marta, it was one of the twelve Etruscan cities; it frequently came into conflict with Rome, notably when it combined with Veii in an attempt to restore the Etruscan Tarquinus Superbus to his throne at Rome. It was finally subdued by the Romans about 300 B.C. The ruins which remain are of the Roman period; the site of the older and purely Etruscan city was probably a little to the S.W. Some fine examples of early paintings have been discovered in the rock tombs. See Corneto Tarquinia.

Tarquinius Priscus, **LUCIUS**. Fifth of the legendary kings of ancient Rome, reputed to have reigned 616-578 B.C. Exiled from Corinth, when Cypselus became tyrant there, and married to an Etrus-

can woman named Tanaquil, he went to Rome, where he won the favour of King Ancus Marcius, and changed his original name of Lucumon to Tarquinius. Elected king when Ancus died, he proved himself a vigorous ruler, defeating the Latins and the Sabines. Among the public works with which Tarquin was credited were the large and splendidly built sewers, some of which are still in use in the city of Rome. He was murdered by the sons of Ancus Martius.

Tarquinius Superbus, *LUCRUS*. Seventh and last of the legendary kings of Rome, reputed to have reigned from 534 to 510 B.C. Though an able and vigorous monarch, who carried the Roman arms farther than any of his predecessors had done, he incurred odium at home by his oppressive tyranny. The violation of Lucretia by his son Sextus Tarquinius caused a revolt, and Tarquin and all his family were banished from Rome. Assisted by the Etruscans, Tarquin made several attempts to return, but his hopes were shattered by his defeat in the battle of Lake Regillus, 496, the site of which has been conjecturally identified with the valley of Isidoro. Tarquin then fled to Cumae, where he died. See Brutus; Lucretia; Rome.

Tarragon (*Artemisia dracuncululus*). Perennial herb of the family Compositae, indigenous to

Tarragon. Leaves and sprays of flower-heads of the bitter herb. Inset, single flower-head

S. Europe. Its stems are about two feet high, with narrow oblong leaves, and roundish pale-green flower-heads. The aromatic leaves are without the bitterness characteristic of most species of *Artemisia*, and are used to flavour salads, pickles, and Tarragon vinegar.

Tarragona. Maritime prov. of N.E. Spain. It lies between Barcelona and Castellon provs., slopes from the W. hills to the Mediterranean, and contains the lower

course and delta of the Ebro. The slopes are well forested; fruit, nuts, olive oil, wine, wheat, hemp, and silk are produced. The prov. is noted for its wines, a popular variety of which is named after it. There are manufactures of textiles, leather, soap, flour, spirits, and paper. Besides Tarragona, the capital, Reus and Tortosa are important towns. Area, 2,426 sq. m. Pop. 332,106.

Tarragona. Seaport city of N.E. Spain, capital of Tarragona prov., and the seat of an arch-

Tarragona, Spain. The west facade of the 12th century cathedral, noted for its magnificent rose window

bishop. The ancient Tarraco, it is on the Mediterranean Sea, 63 m. by rly. W.S.W. of Barcelona, crowning a steep hill 525 ft. in elevation and surrounded on three sides by massive walls of Cyclopean and Roman origin. The old town has a noble cathedral, chiefly 12th and 13th centuries, an archbishop's palace, and remains of Roman buildings. The new town stretches down to the spacious harbour. Water is conveyed by a Roman aqueduct 750 ft. long. Chartreuse liqueur is made by Carthusian monks, and wine, olive oil, and nuts are exported. The city was captured by the Scipios in 218 B.C. and became the capital of the Roman colony Hispania Tarraconensis. Captured successively by the Visigoths in 467, the Moors in 713, the Christians in 1089, and British in 1705, it was sacked by the French in

1811, and fell to the forces of Gen. Franco and Italian supporters, Jan. 15, 1939. Pop. approx. 34,000.

Tarrasa. City of Spain, the ancient Egara. In Barcelona prov., it is situated 20 m. by rly. N.W. of Barcelona city; it has textile factories, an industrial institute, and a technical school. There is a trade in wheat, wine, olive oil, and fruit. Pop. 38,000.

Tarrytown. Village of New York, U.S.A., in Westchester co. It stands on a bay in Hudson river, 25 m. N. of New York City, and is served by the New York Central rly. It is the Sleepy Hollow of Washington Irving, whose grave is in Sleepy Hollow cemetery, about a mile outside. Features are the Dutch church, built 1685, and Philipse manor house, 1683. Pop. 6,874.

Tarshish. Biblical name of an unidentified Phoenician mart. It is presumably the classical Tartessus, a shipping port for metals in S.W. Spain, near the Guadalquivir mouth, then farther inland. Excavations in a cliff at Seville, 1912, revealed Roman, Greek, and Bronze Age levels, not unreasonably identifiable with Tartessus. The Red Sea Tarshish ships (1 Kings 22) were merchantmen like those in the Tarshish trade.

Tarsier (*Tarsius spectrum*). Small lemuroid primate. It is a native of Borneo, Sumatra, and other islands of the Malay Archipelago. Smaller than the European squirrel, and of similar arboreal habits, it is remarkable for enormous eyes and great length of ankle. At the tips of the fingers and toes there are disks which help it in climbing. The skull of the tarsier approaches more nearly to the ape type than that of any other lemur. It is nocturnal in habit, hunting for the insects which are its chief food, and sleeping by day in a tree-hole shared by its mate.

Tarsier. Remarkable for enormous eyes, these lemur-like animals are common in the Malay Archipelago

Tarsus. In anatomy, the back part of the foot, from the heel to the metatarsal bones. Tarsus is the name of a layer of connective tissue in the eyelid. *See* Ankle.

Tarsus. Ancient city of Cilicia, Asia Minor. The modern Tersous, it is about 12 m. from its port at the mouth of the Cydnus. Originally a Syrian city, it became a centre of Greek culture, besides being one of the most prosperous cities of Asia Minor. Before its incorporation in the Roman empire as capital of the prov. of Cilicia, 66 B.C., it had been subject to Persian rule, and afterwards to

Tarsus, Asia Minor. Noted as the birthplace of S. Paul, after whom the gate shown here was named

that of the Seleucid kings of Syria. It was the birthplace of S. Paul, who, before his conversion, was known as Saul of Tarsus.

Tartaglia, Niccolò (c. 1505-57). Italian mathematician and scientist. He was born at Brescia and was a lecturer at Verona, and later professor of mathematics at Venice, where he died Dec. 14, 1557. His reputation rests on a treatise upon arithmetic and studies of cubic equations, the theory of falling bodies, and the range of projectiles. *Pron.* Tartahl-ya.

Tartan. Woollen cloth with coloured check pattern. Early tartans were sometimes of one colour only. The word is apparently derived from French *tiretaine* (linsey-woolsey), and may ultimately come from Tartar. Tartar cloth was the general term for various Oriental cloths, and in 1488 tartan is spelt tartar. The name is specially applied to the kilt and plaid of the national dress of the Highlanders of Scotland, the variations in the markings denoting the different clans. The distinctive sets or patterns of clan tartans are believed to have been settled before or during the 17th century. Wearing Highland dress was forbidden after the rebellion of 1745, but the prohibiting Acts

were repealed in 1782, and clan tartans are still recognized as national dress at the British court and still used as full dress in the Highland regts. Clothmakers have evolved many new combinations of colours and checks. The black and white checkered plaid is called shepherd's tartan. *See* Clan; Highlands; and colour plate facing p. 7952.

Tartar. Name employed in China and medieval Europe for central Asian mounted nomads. Under Jenghiz Khan and his successors, they established the empire of Tartary, and from 1238 to 1462 dominated E. Europe. Derived from the tribal name of the Tata (plur. Tatar), who occupied 5th century Mongolia, the conventional spelling resulted from assimilation with the Latin *tartarus*, hell. In the form Tatar it survives in Russian in the name of the Tatar (q.v.) autonomous republic, and is used also to denote several muslimised groups of Turkic speech.

In European Russia there are probably 2,000,000 of the race. They comprise the Kazan Tartars of the Volga banks, representing the Kipchak irruption; the Astrakhan Tartars of the Volga mouth, remnants of the Golden Horde (q.v.) with Khazar admixture; and the Krim and Nogai Tartars—the former on the mountains and coasts, the latter on the steppes—whereof the Ottoman government in 1861 settled 12,000 in Bulgaria. A few also settled near Plock in Poland. In the Caucasus dwell some 1,500,000. In Siberia and Central Asia they may number 300,000, including the Abakan, Kizil, Altai, and Cholym Tartars, with some Finnic admixture. The Taranches or Ili Tartars are Persianised Kulja Sarts. The name also embraces Tuba and other primitive non-

Turkic Yeniseian stocks which preserve their aboriginal shamanism, and practise hunting and agriculture. *See* Asia.

Tartar. Calcareous incrustation which forms round the base of the teeth when the natural cleansing system is defective.

Tartar Emetic. Common name for potassium antimonytartrate $[K(SbO)C_4H_4O_6]_2 \cdot H_2O$, so called because in small doses it causes vomiting. It is one of the few soluble salts of antimony, and is prepared by boiling together three parts of antimonious oxide with four parts of cream of tartar, filtering whilst hot, and allowing crystals of tartar emetic to form. Tartar emetic, formerly used in small doses in medicine, is in larger quantities a violent poison. The chief use of antimony in medicine is in the treatment of certain tropical diseases, e.g. kala-azar, in which tartar emetic has proved strikingly successful. It is also used in large quantities as a mordant in dyeing and calico-printing.

Tartaric Acid ($C_4H_6O_6$), DIHYDROXYSUCCINIC ACID. A colourless, crystalline acid extremely soluble in water. It occurs widely in plants, partly free and partly as the potassium, calcium, or magnesium salts. Tartaric acid is prepared from the argol or crude cream of tartar which is deposited in the casks during the fermentation of wine. *See* Argol.

Tartarin. Chief character in stories by Alphonse Daudet: Tartarin of Tarascon, 1872; Tartarin on the Alps, 1873; Port Tarascon, 1880. An ingenuous creature who finds an outlet for his romantic and adventurous instincts in many amusing and harmless devices, he is used by the author as a vehicle for playful and entertaining satire on the kind of Southern Frenchmen among whom Daudet was born.

Tartarus. In Greek mythology, the prison or place of punishment in Hades of the Titans, and Tantalus, and others who had outraged the gods. It was surrounded by a brazen wall, and veiled in perpetual and impenetrable darkness. *See* Hades.

Tartary. Name formerly used vaguely for the country between the Pacific Ocean and the Dnieper, presumably because much of it was inhabited by the Tartars. Little

Tartar. Left, a Tartar ox-driver, wearing the characteristic "sheska" headgear. Right, A young Tartar

Tartary, also called Krim Tartary, became the name for part of Russia, and Great Tartary for Turkistan and the surrounding district. See Asia; Tartar; Turkistan.

Tartary, GULF OF. Part of the Pacific Ocean. Between the far Eastern region of R.S.F.S.R. and the island of Sakhalin, it connects the Sea of Japan with the Sea of Okhotsk.

Tartu (Ger. Dorpat; Russ. Yuriev). Town of Estonia S.S.R. It stands on the Embach, 110 m. S.E. of Tallinn, with which it has rly. connexion. Most of the town lies S. of the river, and, as a result of a great fire in 1777, it was rebuilt, the old fortifications being replaced by promenades lined with trees. The town is said to have been founded by Yaroslav, prince of Kiev, in 1030, and it was held by the Teutonic knights from 1224 to 1558, when it came into Russian hands. Later it fell successively to Poland and Sweden, being finally established under Russian rule in 1704. From 1918 to 1940 it was in independent Estonia. Occupied by the Germans soon after their advance against the Russians in 1941, Tartu was turned by them into a stronghold. It was stormed by the Russian 3rd Baltic army under Col.-Gen. Maslennikov, Aug. 25, 1944.

The university here was founded by Gustavus Adolphus of Sweden in 1632, and had, before the Second Great War, some 3,000 students. Tartu also possessed a library of 250,000 volumes housed in a restored part of the cathedral, which had been destroyed by fire in 1624. The town is the centre of a prosperous agricultural and dairy-farming country. Pop. est. 50,000.

Tartuffe; ou, L'IMPOSTEUR (Tartuffe; or, The Impostor). Five-act play by Molière. The first three acts were given at Versailles in 1664. It was at once interdicted, as was a second version, presented at the Palais-Royal in Aug., 1667. On Feb. 5, 1669, however, it was permitted, and had an immediate success. The comedy is a satire on religious pretension masking vice and avarice. The scene is the home of a well-to-do bourgeois named Orgon, a part acted by Molière. One of the greater of Molière's comedies, this play has the defect of a somewhat mechanical ending, Louis XIV being introduced to release Orgon from Tartuffe's power.

Tashi Lama or TESHU LAMA. One of the two Great Lamas of Tibet. He is abbot of the monastery of Tashi Lünpo, and, though subservient to the Dalai Lama in

secular matters, in matters spiritual has an equal, or even greater, authority. See Dalai Lama; Lamaism; Tibet.

Tashkent. Largest city of Soviet Central Asia. It is the capital of Uzbek S.S.R., and stands 450 m. N.E. of Bukhara. It dates back to the 7th century, being captured by the Chinese from the Turks in 659. It came under Russian rule in 1865, when it was made the administrative centre of the then government of Russian Turkistan. The picturesque old city was gradually replaced by the new city, built by the Russians, which was nearly 8 m. long. The houses are low, since earthquakes are frequent. The streets are lined by poplar, willow, and fruit trees, and much fruit, tobacco, and agricultural produce is grown in the immediate neighbourhood. Since the Revolution the city's industry has developed, including cotton mills, chemical factories, and agricultural machinery works. The city has a university and a museum including an outstanding collection of Graeco-Bactrian coins. It is the headquarters of the Russian Army of Turkistan. It is on the Moscow-Bukhara rly., and has regular passenger air connexion with Moscow. Pop. 585,005.

Task, THE. Poem by William Cowper, first published in 1785. In blank verse singularly clear and impressive, the poem, which established Cowper's fame, treats descriptively and thoughtfully of many aspects of human life. It is divided into six books.

Tasman, ABEL JANSZON (c. 1602-59). Dutch explorer. Born near Groningen, he became a sailor in his youth and made several voyages in eastern waters before being given in 1642 command of an expedition sent out by Van Diemen, governor-general of the Dutch East India co. Circumnavigating Australia, he discovered on Nov. 24, 1642, land which he called Van Diemen's Land, but which was renamed Tasmania in 1853. He sailed on to discover New Zealand, the Friendly, and the Fiji Islands. He made another voyage in 1644, when he discovered the Gulf of Carpentaria, and mapped its coast-line with accu-

Tashkent, Uzbek S.S.R. Buildings of the College in the Asiatic quarter of the town

racy. He also explored the N. and W. coasts of Australia as far as 22° S. Tasman commanded other expeditions in 1647 and 1648 before retiring from service and settling in Batavia, where he died.

Tasman Bay or BLIND BAY. Wide opening on the N. coast of S. Island, New Zealand, at the W. end of Cook Strait. The entrance is between Farewell Spit and Cape Stephen, but the steamers from Wellington to Nelson at the head of the bay use French Pass, the strait between D'Urville Island and the mainland. The N.W. corner of the bay is known as Golden Bay, near the shore of which extensive deposits of iron ore are sited.

Tasman Glacier. Largest glacier of the Southern Alps, S. Island, New Zealand. One of the largest glaciers in the world outside the polar regions, it is 18 m. long, 2 m. wide, and about 1,000 ft. deep, and is fed chiefly by the Hochstetter ice fall, a frozen cascade 1 m. in width and 4,000 ft. in height on Mt. Cook.

Tasmania. Constituent state of the Commonwealth of Australia. A large island, it lies S.

Tasmania arms

of Victoria, from which it is separated by the shallow Bass Strait. It stretches from lat. 40° 40' to 43° 40' S., long. 144° 40' to 148° 20' E., is 220 m. from N. to S. and 200 m. from E. to W. It has an area of 26,215 sq. m. Geologists believe that in the remote past it was connected to the mainland by a land bridge across the 140 m. Bass Strait represented by the large granitic islands of the Furneaux group and the islets of Kent group. Physically it forms a dissected plateau of ancient rocks of the same character as the highlands of Victoria. The

E. mts. rise sharply from the coast and culminate in Ben Lomond, 5,160 ft. The W. mts. stretch almost due N. from S.E. Cape; Cradle Mt., towards the N., is 5,069 ft.; E. of Mt.

Tasmania flag

Olympus, 4,680 ft., lies Lake St. Clair. Lying N.W.-S.E., and connecting the other mts., the Great Western Mts. separate the two large drainage basins; here are Great Lake, Lake Sorell, and numerous smaller sheets of water; Dry's Bluff rises to 4,257 ft.

The rivers Tamar, N. Esk, S. Esk, Macquarie, Mersey, Forth, and others drain N., the Derwent, with its tribs., the Huon, and the Coal drain S. This copious supply of water has been harnessed for the provision of electric power for all purposes. The E. coast has few inlets, the W. coast has large indentations, notably Macquarie Harbour and Port Davey.

Tasmania has been richly endowed with natural resources. The landscape generally is beautiful, and in the W. very rugged. The climate is one of the finest in the world. Tasmania lies in the path of the westerly winds, and moderate rainfall is experienced in all seasons, with the exception of the mountainous western side, where the yearly totals may exceed 100 ins.; showers add to the summer precipitation. Cloudiness is greater than over the Australian mainland. Summer temps. are pleasant and winters mild, e.g. at Hobart the monthly mean temp. ranges from 62° F. to 47° F.

The island is very popular as a health and holiday resort, many people visiting it from the mainland, especially for the fishing in the lakes. The soil is varied and exceedingly fertile, the vegetation luxuriant. The forests produce many valuable timbers suitable for building and furniture-making, among them that of the eucalyptus, pines, blackwood, myrtlebeech, and sassafras. Wood-pulp for paper is also produced in considerable quantities.

Tasmania's annual production of apples is normally about 7,500,000 bushels; apples have been exported to England from 1884, sometimes to the extent of 3,000,000 bushels a year. Most of the common fruits of England are grown in Tasmania; what is not exported or consumed is made into jam for export. Wool and butter are other valuable products.

Tasmania is rich in minerals, among them being asbestos, bismuth, copper, cadmium, cobalt, coal, limestone, gold, kaolin, lead, ochre, osmiridium, pyrites, scheelite, silica, silver, tin, wolfram, and zinc; but much of this wealth lies in the rugged mts. of the W. and is difficult of access—hence little exploited.

The total value of exports in 1945-46 was over £A 20 million, of which £A 16.5 m. was to Australia. Principal exports were fresh and other fruit, jams and jellies, potatoes, hides and skins, minerals, especially copper and zinc, timber, and wool.

Tasmania. Map of the island once called Van Diemen's Land, a state of the Australian Commonwealth

The total value of imports in 1945-6 was £A 16 m., £A 14.7 m. being from Australia; principal imports were metals and machinery, clothing and textiles, food, drink, and tobacco.

There are 642 m. of state owned rlys., the main sections being between Hobart and Launceston, and Launceston to Burnie and Macquarie Harbour. There is one class on the rlys., which have been run for many years at a loss.

Tasmania has ten representatives in the Commonwealth senate, five in the Commonwealth house of representatives at Canberra, as well as its own parliament consisting of a legislative council of 19 members, elected for six years, and a house of assembly of 30 members elected for five years. There is adult suffrage and proportional representation with single transferable vote. There is a governor and a cabinet of nine.

The pop. in 1947 numbered 257,117. About 47 p.c. of the natural increase of the pop. is lost by migration.

The majority of schools in Tasmania are under the control of the state; primary education is free and compulsory from 7 to 14 yrs. of age. There are secondary schools in the larger centres of pop. and also in a number of rural areas to which the pupils from outlying districts are conveyed at public expense. Children who pass the necessary examinations can secure free education up to and including the university. The university of Tasmania, established in 1890, obtained a royal charter in 1915. Degrees are granted after examination in all the usual subjects except theology and divinity. The university is on a secular basis, no religious test being permitted.

Hobart (pop. 72,155), near the mouth of the Derwent, is the capital. Its harbour is one of the finest in the world. Launceston (pop. 36,730) is a beautiful town on the Tamar. Burnie and Devonport are important ports.

Tasman, first European to reach the island, landed in Marion Bay in 1642; he named

it Van Diemen's Land, in honour of the governor of the Netherlands E. Indies. Van Diemen's Land became British in 1803 as a settlement of New South Wales, and was made independent in 1825. In 1853 transportation of convicts to the island was abolished, its name was changed to Tasmania, and representative institutions (effective 1856) were granted. In 1901 Tasmania joined the Commonwealth of Australia.

There were some 5,000 aborigines, who had no close affinities among existing peoples, when white settlement began. The 203 left were deported in 1831 to Flinders I. where the last pure blooded Tasmanian man, Billy Lannee, died in 1865, the last woman, Truganini, in 1876. See Australia; Hobart. Consult Early Tasmania, J. B. Walker, 1914; The Aborigines of Tasmania, H. L. Roth, 1914; Wanderings in Tasmania, G. Park, 1934; Early History of Tasmania, R. W. Giblin, 1939; Walch's Tasmanian Almanac, annually.

Tasmania, UNIVERSITY OF. Educational centre at Hobart. Founded in 1890, it received a royal charter in 1915. The faculties are arts, science, law, and commerce, and there are laboratories, a library, and an observatory. It has about 500 students.

Tasmanian Devil (*Sarcophilus ursinus*). Name given by the original British settlers at Hobart to a marsupial mammal in consequence of its persistent raids on their poultry, etc. In size, short limbs, short muzzle, and bear-like feet it is not unlike the badger. It is a carnivorous animal of great strength, clad in thick, close fur of a black or blackish-brown hue, with white patches on the neck, shoulders, chest, and hinder parts.

Tasmanian Devil. Fierce marsupial peculiar to Tasmania and resembling a badger

Length is about 28 ins., to which the tail adds another 12 ins. The creature is fierce and untamable, and its powerful teeth, of which the canines are tusk-like, make it formidable. Like the badger, it lives in burrows, and is nocturnal. Three to five are born at a birth.

Tasman Sea. Portion of the S. Pacific Ocean. It occupies the 1,000-m. stretch between New Zealand and S.E. Australia, and was first sailed by Abel Tasman. It has a depth exceeding 15,000 ft.

Tassie, JAMES (1735-99). Scottish gem modeller. Born at Pollokshaws, Glasgow, July 15, 1735, he studied modelling at Foulis's academy. In combination with Henry Quin at Dublin he invented a vitreous paste for the reproduction of gems, and in 1766 he settled in London. Besides gems, he produced many portrait medallions cast in the same paste; these and the gems of his collection were catalogued by Raspe. Tassie died in London, June 1, 1799. See Foulis, R.; Smith, Adam.

James Tassie, Scottish gem modeller

Tassigny, JEAN DE LATRE DE (b. 1890). French soldier. After

graduating from St. Cyr, he served in the First Great War, being four times wounded. A general at the time of the defeat of France in 1940, he tried to get sent with his div., which had made a notable stand on the Aisne, to the U.K. or N. Africa. Condemned in 1942 to 10 yrs.' imprisonment for opposing the German invasion of unoccupied France, he escaped Sept., 1943, and joined de Gaulle. He commanded the French force that liberated Elba, and the French contingent that landed in S. France, Aug. 15, 1944, liberated Marseilles and Toulon, and with the French 1st army freed Alsace and conquered S.W. Germany. First French representative on the Allied control commission for Germany, June-July, 1945, he then became inspector-gen. of the French army until appointed Oct. 4, 1948, c-in-c. land forces Western Europe.

J. de Latre de Tassigny, French soldier

Tasso, TORQUATO (1544-95). Italian poet. Born at Sorrento, March 11, 1544, the son of a nobleman of Bergamo in the service of the prince of Salerno, he was brought up in Naples, receiving his education from the Jesuits. His father, Bernardo, a victim of political upheaval, had taken refuge in Rome, where, on the death of his mother in 1556, Torquato joined him. They proceeded to Urbino, where Torquato grew up in a literary and artistic atmosphere, and in 1562 completed his first narrative poem, Rinaldo, which established his reputation. Given a post in the retinue of Cardinal Luigi d'Este at Ferrara, in 1565, he soon became the central figure at that court.

In 1571 he entered the court of Alfonso II, duke of Ferrara. Two years later appeared *Aminta*, an exquisitely written pastoral drama, and in 1574 he completed the epic, *Gerusalemme Liberata*. This was long unpublished owing to the conflicting criticisms and suggestions made by those to whom he showed the MS. Discontented with his court position and disappointed at the adverse comments on his great

work, Tasso sought to leave Ferrara, but Alfonso refused his permission, and the poet remained virtually a prisoner until he escaped to Sorrento in 1577.

After two years' wandering he returned to Ferrara, where the duke, alleging his insanity, shut him up in the bedlam of St. Anna for seven years. While in confinement Tasso heard that his *Gerusalemme* was being published from the MS. taken from him when he was imprisoned, and the whole work appeared without his seeing so much as a page or receiving so much as the price of a copy. All his sonnets and odes were likewise published with emendations by minor poets such as Guarini. In 1586 he was released, and after passing a few months at the Gonzaga court at Mantua, began once again his life of wandering between Rome, Naples, and Florence. He settled in Rome, in 1594, at the invitation of Cardinal Aldobrandini, now, after weary years of homelessness, an honoured guest; but the end came before he could enjoy his prosperity, and he died at the convent of S. Onofrio, April 25, 1595.

The great epic of *Gerusalemme Liberata*, *Jerusalem Delivered*, about the First Crusade and the capture of Jerusalem by Godfrey (q.v.), of Bouillon contains twenty cantos, each of about 100 eight-line stanzas. Added to melodiousness and pathos is the attractiveness of the love stories of its heroines, Armida, Erminia, and Clorinda. The best English translation is by J. H. Wiffen, 1830. There are *Lives of Tasso*, in Italian, by P. A. Serassi, 1790; A. Solerti, 1895; consult also T. and His Times, W. Boulting, 1907.

After a print by Raphael Morghen

Tassoni, ALESSANDRO (1565-1835). Italian poet and critic. Born at Modena, he came into notice in 1609 by a critical disquisition on Petrarch, in which he boldly questioned the accepted authorities in matters of taste. He entered the diplomatic service of Charles Emmanuel, duke of Savoy. His principal work is a mock heroic epic in twelve cantos, *La Secchia Rapita*, 1622, Eng. trans., *The Rape of the Bucket*, by J. Ozell, 1715, and republished 1918; it records an incident of the 13th century wars between Modena and Bologna.

Taste. One of the five senses. The organs of taste are the tongue and soft palate. The mucous membrane of the tongue has scattered over it papillae of various forms and taste-buds which contain gustatory cells in close association with nerve fibres. The nerve of taste is the glossopharyngeal nerve. Tastes are classified into sweet, bitter, acid or sour, and salt. Sweet tastes can be best detected at the tip of the tongue, acid tastes at the sides, and bitter tastes at the back. *See Tongue.*

Tata, JAMSETJEE NASARWANJEE (1839-1904). Indian industrialist and philanthropist. A Parsee of Baroda, he was educated at Elphinstone College, Bombay. After successes in the cotton trade he turned his attention to developing the resources of the Central Provinces, and adapted the Japanese silk manufacture for its introduction into Mysore. He built and endowed the research institution at Bangalore. Tata died May 19, 1904.

His son, Sir Dorabji Jamsetjee Tata (1859-1932), developed the family cotton mills, discovered with S. Saklatvala a vast deposit of iron in Orissa, which formed the basis of his iron and steel works at Jamshedpur, and introduced hydroelectric installations in the W. Ghats to bring power to Bombay. Knighted in 1910, he endowed charities to the extent of £2,000,000.

Tatar or Tartar. Autonomous republic of the R.S.F.S.R. Created in 1920, it has several other autonomous republics on its borders and lies on both sides of the Volga and Kama rivers. With a continental climate, it has much fertile land in the S. with forest or marsh elsewhere. Kazan, the capital, is a manufacturing centre, and leather work is a traditional occupation of the Tatars or Tartars who make up half the pop. Area approx. 25,950 sq. m. *See Tartar.*

Tatar Pazardzik. Town of Bulgaria, in Eastern Rumelia. It is situated on the Maritza, 74 m. S.E. of Sofia on the railway to Constantinople. The place was founded by Tartars in the 15th century.

Tate, HARRY (1872-1940). Professional name of Ronald MacDonald Hutchison, British comedian, born July 4, 1872. From the sugar-refining firm which employed him he took this name. On April 13, 1895, he went first on the music hall stage at the Oxford,

beginning as a mimic. Later sketches on such subjects as motoring, fishing, golfing, and

Harry Tate, British comedian, and (right) wearing the famous moustache of his stage make-up

wireless were in the robust Victorian tradition of comedy to which Tate's make-up, especially his moustache, added much. He appeared in pantomime and revue, received the royal command to figure in the first of such performances in 1912, and was an early broadcaster. British dominions and the U.S.A. saw his acts. In one of the first air raids of 1939 he was injured by a flying particle in a Dundee street, and he died Feb. 14, 1940.

Sir Henry Tate, British merchant

he embarked on a commercial career, and while employed in a sugar refinery at Liverpool, patented a device for cutting sugar loaves into small cubes for household use. This made his fortune and that of the firm of Henry Tate & Sons (later Tate and Lyle). A generous benefactor to hospitals, public libraries, and to University College, Liverpool, he was also a judicious collector of modern pictures, and about 1890 decided to give to the nation his private collection at Streatham. After prolonged negotiations a site at Millbank was selected on which the now famous Tate Gallery (*q.v.*) was erected at his expense. In 1898 he was made a baronet; he died Dec. 5, 1899.

Tate, MATRICE WILLIAM (b. 1895). English professional crick-

eter, born April 29, 1895, son of Fred Tate, Sussex and England player. He first appeared for the same county in 1912. During 1924-30 he was chosen for every test match against Australia, and went in at every position in the batting order, but was primarily a fast-medium bowler of great endurance, whose collection of 38 wickets in one series of tests, 1924-25, was a world record. Tate scored a century against the S. Africans in 1929. In the English season 1925 he took 228 wickets for less than 15 runs each.

Tate, NARUM (1652-1715). Irish poet and dramatist. He was born in Cavan and educated at Trinity College, Dublin. His dramatic work was mainly that of an adapter or collaborator, his most notorious adaptation being that of King Lear. *Panacea* or *a Poem on Tea* is his only notable original poem. New Version of the Psalms, published 1696, were made in collaboration with Nicholas Brady (*q.v.*). Tate was appointed poet laureate in 1692, and died in poverty at Southwark, Aug. 12, 1715.

Tate Gallery. Art gallery at Millbank, London, S.W.1. Sir Henry Tate (*q.v.*), who owned a collection of 65 paintings, offered them to the nation with £80,000 for a building, if the govt. would provide the land. This offer was accepted in 1892, and the gallery built on the site of Jeremy Bentham's model prison; it was opened July 21, 1897. Sir Francis Chantrey left to the Royal Academy a large fortune for the establishment of a collection of British art, 1841, and this, together with the Tate collection, as well as 157 works by British artists be-

Tate Gallery, London. The Thames-side art gallery at Millbank, given to the nation by Sir Henry Tate

queathed to the nation by Robert Vernon, 1847, and 233 paintings of the British school left by John Sheepshanks to S. Kensington museum, 1857, provided the nucleus of the collection. Other pic-

tures were presented by various art societies. Nine new galleries, the gift of Sir Joseph Duveen (*q.v.*), were built to exhibit the Turner collection and opened 1910, and in 1919 the original purpose of the gallery was widened to include British art of all periods; 200 pictures were accordingly transferred from the National Gallery. Further galleries were erected in 1916 and 1937. Thirty-nine modern foreign masterpieces were added under Sir Hugh Lane's will, 1915, and Samuel Courtauld gave the trustees £50,000 for the purchase of paintings by Manet, Monet, Degas, Renoir, Sisley, Gauguin, and Van Gogh, 1925. Further extensions were opened by George V, June 26, 1926. By 1948 the collection had more than 3,000 works by British sculptors and painters and 500 by foreign artists. The gallery is governed by trustees with a director and keeper.

The basement of the gallery was flooded during the exceptionally high tide of Jan. 7, 1928, when the Thames burst its banks, and a number of pictures were damaged. At the outbreak of the Second Great War the contents of the galleries were removed to a place of safety. In 1941 the buildings were badly damaged by bomb blast and more than 50 incendiary bombs. Six rooms had been reopened by 1948. After 1939 purchasing policy became extremely catholic, purchases including works by Henry Moore, John Piper, Eric Ravilious, and Matthew Smith: contemporary foreign artists represented included Paul Klee, Max Ernst, and Marc Chagall. Post-war exhibitions of the works of Van Gogh and Chagall attracted large crowds. Selected British works from the gallery were exhibited in foreign cities by arrangement with the British Council. In 1948 the director was John Rothenstein (*q.v.*).

Tateyama OR TACHAIYAMA. A Japanese mt., in the island of Honshu. One of the principal summits in the country, it culminates in a wedge-shaped point, Oyama, at an alt. of 9,186 ft. There are solfataras and extinct craters near the summit. The shrine, situated amid perpetual snows, is visited by pilgrims between July 20 and Sept. 10. The view from the peak is spoken of as the most extensive in Japan.

Tatian (c. 110-180). Christian apologist. A native of Mesopotamia, he became a wandering teacher of philosophy and rhetoric. Converted to Christianity about

150, he settled in Rome, became a disciple of Justin Martyr, and wrote an oration to the Greeks, attacking pagan religion. He travelled widely as a missionary in the East. After Justin's death he developed Gnostic and excessively ascetic views, and was denounced as a heretic. His Diatessaron, a gospel harmony, based on the Syriac versions, was held in high esteem.

Tatler, **THE**. English periodical, mainly consisting of essays. Begun by Sir Richard Steele (*q.v.*), April 12, 1709, it was continued thrice weekly until Jan. 2, 1711. After a time Steele was joined by Joseph Addison (*q.v.*). Though Steele began with an air of providing news, after Addison joined with him the work soon changed into light, suggestive, descriptive, and humorous social essays. The *Tatler* was supposed to be one Isaac Bickerstaff, a name which had also been used as a pseudonym by Swift. Of the 271 *Tatlers*, Steele wrote 188, Addison 42, and the two in collaboration 36. See *Spectator*, *THE*.

Tatler and Bystander, **THE**. London weekly illustrated paper. The *Tatler* was started by Clement Shorter on July 3, 1901, and absorbed *The Bystander* in 1940, the first number with the new title appearing Nov. 6 that year. Society, sport, and stage are the subjects favoured, in articles, gossip paragraphs, and photographic snapshots.

Tatra Mountains OR **THE HIGH TATRA**. Central section of the Carpathians. It lies across the boundary of Czechoslovakia and Polish Galicia. It includes the culminating peaks in the range, the highest being the Gerlisdorfer Spitze, 8,737 ft.; others are Lomnitzer Spitze, 8,642 ft.; Eisthaler, 8,630 ft.; Tatra Spitze, 8,415 ft.; and Meeraugen Spitze, 8,210 ft. Precipitous rockwalls rise sheer above the valleys of the Vag and Poprad, and the lower slopes are covered with coniferous forests.

Tattersall's. Racehorse auction mart and subscription rooms in London. It was established near Hyde Park Corner in 1766 by Richard Tattersall (1724-95), who had been stud-groom to the second duke of Kingston. He was known as Old Tatt, to distinguish him from later well-known members of the family. The establishment was

Richard Tattersall, breeder of racehorses

removed to new premises in Knightsbridge in 1865. Two subscription rooms were reserved for members of the Jockey Club and formed the meeting place of the principal bookmakers and backers. Weekly betting settlement took place here. In 1948 the Knightsbridge premises were sold to Oetzmann and Co., furnishers. See *Betting*.

Tattershall. Village in the Lindsey div. of Lincs, England. It is 7 m. S.S.W. of Horncastle, and is famous for its castle. This was built by Ralph, 4th baron Cromwell, in the 15th century, on the site of an earlier one, and was partially destroyed in the Civil War. In the 20th century it was restored by Lord Curzon, who bequeathed it to the nation. It is regarded as one of the finest existing examples of a fortified dwelling in England. The church of Holy Trinity contains tombs of the Cromwell family and some fine brasses. There is a village cross. Pop. 398.

Tatting. Knotted lace made of linen or cotton threads by means of a shuttle. By constantly twisting this through and over a loop of cotton held round the fingers,

Tatting. Pattern of knotted threads; top, right, shuttle, ring, and pin

small rings of tightly knotted thread are made. A small hooked pin, attached to a ring that passes

over the left thumb, is employed to draw through the thread when fastening two such rings together.

Tattoo. Military term used in two senses. (1) Bugle call or beat of drum formerly used at nightfall to summon troops to their quarters. The word is derived from the Dutch *taptoe* (put the) tap to, and was originally a signal to warn innkeepers to sell no more liquor to soldiers. In the British army tattoo is now generally sounded for lights out, and varies in different branches of the service. Beating tattoo is sometimes a ceremonial evening parade, the buglers and drummers marching up and down, and concluding with the last post. (2) Military tournament and pageant, especially the shows at Aldershot and Tidworth staged annually by the British army.

Tattooing (Tahitian *tatau*, markings). Practice of producing durable designs under the human skin with the aid of pigments. Undertaken from motives of personal adornment or sex attraction, and for amuletic, ritual, or informative purposes, it is effected by puncturing or cutting the skin, and introducing charcoal powder or other colouring matters and ingredients. It should be distinguished from the scarring or scar-tattooing of many dark-skinned peoples, especially in Melanesia and negro Africa, which forms sunken or raised cicatrices, usually without artificial pigmentation.

The body-painting of primeval man apparently passed into tattooing as a means of securing durable designs. Ritual cutting and puncturing, evidenced in the middle Egyptian kingdom, and forbidden to the Jews by Lev. 19, spread with ancient mariners to S.E. Asia and the Pacific, where it became a fine art in recent centuries.

In Burma the complete decoration of the trunk and lower limbs is now passing away. As among the Shans, whose designs are extended from neck to feet, Burmese work is uniformly blue-black, except love-spells and devices to ensure immunity from wounds and disease, which are usually vermilion. Brass styles, with four or eight prickers, are applied by pressure. Japanese tattooing, always more artistic, and formerly prevalent among the lower classes as a partial substitute for clothing, has almost died out. Elaborate designs, sometimes of textile origin, occur in the Philippines, Borneo, and New Guinea. Polynesian tattooing is effected by tapping serrated tools with mallets. For the moko tattooing of the faces of Maori chiefs smooth-edged adzes were employed. The puncturing of simple and local designs for social or ritual purposes is widespread. Eskimo women stitch blackened threads into the skin.

Tattooing, as adopted by European seamen, comprises Oriental designs such as dragons, besides ships, anchors, and amatory tokens. London and New York practitioners tattoo upon their patrons reproductions of sacred, military, and hunting scenes, regimental emblems, and the like. Electric needles, and a wide range of colours, are employed. *See* Ainu; Maori.

Ta-tung-kau. Former treaty port in Liaoning prov., Manchuria. It stands at the mouth of the Yalu river, and was opened to foreign trade in 1907. Pop. 12,581.

Tau or **St. ANTONY CROSS.** In heraldry, the crutch-shaped or Greek T (tau) cross. *See* Cross.

Tauber, RICHARD (1892-1948). Austrian-born British singer. He was born at Linz, May 16, 1892, studied music at Frankfurt, and made his debut, 1913, at Chemnitz, singing the part of Tamino in *The Magic Flute*. He appeared in tenor rôles at Dresden, Berlin, and Vienna; then turned to operetta, his first appearance in this type of production being in Vienna in *Frasquita*, 1923. When he first came to London in *The Land of Smiles*, 1931, the song *You Are My Heart's Delight* became the most popular in his repertoire: it was reported that he sang it more than 10,000 times. He composed the music for *Paganini*, 1937; *Old Chelsea*, 1943. Of his musical films, the most popular was *Blossom Time*, 1934. Tauber, who had married as his second wife the actress *Diana Napier*, became a naturalised British subject in 1940. He died Jan. 8, 1948.

Taumnitz, KARL CHRISTOPH TRAUOGOTT (1761-1836). German publisher. Born near Grimma, Oct. 29, 1761, he began printing books in 1796, at Leipzig. His editions of Greek and Latin classics were widely famed for cheapness and accuracy. He died Jan. 14, 1836, when his business was

German works. He died at Leipzig, Aug. 13, 1895, and was succeeded by his son, *Baron B. von Taumnitz* (1841-1921). The business was sold in 1934 to the firm of Brandstetter.

Tauler, JOHANN (c. 1300-61). German mystic. He was born at Strasbourg, and at the age of 18 became a Dominican friar. He won great fame as a preacher and exercised a wide influence. He died June 16, 1361. Tauler's sermons, published after his death, rank high in devotional literature. *See* Mysticism.

Taungs Skull. Skull of an ape found in S. Africa in 1925. It approaches that of a child, but on the whole rather resembles that of a young chimpanzee. *See* Man.

Taunton. Mun. bor. and co. town of Somerset, England. It stands on the Tone, 143 m. S.W. of London and 45 m. by rly. S.S.W. of Bristol. The chief buildings are the churches of S. Mary Magdalene and S. James, both dating from the 15th century, the former a large and beautiful Perpendicular building with a tower 153 ft. high; shire hall, town hall, market house, and hospital. The castle, which is now a museum, was built in the 12th century, but much of the existing building dates from the 15th. There is a grammar school founded in 1522, and a public school. Cider, gloves, shirts, and agricultural machinery are manufactured, and the town is an agricultural centre of some importance.

Taunton existed in the 8th century and was a borough with a market before the Norman Conquest, although the present charter of incorporation only dates from 1877. It elected two M.P.s 1299-1832, then one until 1885. It now gives its name to a co. constituency. Taunton is the seat of a suffragan bishop, under the bishop of Bath and Wells. The castle was held by Blake during the Civil War, and in 1685 Monmouth was proclaimed king here. Taunton Deane, the valley in which Taunton stands, is very fertile. Market days, Wed. and Sat. Pop. 31,150.

Taunton. City of Massachusetts, U.S.A. The co. seat of Bristol co., it stands at the head of navigation on Taunton river, 37 m. S. of Boston, and is served by the New York, New Haven and Hartford rly. Taunton has machine

Taunton borough arms

Taunton, Somerset. Church of S. Mary Magdalene, from the south-east
Brith

carried on by his son, *Karl Christian* (1798-1884). The elder Taumnitz's nephew, *Christian Bernhard*, born at Schleinitz, Aug. 25, 1816, founded the better-known Taumnitz publishing house in 1837, from which more than 4,000 vols. by British authors have been issued. He also published other series of English, French, and

shops, and manufactures cotton goods, jewelry, electrical apparatus, pewter ware, and stoves. It was settled in 1638, incorporated in 1639, and became a city in 1864. In the first half of the 19th century it rivalled Boston, with more than 200 industries. Pop. 37,345.

Taunton, HENRY LABOUCHERE, 1st BARON (1798-1869). British politician. Descended from a

Huguenot family, he was born Aug. 15, 1798. His father, Peter C. Labouchere, was a banker from Amsterdam, who settled in England, while his mother was a Baring. Educated at Winchester and Christ Church, Oxford, he entered parliament in 1826 as M.P. for a Cornish borough, and in 1832 he took office in the Whig govt. filling minor posts until 1839. As a cabinet minister he was president of the board of trade 1839-41, and again 1847-52; and secretary for the colonies 1855-58. For a short time (1846-47) he was also chief secretary for Ireland. In 1859 he was made a peer as Baron Taunton, a town he had represented in parliament since 1830. The title became extinct when he died, July 13, 1869. Henry Labouchere (*q.v.*) was his nephew.

Taurus. Mountain range of Germany in Hesse. It stretches N.E. for 45 m. from the right bank of the Rhine between Mainz and Bingen and culminates in the N.E. at 2,887 ft. in the Great Feldberg. The crags overlooking the Rhine are crowned with ruined castles and are vine-clad on the slopes. Forests clothe the higher parts of the range, which contains, among others, the mineral springs of Wiesbaden, Homburg, and Nauheim.

Taupo. Lake of North Island, New Zealand. It lies in the volcanic region containing Ruapehu, Ngauruhoe, and Tongariro, and is 241 sq. m. in area, 1,211 ft. alt., and 534 ft. deep. Taupo is also the name of a township on the lake and Waikato river, 227 m. by rly. S.E. of Auckland; it has medicinal and hot springs.

Tauric. Cape forming the S.W. point of the Crimea, R.S.F.S.R. It is 7 m. W. of Sevastopol. On this promontory formerly stood the Greek city of Chersonesus.

Taurt or **Touaris** (Egypt., the mighty one). Egyptian deity.

Represented as a hippopotamus in calf, sometimes crowned with disk, horns, and plumes, she was a primitive animal-goddess, afterwards included in the theogony as consort of Set and, in the Theban form Apet or Opet, as mother of Osiris. As the "good nurse" she presided at childbirth, and as devourer of the wicked waited in Amenti for those who failed when weighed in the scales of judgement.

Taurus or **THE BULL**. In astronomy, one of the signs of the Zodiac. Originally the first sign, it is now the second, the sun entering the constellation about April 22. The Pleiades mark the shoulder of Taurus, the Hyades its head. The chief star is Aldebaran or Alpha Tauri, a red star some 90 times brighter intrinsically than the sun. The constellation contains a number of variable stars, and the well-known Crab nebula. See Constellation; Zodiac.

Taurus. Mountains of Asiatic Turkey. Consisting chiefly of two ranges, named by the Turks the Bulgar Dag and the Ala Dag, they run almost parallel to the coast of S.E. Asia Minor, forming the edge of the Anatolian plateau. On the E. they form the border between Asia Minor and Turkish Syria, the connecting pass being the Cilician Gates. The loftiest peak is the Metdesis, N.W. of Adana, and 11,500 ft. in height. The Anti-Taurus is an extension

Tavern (Lat. *taberna*). House of wayside rest and refreshment. Synonymous with inn, the tavern has the same legal status, both in common law and by statute. But in trade and tradition alike, it is the public house, providing alcoholic drink and sometimes "soft" drinks, and food, rather than the hotel furnishing accommodation. The tavern was created by and for the needs of the road. Unknown to primitive or savage communities, its history is nevertheless both ancient and respectable. It figures in the earliest literature of China and Japan, India, Assyria, Persia, and Egypt, also in the Bible. In ancient Greece its status was not high, but the Roman road makers set great store by their taverns, controlling them by legislation, much of which has been incorporated in modern laws. Cicero mentions Tres Tabernae (three taverns) as a town on the Appian Way. Shakespeare's Mermaid Tavern and Johnson's Cheshire Cheese have been immortalised, and the tavern of Omar Khayyam remains a symbol of life's pilgrimage.

Taveta. Settlement of Kenya Colony (*q.v.*). It is 75 m. W. of Voi on the Uganda rly., and 28 m. E. of Moshi on the Usambara rly., and is close to the frontier of Tanganyika Territory, near the N.E. slopes of Mt. Kilima-Njaro, 2,350 ft. above sea level. In 1884

1st Baron Taunton,
British politician
After Slater

Taurus. Mountain range of Asia Minor, presenting a steep scarp to the Cilician plains at the N.E. corner of the Levant

N. from the E. end of the Taurus. On a northern spur is Mt. Argacus, 11,480 ft., the highest point in Asia Minor. The Bagdad rly. follows the break between the Bulgar Dag and the Ala Dag.

Tavastehus (Finnish Hämeenlinna). Capital of the dept. of Häme in S.W. Finland. About 80 m. N.E. of Abo (Turku), it is connected with Leningrad by the Helsinki rly. The chief occupations are the cultivation of grain, flax, and hemp, and cattle breeding. Jean Sibelius was a native of Tavastehus.

Sir H. Johnston concluded treaties here with the local chiefs, and a little later the German Karl Peters, and General Lloyd Matthews, the latter acting for the sultan of Zanzibar, also made treaties with the same chieftains. The place was allotted to the British, but the greater part of Kilima-Njaro fell to the Germans. The dist. was the scene of numerous encounters during the First Great War.

Tavira. Seaport of Portugal, in the prov. of Algarve. It is 136 m. S.E. of Lisbon on the river

Gila, and has a Moorish citadel and a Renaissance church. The harbour, guarded by two forts, is accessible to small vessels which trade in fruit, tunny, and sardines. Pop. 14,000.

Tavistock. Market town and urban dist. of Devon, England. It stands on the Tavy, 15 m. N. of Plymouth, and is served by rlys. A short canal leads from here to the Tamar. The chief buildings are the church of S. Eustachius, dating from the 14th century, and the

TAVISTOCK ARMS

guildhall and other public offices. Educational institutions include an endowed grammar school and Kelly College. Formerly a stannary town, Tavistock was the centre of an important mining district. It was also famous for its woollens and much cloth was sold at its fairs, but it is now chiefly an agricultural centre. It elected two M.P.s 1295-1867, then one until 1885. It now gives its name to a co. constituency. There are remains of a monastery founded in 961, around which the town grew. This became very rich, a fine building being erected for it in the 15th century. On the dissolution of the monasteries its lands were given to John Russell, whose descendants, the dukes of Bedford, had a seat, Endsleigh, near the town. The eldest son of the duke has the title of marquess of Tavistock. Market day, Fri. Pop. 6,024.

Tavistock Square. London square, in the bor. of St. Pancras, W.C.1. It was built about 1806 on property of the duke of Bedford and named after his heir the marquess of Tavistock. At Tavistock House (demolished 1901) Dickens during 1850-57 wrote *Bleak House*, *Hard Times*, and *Little Dorrit*; he also set up a small theatre in the garden. The E. side of the square, in Woburn Place, is occupied by the appointments office of the ministry of Labour; buildings of the British Medical Association are at the N.E. corner; while on the N. side stand the Jews' College and the headquarters of the Free Church Federal Council.

Tavoy. Dist., harbour, and river of Burma, in the Tenasserim division. The dist. is the coast strip W. of the mountainous Siamese frontier. It has the very heavy rainfall of 227 ins. annually. Hardly any of the land is culti-

vated, a little rice being grown. Wolfram and tin are mined. Tavoy town, 30 m. from the mouth of the river, is well laid out, and timber-built. It is almost in the middle of the coast of the dist. on the E. side of the long narrow estuary of the Tavoy river, a short stream which flows due S. from the N. of the dist. Area, 5,308 sq. m. Pop., dist., 211,729: town, 37,650.

Tavy. River of Devon, England. It rises on Dartmoor and after a course of 20 m. falls into the Tamar. Its estuary is 3 m. long and about $\frac{1}{2}$ m. broad. Tavistock is on its banks, and the river also passes Buckland Abbey.

Taw. River of Devon, England. Rising on Okement Hill, in Dartmoor, it flows N.E. to Lapford, and turns N.W. to Barnstaple at the head of its estuary. Its length is 50 m.

Tawe. River of Wales. Rising in Brecknock, it flows for 36 m. S.W. through Glamorgan to Swansea Bay at Swansea.

as a citizen may enjoy services worth to him much more than he has to pay as taxes.

Every tax is of persons, not things, however it may be expressed. When consumers of goods are taxed by means of duties, e.g. customs and excise duties, on the commodities they buy, the tax is called indirect. Taxes on income and property, on particular classes of people (e.g. auctioneers), and on acts (such as writing a cheque or a receipt) are direct.

Taxation is one of the principal instruments by which a government expresses its policy, and a tax may be most effective when it produces least revenue: for example, protective taxes on imports, or taxes on alcohol imposed to discourage drinking, are entirely successful when they produce no revenue.

Throughout the ages taxation has aroused hostility, and at times has caused rebellion and civil war. Now most people, in

TAVISTOCK, DEVON. The Guildhall, built in 1848 and incorporating remains of the Benedictine Abbey
Frith

Tawell, JOHN (d. 1845). British murderer. He was hanged in 1845 for the murder at Slough of Sarah Hart, whom he poisoned with prussic acid. The crime is memorable for the ingenious defence that the prussic acid was contained in apple pips eaten by the dead woman, and for the fact that Tawell, who escaped to London, was intercepted at Paddington as the result of a telegram from Slough—the earliest use of the telegraph for tracing a wanted criminal.

Taxation (Lat. *taxare*, to compute). Term for the levying of contributions from citizens for the maintenance of the state. A tax is not a direct payment for services provided; thus, a 6d. stamp on an agreement is a tax, a 6d. stamp on a parcel is not. A taxpayer

the U.K. at any rate, regard it as a necessary evil. Four maxims, or canons, of taxation, stated by Adam Smith in his *Wealth of Nations*, 1776, repeatedly quoted and adapted to changed conditions, are: (1) that people should contribute in proportion to their ability; (2) that a tax should be certain, in form, amount, and manner of payment; (3) that the tax should be levied in the most convenient way; (4) that it should be so contrived as to take out and to keep out of the pockets of the people as little as possible more than it brings to the Treasury. These four canons of equality, of certainty, of convenience, and of economy are frequently used to judge the quality of a proposed tax. Thus, a poll-tax (a fixed amount per head) violates the

first canon; so does an income tax at a flat rate irrespective of the size of the income, for each unit—pound, dollar, franc, etc.—of a small income has generally a much greater significance than each unit of a very large income.

Most customs and excise duties violate all the canons except the third; for experience suggests that most people object less to paying taxes on expenditure than taxes on income, notwithstanding that when imposed on *e.g.* household necessities, commodity taxes press much more heavily on the poor than on the rich, that few people know how much tax is included in the price they pay, and that generally the extra amount paid for the taxed goods is very much larger than the tax. A psychological reason for this preference is the citizen's knowledge that if he cares to do without the taxed article he can avoid paying the tax, a choice he cannot make where direct taxes are concerned.

Bad Forms of Tax

A govt. in devising its taxation has to subordinate precept to expediency, and especially has to seek taxes that are elastic, that is, can be adjusted by altering the rate in order to produce more or less as may be desired. Any tax, however, is bad if it produces results quite unexpected and undesired, as did the taxing of the American colonies under George III, or if it tends to impoverish the whole community by lowering the standard of health or by lessening economic activity and initiative. One method of taxing is always bad: that of financing govt. expenditure by depreciating the currency through the issue of bank notes. An easy and insidious form of taxation, it has during the 20th cent. caused immense harm on the Continent, especially in Germany and France.

Since the middle of the 19th cent. there has been in most countries a great increase in taxation, partly because the state has undertaken many additional functions, but principally because of the vastly increased cost of war and defence, and the interest on debts resulting from war. There has also been a tendency in the U.K., and to some extent in other countries, to rely much more on various forms of direct taxation, particularly taxes on income. In 1840–50 direct taxes in the U.K. supplied only 30 p.c. of the total revenue; at the beginning of the 20th century they provided about

50 p.c., by 1913 60 p.c., by 1920 nearly 70 p.c. In 1932 the range of customs duties was greatly increased, and at the outbreak of the Second Great War direct taxes accounted for about 60 p.c. As the war proceeded, the great increase in indirect taxes, chiefly the newly introduced purchase tax, was more than offset by the still greater increase in the rates and the range of direct taxes, and only about one-third of the total tax revenue was raised through duties on goods.

The growth of taxation in the U.K. has been partly caused by the greater willingness of all political parties to use taxation as a social and economic instrument. Most British govts. would not hesitate to increase or decrease taxation if they considered that they could in that way prevent a slump and unemployment. The effect of high rates of taxation on prices, wage demands, the willingness of people to work hard or to undertake commercial risks, etc., has also been studied with considerable divergence of conclusions. See Customs and Excise; Income Tax; Single Tax; Surtax, etc.

Bibliography. A Short Fiscal and Financial History of England, 1815–1918, J. F. Rees, 1930; Principles of Public Finance, H. Dalton, 9th ed., 1936; Fundamental Principles of Taxation, J. Stamp, rev. ed., 1936; Finance of the British Government, 1920–36, U. Hicks, 1938; Redistribution of Incomes through Public Finance, T. Barra, 1945; A Study in Public Finance, A. C. Pigou, 1947.

Taxation of Costs. In English law, the scrutiny by officials of the high court of justice and others of a solicitor's bill of costs. The work is done by masters of the supreme court, which has a taxing office, registrars of the county courts, and

clerks of the peace. All items are checked according to the allowed scale of costs, those charged wrongfully being disallowed and overcharges rectified. See Costs.

Taxco. Town of Mexico, in Guerrero state. Here was mined the first silver shipped to Spain from Mexico. Borda, a Frenchman, made an immense fortune in the 18th cent. from silver mining and founded the magnificent church crowning the hilltop. The town is a Spanish colonial gem, full of picturesque scenes, and the Mexican govt. has made it a national monument, prohibiting the construction of modern buildings. There are several good hotels, however. Taxco is about 130 m. N. of the port of Acapulco and connected to it by rly. Pop. 6,000.

Taxicab or TAXI. Popular name for a hackney carriage provided with a taximeter (*q.v.*). In England taxicabs are licensed by the local council of the district in which they ply, except in London, where they are licensed by the commissioner of police, and regulated by the London cab orders issued by the Home secretary. They must conform to certain requirements in design and safety measures, and are limited as to the number of passengers they may carry. Unlike the owner of a privately hired car, the taxi owner may charge only the amounts indicated on the taximeter. Normally the London taxi is licensed to carry four passengers, but in 1927 two-seater taxicabs were licensed by Sir W. Joynson-Hicks (later Lord Brentford), and after him were nicknamed Jixies; but these never proved popular and soon disappeared.

Taxidermy. The art of preparing, stuffing, and mounting the skins of animals to resemble the living creature. It is an exclusive and highly specialised craft; in England there are only two taxidermist firms, one a family concern in which experience is handed down from father to son. This firm is now owned by the founder's great-grandson, who is assisted by two brothers. The taxidermist's work is varied; not only does he stuff animals, but he fashions all kinds of articles from their skins. His showroom is an exhibition, with stuffed giant pandas, lions, tigers, lambs, dogs, cats, and other pets, monkeys, birds, amphibians, even insects and butterflies. The most important point is that a stuffed animal should be given a lifelike attitude: this calls not only for good craftsmanship, but

Taxidermy. Principal tools required for elementary work. 1. Skinning knife. 2. Scissors. 3. Bodkin. 4. Brain spoon and hook. 5. Round-nosed pliers.

Taxidermy. Stuffing a mandrill. 1. Studying the subject. 2. Softening the skin in a tank of water. 3. Stuffing the animal. 4. Shaping the body. 5. Fitting artificial eyes into the head. 6. Cleaning the fur with a comb. 7. The finished job. 8. A layer of arsenic having been applied to the face to ensure its preservation, a coating of plaster is laid on. This remains there for about two months until the face is completely dry and firmly set

also for artistic gifts and knowledge of natural history.

The process of stuffing is as follows: the skin, with the fur, if any, is immersed for softening in a water tank for several days, after which it is hung up for drying; at the next stage, iron rods are put into the limbs in order that the structure shall be firm; arsenic is applied where the skin is open, as these places are liable to rot; after these preparations, the animal is stuffed and the skull fitted into the head, the head itself being stuffed through the ear. The process of shaping follows, according to directions in a natural history book; artificial eyes are put into the skull (there is a factory in England which manufactures artificial eyes for all kinds of animals); the eyes are modelled for correct expression; the fur is cleaned with a comb; the mask is covered with arsenic and a layer of plaster of Paris, which is left on, sometimes for months, until the face is completely dry and set; finally the body is mounted and ready to be transported to a museum, school, or private house.

It is also the job of the taxidermist to make souvenirs of tusks, fins, hides, furs, elephant nails, etc., such as walking sticks

and ornamental tables from the skin of a hippopotamus, and ashtrays from elephant skin. As correct heat is necessary for stuffing different animals, the taxidermist's shop contains several rooms at varying temperatures. Patience, experience, and scientific knowledge are needed to transform the pitiful skin of a dead animal, with a dangling head, into a perfectly stuffed and mounted object which

gives a convincing illusion of life. Time necessary for completing the job varies from several weeks to months and even years, while the cost of stuffing a large animal like a hippopotamus or elephant may be several thousand pounds.

Simon Wolf

Taximeter. Device used on taxicabs to indicate payments due by the hirer. The inventor of the modern taximeter was A. Grüner, of Magdeburg, in 1895. The basic principle of the instrument lies in the fact that, for any complete revolution of a wheel of a vehicle, a certain distance is travelled by the vehicle. Hence, if the revolutions of the wheel be counted during a certain period, the distance travelled may be calculated. The accompanying figure shows the interior of an instrument. In this illustration *a* is a flexible shaft, the bottom end of which terminates in a wheel, which is geared with another on the nave of a wheel of the vehicle, and thus rotates as the vehicle travels. Through the gearing, *b*, the shaft is connected with the principal counter, *c*, the numbered disks of which are made to revolve by suitable gearing.

Apart from "extras," Grüner's original instrument provided for

five different tariffs. The parts are linked together in such a way that, by turning keys on the outside of the instrument case, the gears can be thrown in or out as required. In the diag. (p. 7965) the key, *d*, turned through a certain distance in one direction, will show tariff No. 1 (distance hire) at the tariff window, and at the same time connects the flexible shaft with the principal counter, *c*; turning the key in the other direction first disconnects the flexible shaft from the fare counter, and then connects the counter with the clock gear, *e*, and tariff No. 2 (time hire) simultaneously appears.

The counter, *f*, which is operated by the flagstaff being turned down, shows the number of times that the cab has been hired; *g* shows the total number of miles the cab travels; *h* the total amount paid for fares; while counter *j* adds up and records the amount paid for "Extras."

Taxodium. Summer-leaving tree of the family Coniferae. It is noted for the richness of the tints of its autumnal foliage. A native of N. America, whence it was introduced into Great Britain in 1640, it thrives in a moist, loamy soil, preferably by the edges of lakes or rivers, and is propagated in the ordinary way by seeds or cuttings, or by layering in the autumn. *T. distichum* is known as the bald or swamp cypress.

Tax Reserve Certificate. Certificate issued under a scheme introduced in the British budget of 1941. These are issued in multiples of £25 by the Bank of England on behalf of the Treasury to companies and others who deposit funds earmarked for the payment of income tax (other than schedules C and E), surtax, excess profits tax, and other taxes.

The certificates provide an investment for money that would otherwise remain probably as a deposit at the bank in readiness to meet the tax demand. Originally interest on such deposits was allowed at the rate of 1 p.c. free of tax, but in 1948 the rate was reduced to $\frac{3}{4}$ p.c. A tax certificate

Tay, FIRTH OF. Indentation of E. Scotland on the North Sea. It is due to a submergence of the lower portion of the Tay valley, and extends inland 25 m. to Perth. See Inchcape Rock.

Tay Bridge. Railway bridge crossing the Firth of Tay. The first rly. bridge across the firth was

Tay Bridge. Railway viaduct, 2 miles and 73 yards in length, across the firth at Dundee. It was opened in 1887

is not transferable; but if the amount for which it is issued prove greater than the tax payable a balance certificate may be issued.

Tay. River of Scotland. It drains the greater part of Perthshire and portions of Angus, Argyllshire, and Inverness-shire, and has a length of 118 m., including its chief headstream and the Firth of Tay. Rising as the Fillan on Ben Lui, 3,708 ft., on the W. border of Perthshire, it flows E. by N. to Loch Dochart, whose name it takes, and then on to Loch Tay. On issuing from the N.E. end of this loch, it assumes its own name, and flows E. and S.E. past Aberfeldy and Dunkeld, and thence S. past Perth to the firth on the N. shore of which is Dundee. From the right it receives the Earn, Almond, Shochie, and Bran, and from the left the Isla, Tummel, and Garry. The area of its basin is 2,400 sq. m., and it discharges more water into the sea than any other river in the U.K. Its salmon fisheries are the most important in Scotland.

Tay, LOCH. Lake of Scotland, in W. Perthshire. It fills a rock basin in the valley of the Upper Tay, at an elevation of 349 ft. and with a depth reaching to 508 ft. In length 15 m. and breadth 1 m., it is an angling and tourist resort. Ben Lawers (*q.v.*) on the W. rises 3,635 ft. above the level of the lake.

opened in 1878, and Dec. 28, 1879, during a night gale, 13 of the main central spans, with a train upon them, fell 90 ft., a third of the bridge being destroyed, and all the passengers on the train, some 90 in number, being killed. The second bridge, built 1882-87 at a cost of £870,000, is just over 2 m. long and carries two lines of rly.

It was constructed within 60 ft. of the site of the original bridge, many of the smaller remaining girders of which were used in the new structure. For part of its length the rly. tracks are carried on top of the girders, but across the 13 main central spans the tracks are laid between the main girders so as to allow a clear height of 79 ft. for the passage of ships below. There are 74 spans, varying from 56 ft. to 245 ft. in length. The big spans were erected on pontoons alongshore and floated out to their positions at high tide. As the tide fell the girders were left resting upon low-level seatings on the piers, whence they were raised by hydraulic rams to the required level.

Taylor, ALFRED EDWARD (1869-1945). English philosopher. He was born Dec. 22, 1869, and educated at New College, Oxford. In 1891 he became a fellow of Merton, and during 1903-08 was professor of philosophy at McGill university, Montreal. In 1908 he became professor at St. Andrews, staying there until 1924, when he was appointed professor of moral philosophy at Edinburgh. He wrote many books on philosophical questions, being especially well known as an interpreter of Plato, Socrates, and the thinkers of Greece. Among his works were *Aristotle*, 1912; *The Influence of Platonism*, 1925; *Plato, the Man and his Work*, 1927; *The Life of Socrates*, 1933. A plea

Tay. One of the landing-stages on the Perthshire loch, from which excursions can be made to the surrounding mountains

for religion, Does God Exist? was widely discussed when it appeared just after his death, which took place Oct. 31, 1945.

Taylor, ALFRED SWAINE (1806-80). British medical jurist. Born at Northfleet, Dec. 11, 1806, and educated at Guy's and St. Thomas's Hospitals, then one institution, he became professor of medical jurisprudence at Guy's Hospital, 1831-77, being the first

Alfred Taylor,
British medical jurist

lecturer on the subject in England, and his profound knowledge and wide experience of poisons, wounds, etc., made him in constant demand at criminal trials. He died May 27, 1880. Taylor was the first man to codify medical jurisprudence, and his *Manual of Medical Jurisprudence*, first published in 1844, remains the standard work on the subject. He also wrote a *Handbook on Poisons*, 1848. See *Jurisprudence*.

Taylor, BAYARD (1825-78). American writer. Born in Chester co., Pa., Jan. 11, 1825, he was apprenticed to a printer, and in 1844 he published *Ximena*, his first volume of poems. He later went on a pedestrian tour of Europe, which he described in *Views Afloat*, or *Europe Seen with Knapsack and Staff* (1846). In 1847 he joined the staff of *The New York Tribune*, for which he travelled as special correspondent in California, Mexico, Egypt, Asia Minor, Syria, India, China, Japan, Greece, Sweden, and Russia. In 1862 and 1863 he was secretary of legation at St. Petersburg. Subsequently he spent many years in Germany, the fruit of which was his best known work, his translation of *Faust*, 1871. He died in Berlin, Dec. 17, 1878, while serving as ambassador.

Taylor, ISAAC (1829-1901). British philologist. A son of Isaac Taylor (1787-1865), author of *The Natural History of Enthusiasm*, he was born May 2, 1829, at Stanford Rivers. Educated at Trinity College, Cambridge, he was ordained in 1857. From 1865-69 he was a vicar at Bethnal Green and from 1869-75 at Twickenham. In 1875 he became rector of Settrington, Yorkshire, where he died Oct. 18, 1901. Taylor's fame rests chiefly upon his book, *The Alphabet*, 1883. His other works include the popular *Words and Places*,

1864. Taylor's aunt, Jane Taylor (1783-1823), won fame as a writer of hymns for children.

Taylor, JEREMY (1613-67). English divine and scholar. A barber's son, born at Cambridge, where he was baptized Aug. 15, 1613, he was educated at Gonville and Caius College, Cambridge, and University and All Souls Colleges, Oxford, becoming in 1636 a fellow of the last named. Chaplain to Laud and Charles I, he was rector of Uppingham, 1638; of Overstone, Northamptonshire, 1643. Taken prisoner at Cardigan, 1645, and deprived of his living by the Parliamentarians, he was for a time a schoolmaster in Wales, and chaplain to the earl of Carbery at Golden Grove, Carmarthenshire, where his chief works were written.

Charles II appointed him bishop of Down and Connor, 1661, and administrator of Dromore. He was vice-chancellor of Dublin university and a member of the Irish privy council, but disputes with the clergy, as a result of his strict episcopalianism, and domestic sorrow clouded his later years. He died at Lisburn, Aug. 13, 1667, and was buried in the cathedral he restored at Dromore.

Taylor's 36 separate works include *Episcopacy Asserted*, 1642; *The Liberty of Prophecy*, 1646;

Jeremy Taylor,
English divine

The Great Exemplar (Life of Christ), 1649; *The Rule and Exercises of Holy Living*, 1650; *The Rule and Exercises of Holy Dying*, 1651, both reissued in numerous editions; *Clerus Domini*, on the Ministerial office, 1651; *Unum Necessarium*, repentance, 1655; *The Golden Grove*, 1655, an expansion of an earlier Catechism for children, with hymns on the mysteries and festivals of the Church; *A Discourse on Friendship*, 1657; and *Ductor Dubitantium*, an erudite treatise on casuistry, 1660.

A man of remarkable erudition, influenced by the Renaissance, gifted with a fertile imagination, and the possessor of a stately and impassioned prose style rarely equalled and perhaps never surpassed by any English author, Jeremy Taylor, whose spiritual nature animates all he wrote, still exercises power and charm upon the appreciative reader.

Bibliography. Works, ed. R. Heber, with Life, 15 vols., 1822, rev.

ed. C. P. Eden, 10 vols., 1847-52; *Poems and Verse Translations*, ed. A. B. Grosart, 1870; *Lives*, J. Wheeldon, 1793; H. K. Bonney, 1815; T. S. Hughes, 1831; E. Gosse, 1904; G. Worley, 1907; W. J. Brown, 1925.

Taylor, JOHN (1580-1653). English writer, known as the Water Poet. Born at Gloucester, Aug. 24, 1580, and apprenticed to a Thames waterman, he served in the navy, being present at the siege of Cadiz, 1596, and at Flores, 1597. He returned to the Thames as a

John Taylor,
English writer
Bodleian Library

waterman, travelled, making a journey on foot from London to Edinburgh in 1618, and settled down in 1645 as an innkeeper in Long Acre. He was buried in the churchyard of St. Martin-in-the-Fields. His ruggedly racy writings, *Penniless Pilgrimage*, *Travels in Germany*, etc., upwards of 150 in number, were reprinted by the Spenser Society, 1869-78, and there is an account of him in Southey's *Observations on Uneducated Poets*.

Taylor, JOHN HENRY (b. 1871). English golfer. Born at Northam, Devon, March 19, 1871, he was for 46 yrs. professional to the Mid-Surrey club. He had a remarkable championship record spaced over more than 20 yrs., being open champion 1895, 1896 (jointly with Vardon), 1900, 1909, and 1913, and runner-up in 1904, 1905, 1906, 1907. In 1948, at the age of 77, Taylor was still a familiar figure at Walton Heath. His publications included *Taylor on Golf*, 5th ed., 1911; *Golf My Life Work*, an autobiography, 1947. With Vardon and Braid, Taylor ranks as one of the three greatest names in the early history of professional golf.

Taylor, MYRON C. (b. 1874). American lawyer and diplomatist. He was born Jan. 18, 1874, and took a law degree at Cornell. He did not establish himself primarily as a lawyer, but was concerned chiefly with finance. He was chairman of the finance committee of the U.S. Steel corporation,

J. H. Taylor,
professional golfer

1927-1934 and chairman during 1932-38, also holding directorships of many other large firms. He went as personal representative of F. D. Roosevelt to the Vatican during the Second Great War. Later he was chairman of the committee on post-war foreign economic policy.

Taylor, Tom (1817-80). British dramatist. Born at Sunderland, Oct. 19, 1817, he was educated at Glasgow university and Trinity College, Cambridge, of which he was made a fellow in 1840. Leaving Cambridge for London in 1844, he was professor of English literature at London university until 1846, when he was called to the bar, but in 1850 he gave up the law for a government post, eventually becoming secretary of the sanitary dept. of the local government board. His leisure, meantime, had been devoted to literature and journalism. He contributed to Punch, and in 1874 became its editor. His dramatic career, on which his fame chiefly rests, had begun in 1844 when four of his burlesques were produced. He wrote, adapted, or collaborated in about 100 plays, some of which have been frequently revived. His best known pieces are *Masks and Faces*, 1852, with Charles Reade; *Still Waters Run Deep*, 1855; *Our American Cousin*, 1858; *The Ticket-of-Leave Man*, 1863; and *Lady Clancarty*, 1874. Taylor died at Wandsworth, July 12, 1880.

Tom Taylor

Taylor, Zachary (1784-1850). American soldier and statesman. Born in Orange co., Virginia, Sept. 24, 1784, except for a few years he was engaged from 1808 to 1847 in active military service. His earliest campaigns were against the Indians—Tecumseh, Black Hawk, and the Seminoles—and his last against Mexico, in which with greatly inferior forces he won the decisive victory of Buena Vista, Feb. 22-23, 1847, over the Mexican president, Santa Anna. In 1848, Taylor was a successful Whig candidate for the presidency. During his brief term, questions connected with slavery, and the disturbed condition of the country generally, prevented much attention being given to domestic reforms. Taylor died at Washington, July 9, 1850.

Taylor Institution. Establishment for the study of medieval and modern European languages, at the university of Oxford. It was founded and endowed in accordance with the will of Sir Robert Taylor (1714-88), architect, and is housed in S. Giles's, in the E. wing of a handsome building in the Ionic style, built 1845-48 after a design by C. R. Cockerell. The rest of the building, facing Beaumont Street, is occupied by the Ashmolean Museum (*q.v.*). The institution contains a library and lecture rooms, and is controlled by a board of curators, who administer endowments for lectures and scholarships.

Tayport or Ferryport-on-Craig. Town of Fife, Scotland. Situated on the S. side of the Firth of Tay on the rly. 3½ m. E. by S. of Dundee and opposite Broughty Ferry, it has a good harbour, and linen and jute factories, and engine works. Pop. 3,500.

Taz. Name of a river and bay in E. Siberia. The river rises in two small lakes and, taking a generally N.W. direction, falls into the bay of the same name, which communicates with the Gulf of Obi. The Taz river is frozen from Nov. until June.

Tbilisi. Ninth city of the U.S.S.R., capital of Georgia S.S.R. and of Transcaucasia. It is situated on the Kura, 170 m. E. of Batum, and has a long history, dating back to the 5th century, when King Vakhtang discovered hot springs here. In 455 it became the capital of the old kingdom of Georgia; it was taken by Russia in 1799. During the First Great War Tiflis, as it was then called, was the main object of the Turks in their Caucasian campaign. For long a centre of fine art manufacture, ranging from carpets to goldsmiths' work, it was modernised under the Soviet régime and became one of the greatest industrial cities of the U.S.S.R. A large hydro-electric plant draws power from the fast flowing rivers of the Caucasus. Here is a university and the Georgian academy of sciences; also the h.q. of the army of the Caucasus. It is linked by rly. with Tabriz, Persia, and by air with Moscow. Pop. 519,175.

Tchaikovsky, Piotr Il'yich (1840-93). Russian composer. He was born at Votkinsk, May 7, 1840, and after studying jurisprudence, entered St. Petersburg conservatoire, where he was persuaded by Rubinstein to adopt music as his profession. Ap-

pointed professor of harmony at Moscow conservatoire, 1866, he stayed until 1877. During these years he wrote his first opera, *Vojevodá*, 1869, which proved a failure, as did *Undine*, 1876; his symphonic poem, *Romeo and Juliet*, was derided in Vienna, and only with the success of his best-known opera, *Eugene Onegin*, 1879, did he attain general recognition. To this period belong the first three symphonies, piano concerto in B flat minor, *Swan Lake* ballet, and *Francesca da Rimini*. He made a disastrous marriage in 1877, but at the same time gained a patroness, *Nadezhda von Meck*, who, though she never met him, made the composer an ample allowance. Then came mature works despite lack of appreciation. The 4th and 5th symphonies reflected the melancholy and morbid introspection which had always characterised Tchaikovsky's disposition. Later works included the operas, *Queen of Spades*, and *Mazeppa*; the Mozartiana suite, *Sleeping Beauty* ballet, and *Casse-Noisette* suite. At a performance of the revised version of his opera *Vakoula* the Smith, entitled *Oxana's Caprice*, 1887, he made his début as a conductor, visiting European capitals and the U.S.A. In 1893 he poured into his 6th symphony (the *Pathetic*) what he regarded as his supreme emotional expression. Within 10 days of its first performance he died of cholera, Nov. 6, 1893.

P. I. Tchaikovsky, Russian composer

Tchaikovsky's music attained universal popularity within a few years because of his capacity to express emotion in well-defined light and shade. In his big works he displayed a breadth and mastery of orchestration attained by few contemporaries. Of his symphonies the 5th and 6th are the most spectacular, and, with the first piano concerto, the most frequently heard works. His supreme artistic achievement is perhaps ballet music, which has a high power of evocation and theatrical lyricism. The 5th symphony was adapted by Leonid Massine as a ballet (*Les Présages*), 1933; and *Francesca da Rimini* and the overture *Hamlet* were also set. Few of his operas are performed outside Russia, where

Tea. Natives of Ceylon preparing the leaves for export. 1. Picking the leaves. The labourers' living quarters built of concrete can be seen in the background. 2. Machines for rolling and bruising the dried leaves. 3. Drying leaves by spreading them on hessian trays called tats. 4. Sifting and grading the tea. 5. Expert checkers removing coarse parts which have escaped the grading process

Eugene Onegin is regarded as his masterpiece. His work is plainly unequal if one compares the noisy 1812 overture with the serenade for strings, Italian capriccio, or piano trio. Many of his more than 100 songs are deservedly popular, and pieces such as *Chanson Triste*, and *Andante Cantabile* (from the serenade) are constantly performed. His *Life and Letters*, by his brother Modeste, was trans. by R. Newmarch, 1906; *Consult also* *Life*, G. Abraham, 1944.

Tchatyr Dagh (Tent Mountain, ancient *Trapezus*). Mt. of S. Russia. It is situated on the S.E. coast of the Crimea, 20 m. S.E. of Simferopol, and is 5,000 ft. high.

Tchekhov, ANTON. The career of this Russian writer is given under the spelling of Chekhov.

Tchernia, CERNIA, OR CRNA. River of Yugoslavia. It rises among the heights N.E. of Lake Ochrida, flows S.E., makes a great bend round the Selecka Planina, and continues N.E. to join the Vardar a few miles above Negotin. It figured prominently in the First Great War.

Tchernigov. This Russian town is described under its alternative spelling of Chernigov.

Tea. Term applied specifically to the leaves of the tea-plant and to the beverage infused from them. It is also applied to similar decoctions used either medicinally or as beverages, e.g. beef tea, camomile tea, sage tea, cowslip tea, etc. The Chinese name is *cha*.

The tea-plant is an evergreen tree belonging to the genus *Thea*, of which the *camellia* is regarded as a sub-genus, and to the family Theaceae. The leaf is strongly veined, with saw-like edges; the flower, usually white, often stalkless, and delicately fragrant; and the fruit has three spherical seeds. Opinions differ as to its original home. In India, Ceylon, and Pakistan, Assam Indigenous, China, and hybrid plants are used.

The Chinese may have used tea medicinally as early as the 3rd or 4th century A.D., but apparently not as a beverage until the 6th century. By the 9th century, when it was introduced into Japan, tea had become the staple Chinese drink. Christopher Borough, who accompanied a trading expedition into Persia in 1579, has been said to have introduced tea into England. It had become a popular beverage by about 1660. Early in the 19th century China tea-seed was experimentally planted in India, and,

after 1834, when the East India company's monopoly ceased and tea was proved through the pioneer researches of the brothers Bruce to grow wild in Assam, India began to cultivate tea.

The growth of the tea industry in Ceylon originated in the failure of the coffee crop in the last quarter of the 19th century. The tea-plant was introduced into Java in 1826 by the German scientist Philipp Franz von Siebold. Tea-growing has spread to British Africa—Kenya, Tanganyika, Uganda, and Nyasaland. Much tea is also grown by Russia, mainly in the Caucasus.

For tea-planting, a hot, moist climate, light friable soil, and good drainage are desirable. The seeds are either first kept in nurseries from six months to a year or more, or planted out direct—"at stake"—in the fields. The plants come to maturity in three years, and require very careful pruning. Tea is made only from the delicate top shoots, which are nipped off with the hand by women and children.

In the factory the pluckings are withered, i.e. exposed to the sun or hot air until soft and flaccid. After rolling, the leaves are allowed to ferment, or rather oxidise, in a cool, moist room. They are quickly

re-rolled and at once fired to extract moisture and prevent further fermentation, then sifted into grades, again fired, and finally packed. The factory processes are mostly carried out by machinery. These methods apply to a typical Indian or Ceylon black-tea concern. In China tea is grown chiefly by peasant proprietors on small plots, and is made by hand.

Green tea is unfermented and possesses more stimulating properties than black. In moderation tea soothes the nerves; excessive tea-drinking, especially if the tea be kept long standing or simmering, produces nervous excitation, insomnia, indigestion, and other evils. The main growing countries for green tea are China and Japan, but India and Ceylon produce some green tea. The principal names of green teas are, in order of quality, Gunpowder, a small closely rolled leaf; Imperial, closely rolled but bold; Hyson, a straight twisted leaf; Young Hyson, similar but much smaller leaf; and Hyson Skin and Twankay—from the river Tun-kei, in eastern Ngan-hui—often imperfectly rolled. The chief grades of Indian and Ceylon teas are of two kinds, broken and leaf, the former including fannings and dust. The customary leaf-grades are Orange Pekoe, Pekoe, and Pekoe Sou-chong.

In China the provinces watered by the Yang-tse are the principal source of the Moning or black-leaf Congous, and of fine green teas. The finest Fu-kien teas are grown on the Wu-i hills.

From a dialect form of Wu-i comes the well-known name Bohea, early used in England for fine tea generally, and later as a trade term for a low-quality tea. Fu-kien produces the "fancy" teas, e.g. Kokew Oolong, a species of green; and Flowery Pekoe, Foochow Scented Orange Pekoe, and Foochow Scented Caper, all scented with petals of jasmine or other sweet-smelling flowers. The term Pekoe means "white down," and denotes the delicate tip of the young tea-shoot.

Formosa produces chiefly Formosa Oolong, a species of green tea with a yellowish leaf, favoured by Americans. Akin to Oolong is Pouchong, "fold-sort," put up in little silk-paper packets, the exquisite packing of which remains a mystery to Europeans. Japan grows mostly green, and exports it direct to the U.S.A.

The principal tea-districts of India are Assam, Darjeeling,

Cachar, Dooars, Chota Nagpur, Kangra Valley, Dehra Dun, Kumaon, Travancore, and the Nilgiri Hills. The principal tea-growing area in Pakistan is Sylhet.

Tea for export is packed in aluminium-lined, air-tight cases, Indian and Ceylon mostly in chests containing approximately 100 lb., or in half-chests, containing about 60 lb., according to the wood available. China tea is packed in chests of about 84 lb., in half-chests of about 50 lb., and in caddies, sometimes gaily coloured, of 20 lb.

As a single tea rarely possesses rich colour, strength, and delicate flavour combined, the custom arose of blending together different teas. The average consumption of tea per head in Great Britain and Ireland just before the Second Great War was about 9½ lb. a year. In 1940 it was less than 1½ lb. per head.

Bibliography. Tea from Grower to Consumer, A. Ibbetson, 1930; The Culture and Marketing of Tea, C. R. Hailer, 1933; To Think of Tea, A. Repplier, 1933; All About Tea, W. Ukers, 1935; Tea: Its Production and Marketing, R. D. Morrison, 1946.

Teaching (A.S. *taecan*, to show). Word used in two senses: first, the body of evidence or instruction, the substance of what is shown or taught (e.g. the teaching of the Church, the teaching of the materialists); secondly, the act of instructing and the theory underlying it. Many wild and domestic animals appear to undertake some teaching of their young. Among human beings such teaching has been the necessary condition for the survival of the race and the transmission of domestic arts and crafts and of traditions. In the past craftsmen undertook the teaching of their "mysteries" to apprentices, and much ritual has been associated with the initiation into and the emergence from apprenticeship. Teaching, like other activities, tended to become a specialised occupation; full-time teachers date at least from ancient Greece, particularly in the arts and sciences—languages, mathematics, rhetoric, etc. Such teaching in medieval times, principally in the hands of the Church, led to the establishment of schools; but the teaching of trades and of domestic crafts was still carried on in the workshop and the home.

During the 19th century teaching in the U.K. emerged as a secular full-time occupation, and colleges were established to train

men and women in the art of teaching, though it remained possible for persons without such theoretical and practical training in teaching to become teachers. Specialisation increased in teaching as in other occupations until many teachers instruct in only one subject, sometimes one section of a subject. Broadcasting and films and other "visual aids" have affected the work of the teacher.

Much teaching of factory processes is organized within the works by employers, sometimes in close cooperation with local schools and colleges. Special methods have been evolved for teaching the blind, the dumb, and subnormal children in Special Schools (*q.v.*).

Teaching by correspondence developed enormously during the 20th cent., principally as a commercial enterprise, but in sparsely populated territories, e.g., parts of Canada, under official auspices. See Froebel; Kindergarten; Montessori; Pestalozzi; University.

Tea Duty. Tax imposed upon imported tea. In Great Britain it was levied in 1660 as a luxury tax, at the rate of 1s. 6d. a gallon of liquid tea, until 1680 when it became 5s. a lb. of tea. During the 18th and 19th centuries the tax was retained at rates varying from 100 p.c. ad valorem to a few pence a pound. During the 20th century tea came to be regarded as a household necessity, and the tea duty was often attacked as a tax on the poor. In 1929 the existing duty of 4d. a lb. on foreign and of 3½d. a lb. on Empire tea was repealed. It was, however, reintroduced at a reduced rate in 1932; and the duty was retained during the Second Great War although its yield was virtually offset by subsidising the price of tea: thus, in 1947 the duty of 6d. a lb. yielded £9.5 million, but the tea subsidy cost £9 million. In Oct., 1948, it was estimated that because of the great rise in the market price of tea the tea subsidy during that fiscal year would cost £17.1 million, nearly twice the amount of the estimated yield from the duty. The attempt of the British govt. in 1767 to enforce the payment of tea duty by the American colonists was one of the immediate causes of the War of American Independence.

Teak (*Tectona grandis*). Large timber tree of the family Verbenaceae, native of Indo-Malaya. It attains a height of 100–150 ft., and has opposite, oval leaves. The panicles of white flowers are

Teak. Foliage and fruit of this Malayan tree; inset, flowers

succeeded by woolly fruits enclosed in the persistent bladder-like calyx. The timber is exceedingly valuable in shipbuilding. It is largely cultivated in India, Burma, and Java, for its timber. Before cutting the growing tree is "girdled," a ring of bark being cut from the base of the trunk, which kills the tree and denudes it of sap. It is then left standing for two years. African teak, a hard and heavy wood, is the product of *Oldfieldia Africana*, a tree of the spurge family (Euphorbiaceae) and a native of W. Africa.

Teal (*Anas crecca*). A small species of duck. It is a native of Europe (including Britain) and Asia. The drake is marked by a jagged white line with black below it along the wing, a buff triangular patch below the tail, and the red-brown head with a buff-edged, curved green band on each side, in which the eye is included. The duck has a more uniform dress of buff dappled with brown; but for its small size it might be confused with the female mallard. It is in general a bird of inland lakes and pools, though in winter large numbers may be seen at the mouths of rivers. It feeds on minute aquatic animals and on water weeds. The nest, of the usual duck type, is built in marshy ground, or among heath plants on the moorland, and contains from 8 to 12 cream-tinted eggs.

Teal. Drake of the small European species of wild duck
W. S. Berridge, F.Z.S.

Te Anau. Lake of New Zealand, in Otago, South Island. The largest and in parts the most picturesque of the lakes in the S. Alps, it stretches for 40 m. almost N. and S., with fjord-like arms between forest-clad and snow-capped mts.

Teano (anc. *Teanum Sidicinum*). City of S. Italy, in the prov. of Naples. Situated 14 m. by rly. N.W. of Capua, at the foot of an extinct volcano Rocca Monfina, 3,297 ft., it contained a 14th century castle and a 16th century cathedral which was almost completely destroyed during the Second Great War. Teano was held by the Hermann Goering div. against the Allied 5th army, British troops of which captured it Oct. 31, 1943. Ruins of a Roman theatre, baths, and houses attested its ancient importance.

Tear Bottle OR **LACHRYMATORY.** Term applied to small, narrow-necked bottles or phials found in ancient tombs, and supposed to have contained tears shed for the dead person. The custom is possibly referred to in Ps. 56, v. 8. Some authorities are of opinion that the bottles contained perfume.

Tear Bottle from an Etruscan tomb, length 6 ins.

of ethyl-bromo-acetate, chloro-acetone, benzyl bromide, benzyl iodide, and iodo. Although tear gas in warfare is prohibited by the Geneva gas protocol (1925) to The Hague convention of 1907, there is no restriction upon its use by civil police in the suppression of riots. Police usually distribute it in grenades which weigh 1 lb. and are thrown by hand. See Chemical Warfare.

Tearle, GODFREY (b. 1884). Anglo-American actor. He was born in New York, Oct. 12, 1884, and educated at Carlisle grammar

school, first appearing as a boy in Richard III at Burnley, 1893. Adopting the stage as a career, 1899, he joined the co. of his father, Osmond Tearle. He formed his own co., 1904-06, and appeared on the London stage at His Majesty's in Attila, 1907. A fine presence suited him to virile parts, and he became a leading actor in London and New York in Shakespeare and in contemporary pieces, his most memorable performances including those in Carnival, 1919; The Garden of Allah, 1920; The Faithful Heart, 1922; Living Dangerously, 1934; The Flashing Stream, 1938; The Light of Heart, 1940. He played in a screen version of Romeo and Juliet as early as 1906; a later film was One of Our Aircraft Is Missing. Tearle in 1932 was elected first president of Equity (q.v.).

Godfrey Tearle, Anglo-American actor

Tea Rose. Name given to a class of perpetual or autumnal roses. Mostly hybrids of *Rosa indica*, they include many of the most popular varieties, e.g. Maréchal Niel and Gloire de Dijon. The name is derived from the scent. See Roses col. plate.

Teasel OR **TEAZEL** (*Dipsacus sylvestris*). Tall biennial herb, one of the family Dipsacaceae. It is a native of Europe, W. Asia, and the Canaries. In the first year it forms a large spreading rosette of oblong, lance-shaped leaves with prickly midribs. In the second it develops a tall stiff stem with prickly ribs, and large leaves in pairs, the lower ones with their bases joined so that they hold a large quantity of water. The small, tubular, purplish flowers are gathered into

heads after the flowers have died, showing the stiff bracts

Teasel. Heads after the flowers have died, showing the stiff bracts

an oblong head. In the cultivated form known as the fuller's teasel (*D. fullonum*) these bracts are used for producing the nap on cloth, or teasing it, whence the name.

Tea-tree (*Leptospermum lanigerum*). Small tree of the family Myrtaceae, native of Australasia. It has alternate, oblong, leathery, and downy leaves, and its flowers are white with a woolly calyx. The name is due to the early English settlers using the leaves as a substitute for tea. In other parts of the world other plants bear this popular name; in England it is applied to *Lycium chinense*.

Teazle, **SIR PETER**. Character in Sheridan's play, *The School for Scandal* (*q.v.*). He is an elderly man with a young, pleasure-loving, extravagant wife.

Tebessa (anc. Theveste). Town of Algeria. It lies at an alt. of 3,500 ft. about 100 m. S.S.E. of Bone, with which it is connected by rly. Here are extensive Roman ruins, including a triumphal arch, a temple of Minerva converted into a Christian church, and a circus, built to seat 6,000-7,000 spectators. The country round is fertile, well wooded, and well watered. The modern town, est. pop. 8,000, is in an important strategic position. It is largely a creation of the French who occupied it in 1851. During the Second Great War Allied forces which landed in N.W. Africa in Nov., 1942, and entered this part of Tunisia without opposition, turned Tebessa into a supply base. During the battle of the Kasserine pass (see North Africa Campaigns), Feb., 1943, the Germans attempted to break through to Tebessa, but were held by U.S. troops.

Tebeth. Tenth month of the Jewish ecclesiastical and fourth of the civil year. Borrowed from the Assyrian calendar and meaning the muddy month, it corresponds approx. to Feb.-March.

Techetium. Chemical element, symbol Tc, at. no. 43; formerly known as masurium. It is very rare, and little is known of its properties.

Technical Education. Term applied to the provision for teaching arts, handicrafts, trades, industrial and commercial processes, principles, and organisation. The distinction between technical and non-technical education lying as much in aim as in content, educational curricula can rarely be classified rigidly into technical and non-technical, vocational and non-vocational. Certain educational provision, however, is made

primarily to meet the needs of those within or proposing to enter certain occupations, or to satisfy the declared requirements of particular industries and trades. Such provision exists to some extent in the U.K. in all types of educational institution, but in certain schools and colleges the relationship to industry and trade is more marked and obvious.

Decline of Apprenticeship

Before the industrial revolution craft apprenticeship, standardised in the Elizabethan Statute of Artificers (1562), was the principal means of technical education. The development of factories in the 18th and 19th centuries brought, on the one hand, the decay of craft apprenticeship, and on the other hand, the need for workers with a knowledge of general principles rather than manual skill. Appreciation of this need led to the establishment in 1823-24 of several mechanics' institutes to give the necessary instruction in mathematics, applied science, etc. By 1850 there were more than 600 such institutes in England and Wales; many of them still exist as technical colleges.

The great exhibition of 1851 drew public attention to the lack of facilities for technical education. In 1852 the dept. of practical art was organized under the board of trade, and four years later this was made a branch of the newly established Education dept., and became the dept. of science and art. In 1859 it established two systems of examinations in science, one for teachers, the other for students. The Royal Society of Arts, itself an offshoot of the great exhibition, also instituted examinations in various branches of applied art, extending them in 1873 to technological subjects.

The relative failure of Great Britain at the Paris exhibitions of 1867 and 1878 emphasised the need for greater provision for specialised technical education in that country and led to the establishment of the City and Guilds of London institute in 1878 by the corporation of London and certain, of the livery companies, and the appointment, 1881, of a royal commission to inquire into technical education in the U.K. and abroad.

The institute, to which the R.S.A. transferred its technological examinations in 1879, has not only maintained colleges of technology and art, but also, through its dept. of technology, provided a flexible link by which advisory committees in an immense

range of industries and trades could influence the development of the technological instruction, training, and certification of their technicians and technologists.

The reports of the royal commission emphasised the need for a good secondary education as the best preparation for technological study, and led, through the passing of the Local Government Act, 1889, the Technical Instruction Act, 1889, and the Local Taxation and Customs and Excise Act, 1890, to the establishment of secondary and technical schools and colleges maintained by counties and county boroughs.

The board of education was established in 1899 to combine various authorities; and following the Education Act of 1902, numerous new secondary and technical schools were established; but the regulations for secondary schools, 1904-05, introduced a division between secondary and technical education, and fostered the tendency to adhere to the traditional grammar school curriculum. The official attitude was modified by the circular on the curricula of secondary schools, 1913; and gradually vocational specialisation became the rule rather than the exception in the sixth forms of secondary schools.

Trade Schools and Others

At the beginning of the 20th cent. a few full-time day trade schools were established, particularly in the London area; e.g. that for furniture and cabinet-making at the Shoreditch technical institute in 1901. Such schools were a substitute for apprenticeship. Their success led to the institution in 1913 of junior technical schools of two kinds: (a) trade schools, a substitute for apprenticeship; and (b) pre-apprenticeship schools, which receive pupils between the ages of 13 and 14. Junior technical schools combine general secondary education with specialised work.

Since 1902 education authorities have been empowered to pay for technical education out of the rates, and most large urban centres have one or more maintained technical colleges, which aim largely to apply science and art to the needs of industry and trade in the neighbourhood.

Quickening of the interest and cooperation of industrialists and business men in the technical training of their employees has been indicated by (1) the appointment by professional, industrial, and commercial associations of

education committees; (2) the provision of funds to endow or to equip technical colleges; (3) the recognition of the technical competence of employees through promotion, money awards, etc., on the passing of examinations or the completion of educational courses sponsored by the industry.

National certificates in building, chemistry, mechanical and electrical engineering, naval architecture, textiles, commerce, and other subjects are awarded to part-time students who have satisfactorily completed a course of study, usually extending over three years of evening attendance, and passed an examination in which the college, the ministry of Education, and the representative technical body (e.g. the institute of mechanical engineers, the institute of builders) cooperate. Higher national certificates involve a further two years of part-time study. National diplomas are awarded on the satisfactory completion of full-time courses.

Most vocational study is undertaken by those who are already in employment, and takes the form of attendance at evening classes. Some employers, however, permit their juniors to stop work earlier in order to attend classes; and in some industries, e.g. engineering and printing, apprentices are usually able to attend day classes on one or more days a week without loss of wages.

Under the Education Act, 1944, it became the duty of education authorities to provide adequate facilities for further education, including technical education and training, and regional advisory councils were set up to cooperate with local industries in the setting up of regional colleges of further education, and other requisite institutions. National colleges, the responsibility of the ministry and of the industry they serve, were contemplated in certain industries of importance in which the workers are comparatively few, e.g. watch and clock industry.

Valuable educational work is also initiated and financed by individual companies, usually on their own premises, much of it of an advanced character and combined with research work. It has been an important factor in the development of the technology of aeronautical engineering, electronics, and plastics, metallurgy, and gas production and supply. Consult Education Act, 1944; Higher Technological Education (Percy Report), H.M.S.O., 1945.

Teck. Castle of Württemberg, Germany. It stood near Kirchheim, and was destroyed in 1575. It gave its name to a duchy dating from the 12th century. The family holding it became extinct in 1439, but from 1495 to 1806 the title was held by the dukes of Württemberg. In 1863 Alexander (1804–85), a member of the royal family of Württemberg, having made amorganatic marriage, was created prince of Teck.

Alexander's son, Francis (1837–1900), made duke of Teck in 1871, had married, in 1866, Mary Adelaide, daughter of the duke of Cambridge and cousin of Queen Victoria. They made their home at White Lodge, Richmond. Their sons were Adolphus (1868–1927),

Duke and Duchess of Teck, parents of Queen Mary

who married Margaret, daughter of the duke of Westminster, Francis (1870–1910), and Alexander (b. 1874), who married Alice, daughter of the duke and duchess of Albany. The daughter, Mary, became the wife of George V. The duchess of Teck died Oct. 27, 1897. In 1917 the family changed its name to Cambridge. Adolphus, who had succeeded his father as duke, Jan. 20, 1900, was made a British peer as marquess of Cambridge, and Alexander was made earl of Athlone. See Mary, Queen.

Tecoma. Genus of evergreen trees and climbing shrubs of the family Bignoniaceae. They differ from the bignonias chiefly in their lack of tendrils, and there are about 24 known species, natives of sub-tropical regions. The leaves are opposite, and the tubular, red, yellow, or orange flowers grow in racemes or terminal panicles. *T. radicans*, the trumpet flower, and *T. grandiflora* grow in the open against a sunny wall, in S. England, but the other species, of which the best known are *T. australis*, the wonga-wonga vine, and *T. capensis*, require hot-house treatment. See Bignonia; Trumpet Flower.

Tectonics (Gr. *tektōn*, carpenter). Art by which implements, buildings, etc., are constructed, taking into consideration their artistic design as well as their use.

In geology, the word tectonic is used with reference to the structure and external form of rocks which have resulted from deformations of the earth's crust. Thus mountains thrown up as a result of earth movements are called tectonic mountains.

Tecumseh (1768–1813). American Indian chief, sometimes called Tecumthe. Born in Ohio, near the site of the present Springfield, a chief of the Shawnees, he took part in 1804 in a plan for uniting the Indians to expiate the whites, and in 1808, on the Tippecanoe Creek, Indiana, he established a village which was intended to be a return to the simple life of the Indians. In 1811 he led a rising, and on its suppression he passed over into the British service as brigadier-general, being given command of the Indians in the war of 1812. He took part in the capture of Detroit, and fell in action at the battle of the Thames, in Canada, Oct. 5, 1813. Consult Life of Tecumseh. B. Drake, 1841.

Tedder, ARTHUR WILLIAM TEDDER, BARON (b. 1890). British air officer. Educated at Whitgift school and Magdalene College, Cambridge, he entered the colonial service. He served with distinction in the R.F.C. in France and Egypt during the First Great War. He commanded a R.A.F. flying training school, 1924–26. Director of

Lord Tedder, British air officer

training at the Air ministry, 1934–36, he was in charge of research and development at the outbreak of the Second Great War, when he was chiefly responsible for introducing new types of aircraft and equipment. In 1940–41 he was in the Middle East. As air officer c-in-c., R.A.F., Middle East, 1941–43, he organized the powerful air offensive which aided the 8th army's advance across N. Africa. Tedder was deputy supreme commander, A.E.F., 1943–45. He signed on behalf of the A.E.F. the confirmation in Berlin of Germany's surrender, May 8, 1945; in Sept. he was promoted marshal

Tecumseh, American Indian chief

of the R.A.F. Chief of air staff 1946-49, he became in 1950 British representative on the N. Atlantic treaty military committee. Knighted 1942, and given a barony 1946, he was elected chancellor of Cambridge univ. 1950.

Teddington, Middlesex. Lock and rollers on the Thames, looking downstream
"The Times"

Teddington. Part of the borough of Twickenham, Middlesex, England. It is 13½ m. by rly. S.W. of Waterloo, and 19½ m. from London Bridge by the Thames, which is tidal as far as Teddington Lock. The manor once belonged to Westminster Abbey. Of the church of S. Mary, dating from the 16th cent. the N. aisle and tower were built by Stephen Hales (d. 1761), who was rector for 51 years and was buried here, as was John Walter, founder of *The Times*. Robert Dudley, earl of Leicester, and William Penn were residents of Teddington, which is a favourite angling resort. The National Physical Laboratory was established here in 1902. Pop. 23,362.

Teddy Bear. Child's toy, used as a variety of doll. Modelled on the koala, it is of soft material, covered with golden brown fur, has movable head, arms, and legs, and can sometimes be made to "growl." First introduced in the U.S.A. about 1909, it was called Teddy in reference to the much publicised big-game hunting expedition undertaken in that year by the former president Theodore Roosevelt, and has been a nursery favourite on both sides of the Atlantic ever since.

Te Deum Laudamus (Latin, we praise thee God). Chief canticle of the Christian Church. In the Church of England it is sung after the first lesson at morning prayer, though in Lent the Benedictus is an alternative. In the Roman service it appears in matins and on special thanksgiving occasions. Tradition ascribed the origin of the canticle to S. Ambrose or S. Augustine or both, but its author was Niceta, bishop of Remesiana. Verses 7-9 resemble closely a passage in S. Cyprian (3rd cent.), and

some of the expressions those of the morning hymn (4th or 5th cent.) of the Eastern Church. Caesarius, bishop of Arles in the 5th cent., is the first to refer directly to the hymn. It is "the great hymn of triumphant praise in the

Western Church, as the Gloria in Excelsis is in the Eastern."

Tee. Small cone of sand, rubber, or other material for driving off at the start of each hole in golf (q.v.). The most general form of tee is a small mound of sand upon the top of which the ball is placed. Of manufactured tees, the most popular is a small peg that is pointed at one end and has a shallow cup on the other. This is pushed into the

ground and the ball placed in the cup. The flight of the ball may be varied according to the height of the tee. The term tee is also used for the aiming mark in curling (q.v.).

Tees. River of England. It rises in Cross-fell, Cumberland, and forms first the boundary between Durham and Westmorland, and then that between Durham and Yorkshire. Teesdale, the valley through which the upper part of the river flows, contains the waterfall High Force, and other beauty spots.

A few miles from its mouth the river flows through a busy industrial area, passing Darlington, Stockton, and Middlesbrough, where the estuary begins. Its tributaries are the Lune, Balder, and other small streams, and its length is about 80 m. It is navigable to Stockton.

Tee. Manufactured variety

TEETH: THEIR GROWTH & VARIETIES

J. Sim Wallace, M.D., D.Sc., Author of *The Teeth and Health*

See the articles *Dentistry*; *Dentition*; *Pyorrhoea*; *Rodent*; those on *Man and various animals*, e.g. *Lion*, *Tiger*; also *Anatomy*.

The teeth are the bone-like structures in the mouth, or at the commencement of the alimentary canal. They are developed from the derma or skin, although the underlying tissue takes part in their formation. A tooth usually consists of a crown projecting through the gum, and a root embedded in the underlying tissue. The crown is typically covered with enamel, and the root with a bone-like substance called cementum. The neck of the tooth is the part between the crown and the root where the gum surrounds it.

The enamel is the hardest tissue in the body. It is white or bluish-white and slightly translucent, having a polished appearance on the surface. It consists almost entirely of inorganic salts of calcium and magnesium, together with a little water. Underneath the enamel is the bone of the tooth or dentine, which as a rule forms its greater part. This is a hard, yellowish bone-like substance, and in one form, ivory, is well known. Unlike the enamel, it consists in organic matter, about 26 p.c. This organic matter is a kind of gelatinous or cartilaginous substance. There is about 8 p.c. of water; the remaining 66 p.c. is composed of salts of calcium and magnesium. There is an elasticity in the dentine, and the cracks seen in worn enamel are not found in dentine.

The teeth of fishes are not confined to the jaws, but frequently cover all the bones in the mouth and even gullet (pharynx), so as to make it difficult, if not impossible, for any foodstuff taken into the mouth to get out of it except by passing down the alimentary canal. Not only are the teeth of fishes often very numerous, but there may be a continuous succession of teeth, so that old and worn teeth are replaced by new and sharp ones. The succession of the teeth may be from below or it may come about from a gradual shifting of the integument carrying the teeth, so that the new and sharp teeth occupy the most suitable ridges on the bones round the mouth, until they become blunted and superseded by new teeth. This is the common mode of succession in the shark. Another interesting form of tooth to be found among fishes is the hinged tooth, found in the cod and hake. The tooth can become more or less recumbent when food is passing down the throat, but is erect and antagonistic to food passing in the opposite direction.

The most highly differentiated tooth in reptiles is to be found in the poisonous snakes. In these, the poison fang is frequently grooved, and in the viper and rattlesnake the groove becomes so accentuated that it is converted

Teeth. 1. Teeth in upper and, 2, in lower human jaw: A. Canine. B. Central incisor. C. Lateral incisor. D and E. 1st and 2nd premolars. F, G, H. 1st, 2nd, and 3rd molars. 3. Section of human tooth: A. Enamel. B. Dentine. C. Pulp. D. Gum. E. Bone. F. Cement. 4. Hyena: A. Incisor. B. Canine. C. Premolar. D. Molar. 5. Orang-utan: A. Premolar. B. Molar. 6. Hedgehog: A. Incisor. B. Premolar. C. Molar. 7. Lower jaw of Llama shark: A. Flap of mucous membrane covering uncompleted teeth. 8. Skull of poison snake, front and side views: A. Palatine bone. B. Maxillary bones. C. Transverse bone. D. Pterygoid bones. E. Quadrilateral bone. F. Mandible. 9. Top and side views of molar of African and, 10, of Asiatic elephant: A. Enamel. B. Dentine. C. Cementine. In 4, 5, and 6, the upper jaw is shown in plan, the lower jaw in elevation.

into a canal running down the crown of the tooth nearly to the tip, so that it comes to resemble somewhat a short, strong, hypodermic needle, its function being to facilitate the injection of poison into the snake's prey. Another point with regard to this tooth is that it is fixed into the maxillary bone, which is hinged so that when the snake strikes, the poison fang is erected before it is driven into the flesh of the victim.

The teeth of mammals are adapted to, and vary considerably according to, the uses to which they are put. In marsupials, varieties of dentition are to be met with, often resembling the dentition of the higher mammals. Thus there are a carnivorous, an insectivorous, and an herbivorous type. In higher mammals, as a rule, there are two sets of teeth—the milk dentition subserving the needs of the animal during its growth, and the permanent dentition from maturity onwards. The teeth are also differentiated according to their position in the mouth. At the front of the mouth there are incisors, three on each side, above and below. Then follow the canines, one above and one below, on each side. Next come the premolars, typically four above and four below on each side. All these teeth succeed the corresponding temporary teeth. Lastly there are

the true molars, typically three above and three below on each side.

Two more marked sets of differentiation may be noted, the first having to do with the nature of the food upon which the animal preys, and the second with the differentiations of the teeth, which permit of their being used as weapons of offence, more especially among the males. With regard to the first group, the most simple form of dentition is found among the piscivorous mammals, such as the dolphin, in which the teeth are all similar in shape, being of a conical form. This group differs from most of the higher animals in not having two sets of teeth. Insectivorous mammals are distinguished by having teeth with numerous sharp cusps. The carnivorous type have large recurved conical canines, and molars adapted for the slicing of flesh from bones.

Herbivorous animals have generally molars of a more or less complex character, which gradually become worn down on the crown, but this is compensated for by the more or less continuous growth of the tooth.

Rodents also have teeth of continuous growth. The omnivorous type does not show extreme variations from the generalised variations typical of mammals. Although monkeys and apes are generally looked on as fruit-eating animals,

their dentition does not differ essentially from the omnivorous type. A further form of specialisation common among some groups of the higher mammals is the development of one or more teeth in the front of the mouth in such a way that they may be used as weapons of combat. Thus, in the narwhal, one incisor tooth in the male is enormously developed, forming a straight tusk of great strength. In the elephant, two incisors form the tusks, which are used not only in combat.

One of the marked characteristics of human teeth is their similarity to those of the anthropoid apes. They are, however, placed somewhat differently. The incisor teeth of apes project obliquely forward: indeed, all the teeth are placed more forward with regard to the body of the jaw than in man. In man there is no interval between the upper canines and incisors, nor between the lower canines and the first premolar, as among apes.

The teeth of man are relatively somewhat smaller than those of

apes. The canines are not developed so as to project above the line of the other teeth, and the wisdom-tooth is frequently relatively small. Sometimes it is quite a dwarfed tooth, and is indeed occasionally absent. When its growth is stunted, it is not so liable to decay as when large, for the crevices in the stunted wisdom-tooth are relatively small.

Lack of oral hygiene is the main general cause of decaying teeth. Lack of function in mastication of such foods as tend to clean the teeth mechanically or otherwise, or the consumption of foods which baffle the beneficent action of the glands of oral hygiene (the salivary and mucous glands), may be regarded as the primary causes. Such lack of function tends to allow of the stagnation of food or secretions, thus giving a foothold to bacteria, which may be able in such circumstances to attack the tooth or surrounding gum.

Irregularities of the teeth may be prevented by methods of feeding which stimulate the functional activity of the jaws, teeth, and gums, and leave the mouth physiologically clean after every meal.

Artificial methods of preservation of the teeth follow the same principles, although they are not so efficacious. The tooth-brush usually fails to clean the crevices of or between the teeth effectually, so that it is desirable in addition to use a slightly acid and aromatic mouth-wash. The friction of the tooth-brush on the gum, when not excessive, also helps to keep it clean and healthy.

Teeth, ARTIFICIAL. Substitute for natural teeth in human beings. A variety of materials is used for taking accurate impressions or casts of the upper and lower jaw. These materials include plaster of Paris, which is introduced into the mouth in shallow metal containers called trays in a soft condition and allowed to harden in the mouth, after which it is removed. More liquid plaster is poured into the tray and allowed to harden. The tray is then removed, together with the first impression, and leaves an accurate cast or die of the mouth. Alternatively an impression may be taken with composition, which is introduced into the mouth in trays after having been softened in boiling water. Another material, zelex, is used with ordinary impression trays after having been mixed with equal quantities of water.

An accurate cast of the mouth being obtained, dentures are con-

structed in several stages. Blocks of wax are used to obtain the "biting" articulation of the patient. The artificial teeth are inserted in the wax; the whole is sunk into plaster of Paris; the wax is poured away, and the space it previously occupied filled in with the actual base material of the denture. Formerly this space was packed with rubber, which was vulcanised under pressure; later plastic materials came to be used for both plate and teeth.

Artificial teeth may replace all the patient's teeth or may be fitted around some of them (partial dentures). Dentures can also be made with 9 or 18 carat gold as a base. The plastic base is commonly called acrylic material; its advantages over vulcanite are that it is non-porous, very light, and made without colour or in colours that more nearly approximate to the natural colourings of the gums.

B. Murray-Davies

Teething. Process of cutting teeth by an infant. Rudiments of the teeth already exist in the jaw before birth. The process is inevitably disturbing and sometimes the gums become red and swollen and the child fretful and feverish. Small doses of "grey powder" may be helpful. The age at which teething occurs varies, and bears little relation to a child's health.

Teetotalism. Popular term for abstinence from alcoholic liquor. See Prohibition; Temperance.

Tegea. Town of Arcadia in ancient Greece, and capital of the surrounding dist. of Tegeatis. Considerable excavations have been made on the site of the temple of Athena, which was rebuilt under Scopas (c. 375 B.C.), and was the finest in the Peloponnese.

Tegern See. Village and lake of Germany, in Upper Bavaria. The village, 37 m. by rly. S. by E. of Munich, lies the E. lake shore and attracts tourists by its beautiful walks. The castle was once a Benedictine abbey, suppressed in 1803 after a life of nearly 11 centuries. The Grosse Parapluie (2,625 ft.) commands fine views.

Tegetmeier, WILLIAM BERNARD (1816-1912). British naturalist.

W. B. Tegetmeier,
British naturalist

The son of a medical practitioner, he was born at Colnbrook, Nov. 4, 1816. He was educated for the medical profession, but after a short

experience of a country practice, he settled in London, and turned to journalism, becoming natural history editor of *The Field*. His scientific interests led him to develop the use of homing pigeons in time of war, and to assist Darwin in his inquiries into variations in animals. One of the founders of the Savage Club (*q.v.*), Tegetmeier died Nov. 19, 1912.

Tegetthoff, WILHELM, BARON VON (1827-71). Austrian sailor. Born at Marburg, Styria, Dec. 23, 1827, he entered the navy, and in the Danish war of 1864 distinguished himself at the battle of Heligoland. In the Seven Weeks War he commanded the Adriatic fleet, and defeated the Italians under Persano, at the battle of Lissa (*q.v.*), July 20, 1866. From 1868 he was commander-in-chief of the Austrian navy until he died in Vienna, April 7, 1871.

Tegnér, ESALAS (1782-1846). Swedish poet and bishop. Born Nov. 13, 1782, son of the pastor of Kyrkerud, Värmland, he graduated in 1802 at Lund, where he was appointed lecturer, and in 1812 was professor of Greek at Stockholm. In 1824 he was made bishop of Vexjö, where he remained until his death, Nov. 2, 1846.

Esaias Tegnér,
Swedish poet

Tegnér began to write poetry at an early age. In 1808 his *Warsong of the Troops of Scania* was enthusiastically greeted by the nation. *Svea*, a patriotic poem which gained the grand prize of the Swedish academy, followed in 1811. His masterpiece, *Frithiof's Saga*, 1825 (Eng. trans. 1833), has been translated into many languages. *Pron. Teng-nare*.

Tegucigalpa. The capital of Honduras. It is situated on the Choluteca river at an alt. of 3,300 ft., and is connected by road and ferry service with its port of Amapala, 78 m. to the S., on the Gulf of Fonseca. There is an airport at Toncontin. The university has faculties of law, medicine, pharmacy, and engineering. There are a cathedral, and Aztec remains. Mines of gold, silver, and marble are worked near by. Pop. 55,715.

Teheran or **TEHRAN.** Capital of Persia and of a prov. of the same name. It stands in the midst of a fertile plain, about 70 m. S. of the Caspian, and is the centre of a net-

work of roads and rlys. With an area of $7\frac{1}{2}$ m., it is girt about with bastioned walls, pierced by 12 gates, and contains numerous mosques and the Ark or citadel, within which is the royal palace. It has a carpet-making industry, and factories turning out silk, tapestry, glass, chemicals, arms, ammunition, tobacco, and matches. There are a university and an appeal court. Teheran is the residence of the shah and seat of the government. Pop. 699,110.

Teheran replaced Ispahan as the Persian capital late in the 18th century. During the revolution of 1909, the shah took refuge in the Russian legation here, and later abdicated. In 1910 Teheran was the scene of another rising.

During the Second Great War, when Persia (*q.v.*) became a centre of Nazi German intrigue, British troops from the S., Russians from the E. and W., entered Teheran Sept. 17, 1941, to enforce Allied demands for the surrender of Axis nationals; they withdrew Oct. 18. At Teheran Nov. 28-Dec. 1, 1943, Churchill, Roosevelt, and Stalin had their first meeting; they discussed and agreed on plans for 1944 in the war against Germany. Churchill, who celebrated his 69th birthday during this meeting, also handed to Stalin the sword of honour presented by George VI to the city of Stalingrad. See Stalingrad, Battle of.

Tehetmes. Variant spelling of Thothmes (*q.v.*), the name of several Egyptian kings.

Tehuantepec. Town of Mexico, in the state of Oaxaca. It stands on the isthmus and river of Tehuantepec, and is served by the rly. running from Coatzacoalcas, on the Gulf of Mexico, to Salina Cruz, on the Pacific. The inhabitants engage in cotton weaving. Pop. 12,300.

Tehuantepec, Isthmus of. Narrowest part of Mexico. It extends 125 m. between the Gulf of Mexico and the Bay of Tehuantepec, an arm of the Pacific Ocean.

Tehuantepec Winds. Strong cold winds experienced on the Pacific side of Central America. The

Teheran, Persia. Rue Ferdusis, with modern shops

air over the mountains is cooled and carried by cyclonic aid to the coast.

Tehueche (Araucanian, big-south-men). South American Indian tribe in Patagonia. From their cold-weather use of guanaco-skin foot-wrappings, Magellan's companions—perhaps appropriating a native name—called them Patagones (big-feet), although the feet are less than 11 ins. See Bororos.

Teifi. River of S. Wales. It rises near the border of Radnorshire and flows in general S.W., to reach Cardigan Bay after a course of about 50 m. For most of its course below Lampeter it forms the S. boundary of the co. with Carmarthenshire.

Teign. River of Devon, England. It rises on Dartmoor, under Liddaford Tor, drains the moor, and falls into the English Channel at Teignmouth. Its length is 30 m.

Teignmouth. Seaport, watering-place, and urban dist. of Devon, England. It stands on the S. coast at the mouth of the Teign, 15 m. by rly. S. of Exeter. The chief church is S. Michael's, rebuilt in the 19th century, but containing a little of the earlier Norman church. S. James's retains a Norman tower. Other buildings

Teignmouth arms

are the market hall, the Athenaeum, and a large convent. The harbour will take small vessels. China clay is exported, and coal imported. The town consists of two parts, known as King's or E. Teignmouth, and Bishop's or W. Teignmouth. At one time it was a centre of the salt industry. Pop. est. 10,000. Pron. Tinnmuth.

Teignmouth, JOHN SHORE, 1ST BARON (1751-1834). British statesman. Born Oct. 8, 1751, and educated at Harrow, he entered the service of the East India co. in 1769. Member of the supreme council in 1787, six years later he succeeded Marquess Cornwallis (*q.v.*) as governor-general, and was made a baron on retiring in 1798. He died Feb. 14, 1834.

The title is still held by his descendants. Henry Noel Shore, the 5th baron (1847-1926), served in the navy, and wrote books on travel and smuggling. His Smuggling Days and Smuggling Ways appeared in 1892. The 6th baron, Hugh Aglionby Shore (b. 1881), succeeded to the title in 1926.

Teind (Old Norse *tiund*). Word used in Scotland as the equivalent of tithes. Tithes were paid to the clergy from ancient days, and at the Reformation John Knox maintained that, after making some provision for the dispossessed clergy, the balance should be devoted to the support of the Protestant ministry, public education, and relief of the poor. This was only partly carried out, and the teinds are now held in part by the crown, universities, and other pious foundations, lay titulars, and landed proprietors. Provision

1st Baron Teignmouth, British statesman After G. Richmond

Teignmouth, Devon. The front, seen from the sea

for the valuation of teinds was made by the Church of Scotland, 1925. See Tithe.

Teisserenc de Bort, LÉON PHILIPPE (1855-1913). French meteorologist. He was born in Paris Nov. 5, 1855, and from 1892 to 1896 was chief meteorologist to the central meteorological bureau in his native city. Later he established his own private observatory at Trappes. His chief claim to fame is his discovery of the stratosphere, which he announced in 1881. He died Jan. 2, 1913.

Teixeira de Mattos, ALEXANDER LOUIS (1865-1921). Anglo-Dutch scholar and translator. Born at Amsterdam, April 5, 1865, he was brought to England in 1874. During the First Great War he occupied various positions in the war trade intelligence dept. His chief claim to fame, however, lies in his excellent translations of Maeterlinck, Fabre, Couperus, Zola, Streuvels, Ewald, and others. Teixeira de Mattos died at St. Ives, Cornwall, Dec. 3, 1921.

War, in which the British were victorious over the Turks, is a hill 3,318 ft. high. It was the centre of a struggle lasting March 9-12, 1918, in which the British secured the high ground W. of the Jordan as far as Mt. Ephraim, during their advance upon Shechem. The Turks were driven headlong from the crest of the hill by troops of the 5th-6th R. Welch Fusiliers.

Tel Aviv (Heb., hill of spring). Jewish settlement combined in 1949 with Jaffa to form Jaffa-Tel

with a fountain and flower beds; there are blocks of flats, a beautiful seashore, a municipal park, a market: opera house and two theatres, symphony orchestra, Herzl college, and hospitals and clinics maintained by the civic authorities. Its factories make textiles, wire, sugar, and chemical and pharmaceutical products. From numerous publishing and printing houses come 40 periodicals and all Palestine dailies in the Hebrew language. The Levant

Tel-Aviv, Israel. General view of this Jewish city and the sea from the air. Upper picture, Dizengoff Square

Tekir Dag. Turkish name of the town described under its more familiar Grecised name Rodosto.

Tekrit. Small town of Iraq, 97 m. N.N.W. of Bagdad. It was the birthplace of Saladin. The British occupied it, Nov. 6, 1917.

Telamon. In Greek legend, brother of Peleus, and father of Ajax. He took part in the hunt for the Calydonian boar and the expedition of the Argonauts.

Tel Asur. Town of Palestine, E. of the Jerusalem-Nablus road, S.E. of Nablus and 2 m. N.W. of Ophrah; it is the Baalhazor of the Hebrews, the scene of the slaying of Amnon by order of Absalom (2 Sam. 13, v. 23).

The Tel Asur which gives its name to a battle of the First Great

Aviv, the largest city in Palestine. Tel Aviv was founded in 1909 as a suburb of the port of Jaffa, with 60 villas and bungalows. It developed rapidly after 1919 through immigration and had by 1946 183,200 inhabitants, nearly 30 p.c. of the Jewish pop. of Palestine. The pop. in 1949 was 300,000. The original residents were deported during the First Great War by the Turks, but had mostly returned by 1921, when Tel Aviv became an independent township. It was separated from Jaffa 1929-49. It has its own harbour for lighters, with quays 1,312 ft. long and a turnover of 196,000 tons in 1938.

Tel Aviv is a pleasant and hygienically constructed place. In the centre is Dizengoff Square,

Fair and Jewish Olympic Games are held here. As the economic and political centre of Palestinian Jewry, Tel Aviv was provisional capital of Israel 1948-50.

Telecommunications. Term generally applied to electrical communications by line, cable, or wireless. In the British Commonwealth, prior to 1928, internal telecommunications were government controlled; external cable communications being operated by private cable companies, and wireless communications by the Marconi Wireless Telegraph Co. and its subsidiaries. An imperial wireless and cable conference, 1928, recommended a merger of the competing companies; and Cables and Wireless, Ltd. was thereupon formed, and a Commonwealth communications council set up. After the Second Great War Lord Reith headed a mission to the Commonwealth to examine efficiency in telecommunications. His report was endorsed by a further Commonwealth telecommunications conference (1945) and was generally accepted by the British government. The recommendations included public ownership of all Commonwealth telecommunications services, with financial contributions by members of the Commonwealth. As a result of these recommendations Cable and Wireless Ltd. was duly nationalised in 1946. The financial arrangements were embodied in the Commonwealth Telegraphs Act, 1949,

which also established the Commonwealth telecommunications board to take over and extend the functions of the Commonwealth communications council.

Telegonus. In Greek mythology, son of Odysseus by the enchantress Circe. When he grew up to manhood, his mother sent him out in search of his father, and, shipwrecked on the coast of Ithaca, he began to ravage the country.

Odysseus and Telemachus went to meet the stranger, who, ignorant of his identity, killed his father.

Telephony (Gr. *têle*, far; *gonos*, offspring). Term for the supposed appearance in the offspring of characters derived, not from the sire of the offspring, but from a previous sire to whom the mother has borne offspring. There is little or no scientific evidence in support of the theory.

TELEGRAPHY: PRINCIPLES & HISTORY

H. K. Milward, A.M.I.E.E., and R. W. Hallows, M.I.E.E.

The invention of electric telegraphy begins with the discovery at the end of the 18th century that an electric charge can be conveyed along a conductor. Here is an account of its development. See also Kelvin, Lord; Morse, S. F. B.; Morse Code; Semaphore; Siphon Recorder; Wheatstone, Sir C.

Telegraphy (Gr. *têle*, far; *graph-
ein*, to write) is the transmission of messages between distant points by means of signals. Formerly applied to all forms of message transmission by signals, e.g. by smoke, flames, or reflected sunlight, the word has come to be generally used in the more restricted sense of transmitting code messages by electrical means.

Towards the end of the 18th century the discovery that an electric charge can be conveyed along a conductor gave rise to a whole series of ingenious inventions such as the pithball telegraph, which operated by friction-generated electricity and required a separate wire for each letter of the alphabet. Owing to their unreliability none of these inventions found a commercial use. In the year 1800 Volta introduced his continuous current pile, which was soon developed into the primary battery, giving for the first time a continuous and reliable flow of electricity. The discovery of electrolytic action followed, and with it the electrolytic telegraph (still using one wire per letter) in which letters were indicated by streams of gas bubbles in glass tubes. Although moderately reliable, it was slow and expensive, and came to nothing. Then Oersted's discovery of the electromagnetic effect in 1820 pointed the way; while the study of codes by Gauss and Weber showed that a combination of five signs was all that was necessary to cover the alphabet.

First Practical System

Samuel Morse, an American painter and sculptor, who was the first man to produce a practical telegraph system, conceived his telegraph in 1831 after reading Faraday's paper on electro-magne-

tic induction, and by 1835 his first model was made. His telegraph was a crude semi-automatic transmitter and receiver; the message was set up on a piece of wood by means of projections corresponding to the signals of the code. When this was passed through the transmitter the projections operated contacts as they went through. The receiver was simply a morse inker which recorded the code in dots and dashes on paper tape. Morse found that the instrument worked satisfactorily over 20 m. of wire. In 1836 he and Alfred Vail invented a relay which could be inserted into the line at intermediate points, thus increasing its range considerably. The code called after Morse he devised in collaboration with Vail in 1837. Shortly afterwards Morse abandoned the semi-automatic sender and substituted the hand-operated key. By 1844 Vail had introduced the sounder, having realized that anyone familiar with the code could read the clicks of the inker by ear. In 1839 a line, financed by congress, was erected from Washington to Baltimore and opened for business shortly after a demonstration before President van Buren. In 1844 Morse formed a private co. and built lines between New York, Baltimore, and Washington, and by 1851 50 telegraph cos. using Morse patents were operating in America. The Morse system had many advantages over others and was soon adopted widely also in Europe.

The development of telegraphy now became very rapid, for by 1860, telegraph communication was possible between most of the important cities of Europe, and a cable had even been successfully laid across the Atlantic, though its working life had been only

two weeks. The first successful Channel cable between England and France had been laid in 1851 and five or six were in operation by 1860. A second Atlantic cable was laid in 1865, but it broke before completion; the next year another was laid satisfactorily, and the one of 1865 was completed. The capacitance of these long ocean cables was enormous, and the amount of current obtained at the far end was minute; however, William Thomson, afterwards Lord Kelvin, had designed an extremely sensitive mirror galvanometer in anticipation of these difficulties, and it proved admirable. At first, owing to the high capacitance, the maximum speed of signalling was 3 words per minute, using cable morse; but with practice and improved instruments speeds increased to about 15 w.p.m.

On land, airline construction, very like that of nearly a century later, was most widely used. Underground cables were little used at first owing to their relatively high cost; but as the number of circuits increased, congestion of wires at main centres forced engineers to use underground cables leading to distribution points outside the towns. Gradually it was realized that the high cost was set off by the smallness of maintenance costs and by reliability, and in the U.K., except in country districts, the main overhead routes came to be maintained only as a stand-by.

High Speed Telegraphy

Of the multitude of instruments invented during the second half of the 19th century, the simple morse key and sounder were by far the most widely used. A workable type-printing machine, the Hughes, was invented in the U.S.A. in 1855. Baudot, in France, developed the idea, and it was successfully used in that country after about 1877 until superseded by the start/stop telegraph. High speed telegraphy was introduced by Wheatstone in his automatic telegraph. It used the ordinary morse code, and later models could, under ideal conditions, work at 500 w.p.m. Developments of this machine are used on wireless circuits. The siphon recorder has an extensive use on submarine cable terminations; though not quite as sensitive as the mirror galvanometer, it was nevertheless sensitive enough to be used on long submarine cables. The name "siphon" is derived simply from the method of supplying the pen with ink. In the record, dots

are represented by pips pointing upward and dashes by pips pointing downward (Fig. 1).

Telegraphy. Fig. 1. A typical record by siphon on tape paper

Wireless communication, predicted by Clerk-Maxwell, proved by Hertz, and made practicable by Marconi, began to change the picture soon after its first demonstration over a distance in 1897. Ocean cables decreased in importance, but slowly, for wireless was not without its troubles, such as atmospheric interference, fading, insufficient suitable frequencies.

ELEMENTARY THEORY. The first telegraph circuits were of the simplest possible kind, invariably using an earth return. The circuit shown in Fig. 2 is of the single-current type; that is, when the

Telegraphy. Fig. 2. Early single-current telegraph circuit

key is depressed, a pulse of current, called the marking current or mark, is sent to line; raising the key cuts off the current and is termed a space. The terms were suggested by the action of the morse inker, which marked the paper tape when the current was flowing and left a space when it was not. On long lines, where the receiving sounder or relay is working near its sensitivity limit, earth currents may become comparable in size with the marking currents and the instrument is liable to "stick" at mark. Double-current working overcomes this trouble by giving both mark and space definite line currents (see Fig. 3). The instruments are a little more complicated with the double-current system; the key must have three contacts, battery power is doubled for a given line current, and it is necessary to use a polarised sounder or relay, i.e. one which is sensitive to direction

Telegraphy. Fig. 3. Double-current telegraph system

of current. Fig. 4 shows simplified diagrams of polarised and non-polarised relays.

The problem of making a telegraph line carry more than one communication, or "channel," is one which has engrossed engineers from the beginning of electrical telegraphy. The first advance in this direction was the duplex circuit, as opposed to those described above, which are simplex. The duplex circuit allows messages to be sent in both directions over a single line without mutual interference.

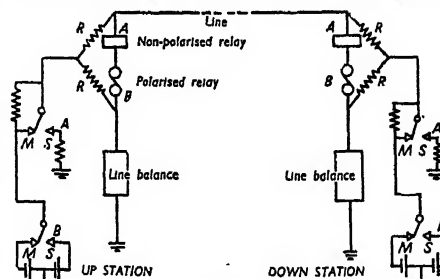

Telegraphy. Fig. 4. Left, polarised relay; right, non-polarised relay

Telegraphy. Fig. 5. Double-current differential duplex telegraph circuit enabling messages in both directions to be sent simultaneously

A double-current differential duplex circuit is shown in Fig. 5; it is so called because the relay has a centre-tapped line coil and operates on the difference of the currents flowing in the two halves.

Telegraphy. Fig. 6. Quadruple circuit by which two messages may be sent simultaneously in each direction

If all possible combinations of positions of the transmitting contacts at each end are considered, the resultant effect of the currents flowing is that the relay in one station is controlled only by the transmitting contacts in the other. An essential condition is that the line-balance and the line should be of equal impedance.

A development of this idea is the quadruplex circuit, which can deal with two messages in each direction simultaneously: Fig. 6 gives an example of such a circuit.

It is a combination of a double-current system, working to a polarised relay, and a single-current system, working to a less sensitive non-polarised relay, both being connected to line through a

bridge duplex circuit. The bridge circuit ensures that the transmitting circuits in the "up" station affect only the relays in the "down" station. Transmitter circuit B produces the double-current signals, and A modifies the actual amount of current flowing. Of the two relays, B is very sensitive, and is affected by reversals of current; A is much less sensitive and operates on the size of the current and not on its direction. The system works satisfactorily on short lines.

No further increase in the number of channels per wire can be obtained satisfactorily without using synchronous distributors or by applying to line telegraphy a modification of radiomethods and using what is called a voice-frequency carrier system. Various multiplex systems using the synchronous distributor principle have been used in the past with varying degrees of success. The general principle is illustrated in Fig. 7. The distributor must rotate fast

enough to complete at least one revolution in the time of the shortest signal. Consider the telegraph transmitter which is connected to contact 5: when the key is on "mark," a series of short negative pulses is sent to line every time the distributor is in exact synchronism; these pulses are received on receiving contact 5 and on none of the others; the pulses charge the condenser C and discharge through the relay during the time occupied by the arm in sweeping over the other contacts.

When the transmitter changes to "space" the pulses to line are of opposite polarity and the relay

there are four rapid alterations between mark and space. The number of times per sec. that

Telegraphy. Fig. 7. The principle of the synchronous distributor telegraph system

changes over. Synchronism, which is obviously essential, is impossible to maintain without some correcting device, and some of the contacts on each distributor are therefore used for speed correction. If synchronism is exact, the synchronising pulse sent out to line has no effect on the receiver-motor speed; but if the receiver motor speed is incorrect, the pulse accelerates or retards it until it is again in step. This correction process takes place at every revolution so that the distributors can never get much out of step before being corrected. In practice the number of channels which can be worked on such a system is limited to about six.

Telegraph speeds, codes, and maximum line-frequencies are to some extent tied up together. In order to get a measure of telegraph speed five letters and a space are taken to be the length of the average English word, and the number of such words per min. is the telegraph speed. To transmit these words in code a certain number of impulses is necessary, and the number per sec. is termed the line speed in bauds, a unit named after the French inventor Baudot. The relationship between telegraph and line speeds depends on the code used. With the morse code, which is an unequal-length code, an average length of any letter has to be taken, and this length is eight units; with cable morse, where no dashes are used, it is five units; with the five-unit start/stop code it is seven. In morse, one baud corresponds to 1.25 w.p.m.; in cable morse, 2 w.p.m.; in five-unit start/stop code, 1.4 w.p.m.

The transmission of any letter, figure, or sign by one of these code systems involves a number of changes from mark to space and vice versa. When H is sent in international or American morse,

mental frequency, but also harmonics up to the third; the third harmonic is a frequency three times the fundamental frequency. A speed of 50 bauds represents a fundamental frequency of 25 cycles per sec. To produce the necessary sharpness of signals at the receiving end, this would mean the transmission of frequencies of three times the fundamental, or 75 cycles per sec. In practice, instruments will work provided that the fundamental frequency is adequately reproduced; but it is normal to reproduce also a fair proportion of the third harmonic. If a telegraph channel is severely limited in frequency response (a long submarine cable, for instance), cable morse is the best code to use as it gives the highest word output for a limited line speed. Cable morse, however, is used only in such conditions, for an unequal-length code adds considerably to the mechanical complication of type-printing machines. The five-unit start/stop code is used for nearly all type-printing telegraph instruments.

Voice-frequency telegraphy was first tried at the turn of the 19th-20th century, but was unsatisfactory owing to the limitations of the apparatus then available. About 1920, however, when efficient types of band-pass filters, thermionic valves, amplifiers, and other apparatus began to be available, voice-frequency carrier systems for line telephony were reintroduced satisfactorily. The theory of modulation and demodulation of the carrier (detection) is essentially the same as in wireless; in the transmitter the tone is simply switched on and off and in the receiver a detector circuit turns the intermittent voice frequency into intermittent D.C. which operates the telegraph relay. As in wireless a tuned circuit is necessary to select the

particular frequency required. For a teleprinter the line speed is 50 bauds, which corresponds to a fundamental frequency of 25 cycles with a third harmonic of 75 cycles; when used to modulate a carrier this causes a total side-band width of 150 cycles. Theoretically filters should be able to pass this band of frequencies, but in practice filters with a pass band of 100-110 cycles are perfectly satisfactory. By international agreement the band of frequencies which a speech channel must be capable of reproducing is from 300 to 3,000 cycles. There are, however, channels in use which cut off 2,500 cycles per sec.; consequently the region 2,500 to 3,000 is not normally used for telegraphy. The rest of the band is divided up in the U.K. into 18 channels; the voice frequencies used are 450, 540, . . . up to 2,460 c.p.s. A typical response curve for the filters is shown in Fig. 8. The cut-off is not abrupt so that a certain amount of "elbow room" must be allowed between the channels.

Telegraphy. Fig. 8. A typical response curve of filter used in voice-frequency telegraph circuits

INSTRUMENTS. Instruments such as the sounder, morse key, automatic morse machine, and morse recorders of various types, although in use on some circuits, are becoming obsolete. The principal instrument in use is the teleprinter. It has a typewriter keyboard, uses the five-unit start/stop code, and prints either on a continuous gummed paper strip or on 84-in.-wide paper, according to the model used. The principle on which it works is illustrated in Fig. 9. In the rest condition a marking signal is sent continuously to line via the "stop" contact. This holds the receiver line relay to mark, so that the receiver starting magnet circuit is open. Depression of any of the keys on the keyboard closes the start switch and simultaneously sets the keyboard code selectors in the correct positions for the particular letter. The closing of the start switch operates the starting magnet which lifts the pawl and engages the clutch (not shown), so that the motor, which is running continu-

ously, drives the distributor arm round. The first contact it comes to is the start contact, which sends

Telegraphy. Fig. 9. The general principles of the teleprinter, which is now the most widely used telegraph instrument

a spacing impulse to line; at the receiver this causes the line relay to space, thus connecting the receiver starting magnet; this releases the pawl, engages the clutch, and starts the receiver distributor arm rotating. The motors are running at the same speed (within $\frac{1}{2}$ p.c. if the governors are adjusted correctly), so that as the contacts 1, 2, 3, etc. are connected in turn at the trans-

mitter, they are simultaneously connected in turn at the receiver; thus each of the type selecting elements receives a marking or spacing pulse according to the code originally set up in the transmitter. At the end of one revolution the pawl re-engages and the clutch disengages in both the transmitter and receiver, leaving the mechanism ready to start

again. In the practical teleprinter an arrangement of cams and contacts replaces the distributor but the principle remains the same. The great advantage of the start/stop instrument over its predecessors using synchronous motors is that instead of having to keep exact synchronism over long periods, the motors must simply be running so nearly at the same speed as not to get out of step by the width of one contact during one revolution.

Automatic tape machines developed from the Wheatstone high speed automatic equipment are used extensively over wireless circuits. The most common type uses the morse code and is developed directly from the original Wheatstone. The transmitter uses a tape punched by a special perforator with a typewriter keyboard. The receiving apparatus is called an undulator; it is a development of the siphon recorder and draws a similar sort of wavy line on paper tape. This paper tape passes in front of trained operators who can read it at approx. 40 w.p.m. and record it on typewriters or teleprinters.

A more fully automatic system which can be used on good wireless circuits has transmitting apparatus which is almost exactly the same as that of the high-speed morse type except that it uses the five unit code. The tape is punched either by a keyboard perforator or by a perforator fed from a distant teleprinter. The receiving portion, coupled to the wireless receiver, is simply another perforator, and the tape which it punches is fed into a second transmitting apparatus working at the normal teleprinter speed, its signals being used to operate a teleprinter. The advantage of this over the high-speed morse system is that trained operators are required only at the terminals; the tape-

machine operators have a comparatively easy job, and one man can attend to several automatic machines.

CIRCUITS. Single and double current D.C. circuits are used for telegraphs only in remote country districts, and for local "ends" between teleprinter rooms and main equipment centres. The chief means of telegraph communication over land line or cable is by voice frequency, and the 18 channel equipment is becoming standard for main circuits in the U.K. A simplified schematic diagram is given in Fig. 10. The carrier frequencies used are all generated in a composite motor generator, whose speed of rotation is accurately controlled. The modulators simply switch on and off the voice frequencies supplied by the motor generator, and the demodulators are comparable with detectors used in wireless sets. It is normal to use one speech channel (300-3,000 c.p.s.) for the 18 channels in

the outward direction, and a completely separate speech channel for the inward telegraph channels.

When a wireless telegraphy circuit of the on-off keying type is used for any form of automatic printer, difficulties at once appear, unless the signal-to-noise ratio is much better than is usually found on long-distance links. A good operator can pick out his signal from noise and interference even when it is weaker than the noise; an automatic instrument cannot do so. Some success has been achieved with teleprinters working over wireless circuits by modulating the carrier with two tones, one for mark and the other for space, these two tones being separated by filters at the receiver. The

leakage resistance; "meggers" are also used, but caution is required here, as some underground cables will not stand the high voltages used. In a type of test equipment using the radar principle a short pulse is sent out to line and is reflected back from any point at which there is a discontinuity; the distance to that discontinuity is measured in exactly the same way as is the range to a target by radar.

Instrument test equipment includes the stroboscope for adjusting the teleprinter speed, the distortion measuring set which measures the distortion of a telegraph signal over any system, and the transmission measuring set for adjusting the power level of signals at various points on the system.

Telegraphy. Fig. 10. An 18-channel voice - frequency circuit

filters cut out a great deal of the noise, but the signal-to-noise ratio over the wireless circuit must still be good before accurate printing can be assured.

A successful development in this field is the use of frequency modulation or "carrier-shift." Here the carrier remains at constant amplitude and changes frequency for mark and space; in the receiver this varying frequency is reconverted into intermittent D.C. by a discriminator circuit. The system is superior to the two-tone system, but it fails at a signal-to-noise ratio which an experienced operator would still consider quite good.

High speed automatic morse with each message sent twice is still superior on long-distance circuits where the signal-to-noise ratio is not good enough for carrier shift. It is, however, wasteful in trained operators.

TEST EQUIPMENT. Much of the line test equipment in use in 1948 had altered little from that of 1900. Simple D.C. instruments are used to measure continuity and

Most line termination equipments include a test panel containing the appropriate testing units.

COMMUNICATION SERVICES. Normal telegram and cablegram services all over the civilized world are maintained by a network of telegraph systems. Within the U.K. most of the large towns are directly interconnected, although teleprinter exchanges are used to some extent; to countries overseas wireless and submarine cable circuits are used.

Specialised internal services also exist in some countries, chiefly to facilitate commerce. In the U.K. there are the telex and printergram services. The telex equipment is simply a teleprinter coupled to a voice frequency unit: communication is established by telephone and the telex apparatus switched into circuit by means of a change-over switch. This gives direct teleprinter communication between the two correspondents, and is quicker and cheaper than using the public telegraph service.

Printergrams are an extension of this service, enabling a subscriber to use his telex to send telegrams

on the normal public network. Main telegraph centres are equipped with telex machines and when the subscriber asks the exchange for printergrams the telex operator is put on the line.

STILL PICTURE TRANSMISSION. Suppose that any photograph is sliced up into, say, 100 narrow strips. Each will be something like what is seen in Fig. 11: it will consist of light and dark patches of varying sizes and shades.

Telegraphy. Fig. 11. Still picture transmission. Diagram showing the appearance of one of the large number of strips into which the picture is sliced

Each line can be transmitted separately by telegraphy, and when they are properly recombined at the receiving end a facsimile of the original image appears. The greater the number of lines into which the transmitted picture is broken up, the more faithful and more detailed is the copy at the receiving end.

In still-picture transmission no actual slicing up is done. The image is resolved into narrow lines in the way indicated in Fig. 12. The photograph to be transmitted is wrapped round a revolving drum, which is carried steadily from right to left by the action of the lead (pron. "lead") screw. A minute but intense spot of light from a fixed source is focused on to the photograph. As the latter rotates and is carried from right to left, the light spot describes a helical path over the whole of its surface, slicing the image into one long narrow strip. One British system has 104 threads to the in.

Telegraphy. Fig. 12. The principle of still picture transmission

As the spot passes over the surface of the image, the amount of light reflected varies from moment to moment according to the shade of the particular part it is passing at any instant. This reflected light is applied to a photo-electric cell, where similar fluctuations are produced in the cathode-to-anode electron current which can be transmitted

over telegraph wires or used to modulate the carrier wave of a radio transmitter.

At the receiving end of a still-picture service, reversion of the electrical copies into light fluctuations must be carried out. Fig. 13 shows diagrammatically the methods of both transmission

Telegraphy. Fig. 13. Still picture transmission. Skeleton diagram of radio system

and reception by radio. The output of the receiver is fed to a special type of glowlamp, whose brilliance varies in exact accordance with the electrical pressure applied to its filament. The light from this lamp is focused by means of a system of lenses into a tiny spot. This spot falls on the surface of a sensitised photographic film wrapped round a drum and housed in a chamber which is otherwise light-proof. The drum is carried on a lead screw of exactly the same type as that used at the transmitter, and the fluctuating intensity of the spot of light from the glowlamp builds up as it traverses the rotating film a negative reproduction of the transmitted photograph. Synchronising devices ensure that the transmitter and receiver drums revolve at exactly the same speed so that at any moment the light-spot on the receiving film has travelled exactly as far from its start as had the spot traversing the original photograph at the transmitter. The average time taken to transmit a picture 5 ins. by 7 ins. from e.g. London to Melbourne is 7 to 12 mins.

Tel-el-Kebir, BATTLE OF. Victory by a British force under Sir Garnet Wolseley over an Egyptian army led by Arabi Pasha, Sept. 13, 1882. After the battle of Kassassin Aug. 28, the British were concentrated to attack the main enemy position, about 2½ m. long, at Tel-el-Kebir, which was held by 38,000 Egyptians with 60 guns.

The British army consisted of about 15,000 men. The advance began at 11 p.m., terminating after a march of about 6½ m. in an attack at daybreak. The battle began by an assault on the enemy's trenches by the Highland brigade. A few minutes later the attack became general, the enemy evacuating the trenches, only to be slaughtered by the cavalry which had

worked round the Egyptian left, or by the Indian contingent, now posted so as to intercept fugitives at the bridge over the canal. By 6 a.m. the battle was over, nearly 2,000 Egyptians having been killed and over 500 wounded, as against British losses of 58 killed and 401 wounded and missing.

Next day the British cavalry pushed forward to Cairo. There they secured the surrender of 15,000 Egyptian troops in the city, which was entered by Wolseley on Sept. 15. See Egypt.

Telemachus. In Greek mythology, son of Odysseus and Penelope. He was an infant when his father left to take part in the Trojan War, but after twenty years had passed without Odysseus reaching home, Telemachus set out to look for him, visiting Nestor at Pylos and Menelaus at Sparta. On reaching home again, he found that his father had arrived, and assisted him in slaying the suitors for Penelope's hand. In Homer Telemachus is the ideal of a loving and dutiful son. See Odysseus. *Pron.* Te-lemma-cus.

Telemark, TELLEMAR, OR TELEMARSEN. Maritime fylke or co. of S. Norway, formerly called Bratsberg. It is mountainous, well watered, heavily timbered, and contains several large lakes. The rivers flow S.E., and discharge into the Christiania Fjord. A romantic mountain region, considered the finest in S. Norway, lies in the W. of the fylke. Here is the Skien-Dalen steamer route through the Telemarken canal, a waterway completed in 1892 to connect Ulefos with the Bandak lakes. The inhabitants are mainly engaged in lumbering and fishing. The capital is Skien (*q.v.*). Its area is 5,837 sq. m. Pop. 129,854.

Telemeter (Gr. *têle*, far; *metron*, measure). This is another name for Range-finder (*q.v.*).

Teleoceras. Sub-genus of fossil rhinoceros. They were short-skulled, short-footed, three-toed, and hornless. Remains of the animals are found in the Lower Miocene and Lower Pliocene deposits of Europe and America.

Teleology (Gr. *telos*, end; *logos*, theory). In general, the doctrine of final causes, all speculation in reference to the idea of purpose, not only in man's conscious actions but in all natural and historical processes. In teleology, the teleological argument is that the evidence of design in

nature proves the existence of a personal God. Teleology is opposed to the mechanical theory, which would explain all phenomena by the law of mechanical causation. Teleology insists that it is impossible to regard such phenomena as the progressive development of the animal world culminating in man, as the result of the accidental cooperation of blind natural forces, and that such an assumption would deprive the idea of morality of all significance.

Mechanical determinism, on the other hand, holds that no aim is in itself strong enough to ensure its realization; that that which follows is always the necessary consequence of that which precedes, and that a final result can never be considered a determining cause. Teleology held the field till the rise of modern philosophy, when it was repudiated by Descartes, Spinoza, and Bacon in favour of "operating causes." Leibniz attempted a compromise, asserting that everything in the world took place in accordance with mechanical laws, but that these laws themselves were teleologically determined to produce the most perfect results. Kant also found elements of truth in both doctrines. The teleological view was entirely driven into the background, especially by the Darwinian theory; in the 20th century there has appeared a tendency to reassess the doctrine in biology.

Teleosaurus (Gr. *teleos*, perfect; *sauros*, lizard). Fossil marine crocodile found in rocks of the Jurassic period. The animal was remarkable for a long pointed snout armed with a large number of small teeth, and for a body covered with bony tuberculated plates. See Dinosaur.

Teleostei (Gr. *teleos*, perfect; *osteon*, bone). Group of fishes in which the skeleton is well ossified. The spinal column consists of distinct bony vertebrae, the pectoral arch has a collar-bone, and the head a mandible or bony lower jaw. The gill chamber is covered by a bony shield or operculum, and the body is clothed with symmetrical scales. Teleostean fishes are by far the most abundant of the known species, and include such well-known and diverse forms as the eels, herrings, salmon, cod, flat fishes, perch, blennies, etc.

Telepathy (Gr. *têle*, afar; *pathein*, to feel). Communication between two minds apart from the ordinary sense channels. Since about 1876, when Prof. Sir W. F.

Barrett drew attention to such phenomena, the existence of the faculty has slowly gained acceptance, though not yet universally admitted. Spontaneous cases include hallucinations and other impressions referred to a person who, unknown to the percipient, is dying, passing through a crisis, or thinking of the percipient. The frequency of these coincidences appears to preclude chance. In many carefully conducted experiments, the percipient had named a high

proportion of playing cards, copied diagrams and sketches looked at by the agent, described scenes thought of, or objects tasted or smelt, localised pains, etc. There is also a curious and as yet unexplained tendency to describe cards, etc., before they are looked at by the agent. See Apparition; Hypnotism; Psychical Research; Subliminal Self. *Consult* Telepathy, W. Carrington, 1947; Telepathy and Medical Psychology, J. Ehrenwald, 1947.

TELEPHONY: PRINCIPLES AND HISTORY

R. W. Hallows, M.I.E.E., Author of *Wireless Simply Explained*

This article on the direct transmission of intelligible sounds should be read in conjunction with those on Radio and Telegraphy. See also Appleton Layer; Bell, A. G.; Marconi, G.; Microphone; Pupin, M. I.; Thermionic Valve

Telephony (Gr. *têle*, far; *phônê*, sound) is the transmission of recognizable sounds, in particular of the human voice, over distances beyond the range at which such sounds can be heard without aids. The word is normally used to denote transmission by electrical means, though it was formerly applied to mechanical systems such as the speaking tube and the string or tight-wire telephone.

The fundamental processes of telephony are:

I. *At the sending end:* (a) the conversion of sound waves into fluctuations of electric current by means of the microphone; (b) the transmission of these fluctuations either directly over the wires of a circuit (line telephony) or in the form of a modulation envelope applied to a carrier frequency. The carrier may consist either of an oscillating electric current in a wired circuit (carrier-current telephony) or of electromagnetic waves sent through the ether (wireless telephony).

II. *Between the sending and receiving ends:* in line and carrier-current telephony, amplification by means of repeaters, placed at intervals of about 25 m., to make good the loss of signal strength due to attenuation.

III. *At the receiving end:* the reconversion of electrical current fluctuations into sound waves, in line telephony by applying the incoming currents to the telephone receiver; in carrier-current and wireless telephony by demodulation or detection, which involves removing the carrier and one of the side bands, reconstituting the original audio frequency fluctuations of current, and applying these to the receiver. In wireless telephony, where amplification by repeaters between sending and re-

ceiving ends is impossible, high frequency amplification, preceding the detector stage, and audio frequency amplification, following the detector stage, may be required.

IV. *Calling system.* In line and carrier-current telephony, a call system is required, using a bell, lamp, falling shutter, or other device. In wireless telephony

either a constant watch or a watch between pre-arranged hours is usually kept. No special electrical calling system is needed. Each station has its "call sign," consisting of a combination of letters and numbers. The operator gives his own call sign and either that of the station (or stations) he wishes to contact or the words "Hallo CQ," meaning that he is calling all stations.

The electric telephone was the invention of A. Graham Bell, who, when professor of vocal physiology at Boston, U.S.A., demonstrated successfully in 1876 the transmission of sounds by electrical means. With improvements and modifications, Bell's instrument is essentially that in use today.

The chief handicap to the early development of telephony was lack of a means of amplifying an electric current. In passing over the wires of a circuit a current must expend some of its energy in overcoming the opposition, or resistance, presented by the conductors. Line telephony currents are of the alter-

nating kind; with these the energy lost in overcoming resistance, or the power loss, is I^2R , where I is the current in amperes and R the resistance in ohms. This power loss is called attenuation. If attenuation is to be minimised in a circuit containing no power amplification, the resistance must be kept as small as possible, or the power in the line must consist of a high voltage and a low current, rather than a low voltage and a high current. The microphone operates with a low voltage and a comparatively high current. Hence the earliest telephones, using simple circuits of the kind seen in Fig. 1, could be worked over only very limited lengths of wire.

The operation of such a telephone was as follows. Normally the switches SW1, SW2 at either end are kept by springs in the "stand-by" position shown in the drawing. In that position both batteries are cut out of circuit. Suppose that A wishes to call B. He presses down his K_1 , which causes his battery to actuate B's bell. He then releases K_1 , and awaits the answering ring, which B gives by depressing and releasing his K_1 . This done, A and B both depress and hold down K_2 . The bells are now cut out, and the two microphones, the two receivers, and the two batteries are connected in series through the line wires. At the end of the conversation A and B both release K_2 and the instruments return to the stand-by position.

Improvements came thick and fast. One of enormous importance is illustrated in Fig. 2, where the output of the microphone is seen applied to the primary of a

Telephony. Fig. 2. Diagram illustrating the use of the step-up transformer and single line earth return circuit

step-up transformer. In this way the line voltage could be greatly increased and the line current correspondingly reduced, with the result that losses were smaller and operation could take place over a far greater length of wire. Alternatively, the cost of installing short distance telephone links was reduced, since wire of smaller

gauge could be used. Ringing over long distances remained a problem until the introduction of the polarised bell, operated by a hand-driven magneto generator. As alternating instead of direct current was now used for ringing, high line voltages and small currents could be used for this purpose as well.

The circuit in Fig. 2 consists of a single wire with earth return, the regular form in the early days of the telephone. It was fairly good for short distance working, though overhearing was a common trouble. In the 1890s, when telephony over distances of 200 m. and more was in use, the increasing use of electrical machinery in factories and elsewhere led to so much noisiness in earth return circuits that the system was abandoned in favour of the entirely metallic circuit.

Switching became more complicated inside the instruments, but much simpler for the user. When the instrument was not in use the microphone, later a combination of microphone and receiver called the hand set, hung from a hook, depressing it by its weight and causing it to keep a switch in the stand-by position. In this position the microphone battery was cut out of circuit and the ringing circuit was made; turning the crank handle of the generator rang the bell at the other end of the line. When the hand set was lifted off, the hook

Telephony. Faraday Building, London, is one of the largest telephone exchanges in existence, and through its international switchboard Great Britain is connected to large centres all over the world. Here operators are handling calls on the trunk switchboard

was raised by a spring; the bell was cut out, and the battery switched into circuit with the microphone; in many cases, though, the switching in of the microphone battery was not automatic; it was done by means of a "pressel switch" in the hand set, which had to be kept closed by the fingers during a conversation.

Drawbacks to this system are that there must be a microphone battery, requiring frequent attention, in each subscriber's home; and the pressel switch may cause trouble. A great improvement was the central battery system (C.B.S.) which uses a single large battery at the exchange both for signalling and for supplying current to the microphones. The instrument in the subscriber's home consists of a pedestal bearing a "cradle" on which the hand set rests when the instrument is not in use. In this position a switch is kept open, breaking the circuit between the battery and the microphone. When the hand set is lifted a spring causes the cradle to rise. The microphone is switched into circuit and, in a non-automatic exchange, an indication is given to the operator there. This may be the lighting up of a lamp or, at exchanges where there is no operator on all-night duty at the switch board, the ringing of a bell. On receiving the signal the operator turns a key to the "speak" position, cutting out the calling circuit and connecting the subscriber to her head set. She then takes the number required and (if it is a

local call) plugs the caller into it and rings the subscriber who is being called. If the call is to another exchange "controlled" by her, she rings that exchange, passes the number, and connects her subscriber. Otherwise she connects him to Toll or Trunks as the case may be. For all calls beyond a certain radius an automatic timer is switched in. This records the time occupied by the conversation and emits three warning "pips" just before the end of each three minutes. When the subscribers replace their hand sets on the cradles their microphones are cut, the timer (if in use) is stopped, and a signal at the operator's switchboard shows her that the line has been cleared. She then disconnects both subscribers, returning their circuits to the stand-by state.

An invention greatly increasing distances over which speech could be conveyed was the Pupin loading coil, patented in 1899 by M. I. Pupin of Columbia university. The insertion of these coils at regular intervals into telephone cables causes the cables to behave as if their inductance were substantially uniform throughout. The result is reduced attenuation and therefore improved results. Loading is of the greatest advantage in the case of underground cables, used for all main trunk lines, as well as for the lines in all big towns and cities between exchanges and from subscriber to exchange. Another was the valve repeater, an automatically operated valve amplifier, which began

Telephony. An engineer at work on one of the automatic distributor boards of the internal exchange on Paddington station, London. There are more than 1,000 departmental connexions

to come into use in trunk lines soon after 1918. They are inserted into all trunk lines at intervals of about 25 m. Attenuation is made good, the proper balance of the audible frequencies is preserved, and speech over distances of hundreds or even thousands of miles is as strong and as clear as it is on local calls. The submarine repeater, developed by engineers of the G.P.O., and installed in one of the cables between England and Ireland, consists of a hermetically sealed metal cylinder containing specially designed valves with a working life of more than 20,000 hrs.—about 20 times that of those used in broadcasting receiving sets. Both high tension and low tension current for the valves is supplied through the cable from the shore. Every valve has one or more stand-by replacements within the metal cylinder. Should any valve break down, or become inefficient through long service, a replacer is automatically switched into circuit. The submarine repeater is designed to work for years without attention.

The C.B.S. telephone exchange has many disadvantages. It requires operators to be on duty at all times at the switchboards; at small exchanges the operator may sit for long spells with almost nothing to do; at large and busy exchanges she may at times be so overwhelmed by the volume of calls that the human factor leads to errors. The idea of an automatic exchange was conceived early in the history of the telephone. The first man to work out a practical automatic system was Almon B. Strowger, of Kansas City, an undertaker by trade, who took out his first patent in 1889. It was for a crude system requiring five wires between each subscriber and his exchange; but it included the basic principles upon which a practical automatic exchange was developed, and eventually adopted all over the world. The rotating dial, operated by the finger of the

caller, was patented in 1898 by W. P. Thompson.

In the dial system each exchange has a three-figure number, and each subscriber a seven-figure number, the first three digits identifying the exchange by which he is served and the other four constituting his personal number on the exchange switchboard. Numbers consisting of seven digits are not easy to memorise; combinations of letters and numbers are much simpler. Hence on the dial in the U.K. the letters ABC correspond with the figure 2; DEF with 3; GHI with 4, and so on. The only figures which have no corresponding letters are 1 and 0. Suppose one wishes to call a friend whose number is SLEepy Hollow 1769; the wanted number is actually 7531769; but it is a good deal easier to remember the three letters SLE plus the figures 1769.

When the hand set of a telephone connected to an automatic exchange is resting on its cradle the central battery is cut out of circuit with the microphone. At the same time the subscriber's bell is so switched that it is brought into action, should the automatic ringer at the exchange come into play. When a subscriber lifts the hand set from its cradle, the selectors at the exchange are brought under his control. If he dials the three letters which are those of his own exchange, these remain passive. But

1ST SELECTOR2ND SELECTOR.

FINAL SELECTOR.

Telephony. Diagram showing the working of the automatic telephone. The number 2368 is here seen being called by the number 2237, and it is clearly shown what happens as the digits are dialled and contacts are engaged

should he dial the letters of another exchange or, e.g., the TOL (805) of Toll, selectors at his own exchange pick out a disengaged line to whichever of these it may be, connect him to it and switch in the automatic ringer. But let us suppose that the call is a local one from EGGshell 2237 to BIRdsnest 2368. On receiving BIR (247) the home exchange selectors find a disengaged line (if there is none, the "engaged" signaller is brought into play), over which 2368 is passed to the second exchange. Here the selectors pick out the eighth unit of the sixth ten of the third hundred of the second thousand and cut in the ringer or the "engaged" signaller as the case may be. If BIR 2368 answers, replacement of the hand sets at the end of the conversation causes all the moving parts at the exchanges to return to their stand-by positions, and the call is automatically charged to the subscriber who made it. Advances in automatic telephony will almost certainly render both

Toll and Trunk exchanges unnecessary. Any subscriber will then obtain connexion to a subscriber in any part of the country simply by dialling the required exchange and individual number.

So far, no means has been found of making telephony possible over submarine cables, save over such comparatively short spans as the Irish Sea, the Strait of Dover, and the narrower parts of the North Sea. The submarine repeater cannot be installed in more than moderate depths of water, or at places more than a short distance from the shore. So great is the attenuation over a submarine cable that for many years it seemed impossible that telephonic communication across the Atlantic would ever be established.

Transoceanic Telephony

But in 1901 Marconi succeeded in transmitting wireless signals between England and the N. American continent; and the thermionic valve made transoceanic telephony a possibility. At first there were great difficulties. It was believed that the only way of spanning great distances was by the use of high-powered transmitters using very long waves. On the long waves atmospheric interference frequently makes telephonic communication impossible. Between the First and Second Great Wars amateur radio enthusiasts clamoured to be assigned bands of wavelengths on which they could carry out experiments. As a sop they were given bands of short wavelengths below 100 metres, which the experts of the day had declared to be useless except for very short-range working. But the amateurs were soon reporting successes at ranges of hundreds and even thousands of miles, though their transmissions were made with very small power behind them. The experts revised their opinions and, thanks to the pioneer work of the amateurs, the development of short-wave radio made possible world-wide radio telephony.

Short-wave radiations can be focused into a comparatively narrow beam, and their energy is not therefore dissipated in all directions as is that of long-wave transmissions. The short-wave transmitter's aerial system is designed to concentrate the greater part of the radiated energy towards the receiving station or stations with which it is working. Hence a much smaller output power suffices; and smaller output power rating means transmitters which are less costly to install and maintain.

Short waves, however, behave curiously, and in its early days transoceanic radio telephony was neither very good nor very reliable. Research showed that there are optimum bands of wavelengths for particular times of the day and night, for particular seasons of the year, and for particular periods of the eleven-year sunspot cycle. Every long-distance radio telephone service, therefore, must be so designed that it can make use at any time of the most suitable group. Even so, another complication arises: except at ranges of a few miles, the short waves reaching the receiving aerial are reflected from the Appleton or F layer, which is about 180 m. above the earth's surface.

If only one set of waves were reflected on to the receiving aerial, all would be well. But trains of waves reflected from two or more points in the F layer continually reach it simultaneously. The paths that such waves have followed are not all of the same length; hence it is purely a matter of chance whether they arrive in phase, partly out of phase, or completely out of phase. When they are in phase the signal is abnormally strong; partial dephasing reduces the strength; complete dephasing means silence, if the waves are of equal amplitude. The process is called fading.

Normally, short waves are polarised by the transmitting aerial so that the electric field is vertical and the magnetic field horizontal. When reflection from the F layer takes place the waves may be "twisted" by an alteration in the directions of the electric and magnetic fields. This leads to distressing distortion of speech, which at times may become unintelligible. A method called diversity reception was devised to reduce fading. If two receiving aerials are arranged an appropriate distance apart, and two sets of reflected waves arrive at each, the phase relationship will be different at each at any instant. When signals at aerial A are very weak those at B may be strong or *vice versa*. Both aerials serve a common receiver, which is provided with a device that automatically selects the in-

put from the "best" aerial at the moment and rejects that of the other. In this way the input to the receiver can be kept substantially constant and the effects of fading are minimised.

A method was also devised for dealing with "twisted" waves at a large and very successful short-wave receiving station, M.U.S.A. (Multiple Universally Steerable Aerial), installed by the G.P.O. in the Romney marshes. The total length of the M.U.S.A. aerials is more than 15 m. The system combines spaced-aerial diversity reception with what may be termed angular diversity reception. Suppose that two sets of waves are arriving from different points in the

Telephony. Fig. 3. A country's transoceanic transmitting and receiving stations are usually situated a long way from one another. The illus. shows diagrammatically that during a conversation the route from the microphone of a subscriber in Eastland to the receiver of a subscriber in Westland is quite different from that between the Westland microphone and the Eastland receiver

reflecting layer, one badly twisted from its original polarisation, the other less twisted or not twisted at all; the two will come in at different vertical angles. The M.U.S.A. aerials are so arranged that any one receives only those waves arriving at a particular vertical angle. At the receiver an ingenious device selects at any instant the input from the aerial which is giving the smallest amount of fading and the smallest amount of distortion. Changes from aerial to aerial may be made many times a sec. when conditions are bad, but these are imperceptible to the listening ear. At all times both the volume and the quality of speech reception are maintained substantially level, so that a trans-Atlantic conversation is very nearly as strong, clear, and free from background noises as a local one between two subscribers belonging to the same exchange. The system is used for trans-Atlantic items in B.B.C. programmes.

The transmitter and the receiver of a long-distance radio telephony

system are, as a rule, a long way from one another. Fig. 3 shows diagrammatically what happens when a transoceanic conversation is in progress. The microphone of the speaker in Eastland is connected through his own exchange and a trunk line to transmitter A, whose radiations are picked up in Westland by receiving station B and passed over trunk and local lines to the listener in Westland. When the latter speaks he does so through transmitter B. Receiving station A passes the incoming signal over another trunk line and so to the telephone receiver of the listener in Eastland.

One early difficulty about using radio for long-distance telephony was that there was no kind of secrecy about such communications. Though they were "beamed," the beam was a comparatively wide one and anybody living in the area which it reached could overhear conversations by means of a short-wave receiving set. That

directed towards making the maximum possible use of a single pair of wires. Various duplex and multiplex systems were evolved so that two or more conversations could take place simultaneously over the same pair; but the really big advance came when modified radio methods were applied to line telephony to produce the carrier current system. In broadcasting, each station has its own individual frequency and sends out a carrier wave of that frequency modulated by the audio frequencies occurring in the studio. The owner of a receiving set can bring in any broadcasting station within the range of his apparatus by tuning it to that station's carrier frequency. Each station has a channel extending to 4.5 kcs. above and below its carrier frequency. A similar system can be used over a suitable pair of wires.

Consider the very simple system illustrated diagrammatically in Fig. 4. When A is speaking a carrier current with a frequency of 100 kcs. is modulated by the transmitter to which his microphone is connected. This is received, detected, and passed on to B's telephone receiver by receiving equipment tuned to 100 kcs. B replies by way of his transmitter, a 300 kcs. carrier

and rejects all those above this level. Thus the 100 kcs. and 140 kcs. transmissions of A and C are passed to the "outwards" amplifier. Having passed through this amplifier they are prevented by the high-pass filter from going back through the "inwards" amplifier. Similarly, the transmissions from B and D are suitably directed by the filters which they encounter.

The range of modulation frequencies needed to produce understandable speech is much smaller than that required by broadcasting stations for the transmission of music: about 500-3,000 or 3,500 cycles is sufficient for practical purposes. Nor is there any need to send both the modulation side bands: one can be suppressed; the carrier frequency itself can be suppressed. What goes into the line wires may be described as the narrow band of frequencies which would represent one side band of a modulated carrier frequency—if the carrier were there. To receive "single" side band, carrier-suppressed transmissions, the carrier frequency, removed at the transmitting end, must be restored by locally generated oscillations in the receiver, but that presents no difficulty.

With the co-axial cable laid on many of the important telephone trunk routes a very large range of frequencies can be transmitted faithfully. Its cost is high—£5,000 or more per mile—but this is amply justified by the fact that the carrier current system used by the G.P.O. allows 660 simultaneous telephone conversations to take place over one pair of co-axial cables without mutual interference.

Fig. 6 shows how frequencies in a co-axial cable are built up by a progressive modulation system: 12 channels form one of 55 groups; 5 groups are combined into one of 11 super-groups. The super-groups combine into $12 \times 5 \times 11 = 660$ individual

Telephony. Fig. 4. Illustrating the principle of carrier current telephony. In the simple example described in the text carrier frequencies of 100 and 140 are used for transmission from west to east, and 250 and 300 kcs. from east to west

drawback was overcome by the invention of the method of transmission called "scrambling." Put simply, this means that a "scrambler" at the transmitting end mixes up the speech frequencies reaching the microphone. The result (as any owner of a set capable of receiving short-wave transmissions may hear for himself) is a series of sounds which, though obviously those of speech, are completely unintelligible. They can be made understandable only if at the receiving end there is a "descrambler" so adjusted that it restores the proper balance of the original speech frequencies.

Besides its use for long-distance services short-wave radio telephony provides connecting links across estuaries or between mainland and island. Its cost is far less than that of laying an underwater cable. The radio links are often of the "unattended" type, entirely automatic in action and needing no operator, though maintenance men visit them regularly.

As with telegraphy, the efforts of telephone engineers have been

and A's receiving equipment tuned to that frequency. C can speak simultaneously to D and D reply to C by the use of carrier currents with respective frequencies of 140 kcs. and 250 kcs. If the receiving apparatus is sufficiently selective, no mutual interference or overhearing takes place. Trouble would occur at the repeater if steps were not taken to prevent it; A's speech transmission, for instance, might be amplified at the

repeater and allow any transmission to pass only in its proper direction. A low-pass filter accepts frequencies below a pre-determined level (here 150 kcs.)

it not for the filter circuits (Fig. 5), which act as traffic controllers and allow any transmission to pass only in its proper direction. A low-pass filter accepts frequencies below a pre-determined level (here 150 kcs.)

Telephony. Fig. 5. Showing the arrangement of a repeater with filters suitable for the conditions seen in Fig. 4

speech channels. Put simply: the frequencies allotted to each channel, including those used for ringing, range up to 4,000 cycles or 4 kcs. These are used in channel No. 1 of each group to modulate a carrier current with a frequency of 64 kcs.

This would normally result in a band of frequencies extending from 60 to 68 kcs. One side band however, is suppressed and the channel frequency becomes 60-64 kcs. The frequency of each No. 2 channel is 64-68 kcs. and so on to No. 12, with a frequency of 104-108 kcs.

At group stage No. 4, the 60-108 kcs. frequencies of the 12 channels are made to modulate a 564 kcs. carrier current; only the lower side band is retained and the resulting output of the group is the band of frequencies from 564-108 to 564-60=456 to 504 kcs. A 1,116 kcs. carrier at super-group No. 3 is modulated by the entire range of frequencies extending from 312 to 552 kcs. from five groups. Again, one side band is removed and the frequency range from super-group to line is 1,116-552 to 1,116-312=564 to 804 kcs. The frequencies built up in the co-axial line by the 11 super-group units ranges from 60 to 2,788 kcs.

Telephony. Fig. 8. The principle of through-group working, enabling 660 separate speech transmissions to be made simultaneously over one co-axial cable

Telephotography. Photography by means of a lens of special type, permitting of photographs of large scale being taken from a distant standpoint. This telephoto type of lens consists of one of ordinary pattern with a negative or diverging lens behind it; or the two may be constructed as one instrument. Such lenses, while calling for an extension of camera only three or four times the ordinary, yield photographs on a scale equivalent to that given by lenses ten to twenty times the focal length. A telephoto lens allows clear snapshots to be made, and is extensively used in many forms of sporting photography.

The term is also inaccurately used to refer to the electrical transmission of pictures over wires, first carried out by Bidwell in London in 1881. See *Telegraphy: Still Picture Transmission*.

THE TELESCOPE AND ITS USES

* A. Hunter, Ph.D., F.R.A.S., Royal Greenwich Observatory

In connexion with this article see others on astronomical subjects, e.g. Astronomy; Mars; Moon; Planets; Sun, etc. See also Lens; Optical Glass; and the biographies of Herschel and other astronomers

The telescope (Gr. *tēle*, far: *skopein*, to see) is an instrument formed by a combination of lenses, or of mirrors, or of both, for the purpose of seeing distant objects distinctly.

There is reason for thinking that the method of combining lenses to form an instrument like a telescope was known to Roger Bacon (d. 1294), though there is no evidence for the existence of the instrument at that date. Leonard Digges (d. c. 1570) is also said to have known the principle of the telescope, his knowledge being derived from a manuscript book of Bacon, but its invention is generally associated with the name of Johan Lipperhey or Lippershey, a spectacle-maker of Middelburg, Holland, who announced his discovery in Oct., 1608. Other persons to whom the credit has been assigned are James Metius and Zacharias Jansen, also a spectacle-maker of Middelburg, contemporaries of Lipperhey.

Though it is impossible to trace the inventor or maker of the first telescope, it is generally agreed that Galileo in Italy and Simon Marius in Germany were the first to apply the telescope to astronomical observation. In fact, Galileo is credited with having found out the principle of the telescope himself; and his early additions to astronomical knowledge were made by its aid.

The essential feature of a telescope is a lens or mirror, called the objective, which collects more of the rays emanating from any point of a distant object than would otherwise enter the eye, and bends or reflects them so that they unite in a point called the focus. There is a focus for each point of the distant object, and these combine to form an image of it in the focal plane of the objective. This can be seen by placing the eye about 1 ft. beyond it, but is ordinarily examined more closely with a lens or combination of lenses termed an eyepiece.

The function of the objective is to gather sufficient light to make a perceptible image in the focal plane. The function of the eyepiece is to enable the eye to see that image when as near to it as possible, so that the angle which it will subtend at the eye may be large. In early telescopes, the objective

was a convex lens, and the eyepiece concave, the latter being placed between the objective and its focus. This type is known as the Galilean, and the picture seen by the user is direct or upright, whereas in the instrument invented by Kepler in 1611 the eyepiece is a convex lens or its equivalent and is placed farther from the lens than its focus, and the image of the object is seen inverted. Kepler's form of telescope was not brought into use until the middle of the 17th century. The terrestrial telescope, or spyglass, is of this type: the image, which is inverted by the object glass, is re-inverted by means of an eyepiece formed by a combination of four lenses.

Aberrations and their Remedy

Early telescopes suffered from two defects, known as aberrations. Spherical aberration gives an indistinctness to the image because, if the surfaces of the lenses are parts of spheres, all the rays which emanate from a point of the object do not meet after refraction precisely at a point. The second defect, chromatic aberration, the cause of which was not known until Newton's discovery of the spectrum, gives spurious colours to the image, because the lens is, in effect, a collection of prisms.

To obviate these defects long telescopes were made, and at the end of the 17th century telescopes were in use, having small object glasses, but were as much as 200 ft. in length and very unwieldy. From about 1760 the colour defect was removed by making achromatic object glasses of two lenses combined: a convex one of crown glass and a concave one of flint glass. The flint lens does not destroy the convergence produced by the crown lens, and it re-unites the colour rays at the same single focus.

REFLECTING TELESCOPES. Before the invention of the achromatic object glass, it was recognized that a concave mirror with a reflecting surface of parabolic shape would unite, at the focus of the paraboloid, the parallel rays which fell over its surface, and that this would supply an objective free from aberrations. James Gregory, 1663, was the first to give a complete explanation of the construction of a reflecting telescope. The objective of such an instrument is

a mirror placed at the end of a tube, the other end of which is open to the sky. In some forms, a hole is pierced through the centre of the mirror, and the rays passing into the tube are reflected from the object mirror on to a smaller one within the tube, which, in the Gregorian telescope, is concave. From this they are reflected through the aperture in the objective, and pass through an ordinary eyepiece.

Telescope. Top to bottom, Gregorian form of telescope; Cassegrainian type; Newtonian, with eyepiece in side of tube; Herschelian telescope, allowing direct examination without aid of second reflector. See text

Newton altered this scheme by dispensing with the hole in the mirror, making the second mirror plane, and setting it at an angle of 45° to the axis of the tube, that it might reflect the light through an aperture in the side of the tube to an eyepiece. In 1672 Cassegrain, a Frenchman, devised a form similar to the Gregorian, the difference in construction being that the second mirror was to be convex instead of concave.

William Herschel made nearly 200 mirrors of all sizes, the largest being the reflector of 4 ft. diameter and of 40 ft. focal length. He altered the plan of the reflecting telescope by tilting the objective mirror with respect to the tube, so that the reflected rays emerged through an aperture in its side, and the image is seen directly by an eyepiece without the interposition of a secondary mirror.

MODERN TELESCOPES. With the advent of photography, telescopes were designed to use it. For this purpose the eyepiece is dispensed with, the image being formed directly on the photographic plate. The processed plate is afterwards examined under a low-power microscope, which performs the function of an eyepiece.

The principal development of the late 19th and early 20th centuries was a great increase in diameter of the objective lens or

mirror, the aim being to collect more light. The practical limit to the size of a refracting telescope is set by the difficulty of making large blocks of homogeneous glass. Telescope mirrors were originally of speculum metal, a brittle, heavy alloy of copper and tin, which tarnishes and has to be refigured by a skilled optician. In 1856 a chemical process was discovered for depositing metallic silver in a thin, highly-reflecting layer on glass; and it became possible for a large mirror to be made of glass only one-third the weight of metal, optically figured once for all and then silvered and resilvered as the coating tarnished. After 1935 it became common to use, instead of silver, an aluminium coat deposited by evaporation in a high vacuum. This tarnishes less easily and reflects ultra-violet light better.

The reflector has the great advantage of achromatism: its main defect is its restricted field. Images of objects more than a fraction of a degree away from the axis are blurred by the defect called coma. The Schmidt telescope, invented in 1931, enables a field about 15° across to be covered by using a spherical mirror and correcting its aberrations by means of a specially shaped glass plate at its centre of curvature.

The location and size of the largest telescopes in the world are given in the following table, in which M signifies a mirror objective, L a lens, and S a Schmidt-type

system; the date is that of completion:

M Mt. Wilson, Calif.	100 in.	1917
M McDonald, Texas	82 in.	1939
M Raddcliffe, S. Africa	74 in.	1948
M Mt. Palomar, Calif.	200 in.	1947

S Tonanzintla, Mexico	26 in.	1942
S Mt. Palomar, Calif.	48 in.	1948

Telescopes are mounted for use in various ways according to the purpose for which they are designed. Instruments of comparatively small size are used as sighting instruments, the principal type of this description being the meridian instrument or transit circle (*q.v.*). In the equatorial mounting the telescope is suspended on an axis parallel with the axis of the earth, and is rotated, generally by mechanical means, in a direction opposite to that of diurnal rotation, with the result that the object under observation remains constantly in the field of view.

Telescopium. Southern circumpolar constellation. Named by Lacaille, it is between Ara and Sagittarius. Its chief star is Alpha Telescopii, an early type star of about the fourth magnitude.

TELEVISION AND ITS PROGRAMMES

R. W. Hallows, M.I.E.E., and Maurice Gorham, former B.B.C. Television Director

The principles of television, the history of its development, and the method of its application are here described. Closely related subjects are Radio and Telegraphy. See also articles on Baird, J. L.; Cathode Ray Tube; Cinematography; Photography

Television is a term coined to express the transmission, by electrical means, to distant places of images of events as they occur, and the reception of such images. Though inventors had been engaged for many years in attempts to evolve methods of transmitting images over wires or by wireless, it was not until the 1920s that J. L. Baird devised the first practical working system. Regular broadcasts by the Baird method were made for a considerable time from the London medium-wave broadcasting station. The received images were reddish-brown in colour, small, flickering, and not very distinct. They were of low definition, but they were recognizable. For a time Baird conducted medium-definition transmissions from his experi-

mental station at the Crystal Palace, London; then in 1936 the high-definition station at the Alexandra Palace, London, came into action. For some months broadcasts were made on alternate days by the latest Baird system and that developed by E.M.I. The latter was, by general consent, voted the better. It was adopted by the B.B.C., and, with modifications and improvements, continued to be the standard British system.

During the Second Great War the Alexandra Palace station was closed to prevent its use as a radio landmark by German bombers on their way to London. It was reopened in 1946; and other stations, including one at Sutton Coldfield near Birmingham, were planned

so that all but the sparsely populated areas of the U.K. should be served by at least one television transmitter.

PRINCIPLES OF TELEVISION. The deviser of a television system has to find a means of converting into electrical impulses something which affects one of the human sense organs. He must find a way of making electro-magnetic waves convey faithful copies of those electrical impulses. He must contrive a means of interpreting the impulses borne by electro-magnetic waves in such a way that they convey an intelligible message to the sense organ concerned.

The eye can send to the brain an instantaneous detailed impression of a small object fairly close to it, or of larger ones at greater distances. But it cannot see at a glance the whole detail of, for instance, a large oil painting 6 or 8 ft. away. Quite unconsciously, a man scans the surface of the canvas by quick horizontal and vertical movements of the eyes. The area he can see in detail if by an effort of will he keeps his eyes fixed on a point in the middle of a large picture is surprisingly small, and only portions of the message put on the canvas by the artist can be received at any instant. By rapidly scanning the picture, the eye enables the brain to build up a complete and detailed impression of the whole.

Any page of the New Universal Encyclopedia contains a great deal of information. No eye could glance at a page and instantly convey the whole of that information to the brain. What the eye does in reading is to scan the page, travelling first from left to right along one line of print and then switching back much more rapidly to the beginning of the next line below. The movement of the eye over a page is thus a combination of horizontal and vertical travel: a moderately slow horizontal traverse from left to right is followed by a rapid "fly-back" from right to left, with a downward movement to the start of the next line.

Suppose that a page of print 6 ins. deep and containing 30 lines each $3\frac{1}{2}$ ins. long, is read in one min. Then the eye's horizontal scan works out (including the rapid fly-backs) at 7 ins. in each 2 secs., or an average of $3\frac{1}{2}$ ins. a sec. The vertical scan is 6 ins. in 60 secs., or $\frac{1}{10}$ of an in. a sec. The page is thus covered by a combination of a rather rapid horizontal scan and a much slower vertical span.

That is exactly how television apparatus sends and receives its images. The earliest systems made use of a scanning disk, containing 30 equally spaced apertures of small size placed near its rim and forming a portion of a spiral. The disk, revolving $12\frac{1}{2}$ times a sec., was placed between a powerful light source and the object to be "televised." At any moment only the pencil of light admitted by one aperture fell upon the object. As the disk revolved, this pencil of light traversed the object in a narrow line. As soon as one aperture had allowed a spot of light to pass across the object the next took up the work. The light-spot again traversed the object, but, owing to the spiral form of the array of apertures, the line described by the spot of light now followed a path parallel to and just not overlapping the one before it. In this way the whole image was broken up into 30 parallel lines, each traversed once by the spot of light at every revolution of the disk, and each consisting of patches of varying size and of shades ranging from pure white through many different greys to dead black.

As the spot passes over the object, light is reflected from the portion of the surface illuminated at any instant. From pure white dots and patches there is maximum reflection; from those which are dead black, no reflection at all; from those of intermediate shades a greater or less amount of light is reflected according to the degree of their greyness.

The Photo-Electric Cell

This reflected light can be applied to a photo-electric cell, which passes an electric current proportionate to the amount of light reaching it. In this way the fluctuations of the light reflected as the scanning spot traverses the object are converted into corresponding fluctuations of electric current, and these latter fluctuations are made, after amplification, to modulate the output of a wireless transmitter. The action of the photo-electric cell in converting light-wave fluctuations into electric current fluctuations is parallel to that of the microphone in its conversion of sound-wave fluctuations into current fluctuations. The essential difference is that whereas the microphone receives and conveys an impression at any instant of all the sounds reaching it, the message reaching the television transmitter and sent out by it concerns at any instant only one minute element of the whole image.

At the receiver the image is built up on the viewing screen not as an instantaneous whole, but dot by dot and line by line. This is made possible by that quality of the eye called persistence of vision—a quality exploited also by the cinematograph. Images formed on the retina of the eye do not instantly disappear when the object by which they are caused is removed. At any moment there is actually nothing on the viewing screen of the television receiver but a single minute spot of light, whose brightness is in proportion to the shade of the dot, or picture element, then being received. Thanks to persistence of vision the tiny individual picture elements recorded on the screen build up on the retina the impression of a complete picture.

The Scanning Disk

In early television receiving equipment a scanning disk was used. The incoming wireless waves were amplified, detected, and again amplified. The messages conveyed by the modulation were converted into corresponding fluctuations of electrical pressure. These were applied to a special form of glow-lamp, whose brilliance was thus correspondingly varied from instant to instant. The scanning disk, revolving in exact synchronisation with that of the transmitter, was interposed between this source of light and the large lens which formed the viewing screen. In this way the image, dissected at the transmitter, was rebuilt on the retina of the viewer's eye. Scanning disks ceased to be used, the cathode-ray tube in one form or another taking the place of both photo-electric cell and glowlamp. But the basic principles of television remain the same.

TELEVISION TECHNIQUE. Both in the studio and for outside broadcasts a television camera, the emitron, or iconoscope, is used. These cameras are so sensitive that transmissions have been made from theatres with no addition to the normal stage lighting. Out of doors the television camera has often sent clear images to the television screen when the light was so poor that the spectators on the spot had difficulty in following a game. The principle of the emitron is illustrated diagrammatically in Fig. 1. By means of the lens system the image is focused on to the mosaic screen, which consists of a vast number of minute photo-sensitive elements, insulated from one another and from the metal backing. Each element.

together with the metal backing, forms a tiny capacitor which becomes positively charged to a

Television. Fig. 1. The principle of the iconoscope

voltage proportionate to the amount of light falling upon it. The result is that an electrical copy of the image is formed on the mosaic, the individual charges of the photo-sensitive elements each recording one small detail of the picture. The iconoscope contains also an electron gun, with focusing and deflecting arrangements (not shown in the drawing) similar to those used in the ordinary cathode-ray tube. The beam of electrons from the gun is made to scan the mosaic by means of horizontal and vertical time bases in exactly the same way as the eye scans this column in reading it.

Electrons are negative particles of electricity; as the beam reaches each tiny positively charged element of the mosaic the capacitor formed by this element and the back plate is discharged. This causes a flow of current through the resistor R and, in accordance with Ohm's Law, a corresponding potential difference across R . These potential differences, each recording the "message" imprinted by the image on one tiny cell of the mosaic, are used, after amplification, to modulate the output of the transmitter.

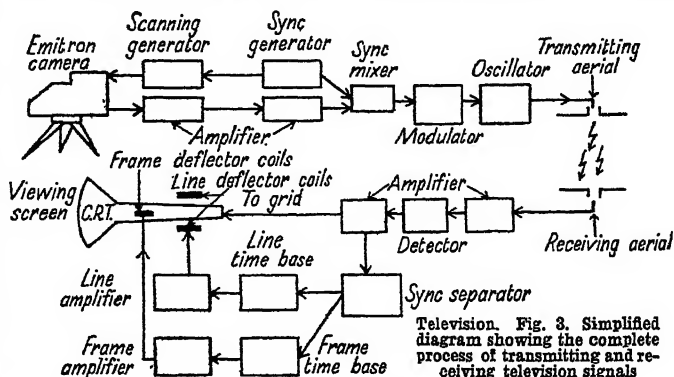

The way in which the vision carrier wave is modulated is illustrated in Fig. 2. Pure white leaves the carrier at its ordinary level. Dead black brings its amplitude down to 30 p.c. of normal, and the various grades of grey produce percentages of the normal carrier between 31 and 99: the paler the grey, the higher the percentage of the carrier.

This is the British system. It is precisely the opposite of that used in the U.S.A., and in some other countries. In other words American vision signals would give a negative image on a British television and vice versa.

Carrier percentages below 30—the region sometimes referred to

as "blacker than black"—are used to convey the synchronising pulses. In television parlance synchronising and synchronisation are usually shortened to "sync," pronounced "sink."

Fig. 3 shows diagrammatically the whole process of transmission and reception. From the television transmitter two modulated carriers, one carrying the vision signals and the other the sound signals, are sent out on different frequencies. (The sound transmitting and receiving apparatus is not

Television. Fig. 3. Simplified diagram showing the complete process of transmitting and receiving television signals

shown.) Both are picked up by the receiving aerial and in most cases both are amplified by the first H.F. stages of the receiver. Then vision and sound signals are sorted out into their own circuits by means of filters. After amplification, the image-detail parts of the vision signal (those, that is, corresponding to carrier percentages between 30 and 100) are fed to the grid of a cathode-ray tube in the form of varying positive voltages. The grid of the tube is so negatively biased that the voltage due to the modulation corresponding to dead black is just not sufficient to allow any flow of electrons from the cathode across

Television. Fig. 2. Illustrating the modulation system used in British television

the tube. The screen thus remains dark. Voltages corresponding to less and less dark greys allow the electron-stream to be denser and denser, with the result that the spot of light is more and more brilliant. It reaches full brilliance when a positive voltage corresponding to white reaches the grid.

The illumination of the receiver screen is thus varied in exact accordance with the amount of light on the tiny cell of the transmitter iconoscope mosaic which is discharged at any instant by the scanning beam.

To "paint" the image on its screen, scanning must also take place in the receiver; the spot of light, fluctuating in intensity, must be made to move over the screen. And it must at any instant be at exactly the same point of the receiver screen as that reached on

the mosaic by the transmitter's scanning beam. A device called the sync separator picks out the sync pulses from the vision signal; it applies the short line-sync pulses to the line time base, which controls the horizontal movements of the spot, and the long frame-sync pulses to the frame time base, which controls its vertical movements. The output of the time bases is applied to the deflector coils, for a magnetically controlled tube is almost always used for television. If the line time base is properly designed and adjusted, the line-sync pulses ensure that the receiver light-spot starts each line at the same instant as the scanning beam starts its journey across the mosaic and covers the whole line in exactly the same time. Each little element of the line is thus painted in at precisely the right place. Similarly the frame time base ensures that each line fits into its proper place, and that the scan of each complete image starts and finishes simultaneously in both transmitter and receiver.

Under the British system each complete image is built up by 405 scanning lines. But the lines do not run consecutively from 1 to 405. The odd-numbered lines, Nos. 1, 3, 5, and so on, are first scanned, and build up a rather sketchy "frame," with gaps be-

tween the lines. The next frame is made up of the even-numbered lines which fill in the gaps. Each frame occupies $\frac{1}{25}$ sec., and a completely scanned image is produced 25 times a sec.; $202\frac{1}{2}$ lines go to each frame.

In the U.S.A. 525 lines (interlaced frames of $262\frac{1}{2}$ lines each) are used; but the quality and definition of a television system do not depend simply upon the number of lines used. A large number of scanning lines transmits good, detailed images only if the transmitter is able to deal without distortion with a very wide band of modulation frequencies. The same is true of reception and the receiver.

Examination through a magnifying glass of any of the photographs in this volume will show that its surface consists of a large number of tiny dots, or picture elements. The television image is also made up of picture elements, stippled-in in series as the scan progresses. The number of elements in a television image is found by squaring the number of scanning lines and multiplying this by the form-factor, or aspect-ratio, which is the ratio of the long side of the image to the short. In the B.B.C.'s transmissions 377 lines are used for scanning, 28 out of the 405 being needed for the sync pulses. Thus the total number of picture elements is $377 \times 377 \times \frac{4}{3} = 177,661$. If the image consisted entirely of alternate black and white elements (Fig. 4A), one complete voltage cycle would be required for each pair (Fig. 4B). To transmit such an image 25 times a sec. would call for modulation frequencies of $25 \times 177,661 \div 2 = 2,222,000$ cycles a sec., or 2.222 megacycles. As large parts of every image are the same shade, this sort of thing does not happen, and about one-tenth of this frequency range would suffice. But suppose that the transmitted image contains fine, equally spaced black and white vertical lines. What takes place during part of each horizontal scan is shown diagrammatically in Fig. 4. Unless special measures were taken, the corresponding impulses would

be as at B and the reproduced image would be as at C. Pure whites would be reproduced only at the crest of each wave and dead blacks only at its trough. Instead of being sharp and distinct, the vertical black and white lines built up by a succession of horizontal scans would be blurred and muzzy. They would in fact appear not as vertical lines at all, but as parts of an indistinct patch of grey.

Ideally the modulating impulses

Television. Fig. 4. Showing that unless precautions were taken the voltage wave form corresponding to the scan of picture elements at (A) would be as at (B). Such voltage variations applied to the grid of the receiving G.E.T. would reproduce (A) in the way shown at (C). The ideal square voltage wave form at (D) would reproduce (A) perfectly as at (E).

during the morning transmissions makes it possible to check the response of the receiver. The sets of fine vertical lines correspond respectively to 1.0, 1.5, 2.0, 2.5, and 3.0 megacycles. A good receiver should resolve the 2.5 megacycles lines clearly.

A great deal of work is being done on both colour television and stereoscopic television, but it may be a long time before either is economically practicable. Television suitable for magnification to full cinema screen size is in a more advanced state of development.

R. W. HALLOWS

TELEVISION BROADCASTING. Television is capable of conveying visual information and entertainment of every kind. Like sound broadcasting it comes directly into the home, and like the theatre and the cinema it appeals to the eye as well as to the ear. It can even be used for transmitting printed mat-

ter in facsimile. The limitations on its growth arise chiefly from the complexity of the apparatus needed at both producing and receiving ends and the consequent high cost of providing high-quality television, especially outside densely-populated areas.

These limiting effects have been apparent ever since the first regular service of high-definition television was started in London in 1936, and can be seen in the slowness with which television has spread to other parts of the world except the U.S.A.

Most of television's early successes were in the realm of actual events: the coronation procession of George VI, 1937, the Victory parade, 1946, the Olympic games, 1948, were landmarks in British television, as the Louis-Conn fight of 1946 and the Philadelphia political party conventions and the presidential election campaign of 1948 were in the U.S.A.

Actual events of all kinds, from public parades to street scenes and work in progress, provide television with ready-made material, and the new medium inevitably leaned heavily on them in its earlier days, as sound radio did on music. But for the reluctance of the film industry to cooperate with a possible rival, it would no doubt have depended largely also on transmitting ready-made films. From the beginning, however, productions created in the television studio proved to have as great an appeal as outside spectacles, and the straight play running for 90 mins. or more—about the length of a cinema film—became the backbone of British television.

Television can direct the audience's attention at will to any part of the scene or any significant detail in it, whilst excluding the rest; the television producer has direct control of the production whilst it is taking place; and television gains in effectiveness over both theatre and cinema from the fact that "viewers" see it in the intimacy of their own homes. Ballet can be presented with a degree of selective emphasis that cannot be achieved on the stage; so to some extent can variety and revues, in which the face of a comedian, the feet of a dancer, or the hands of a conjurer can be shown in close-up whenever the producer chooses, without any break in the action. Music gains least from the addition of sight to sound, though some "viewers" welcome the chance of studying at close quarters the fin-

Television. Televising a studio play at the B.B.C. transmitting station at Alexandra Palace, London

gering of a pianist or the antics of a dance-band drummer.

Every sort of programme known to sound radio has been attempted in television, from the straightforward talk and short story to the elaborate feature programme which combines filmed actualities, dramatised reconstructions, and expert speakers in the studio.

In the sphere of information the potentialities of television are almost unlimited. To see a thing is normally more convincing than to be told about it, and television's increasing facilities are accompanied by developments in the technique of visual reporting. Eventually, when television stations are many and are linked together so that what is happening in one country may be seen simultaneously in another, when pictures are clearer, more detailed, larger, and, ultimately, in natural colour instead of black-and-white, with receiving sets plentiful and cheap enough to find their way into the ordinary home, the television screen will form the chief means of contact of the ordinary household with the outside world.

Maurice Gorham

Telford, THOMAS (1757-1834). British engineer. Born at Westerkirk, Dumfriesshire, Aug. 9, 1757, he learnt the trade of a stonemason, and in 1783 settled in London. In 1787 he became surveyor of public works for Shrop-

shire, and in 1793 was appointed engineer in charge of the proposed Ellesmere Canal. In 1801 he was appointed by the government to report on improvements of means of communication in Scotland. He was responsible for the construction of the Caledonian Canal, begun 1804, and for more than 900 m. of roads in Scotland and for more than 100 bridges, as well as improvements of harbours at Wick, Aberdeen, Peterhead, Banff, Leith, etc.

Telford superintended the construction of many roads in England, as well as the Carlisle-Glasgow and Shrewsbury-Holyhead roads, with the Menai suspension bridge and the Conway bridge. In 1818 he helped to found the Institute of Civil Engineers, and became its first president. The leading civil engineer of his time, Telford died Sept. 2,

Thomas Telford, British engineer

1834, and was buried in Westminster Abbey. *See* Caledonian Canal; Menai Bridge; *consult also* Life by himself, 1838; *Lives of Engineers*, S. Smiles, new ed. 1905; *The Story of Telford: the Rise of Civil Engineering*, Sir A. Gibb, 1935.

Teli. Indian caste of oilmen. Numbering some 4 million, mostly in Central and N. India, one-seventh are Mahomedan, six-sevenths Hindu. Only 7 p.c. of the caste are now engaged in oil-pressing; the remainder have turned to other callings.

Telissu OR WA-FANG-KOU, BATTLE OF. Fought between the Russians and the Japanese, June 15, 1904. This battle was the result of the first attempt of the Russians to relieve Port Arthur from the N. On May 30 the Japanese cavalry came in touch with the Russian horsemen, and from this date

until June 5 there were constant cavalry skirmishes in which the Japanese had the advantage.

Stackelberg's first instructions were not to fight a decisive action against superior forces, and he therefore selected a defensive position S. of Wa-fang-kou, on a line running through Telissu, and across the valley of the Fuchou river, which divided the position in two parts. On June 15 Oku attacked and crushed the weakened Russian right, and the Russians were badly defeated and forced to retreat with a loss of 3,500 men and a considerable number of guns. The Japanese losses were less than 1,200.

Tell, WILLIAM. Legendary national hero of Switzerland. He is first mentioned in a ballad and a chronicle, both probably written about 1470, and from these and other sources a narrative was compiled, which is still popularly accepted as historical. It relates that Gessler, the tyrannical bailiff of the duke of Austria, ordered those who passed to salute the duke's hat set up in Altdorf. Refusing to do so, Tell, a peasant of Uri, was sentenced to execution unless he could with an arrow shoot an apple placed on his young son's head. This he did.

Taken as prisoner in a boat with Gessler and his men, he leapt ashore during a storm, and from an ambush shot the tyrant in the "hollow lane" at Küssnacht. Tell then led a rising, resulting in Swiss independence. These events are dated 1307. It has been shown that the story is largely mythical, and that it is in the main a form of the very widespread folk-tale of the hero archer. Schiller's great

William Tell. Memorial statue, by R. Kissling, erected at Altdorf in 1895

drama, *Wilhelm Tell*, was written 1804, and Rossini's opera, *Guillaume Tell*, was produced in 1829.

Tell el-Amarna. Ancient city on the right bank of the Nile, 25 m. upstream from Beni Hasan, Upper Egypt. It was built by the heretical Pharaoh Akhnaton about 1375 B.C. in honour of his new god Aton, the sun's disk. In 1892 Flinders Petrie excavated in Akhnaton's royal residence, Akhetaton, stucco pavements with naturalistic paintings and much pottery. Many rock-hewn tombs preserve vigorous sculptured scenes. About 300 clay tablets in Babylonian cuneiform, from the archives of Amenhotep III and Akhnaton recovered in 1887 and subsequently, include letters from Mesopotamian kings and Syrian governors. The famous head of Nefertiti was found by a German expedition. Exploration was continued during the 1920s and 1930s by the Egypt Exploration society, and large areas of the city and its temples were uncovered. *See Egypt; consult Tell el-Amarna, J. D. S. Pendlebury, 1935.*

Tell el-Yehudiya (Arabic, mound of the Jews). Ruin-mound near Shibin el-Kanatr, midway between Cairo and Zagazig, Lower Egypt. Native diggers from 1870 onwards exposed and dispersed an exquisite alabaster-paved palace of Rameses III, with chambers lined with glazed mosaic tiles. In 1906 Petrie, who excavated the mound, found proofs of Hyksos occupation and also disclosed what may be the temple which Josephus says was built at Leontopolis about 170 B.C. by Onias IV, son of the high priest of Jerusalem, in imitation of Solomon's temple.

Teller of the Exchequer.

Former official in the exchequer whose duty was to collect all moneys due to the sovereign. The teller, or tallier, received them, and gave the clerk of the pells (*q.v.*) a bill to charge him with the amount. There were four tellers of the exchequer. The office was abolished in 1834. *See Exchequer.*

Tellicherry. A picturesque Moplah seaport of India. It is in Malabar dist., Madras state, and was the site of the E. India co.'s first factory on the Malabar coast, 1683. In 1781 the co.'s forces beat off an attack by Haider Ali. The frigate *Superb* was lost here in 1783. From the anchorage, a mile from the shore, coconuts, coffee, and spices are sent to Bombay and Colombo. Pop. 27,576.

Tell el-Amarna. Fresco of the Princesses, discovered in the ruins of the palace, probably representing the daughters of Akhnaton at play

Tello OR **TELL-LO.** Arabic name of ruin mounds 8 m. N.E. of Shatra, S. Babylonia. De Sarzec's excavations 1877-1901, continued by G. Cros, revealed the Sumerian city Lagash. The temple of the city-god Ningirsu and several palace buildings yielded many important examples of early art, including votive figures in copper of about 2450 B.C. *See Lagash.*

Tellurium (Lat. *tellus*, earth). One of the non-metallic elements. Its chemical symbol is *Te*; atomic no. 52; atomic weight 127.61; density, 6.25 gm per c.c.; melting point 452.5° C.; boiling point 1,390° C. It has a spiral chain type structure. Tellurium was first isolated in 1782 by Von Richenstein, and the discovery confirmed in 1798 by Klaproth, who suggested the name. Berzelius in 1832 showed that the element was closely related to sulphur and selenium. Besides occurring native with sulphur, selenium, gold, silver, etc., it is found in combination with metals in the form of tellurides, *e.g.* hessite, Ag_2Te , and tetradymite $Bi_2(TeS)_3$. Main sources are the slimes from the electrolytic purification of copper and lead and certain flue dusts. Production is confined to Canada and the U.S.A.

Separation of tellurium from selenium is accomplished by precipitating the latter from 28 p.c. hydrochloric acid by sulphur dioxide. Tellurium may be obtained from the oxide by reduction with carbon or with sulphur dioxide in dilute acid solution. The element forms compounds analogous to those of sulphur and selenium. Diethyl telluride has been used as an anti-knock agent, and other compounds in

artificial rubber and as a dark finish for electroplating silver. The presence of tellurium in steel and non-ferrous alloys improves machinability and ductility, while the addition of only 0.1 p.c. to chemical lead greatly improves resistance to wear and corrosion.

Telpherage (Gr. *tele*, far; *pherein*, to bear). Name given to a form of cableway transportation

in which the supporting trolleys are equipped with their own self-propelling electric motors. The trolley, usually known as the telpher, is supplied with electricity by an auxiliary wire, and may be controlled by an operator at certain points or by automatic switches. The term is more widely used for any form of ropeway transmission. *See Ropeway.*

Telugu. Agglutinative speech of the Dravidian family. The typical Andhra language, often called the Italian of India, it is spoken by some 23,000,000, mostly in N. Madras and Hyderabad, and by a few settlers in Ceylon. Its poetical literature, traceable back to the 9th century, has greatly influenced the colloquial language, which is taught at the London school of oriental studies. The Telugu-speaking peoples, of Tamil type, but taller and fairer, are energetic cultivators and seamen.

Tembuland. One of the Transkeian Territories of Cape Province, South Africa. It was formally proclaimed British territory in Nov., 1881, and annexed to Cape Colony in 1885. The country, in addition to Tembuland proper, comprises Bomvanaland and Emigrant Tembuland, and has a pop. of 27,680 Kaffirs and 5,292 Europeans. *See Transkei Territories.*

Teme. River of Wales and England. It rises on the borders of Radnor and Montgomery and flows S.E. to join the Severn 1½ m. S. of Worcester, after a course of 60 m. Its main affluents come from the Long Mynd, Wenlock Edge, and Cleve Hills.

Téméraire. British warship. The first and most famous to bear the name was a wooden vessel carrying 98 guns captured from the

French at the battle of the Nile. Under Harvey she fought at Trafalgar. Her record won for her the name of the Fighting Téméraire, and she was immortalised by Turner's picture, now in the National Gallery, showing her being tugged to her last berth. This was exhibited at the Academy in 1839, the year after she was broken up.

Temes or **Timis**. River of Central Europe, in the Banát. It rises in Rumania, in the Carpathians, and flows N., N.W., and W. round the heights of the E. Banát, passing Lugos, and then flows S.W. across the S. of that portion of the Banát which is in Yugoslavia, past Pančevo (Pancsova) to join the Danube, 6 m. E. of Belgrade, after a course of 250 m. Timisoara (Temesvar) lies a little N. of the W. end of the great bend of the river.

Temesvar. Hungarian name of the capital of the Banát, in this work called Timisoara.

Temme, EDWARD HARRY (b. 1904). British swimmer. A native of West Ham and a London insurance clerk, he became an international water-polo player, representing Great Britain at the Olympic Games in 1928.

Trained by T. W. Burgess (*q.v.*), he swam the English Channel from Cap Gris Nez to Dover, Aug. 5, 1927, in 14 hrs. 29 mins. After several attempts, by swimming from Dover to Cap Gris Nez, Aug. 18, 1934, he became the first person to swim the Channel in both directions, his time from England to France, 15 hrs. 54 mins., the fastest that way until 1948. Temme, who also swam the Bristol Channel, used the trudgeon stroke throughout. Later he became superintendent in turn of Nottingham, Hampstead, and Newport, Mon., baths. He trained Tom Blower, who broke his record in 1948. *Pron.* Temmy.

Temora. Township of New South Wales, Australia. It is 296 m. by rly. S. of Sydney, and is a trading centre for the goldfields and for the sheep-rearing district near by. Pop. 4,230.

Tempē (Gr., cuttings). Name of a valley in Thessaly, ancient Greece. Lying between Mts. Olympus and Ossa, about 6 m. long, and watered by the river Peneus, it was celebrated for its wild and romantic scenery. Associated with the wor-

ship of Apollo, it was one of the most important and most easily defensible passes of northern Greece. Its modern name is Lykostomo, wolf's mouth. Tempē was used by the Romans for any delightful valley.

Tempelhof. One of the 20 bors. of Berlin. Situated in the centre of the city, it has what was until the Second Great War one of the largest civil aerodromes in Europe. This was taken over by the Luftwaffe as a fighter base for the air defence of the city. Tempelhof and its airport were captured by the Russians on April 27, 1945. Under the Allied arrangements for dividing Berlin into sectors of occupation, it was part of the U.S. sector of the city, and was used during the Allied air transport of supplies into their sectors when the Russians closed surface routes in 1948.

Tempera (Ital., distemper). In painting, strictly, a medium of a glutinous nature such as yolk of egg, with which pigments can be mixed; by extension, the mixture itself. Tempera is one of the oldest forms of painting, and was the favourite medium for wall decoration until the introduction of fresco.

Temperament. Name applied to methods of tuning the constituent notes of a musical system. That in universal use is termed equal temperament, devised when the necessity for unfettered modulation arising from the development of the European system of music, caused the abandonment of the earlier mean-tone temperament, which, for practical purposes, would require the octave to be divided into more than twelve parts. The trouble arises from the incommensurability of the intervals of the fifth and the octave. If twelve fifths and seven octaves from C are tuned upwards in just intonation, we reach a B sharp in one case and a C in the other, which although regarded enharmonically as the same note, differ from each other by about an eighth of a tone, the vibrations being as 80 to 81.

Equal temperament consists in distributing this difference over all the twelve semitones of the octave, so that every interval, except the octave, is slightly out of tune. The fifths are a trifle flat, and the fourths correspondingly sharp. The result is that the seconds, thirds, sixths, and sevenths, are decidedly out of tune, though not enough to be offensive. Modulation of every kind thus becomes feasible, which

was not so with the mean-tone system, as with this it was impossible to use more than the major keys of E flat, B flat, F, C, G, D, and A and the minor keys of G, D, and A. The farther C major was left behind, the less could inflected notes be used enharmonically, *e.g.* E flat could not be used as D sharp. This difficulty was somewhat clumsily dealt with by means of divided keys, the two portions respectively giving the required enharmonics. *See* Harmony.

Temperance (Lat. *temperantia*). Literally moderation in anything. The word is specially used for temperance in the use of alcoholic liquors. The so-called temperance movement began in the U.S.A. and Great Britain in the 18th century and was first organized early in the 19th. Its pioneers sought to promote a temperate use of malt liquors, and abstinence from distilled spirits; next the suppression of all kinds of intoxicating drink. It has had three platforms, social, religious, and physiological, and from approaching the individual with arguments founded on Christian service or self-interest, it has proceeded to influence the law in favour of compulsory total abstinence for the benefit of the community as a whole, achieving notable victories in the U.S.A., where prohibition was nationwide 1919-33, and was maintained in several states. Scotland has "dry" areas by local option.

Among prominent temperance advocates have been Dr. Benjamin Rush, Lyman Beecher, Joseph Livesey, Father Mathew, Cardinal Manning, Sir Wilfrid Lawson, both archbishops Temple, Dean Farrar, Sir Victor Horsley, Frances Willard, Lady Henry Somerset, W. E. Johnson, Lord and Lady Astor, Dr. C. C. Weeks, Dr. C. W. Saleeby, Lord and Lady Snowden.

The movement became vital in the U.S.A. with the founding of the American temperance society at Boston, 1820; in the U.K. with that of the British and Foreign temperance society in London, 1831. The first world's temperance convention was held in London in 1846. After the Christian churches took up the campaign, societies and leagues sprang up in all directions; Bands of Hope were formed to interest the children, similar bodies to influence women; friendly and provident societies were founded on a temperance basis; temperance hospitals were started, the first in London in 1873; attention was devoted to the subject in the

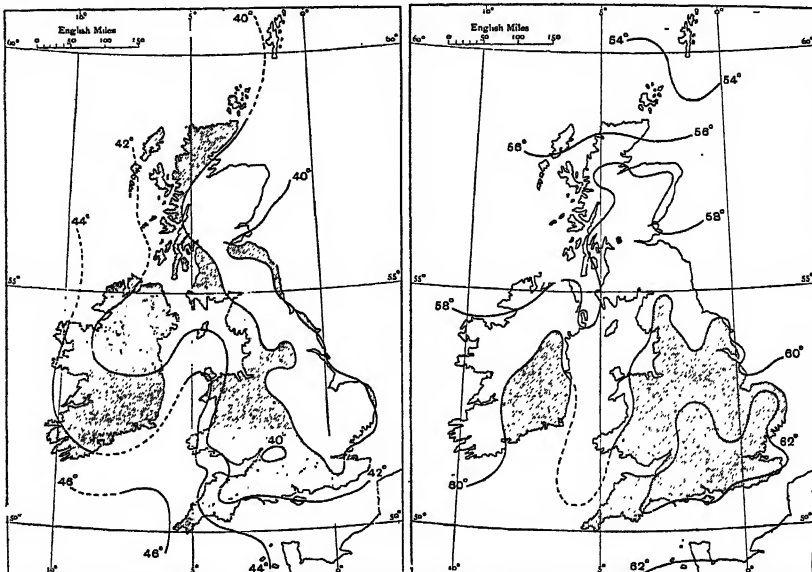

E. H. Temme,
British swimmer

British parliament and other legislative bodies, by medical men and by insurance societies; and it received marked impetus from the missions of Moody and Sankey and the Salvation Army, which from the start made total abstinence a condition of membership. The introduction of unfermented wine at Holy Communion was a revival of the practice of the Abstemii of the time of Calvin and Luther.

Among temperance organizations in Great Britain are the British Temperance League; U.K. Alliance for the Legal Suppression of the Liquor Traffic; U.K. Band of Hope Union; National Temperance League; and the orders of Good Templars, Rechabites, and Sons of Temperance. See Band of Hope; Gothenburg System; Licensing Laws; Local Option; Prohibition.

Temperature (Lat. *temperatura*). Condition which determines the flow of heat from one substance to another. It is essential to distinguish between temperature and heat, e.g. if a thin strip of platinum and another of copper are held for 10 secs. in the flame of a gas jet and then withdrawn, the copper strip will feel considerably hotter to the touch; both must have reached the same temp., viz. the state of hotness of the flame, but the copper has acquired more heat than the platinum. Again, the amounts of heat required to raise the temp. of a lb. of iron, a

Temperature. Maps showing, left, mean temperatures over the British Isles reduced to sea level for the month of January, taking an average from the years 1906 to 1935, and, right, for the month of July as averaged over the same period. The shaded areas have mean temperatures above 40° F. for January, and above 60° F. for July

From "Climate of the British Isles," E. G. Bilham (Macmillan)

gall. of water, and a cub. ft. of air from 60° to 70° C. differ, although the temp. changes are identical. Whenever two bodies are in thermal communication, there is an interchange of heat; should this result in a net gain to the one and a loss to the other, the temp. of the former is said to have been lower than that of the latter. On the other hand, if there is no net gain or loss by either, the bodies are said to be at the same temp.

Heat is conceived to be a form of motion; the heat which a body contains is the total energy of its atoms or molecules, the temp. being proportional to the average kinetic energy of one of these molecules. If we therefore imagine two bodies of the same material (hence whose molecules have the same mass) to be brought into contact, heat will then pass from the body whose molecules are moving faster to the one whose molecules are moving more slowly; the body which is the larger, i.e. possessing more molecules, will contain the greater heat. It is not possible to determine average molecular energy directly, but it is fairly easy to express temp. change as a change in some resultant effect. Generally, the rise of temp. of a body is accompanied by e.g. expansion of the body, increase in its electrical resistance, change in its electro-motive force. Any device for measuring temp. in this way is termed a thermometer, but

such scales of temp. are purely arbitrary since equal steps on a particular scale do not necessarily correspond to equal changes in the average molecular energy.

If heat is applied steadily to a solid, there is a gradual rise in temp. until the melting point is reached; the temp. then remains at this level until melting is complete, after which there is again a rise to the boiling point temp.; when the liquid is completely vaporised a further rise in the temp. of the gas may be brought about by continued heating. The freezing and boiling points of water under standard conditions (i.e. under a pressure of 760 mm. of mercury at sea level in lat. 45°) on the Centigrade scale are designated 0° C. and 100° C. and on the Fahrenheit scale 32° F. and 212° F. respectively. Sulphur melts at 112.8° C. and boils at 444.6° C.

Temp. is of vital importance to living things, and of all the meteorological elements its influence upon human distribution is the greatest. Waterless deserts can be rendered habitable by irrigation, but artificial heat and clothing are often inadequate to overcome hardship due to the low temps. of climates which do not permit vegetation. Winds, rainfall, cloudiness, etc., are dependent, either directly or indirectly, upon temp. The atmosphere owes its temp. almost entirely to the sun, which is continually radiating energy into

space. All of this solar energy does not reach the earth's surface; part is absorbed by the atmosphere, part is scattered by the molecules of air and tiny particles of dust—most of this eventually reaches the earth—and part is reflected back from the upper surfaces of clouds. Further reflection of the rays takes place from land, water, and, particularly, snow and ice surfaces. Of the half or more of the sun's heat which is neither absorbed by the air nor reflected, part is used up in evaporating water. The lower layers of the atmosphere are heated or cooled by the transference of heat by conduction, convection, and radiation from the surfaces on which they rest.

Atmospheric temp. decreases with alt. at a rate of approx. 5.5° C. per kilometre (.621 m.) up to the lower limit of the stratosphere, i.e., c. 7 m. on the average. There is, generally, very little change of temp. with height in the stratosphere. Observations, chiefly of sound waves refracted back to earth, indicate that from c. 15 m. to 30 m. higher the temp. again rises steadily, and reaches a maximum exceeding that at ground level. At greater heights the vertical distribution of temp. is more uncertain, but it appears that before the Heaviside or "E" region is reached (i.e., c. 65 m.) there is once again a fall to stratospheric temps., followed by another rise. After the Second Great War direct measurements of temp. made in the U.S.A. with German V-2 rockets, assigned the value of 60° C. to air at an alt. of 75 m.

The temperature of a place is usually measured by thermometers exposed about 4 ft. or so above the ground in special screens or shelters; it depends, directly, upon the sun's altitude and the duration of sunlight, and, indirectly, upon the warming of the air by heat transferred by winds. The hottest regions of the earth are not on the equator, which to some extent is screened by cloud, but the trade wind deserts, e.g. the Sahara, where in summer months the skies are continuously clear. The lowest temps. occur in winter in the interior of great land masses, e.g. N.E. Siberia, where nocturnal radiation is strong and lakes of cold air form. Temps. in these warm and cold areas have ranged from about 100° F. above to 125° F. below freezing point.

Land and sea distribution has a marked effect upon temp., the interior of a continent being subject to extremes of heat and cold, while

the oceans and the adjacent land areas enjoy more equable conditions. Temps. also depend upon the direction and character of the prevailing winds since air moving over the surface of the earth tends to carry with it the temperature of its place of origin, modified by its subsequent passage. Winds blowing from sea to land tend to ameliorate the climate, whereas winds from land to sea carry extreme conditions with them. The great ocean currents also play an important rôle, warm currents warming the winds, cool currents cooling them. Elevation is a principal factor in determining the temp. of a place; as a rule there is a decrease of approx. 1° F. for every 300 ft. increase in height. Snow- and ice-covered surfaces are efficient reflectors of solar radiation and radiators of terrestrial radiation; consequently the temp. of such surfaces sinks to very low levels, and even if there is sufficient heat to bring about melting, the temp. cannot rise above the freezing point as long as the snow or ice remains. Frozen seas behave in the same way as land surfaces. Local factors such as the slope of the ground and the nature of the soil also have their effects.

The isothermal maps accompanying this article indicate that in the British Isles summer temps. differ only slightly from those of corresponding latitudes. In Jan., however, the air over Scotland is, on the average, 25-35° F. warmer than the lat. warrants, with the result that the W. coast of Great Britain has virtually the same temp. from N. to S. The winter warmth of Great Britain is due to the autumnal and winter clouds which blanket the earth and pre-

vent the loss of heat, the relative warmth of the surrounding seas due to the surface drifts of warm oceanic water from the S.W., and the prevalent warm, moist, westerly winds. See Atmosphere; Boiling Point; Climate; Heat; Isotherm; Meteorology; Thermometer; consult also Climate of the British Isles, E. G. Bilham, 1938; Climate, W. G. Kendrew, 1938; The Oxford Advanced Atlas, J. Bartholomew, 1942; Climatology, B. Haurwitz and J. M. Austin, 1944.

A. J. Drummond, F.R.Met.S.

Temperature. In medicine, the temperature of the body may afford valuable help in the diagnosis of disease. In health the human bodily temp. is about 98.4° F., but varies slightly during the day, being most often rather higher in the evening than in the early morning. The temp. taken in the mouth or rectum is slightly higher than that taken in the armpit. A temp. below normal may occur in conditions of collapse following peritonitis, typhoid, cholera, and other fevers, poisoning by certain substances, and some injuries to the brain. An increase of temperature occurs in many forms of acute illness, as well as in acute fevers. Temps. as high as 112° F. have been observed in cases of tetanus and sunstroke; high temp. may be the result of the action of toxins on the heat-regulating centres of the brain.

Tempering. Metallurgical process of treating steel by heat. It follows hardening by quenching, and involves reheating the hardened steel to a certain temperature in order to remove internal stresses and to toughen it. Hardened steel has a hard, brittle constituent, martensite, which is iron supersaturated with carbon, and is usually internally stressed by the severity of quenching. On reheating to some temperature below 700° C., the internal stresses are relieved, and the martensite decomposes, carbon being precipitated as fine particles of cementite. These particles are dispersed throughout a matrix of a soft constituent, ferrite, and this tempered martensite structure imparts the best combination of strength and toughness. Where hardness and strength are the most desirable properties, as in tool steels, tempering is at about 200°-300° C., but where shock resistance is of supreme importance, the figure is 600°-700° C.

Temperley, HAROLD WILLIAM VAZELLE (1879-1939). British historian, born April 20, 1879. From Sherborne school he went to

King's College, Cambridge and then to Peterhouse. After holding a fellowship at the latter college for 34 years he was elected its master, being also university professor of modern history, in which capacities he died, July 11, 1939. Editor of the *Cambridge Historical Journal*, 1922-37, and several

H. W. V. Temperley,
British historian

times president of the international historical congress, Temperley was the leading British authority on the Near East. During 1917-21 he served at Salonica, went on missions to the Yugoslavs, and helped to draw the Albanian frontier. His big work on the foreign policy of Canning was published 1925. He was joint editor with G. P. Gooch of British documents in 11 vols. on the origins of the First Great War; projected a series of studies on England and the Near East, of which *Crimea* came out first in 1936; and wrote with A. J. Grant a text-book on Europe in the 19th and 20th centuries, new ed. 1938. Radio dramas of contemporary history were produced by Temperley with Laurence Gilliam.

Tempest, THE. Last of Shakespeare's plays, a romantic comedy written about 1610-11. Prospero, duke of Milan, as the result of a conspiracy by his brother Antonio, and Alonso, king of Naples, has been exiled with Miranda, his daughter, on a desert island. By the agency of Prospero's servant-spirit Ariel, the conspirators, with Alonso's son Ferdinand, are wrecked on the same island. Miranda and Ferdinand fall in love, Prospero consents to their union, forgives his brother and the king, abandons the magic to which he has devoted his time, and resumes his dukedom. An underplot concerns an unsuccessful conspiracy by Caliban, Prospero's monster slave, and the Neapolitans Stephano and Trinculo, to murder Prospero.

First printed in 1623, *The Tempest* seems to have been suggested by narratives of the wreck of Sir G. Somers in the Bermudas in 1610, and also indebted to Italian and German sources. In the soliloquies of Prospero, some commentators have found a suggestion that Shakespeare was taking leave of the stage. These passages and Ariel's songs touch his highest

poetic level. The play is short, 2,068 lines, including 458 in prose and 1,458 in blank verse. In a notable revival at His Majesty's, 1904, Tree played Caliban, and his daughter Viola was Ariel. John Gielgud was a fine Prospero, at the Old Vic, 1930 and 1940, and Ion Swinley acted the part at the Open-Air Theatre.

Tempest, DAME MARIE (1866-1942). British actress. Mary Susan Etherington was born in London, July 15, 1866; educated in Belgium; studied singing under Manuel Garcia at the R.A.M., and first appeared on the London stage in Suppé's *Boccaccio* at the Comedy Theatre, May 30, 1885. During the 1890s she was brilliant in musical comedy at Daly's, e.g. *The Geisha*, *A Greek Slave*, and *San Toy*. At the height of her popularity she abandoned this style to appear as Nell Gwynn in *English Nell*, 1900. In such rough parts she quickly became perhaps the most sparkling comedienne of her time. In Mrs. Dot, 1908, she created a type of character to which she long adhered. She was excellent in *Hay Fever*, 1926; *Mr. Pim Passes By*, 1928; *The First Mrs. Fraser*, 1929; *Theatre Royal*, 1934; *Dear Octopus*, 1938. Her jubilee as an actress was celebrated in 1935 by a performance at Drury Lane, when the proceeds were devoted to building a ward for members of her profession at St. George's Hospital. Marie Tempest was created D.B.E. in 1937. Her husband, Cosmo Gordon-Lennox (d. 1921), wrote some of her most successful plays; later she married W. Grahame Browne (d. 1937). She died Oct. 14, 1942.

Marie Tempest,
British actress

Templars. Name by which the knights of the order of the Temple are sometimes known. See *Knights Templars*.

Template or **TEMPLET** (Lat. *templum*, small timber). Pattern made of wood or sheet metal to show the outline size of a thing, the position of bolt-holes, rivet-holes, etc.

In masonry, templates are slabs of hard stone set in a wall to take the ends of a beam or girder, and so to distribute the stress over a greater area. In shipbuilding, the two wedges in a keel block which are knocked away when the block

is to be removed are called templates. In certain types of patchwork, a template of card or metal is used to ensure similarity in size and shape of patches.

Temple (Lat. *templum*). Building dedicated to the worship of a god or goddess. The first *templum* of the ancient Romans was simply the space of earth and sky marked off by an augur for divination.

Egyptian temples were built by degrees over a long period, each new king adding to the original plan by building new courts in, front of old ones, or converting courts into covered halls, until a vast area was covered by the sacred building. Permanence was ensured by the use of solid materials. Temples in Mesopotamia were constructed of unburnt bricks. In Egypt, the temple dominated all other buildings, in Mesopotamia it was subsidiary to the palace.

The Hindu temples of India resemble those of the Egyptians in regard to successive growth, though their style is widely different, the peculiar religious ideals of the Indians finding expression in luxuriant and involved ornamentation rather than in rational principles of construction. Many are cut out of solid rock. The pagoda form is well illustrated at Madura. Buddhist temples in China and Japan are generally of two storeys. The actual sanctuary is enclosed by a sort of cloister, and there are pagodas in the outer enclosure.

The Greek temple affords the most conspicuous examples of Greek architecture. Roman temples are mostly governed by Etruscan and Hellenistic influences. The circular temple, illustrated by the Pantheon and the Temple of Vesta in Rome, is a very ancient Italian type, to which the Romans clung for a long time. Roman temples as a rule rise on a high platform, with a flight of steps, and surrounded by a rectangular enclosure. See *Architecture*; Baalbek; Babylon, plate; Boro Budur; Buddhism; Cave Temple; Elephanta; Ellora; Greek Art; Kandy; Karnak; Mandalay; Pantheon; Parthenon; Peiping; Petra; Pola; Pompeii; Poona; Teocalli; Ziggurat.

Temple. In Hebrew history, the building at Jerusalem, the only authorised sanctuary of Jehovah. The site, occupied by three temples in succession, was on the E. ridge, sometimes called Moriah, separated from the main part of the city by the Tyropoeon valley. The existing area, called the Haram, is formed by enormous

Temple. Reconstruction of the temple built by Herod at Jerusalem, from the south-east. From the model by C. Schick

retaining walls, partly the work of Herod, and perhaps also of Solomon. Solomon's temple, described in 1 Kings 6, 7, appears to have belonged to the Phoenician type, with certain Egyptian and Aegean features. Destroyed by Nebuchadrezzar, 586 B.C., it was rebuilt by Zerubbabel, encouraged by Haggai and Zechariah, 520-516 B.C.

Herod the Great, who had in 37 B.C. carried the temple by assault, began 20 B.C. to rebuild it on a magnificent scale. The area, doubled in size, and 26 acres in extent, was surrounded by a lofty colonnade, triple on the S. side. It was burnt by the Romans, A.D. 70.

Temple. Group of buildings formerly standing in Paris, originally the headquarters of the Order of Knights Templars. Here Louis XVI, his sister Elizabeth, his wife Marie Antoinette, his daughter, and his son, Louis the dauphin, were confined on Aug. 13, 1792. The dauphin, called Louis XVII (*q.v.*), was kept a prisoner in the Temple until Jan. 19, 1794, under the care of a cobbler, Antoine Simon, and his wife. It was announced that he had died on June 8, 1795, but rumours that he had escaped were never definitely disproved.

Temple, EARL. British title held by the family of Temple since 1749. In the 14th century the Temples were seated at Temple Hall, Leics. A younger branch settled in Bucks, where about 1590 John Temple bought the estate of Stowe. His son Thomas was made a baronet in 1611, and from him the earls are descended.

The title was first bestowed upon Hester, daughter of Sir Richard Temple of Stowe. She married Richard Grenville, who died early, and their son was Richard Grenville Temple (1711-79), first earl.

In 1756 he became first lord of the Admiralty by the influence of his brother-in-law, the elder Pitt; and he

1st Earl Temple, British politician

was lord privy seal 1757-61. George Grenville (*q.v.*) was his younger brother. On Richard's death the earldom passed to his nephew, George Grenville-Temple-Nugent. Twice lieutenant of Ireland, he was made marquess of Buckingham, and was the father of the first duke of Buckingham and Chandos. The latter in 1822 was created Earl Temple of Stowe, with remainder to his granddaughter Anna, who married W. H. P. Gore-Langton. On the death of the 3rd duke of Buckingham in 1889, the original Temple earldom became extinct, and the new one passed to W. S. Gore-Langton. In 1940 Chandos Grenville Temple-Gore-Langton (b. July 13, 1909) became 6th earl.

Temple, DOROTHY, LADY. This English letter-writer who married Sir William Temple is better known by her maiden name, Dorothy Osborne (*q.v.*).

Temple, FREDERICK (1821-1902). British prelate. He was born at Santa Maura, or Leucadia, Ionian Islands, Nov. 30, 1821, second son of the lieutenant-governor of Sierra Leone, and was educated at Blundell's and Balliol College, Oxford, of which he became fellow and

Frederick Temple, British prelate

lecturer. Ordained 1846, he was examiner to the board of education, 1848-49; principal of Kneller Hall, 1849-55; inspector of men's training colleges, 1855-57; for 12 years headmaster of Rugby; bishop of Exeter from 1869 until in 1885 translated to London; and archbishop of Canterbury, 1896-1902. He died at Lambeth, Dec. 23, 1902, and was buried at Canterbury.

Temple was perhaps the greatest schoolmaster after Thomas Arnold. His contribution on *The Education of the World to Essays and Reviews*, 1856, aroused a storm of criticism from those who doubted his orthodoxy. His other publications were *Sermons Preached in Rugby School Chapel*, 1861-71; and the *Bampton lectures on Relations between Religion and Science* 1884. *Consult* Life, W. F. Aitken, 1903.

Temple, SHIRLEY JANE (b. 1923). American film actress. Born at Santa Monica, Calif., April 23, 1923, she first appeared on the screen at three, and a full-length film, *Red-Haired Alibi*, 1933, established her as an infant prodigy. In a succession of films over the next three years—*Stand Up and Cheer*, *Baby Takes a Bow*, *Bright Eyes*, *Our Little Girl*—she sang, danced,

Shirley Temple, American film actress, as she appeared in her early films

and acted with such extreme naturalness that there was no bigger box-office draw in the U.S.A. or Great Britain. Rebecca of Sunnybrook Farm, 1938, was her last important picture as a little girl, but she developed into an ingénue, playing in *Fort Apache*, 1948.

Temple, SIR WILLIAM (1628-99). English diplomatist and essayist. Eldest son of Sir John Temple (1600-77), master of the rolls in Ireland, he was born in London and educated at Emmanuel College, Cambridge. After a period of foreign travel, he married in 1655 Dorothy Osborne (*q.v.*). Having represented Carlow in the Irish parliament since 1660, he began his diplomatic career in 1665. In 1668 he effected the Triple Alliance

Sir William Temple, English diplomatist

between England, Holland, and Sweden; and in 1677 brought about the marriage of William of Orange and Mary. He several times refused a state secretaryship, and spent the latter part of his life at Moor Park, Surrey, where Swift was his secretary. He died Jan. 27, 1699, and was buried in Westminster Abbey. A brilliant diplomatist, Temple wrote memoirs, letters, verse, and essays, easy and graceful in their style. *Consult Works*, 4 vols., 1814; *Memoirs*, T. P. Courtenay, 1836; *Letters of Dorothy Osborne*, ed. E. A. Parry, 1888; *Sir William Temple*, C. Marburg, 1932.

Temple, WILLIAM (1881-1944). British prelate. Born at Exeter Palace, Oct. 15, 1881, he was the

William Temple,
British prelate

second son of Frederick Temple, bishop of Exeter and later archbishop of Canterbury. William went to Rugby and Balliol, and at Oxford a brilliant career led to a lectureship in philosophy at Queen's College, 1904-10. He did not take holy orders until he was 27. He became chaplain to the archbishop of Canterbury (R. T. Davidson), 1910; headmaster of Repton, 1910-14; and held the rectory of S. James's, Piccadilly, during the First Great War. Chaplain to the king and canon of Westminster, he received in 1921 the bishopric of Manchester. Archbishop of York from 1929, he succeeded Lang at Canterbury in 1942.

Temple was one of the outstanding English archbishops. A man in whom great gifts went side by side with humility, of abounding vitality and singleness of purpose, he aimed at a revitalised Church and breathed something of his own fervour into its activities. His social conscience was sensitive, and injustice aroused in him righteous anger. The man who had been president of the Workers' Educational Association, 1908-24, was not so much an orthodox Socialist as one who believed that the profit motive must be harnessed to the idea of social service. Speaking on this and kindred subjects, he could fill the Albert Hall; but at the height of his influence, on Oct. 26, 1944, he died suddenly.

He had published *Plato and Christianity*, 1916; *Personal Religion and the Life of Fellowship*,

1926; *Christianity and the State*, 1928; *Thoughts on Some Problems of the Day*, 1931; *Nature, Man, and God*, 1934. His *Life and Letters* were the subject of a book by F. A. Iremonger, 1948.

Temple, INNER AND MIDDLE. District of London. It lies between W. Fleet Street and E. Strand and

Temple. Arms of, left, the Inner; right, the Middle, Temple

the Thames. The property, 1184-1313, of the Knights Templars (*q.v.*), then of the Knights of S. John of Jerusalem (*q.v.*), from 1608 it belonged to the two inns of court named after it, who jointly maintained the church.

The E. or Inner Temple portion is marked by the device of a winged horse; the W. or Middle Temple by the lamb and flag. Each society is independent, and both date from the 15th century. In 1668-69 and 1678-79, the City made unsuccessful attempts to assert authority over the precincts. The ancient privileges included the right to hold a court leet and the right of sanctuary. Much damage was done by fire in 1666, 1677, 1678, and 1941. The gate-house in Fleet Street of the Inner Temple dates from 1610-11; Inner Temple Hall, built by Smirke in 1866, was completely destroyed in an air-raid, May 10-11, 1941. Middle Temple gate-house was repaired in the time of Henry VIII; Middle Temple Hall was built 1562-72, and stone-faced 1757, the entrance tower being added in 1832. Damaged by incendiary bombs 1941, it was restored and reopened in 1949. In Middle Temple

gardens, Shakespeare (Henry VI, part 1) places the incident leading to the Wars of the Roses. Middle Temple library, opened in 1861, was declared a dangerous structure in 1944, as the result of a nearby bomb explosion. The precinct is redolent of literary as well as legal memories. *See Inns of Court. Consult The Temple*, H.H.L. Bellot, 1914; *The Ravages of the War in The Inner Temple*, Sir F. MacKinnon, 1945.

Temple Bar. W. boundary, at the N. side of the Temple, of the City of London liberties. The spot has been marked since 1880 by Temple Bar memorial. The 13th cent. bar or chain was superseded in 1533 by a stone gateway, which, damaged by the Great Fire, was replaced in 1670-72 by another, built by Wren. This was removed, 1878-79, and put up again in 1888 by Sir H. B. Meux at Theobald's Park, near Waltham Cross. Wren's gate was adorned with statues of Charles I and II, James I, and Anne of Denmark; heads of felons and traitors were until about 1772 displayed on iron spikes projecting from the top; and over the central arch was a room, once occupied by Pynson the printer. At Temple Bar, on a royal visit to the City,

Temple, London. The Cloisters, with the Temple Church, bottom picture, as they appeared before the Second Great War. Top, the same corner after the severe air raids which greatly damaged the Temple as a whole in 1941

has been observed since early times the custom of the lord mayor presenting the civic sword to the sovereign, by whom it is returned. See Griffin; Pillory.

Temple Church, THE. Church belonging to the Inner and Middle Temple inns of court, London. One of the four round churches in England, the others being Cambridge, Northampton, and Little Maplestead, Essex, it was erected by the Knights Templars (*q.v.*), dedicated to S. Mary, and consecrated in 1185 by the patriarch of Jerusalem, its form being that of the Holy Sepulchre.

The Round is of transition Norman work; the choir, Early English, was added in 1240, its S. half being allocated to the Inner, and the N. to the Middle Temple; raised seats in the aisles

Temple Church, London. The original round church, from the north-west, as it was before the Second Great War, during which it was severely damaged in an air raid

were reserved for benchers. The entrance to the church is a fine porch. Restorations were carried out by Smirke in 1839-42 James Howell, John Selden, and Edward Thurlow were buried here. Goldsmith's grave is in the churchyard N. of the choir. Remains of the chapel of S. Ann on the S. side were removed in 1825. The church.

which was noted for its musical services, is exempt from episcopal jurisdiction; its masters (preachers) have included Richard Hooker and Alfred Ainger. The organ built

came later to the Meynell Ingrams. From them it was inherited by the Hon. E. Lindley Wood, afterwards 1st earl of Halifax, who sold the estate in 1921 to the corporation of Leeds. The house, which is now used as an art gallery and museum, and the extensive grounds form one of the chief amenities of that city, with which Temple Newsam is

Temple Bar. The old London gate as it was erected in Theobald's Park, Hertfordshire. Top, left, the Bar before its removal in 1878, seen from the Strand

late in the 17th century was destroyed by fire during the air raid of May 10-11, 1941, as were the recumbent marble figures of Templars dating from the 12th-13th cents., which the church contained; the structure of the church was reduced to a shell and the master's house, which dated from after the Great Fire, was destroyed. See

Temple. Consult The Temple Church, T. H. Baylis, 1893; The Church of the Knights Templars in London, G. Worley, 1907.

Templemore. Urban dist. and market town of Tipperary, Eire. The centre of an agricultural area, it stands on the Suir, 11 m. S. of Roscrea, with a rly. station. The town was founded by the Knights Templars, of whose castle only a gateway remains. Market day, Wed. Pop. est. 2,300.

Temple Newsam. Estate of Yorkshire (W.R.), England. It is 3½ m. from the centre of Leeds. The name is due to the fact that here, in 1181, the Knights Templars built one of their houses. After the suppression of the order, the estate passed to the family of D'Arcy and

connected by tram and bus. Temple Newsam is thought to be the original of Templestowe in Scott's Ivanhoe.

Templewood, SAMUEL JOHN GURNEY HOARE, 1st VISCOUNT (b. 1880). English politician and diplomatist. He was born Nov. 24, 1880, and educated at Harrow and New College, Oxford. He entered politics

in 1905, becoming assistant private secretary to A. Lyttleton, then colonial secretary, and in 1910 was elected Conservative M.P. for Chelsea, a seat he held until raised to the peerage in 1944. During

1922-24 and from Nov. 1924 to 1929 he was Air minister, and Indian secretary during 1931-35. Foreign minister in 1935, he was forced to resign by the

Lord Templewood, English politician

hostile criticism aroused by the Hoare-Laval Pact (*q.v.*). Returning to the govt. as Home secretary in 1937, he again became Air minister in 1940, but was sent to Spain as ambassador in the same year and stayed in that post until 1944. His efforts to keep Franco Spain out of the war were described in his book *Ambassador on Special Mission*, 1946. In 1937 he made the first civilian flight to India, described in *A Flying Visit*, published the same year. He was well-known as an athlete, having represented Oxford at tennis and rackets, and being a first-rate skater.

Tempo (Ital., time). Term relating to the pace of music, and not to time (*q.v.*) in the technical sense. It is usually indicated by Italian words which have now gained a cosmopolitan meaning

These words are sometimes exact in signification, *e.g. Lento*, slow; *Presto*, quick; sometimes they are indicative of character, *e.g. Allegro*, gay; *Andante*, going. They can be modified by the addition of other words such as *più*, more; *meno*, less; *molto*, much; *poco*, little; and by terminations such as the superlative form of an adjective (*Prestissimo*), or a diminutive (*Allegretto*).

Temporal Power. Term applied to the civil authority formerly exercised by the pope. With the removal of the seat of the Roman empire to Constantinople the authority of the bishops of Rome became largely territorial; but the actual origin of the temporal power dates from the victorious struggle with the Iconoclast emperors in the 8th and 9th centuries. Thenceforward the popes ruled over the greater part of central Italy with unquestioned authority until the end of the 18th century, when Napoleon incorporated the papal provinces in the Cisalpine republic. On the downfall of the empire the popes resumed their temporal dominion, which was, however, curtailed to the city of Rome itself in 1859. Their last foothold was lost in 1870 with the capture of Rome by the Italians. *See* Papacy.

Temps, Le. Former French daily newspaper. Established in Paris, April 24, 1861, by Auguste Nefftzer (1820-76), a native of Alsace, it soon became widely known as an exponent of moderate political views. In 1867 it came under the control of the Hébrard family, who continued in ownership for many years. It was the most influential organ of the French press, and its outstanding achievement was to win over the French bourgeoisie to republican institutions. Among its many famous contributors were André Tardieu (foreign editor, 1902-14), Ernest Lavisse, Sainte-Beuve, Renan, George Sand, and Francisque Sarcey, perhaps its most famous theatrical critic. After the liberation of Paris in 1944 *Le Temps* was closed down, like all other papers which had continued to appear during the Nazi occupation; but its place was taken by *Le Monde*.

An earlier *Le Temps*, founded by Jacques Coste, was published during 1829-42, and had Guizot among its contributors.

Temptation (Lat. *tendere*, to stretch). Condition of being tempted or persuaded, usually to evil. The term is applied specifically to the experience of Jesus Christ in

the wilderness when, after fasting 40 days and nights, the devil appeared to Him (Matt. 4), and to the appearance of the serpent to Eve (Gen. 3).

Temuco. City of Chile and capital of the rich agricultural prov. of Cautin. It lies 430 m. S. of Santiago. Apples, barley, oats, timber, and wheat are the principal products of the dist. It is the h.q. of the S. American Missionary Society. Pop. 84,696.

Ten, COUNCIL OF. Supreme tribunal of the former Venetian Republic. It originated after the rising of 1310, when Bajamonte Tiepolo headed the popular outcry against the despotic closing of the grand council. Tiepolo's rising was suppressed and a council of ten members of the patrician class was hastily summoned to investigate the causes of the revolt, and punish those concerned. In 1335 the council was made permanent, and, thereafter, until the overthrow of the republic in 1797, it governed the city, sometimes assisted in emergencies by a giunta of 20. The council had supreme power and authority to examine and determine all political, criminal, and domestic affairs, and, though its methods were secret and often tyrannical, it ruled the republic justly, and saved it from foreign aggression. The council consisted of the doge and ten annually elected members. *See* Venice.

Tenacity (Lat. *tenere*, to hold). State or condition of holding fast. The term is used in physics for the greatest stress a substance can bear without breaking. This is usually estimated in tons per sq. in. Different metals have different tenacity values, varying from 1 for lead to 100 for certain kinds of steel. *See* Engineering; Strain and Stress.

Tenant. In English law, one who holds, *i.e.* possesses property of which another is the owner. In theory, no one in England is the owner of land. He always holds of someone; and, if of no one else, of the king. This is part of the feudal law. Thus we speak of a tenant in fee simple, a tenant in fee tail, a tenant for life, a tenant for years, a tenant from year to year, a weekly tenant, and the like. In a more limited sense, a tenant is one who holds for a definite period, subject sometimes to notice to quit, at a rent. A service tenant is one who holds a tenement as part of his contract of service, and as part of his remuneration, *e.g.* a gardener whose employer provides

him with a cottage. *See* Land; Landlord; Rent Restriction.

Tenant-right. In England, a custom whereby an outgoing agricultural tenant can recover from his landlord compensation for some labour expended, or improvement effected by the tenant in the holding, of which, by reason of the termination of the tenancy, he has not reaped the full benefit. *See* Agricultural Holdings Acts.

Tenasserim. River of Burma. It rises in the Tenasserim coastal range, flows N., and then curves round to flow S. to enter the Bay of Bengal round the S. end of the range in the neighbourhood of Mergui. Its length is 200 m.

Tenasserim. A division of Burma. It occupies the S.E. of the prov., and includes the long narrow extension E. of the Gulf of Martaban, and the lower Salween Valley. The rainfall is exceptionally heavy, varying from 200 ins. in the centre to 150 ins. in the N. and S. Rice is the chief crop. Except in the Amherst and Thaton dist. the land is almost entirely incapable of cultivation. Tin is mined in parts. The chief towns are Moulmein, Mergui, and Amherst. Tenasserim, which became British in 1826, covers 35,886 sq. m. Pop. 2,110,420.

Tenbury or TENBURY WELLS. Market town of Worcestershire, England. It is 22 m. N.W. of Worcester on a branch rly., in a corner of the co., and on the river Tem, which here forms the boundary with Shropshire. There are pump and bath rooms for the medicinal springs which yield water beneficial to gouty and rheumatic complaints. Near by is the church and college of S. Michael, built in 1856. Market day, Tues. Pop. 1,755.

Tenby. Mun. bor., seaport, and watering-place of Pembrokeshire,

Tenby, Pembrokeshire. Parish church of S. Mary, from the N.W.

Wales. With a station on the main rly. it is $9\frac{1}{2}$ m. E. of Pembroke, on Carmarthen Bay. Formerly a busy port, it now depends on its increasing popularity as a seaside resort. The town walls, repaired by Henry VIII, are mostly existing, while in the ruined castle the keep, built by the Flemings, is almost intact. The parish church of S. Mary was restored in 1885. There was a Flemish colony of weavers in Tenby in the 12th century. Market days, Wed. and Sat. Pop. 4,108.

Tench (*Tinca vulgaris*). Fresh-water fish of the carp family. It is native to Europe, including Great

Tench. European fresh-water fish about 18 ins. long

Britain, and parts of Asia Minor. Attaining a length of about 18 ins. with a weight between 3 lb. and 4 lb., its upper parts are coloured a rich olive, which pales to a light grey beneath; but the coloration varies considerably with surroundings. The reddish-brown or violet fins are all rounded, the scales very small, and the fleshy lips have a small barbule at each angle. The fish is thickly coated with mucus. It inhabits still waters, preferably those with deep muddy bottoms, in which it can hibernate, and on which in summer it prefers to lie lazily. It feeds on water-weeds and the snails and insects found among them. Carefully cooked the tench is a palatable food.

Tenchebrai, BATTLE OF. Fought between Henry I of England and his brother, Robert, duke of Normandy, Sept. 28, 1106. Henry had invaded Normandy and the rival armies met outside the town of Tenchebrai. The English king dismounted his knights and arranged them in a solid mass, and although the Norman cavalry had an initial success, Henry's phalanx drove the rival infantry in utter rout before it. The results of the battle were important; Robert was taken prisoner and Normandy came under Henry's rule. The town, called in modern times Tinchebrai, lies 13 m. N.N.W. of Domfront, in the dept. of Orne, on the road and rly. between Flers and Granville, and is specially interested in making hardware.

Tencin, CLAUDINE ALEXANDRINE GUÉRIN DE (1681-1749). French novelist. She was born at Grenoble, and having failed to find a vocation in a religious community, was released from her vows and in 1714 went to Paris. There she established a salon and led a brilliant but irregular life, Cardinal Dubois and possibly the regent Orléans being among her numerous lovers. She died Dec. 4, 1749. She wrote several romances, notably *Mémoires du Comte des Comminges*, 1735, and *Le Siège de Calais*, 1739. *Mémoires Secrètes de Madame de Tencin*, and her correspondence with her brother, were published in 1790. Consult *Madame de Tencin*, P. Masson, 1909.

Claudine de Tencin, French novelist After Des Neiges

Ten Commandments, THE. Term used for the Decalogue, or code of ten laws given through Moses to the children of Israel. They formed part of the Jewish law and were adopted by the Christian Church. See Decalogue.

Tende, COL DE (Ital. Col di Tenda). Alpine pass in S.E. France. It separates the Maritime from the Ligurian Alps. A carriage road traversing a tunnel 2 m. long at an alt. of 4,300 ft. connects Nice with Cuneo; there is also a 5 m. long rly. tunnel at 3,400 ft. Formerly Italian, the area in which the Col de Tende lies was surrendered to France in the peace treaty of 1947.

Tender (Lat. *tendere*, to stretch out). In English law, an offer to pay a debt. To constitute a legal tender, the debtor must actually produce the exact sum and offer to pay it then and there. It must be made in legal coinage. (See Legal Tender.) The word is also used for an offer made to supply goods or services, with an estimate of prices to be charged, to a firm or council in response to an "invitation to tender."

Tender (shortened from attendant, attendant on). Vehicle coupled to the rear of a locomotive engine. Part of the tender is constructed as a water tank for replenishing the boiler, and the rest of the space may form either a bunker for carrying coal or wood fuel, or a tank for oil fuel. A small vessel which conveys passengers, mails, or supplies to or from a larger vessel is also called a tender. See Locomotive.

Tendon. Fibrous cord which connects the fleshy part of a muscle with the bone into which the muscle is inserted. Rupture of a tendon is most frequently the result of violent strain.

The tendon of Achilles is a stout tendon forming the lower part of the gastrocnemius muscle. It passes down the leg and is inserted into the back of the heel. The name perpetuates the legend that it was the place where Achilles was vulnerable, because he had been held by the heel when dipped in the water of immortality.

Tendrill. In botany, a twining thread-like organ by means of which certain plants cling to a support. It is extremely sensitive, and when it rubs against the rough surface of a suitable support, twines many times round it. In some plants it is a modification of the whole leaf; in others, one or more leaflets of a compound leaf are modified; in the white bryony, vine, and other plants it is a modified side-shoot. See Climbing Plant.

Tenebrae (Lat., darkness). Name given in the R.C. liturgy to the office of matins and lauds of the three last days of Holy Week (*q.v.*). Originally said in the early hours of the morning, the combined office is now said or sung on the evenings of the Wed., Maundy Thursday, and Good Friday.

Tenebrae for each day consists of 16 psalms with their antiphons, together with certain lessons and responsories dealing with the Passion; the name being taken from the responsory after the fifth lesson on Good Friday, beginning, *Tenebrae factae sunt dum crucifixerunt Jesum Judaei* (There was darkness while the Jews crucified Jesus).

While the psalms are being sung all save the topmost of the fifteen tandles in the triangular candlestick are extinguished one by one; during the chanting of the Bene-

Tendon. Diagram of tendons at back of leg. A. Semitendinosus. B. Semimembranosus. C. Biceps. D. Tibial nerve. E. Gastrocnemius. F. Tendon of Achilles

dictus the six altar candles are put out; and at its conclusion the remaining light from the candlestick is hidden under the epistle side of the altar. After the Pater Noster and Miserere have been said in darkness, a clapping or rattling noise is made to represent the confusion of Nature at the death of its Author, and the lighted candle is then produced as a symbol of the Resurrection.

Tenedos. Turkish island in the Aegean Sea off the W. coast of Asia Minor. It played a considerable part in Trojan times. It exports wines and raisins. About 6 m. long and 2 m. broad, its area is 16 sq. m. and its pop. some 5,000. Formerly belonging to Turkey, it passed to Greece under the treaty of Sévres, 1920, but was returned to Turkey in 1923, though with the proviso that it should be demilitarised.

Tenerife OR TENERIFFE. Chief island of a maritime prov. of Spain of the same name, and the largest of the Canary Islands. It is of volcanic origin and is crowned by the famous Peak of Tenerife, El Pico de Teyde, 12,185 ft. alt., with a crater 300 ft. in diameter and 70 ft. deep. The Peak may be seen more than 100 m. away and forms a valuable landmark for navigators. The top is snow-clad in winter. Dates, coconuts, cotton, grain, sugar, bananas, and grapes are the chief products of the island. Its area is 782 sq. m. Pop. 401,283. The chief town and seaport is Santa Cruz de Tenerife, cap. of the prov. Pop. 79,928.

Tenerife, Canary Islands. The town and seaport of Santa Cruz de Tenerife, capital of the province

Tengri Nor. Lake of Tibet. It stands at an alt. of over 15,000 ft. 80 m. N.W. of Lhasa, and is about 50 m. long.

Tengyueh. Walled town on the W. border of Yunnan prov., China, situated at an alt. of 5,360 ft., on the Namti, a tributary of the Taiping river. It was opened as a

David Teniers the Younger. Portrait of Himself in an Inn, a painting characteristic of this Flemish artist's style

treaty port in 1902. Captured by the Japanese advancing from Burma during the Second Great War, Tengyueh was recaptured Aug. 4, 1944, by the American trained and equipped Chinese 2nd army advancing from the Salween (*g.v.*) river. Pop. 21,861.

Teniers. Name of a family of Flemish artists. The first to attain distinction was David Teniers the elder (1582-1649). He studied under Rubens and passed most of his life in Antwerp. The National Gallery, London, and other European galleries contain examples of his work.

David's son, David Teniers the younger (1610-90), was born in Antwerp, Dec. 15, 1610. He studied under his father and became painter to the court of the Hapsburgs at Brussels, giving lessons to Don John of Austria. Nearly 1,000 of his works are known to exist; mostly small genre paintings, they are found in many public and private collections. They show the life of the

peasantry, especially their pleasures, and bear witness to the influence of Rubens. A notable example is *The Village Fête*, in the National Gallery, London. Teniers, who married Anna, daughter of Jan Brueghel (*g.v.*), founded the academy at Brussels in 1663. He died at Brussels,

April 25, 1690. He had a son David who also became a painter.

Tenison, THOMAS (1636-1715). English prelate. Born at Cottenham, Cambs, Sept. 29, 1636, he was educated at Norwich and Corpus Christi, Cambridge. Ordained in 1659, he held livings in Cambridge and at Norwich—S. Peter Mancroft—and in London—S. Mar-

Thomas Tenison, English prelate

tin-in-the-Fields. In 1691, having secured by his actions and by his Protestant zeal during the reign of James II the favour of William III, he was made bishop of Lincoln. He delivered the funeral sermon on Mary II, and in 1695 became archbishop of Canterbury, taking an active part in affairs of state until his death, Dec. 14, 1715.

When at S. Martin-in-the-Fields, Tenison built and endowed a school for boys and established a public library, the first in London. From 1871 the school was in Leicester Square until in 1928 it was moved to a new building near the Oval at Kennington. The old premises were bombed in the Second Great War.

Tennant, SIR CHARLES (1823-1906). British merchant. Born at Glasgow, Nov. 4, 1823, he was educated there, and in 1846 joined his father as partner in the family chemical works at St. Rollox. Tennant also secured interests in explosive, mining, and other companies. As a Liberal he represented Glasgow and Peebles and Selkirk

in parliament, 1878-86, and in 1885 was made a baronet. He died June 4, 1906, leaving over £3,000,000 to his three sons. The eldest was made Lord Glenconner (1859-1920), and the youngest, Harold John (1865-1935), was secretary for Scotland, 1916. One of Sir Charles's daughters, Margot, became the countess of Oxford and Asquith (*q.v.*).

Tennantite. In mineralogy, one of the grey copper ores, sulphide of copper and arsenic, often contains some antimony and grading towards tetrahedrite (*q.v.*). Tennantite occurs in association with other minerals of copper.

Tenné or **ORANGE** (Old Fr., *tawny*). In heraldry, one of the little-used colours. It is represented in drawing by lines from sinister chief to dexter base, crossed by vertical lines.

Tennessee. River of the U.S.A. Formed by the union of the French Broad and Holston rivers above Knoxville, it flows S.W. through Tennessee into Alabama, re-enters Tennessee, following a generally N. course through that state, and finally traverses Kentucky to join the Ohio at Paducah. Including the Holston it has a total length of about 1,200 m. It is fed by a soaking rainfall—84 ins. a yr. in some places. Even before the Tennessee Valley Authority (*v.i.*) began construction, the federal govt. had spent up to 1927 about £10,000,000 on improving navigation of the Tennessee and its tribs. By 1933 the income per head in the valley had sunk to 40 p.c. of the national average, so much had erosion and flood of "America's worst river" reduced the output of the farms.

Tennessee. East central state of the U.S.A. It has an area of 42,246 sq. m. The surface ranges from the Great Smoky and Unaka Mts. in the E., along the border with N. Carolina, through tablelands and basins to bluffs of the Mississippi, which flows along the W. border, separating the state from Arkansas and Missouri. Here is the major portion of 41,000 sq. m. of the Tennessee River Valley, scene of the great experiment conducted by Tennessee Valley Authority (*v.i.*). Other river systems are those of the Mississippi and Cumberland. Alts. range from Clingman's Dome, 6,643 ft., in the Great Smoky Mts., to 182 ft. on the Mississippi. Agriculture is the predominant industry; crops include maize, oats, hay, potatoes, and peanuts. Some 30,000 sq. m. of forest yield valu-

able hardwood. The state ranks seventh in output of cotton and fifth among tobacco producers. Minerals include coal, lead, zinc, and marble, and there is a high yield of aluminium, copper, pyrites, and sulphuric acid.

Largest cities are Memphis, Nashville (the capital), Chattanooga, and Knoxville, the last an administrative centre of T.V.A. At Oak Ridge, 18 m. N.W. of Knoxville, was one of the towns built to accommodate workers on the first atomic bomb. There are six universities, including Tennessee, Vanderbilt, and Fisk (for negroes), and the George Peabody college for training teachers. Two senators and 10 representatives are returned to congress. Pop. 2,915,841.

First visited by de Soto in 1541, Tennessee was successively claimed by Spanish, French, and English, but the first permanent settlement was not made until 1757, when it was part of N. Carolina. It was ceded to the U.S.A. in 1790 as part of the territory S. of the Ohio, and joined the Union six years later. The nickname of Volunteer State dates from its record in supplying troops for the Mexican Wars. Except Virginia, it was the principal battleground of the Civil War, and the first confederate state to be readmitted to the Union. The original Ku-Klux-Klan (*q.v.*) was formed at Pulaski, 1865. The history of Tennessee was written by P. M. Hamer, 1933.

Tennessee Valley Authority. American government planning agency. One of the world's boldest as well as largest ventures in regional reconstruction and state planning, it was created by an act of congress in 1933. Its operations affect seven states (Tenn., Va., Ky., Ala., Ga., N.C., and Miss.). The authority owns 26 immense dams on the Tennessee River and its tribs., by which destructive floods are prevented, seasonal fluctuations levelled off, a 650-m. channel kept suitable for ships of 9 ft. draught, and hydro-electric power developed. Norris Dam, on the Clinch, is the chief of these. By 1947, T.V.A. power, distributed by 92 municipalities and counties, was being used by 743,000 customers. In connexion with the scheme 150 million trees were planted. There are soil clinics and demonstration farms, and experiments are carried out in chemical, agricultural, and biological research laboratories; one result being the wiping out of malaria, another the arrest of soil erosion,

in areas covered by the authority. By 1948 T.V.A. had spent about \$750 million (£185 m.), raised the income level of 3½ m. people by 75 p.c., and created 9,000 miles of shore open to recreation along new lakes. T.V.A. power fed the plant at Oak Ridge, Tenn., which in 1941 secretly began the production of the atomic bomb.

Tenniel, SIR JOHN (1820-1914). British pictorial artist and cartoonist. He studied at the R.A. schools, and was cultivating the severest form of high art when in 1850 he was invited to fill the vacancy left by Doyle on Punch. In 1862 he began to supply a

Sir John Tenniel,
British artist

weekly political cartoon regularly, and continued this work till he retired in 1901. Although deprived early, through a fencing accident, of the sight of one eye, Tenniel was a meticulous draughtsman, fertile in invention and restrained, while always effective, in his humour. Many of his cartoons became famous, e.g. his record of the dismissal of Bismarck by William II, entitled *Dropping the Pilot*; but few of his Punch drawings made so permanent an impression on the public mind as his illustrations to Lewis Carroll's *Alice's Adventures in Wonderland* (*q.v.*), and *Through the Looking-Glass*, which first introduced the familiar lineaments of such characters as the Mad Hatter and the Duchess. He was knighted in 1893, and died Feb. 25, 1914. See *Cartoon*. *Consult* Life, F. Sarzano, 1948.

Tennis or **REAL TENNIS** (O.Fr., *royal*). Game played with a ball and rackets by two or four persons on a walled court divided across the middle by a net. The game was first played with the hand and in the open air. By degrees the racket was developed, chiefly in Italy, and in that country, France, England, and elsewhere courts began to be built for the game. The game began to decline during the 17th and 18th cents.

The oldest court extant is that at Hampton Court Palace, built for Henry VIII in 1530. He and many English and French kings were tennis players. The Versailles court, built in 1686, which is now a museum, will always remain famous as the scene of the Tennis Court Oath (*v.i.*) in the French Revolution.

There is no standard size for a tennis court, which is an oblong building with four walls and roof, but the main dimensions are about as follows—greatest internal length 110 ft., greatest internal breadth 38 ft. 10 ins., length of floor 96 ft., breadth of floor 31 ft., height of side walls in play 24 ft., height of end walls in play 30 ft. The net is 5 ft. high at the sides, and 3 ft. in the centre of the court. Round the outer walls there runs on three sides of the court an inner wall with a sloping roof. This roof, which joins the outer walls at a height of 10 ft. 7 ins., and the inner wall at a height of 7 ft. 2 ins., is known as the penthouse. The remaining outer wall, known as the main wall, is plain, with one buttress known as the tambour. On one side, the service side, is a large opening in the inner end wall known as the dedans, and on the other, the hazard side, is a small opening in the inner end wall known as the grille. In the inner side wall on either side of the net are a number of openings known as galleries. The last opening farthest from the net on the hazard side is the winning gallery. Dedans, grille, and winning gallery all provide winning strokes for the striker on that side of the net opposed to them. The floor of the court is of stone or composition specially treated. The interior of the balls is made of strips of cloth bound tightly together and tied in a certain way. They are covered with the best white cloth. Rackets are made of ash, and weigh 15–17 ozs.

Among famous modern professional players have been George Lambert, champion 1871–1885, and Peter Latham, 1895–1905 and 1907–08. World champion in 1948 was Pierre Etchebaster. Leading British amateurs were J. M. Heathcote, 1859–1884; Alfred Lyttelton, 1884–1896; E. M. Baerlein after the First Great War; Lord Aberdare. The chief English competitions are the amateur championship and the M.C.C. prizes.

The first known rules of the game were written in 1599 by Forbet. Those now in use in England were drawn up and published by Julian Marshall in 1878. English and French laws differ slightly. See *Lawn Tennis*; consult also *Annals of Tennis*, J. Marshall, 1878; *History of Tennis*, E. B. Noel and J. O. M. Clark, 1922.

Tennis Court Oath. Episode in the French Revolution. On June 20, 1789, the deputies to the states-general from the third estate, i.e. neither nobles nor clergy, found their debating chamber at Versailles occupied by workmen and a notice announcing that a royal session of all three estates was to be held. Adjourning to a nearby tennis court the deputies, with only one dissident, acclaimed by a solemn oath the proposal of Mounier that they would never separate until they had given France a constitution. This episode is referred to in France as *Jeu de paume* (game with palms, hand tennis), the early name for the game in that country.

Tennyson, ALFRED TENNYSON, 1ST BARON (1809–92). English poet. Born Aug. 6, 1809, at the rectory, Somersby, Lincolnshire, he was the fourth son of the Rev. George Tennyson. During 1816–20 he was a pupil at Louth grammar school. After leaving school he prepared, mainly with the help of his brother Charles, the *Poems by Two Brothers*, published 1827. A year later he entered Trinity College, Cambridge, and there met Arthur Henry Hallam (q.v.), son of the historian, whose youthful genius and tragic doom were destined to have an abiding influence on his life and thought.

Tennyson made his first real bid for public recognition with *Poems Chiefly Lyrical* in 1830. The critics, with the exception of Blackwood, were favourable, and Tennyson entered definitely upon the poet's career. An onslaught by *The Quarterly* on the volume of 1833, which contained *The Lady of Shalott* and *The Lotus Eaters*, caused him some bitterness; but he recognized the element of truth in the harsh criticism, and sedulously repaired the defects. He now sustained the shock of Hallam's sudden death; and he poured forth his sorrow in that symphony on death and immortality, *In Memoriam*, which years later was to bring him fame. But for nine years his silence was almost unbroken.

In 1842 the famous two-volume edition of Tennyson's poems won general acclaim. There was a haunting melody in his lines, and his pellucid and delicate diction threw an enchanted glow over his descriptions. But with *The Princess*, 1847, he manifested new style and power; it was cast in epic form, and the strain was lofty, yet it failed to satisfy wholly, and suggested a greatness that was yet to ripen.

The year 1850, in which he married and was appointed poet laureate in succession to Wordsworth, saw the publication at first anonymously, of *In Memoriam*. While enshrining the memory of his friend, his genius had fashioned a mausoleum

The dimensions shown are usual, but there is no standard size.

Lord Tennyson. Left, Somersby Rectory, Lincolnshire, where the poet was born. Right, Aldworth House at Haslemere, Surrey, built in 1868, where much of his later work was written, and where he died, October 6, 1892

Frith

of verse of impressive beauty and worth. During the years of his mourning he had pondered the problem of life and death, had questioned much, hoped, despaired, lost faith in a divine purpose and regained it—and all the moods were expressed in the poem. If there is no clear and emphatic solution of the abiding mystery there is at least in *In Memoriam* a bold examination of the possible clues, and the conclusion leads to the trust, though faint, in the “larger hope.”

Two other works were to crown the poet's career—*Maud*, a poem of passionate love and of war, in 1855, and the prolonged series of *Idylls of the King*, beginning in 1859 and not concluded until 1872. *Maud* shows his lyrical capacity in fullest charm and intensest power; and although the war passages have been sternly reprobated, they have a touch of sublimity. Its theme is the redeeming power of love, and the regeneration which follows the strife of men and the scourges of Nature. But for perfect idealism we turn to the *Idylls of King Arthur*, the dim British hero who shines out in the transcending splendour of romance. The subject had allured Tennyson from his earliest years, and at the maturest period of his life he concentrated his intellectual strength upon it, imparted new glamour to medieval splendours, restored the Table Round, and quickened the inspiration derived from the quest of the Holy Grail.

By the side of this masterpiece the remaining work of Tennyson's last years seems somewhat of an anticlimax. He was amazingly prolific in his old age, and his successive volumes excited interest amounting to enthusiasm. He grew more versatile and fond of experiment. His first drama was published when he was 66; and *Queen Mary*, though doubtfully received, was followed rapidly by *Harold and Becket*, all on the

Elizabethan model; later came *The Falcon*, *The Cup*, *The Promise of May*, and *The Foresters*.

Of greater value were his *Ballads and Poems*, 1880, while the recantation of the frenzied judgements of youth in *Locksley Hall Sixty Years After*, published in 1886, showed that fires still glowed luridly in his heart. Among the swansongs that came from him there was at least one, *Crossing the Bar*, which will be unforgettable. It

Tennyson

served as his dirge when he was laid in Westminster Abbey, Oct. 12, 1892, his death having taken place six days before.

Tennyson's life was uneventful and unromantic. He had consecrated himself to the muse, and kept aloof from the world. Notable friendships were his, and many of them are fitly commemorated; but to most men he appeared remote and cold. The honour in which he was held was attested when he reached his 80th birthday. He had been raised to the peerage five years previously.

Since his death his place in litera-

ture has been impartially reviewed, not altogether to the advantage of his fame. Student, nature-lover, philosopher as he was, he does not display the strength of Browning or penetrate so deeply as Wordsworth. He expressed obvious or accepted truth with rare felicity, but discovered no new truth. Consequently he holds his place rather as an exquisite phrase-maker than as an original thinker. Belonging to the school of Spenser and Thomson, he delighted in rich words, unerringly chosen; his lines are jewelled; the idea is often thin and superficial. As an idealist, however, he is unexcelled, and, avoiding the rapture and extravagance of Shelley, he makes his ideals possible with all their exaltation.

No poet of the past centuries minted more current coin of speech—his flashing sentences are unexcelled for service. Like his predecessor he uttered nothing base, and he entertained only the noblest conceptions of duty and of the destiny of mankind. Palgrave declared that his work lies somewhere between that of Virgil and Shakespeare, having its portion in the inspiration of both; and, after every requisite allowance has been made, this bold declaration has much to justify it. See *English Literature*; *Idylls of the King*; *In Memoriam*, etc.

The official Life is by his son Hallam (v.i.), 1897, but that by his grandson, Sir C. Tennyson, 1949, contains much new information. Other lives are by S. Gwynne, 1899; A. Lang, 1901; A. C. Lyall, 1902. Consult also *Bibliography of Writings*, T. J. Wise, 1908; *Memories of the Tennysons*, H. D. Rawnsley, 2nd ed. 1912; T.: *A Modern Portrait*, H. I. Fausset, 1923; T.: *Aspects of His Life, Character, and Poetry*, H. Nicolson, 1923; *The Reaction Against Tennyson*, A. C. Bradley, 1923; Tennyson, H. Wolfe, 1930; Tennyson, A. Noyes, 1932; Tennyson: *Introduction and Selection*, W. H. Auden, 1946.

Tennyson, HALLAM TENNYSON, 2ND BARON (1852-1928). English administrator and biographer. The poet's eldest son, he was born Aug. 11, 1852, and acted for some years as his father's secretary. In 1897 he produced an official Life, and also edited the poet's works. During 1899-1902 he was governor of S. Australia, and in 1902-04 gov.-gen. of Australia. Succeeding to the peerage in 1892, he lived until Dec. 2, 1928.

2nd Baron Tennyson,
British administrator

Tennyson, LIONEL HALLAM TENNYSON, 3RD BARON (b. 1889), English cricketer. Born Nov. 7,

3rd Baron Tennyson,
English cricketer

1889, he went to Eton and Trinity College, Cambridge. He played cricket for England against S. Africa in that country, 1913-14; and when the Australians came over in 1921 he led England in four test matches. For several seasons he captained the Hampshire eleven, before and after succeeding to the peerage in 1928.

His cousin, Sir Charles Bruce Locker Tennyson (b. 1879), knighted 1945, was sometime deputy director of the F.B.I. He wrote (1949) a biography of the 1st Lord Tennyson, the poet. Of Sir Charles's sons (Frederick) Penrose (1912-41), film director, married the actress Nova Pilbeam, and died on active service, July 7, 1941; and (Charles) Julian (1915-45), author of *Suffolk Scene*, 1939, was killed in Burma, March 7, 1945.

Tennyson, FREDERICK (1807-98). A British poet. He was born at Louth, June 5, 1807, eldest brother of Alfred Tennyson, and was educated at Eton and Trinity College, Cambridge. His works include *Days and Hours*, 1854; *The Isles of Greece*, 1890; an epic, *Daphne*, 1891; *Poems of the Day and Year*, 1895. He died Feb. 26, 1898. Overshadowed

Frederick Tennyson,
British poet

always by his greater brother, Frederick has scarcely obtained the recognition he deserves.

Tennyson-Turner, CHARLES (1808-79). British poet. Born at Somersby, Lincs, July 4, 1808, an older brother of Alfred Tennyson, he was educated at Trinity College, Cambridge, and became vicar of Grasby, Lincs. He assumed the name of Turner on succeeding to the estate of an uncle. His first literary effort was in the *Poems by Two Brothers*, 1826, by himself and Alfred. Subsequently he devoted himself chiefly to the sonnet, and the volume issued in 1880, *Collected Sonnets Old and New*, contains some pieces displaying great power and beauty. The author had died, April 25, 1879.

O. Tennyson-Turner,
British poet

Tenor (Lat. *tenere*, to hold). Musical term with several connotations. The male voice which lies between the bass and the alto, having moreover its own distinctive quality, is called tenor, because when a lower part was added to the plainsong, the latter was said to be "held" by the higher voice. The viola is sometimes termed the tenor, because in a quartet it takes the part next above the bass. Tenor is also applied to one of the trombones (*g.v.*) and to a military drum. In a peal of bells, the tenor is the lowest in pitch. The tenor clef is the C clef placed on the fourth line of the stave.

Tenorite or **MELACONITE**. In mineralogy, an oxide of copper, CuO, containing nearly 80 p.c. copper. It occurs mostly as a black powder in the zone of weathering of copper veins.

Tenrec (*Centetes*). Genus of small mammals of the order Insectivora. Natives of Madagascar, they are much like hedgehogs in appearance and habits, being sometimes known as the tailless groundhog. They are about 14 ins. in length, brown in colour, and are clothed with a mixed coat of hair and spiny bristles. They have long pointed muzzles and rudimentary tails. Their close affinity with the hedgehogs is shown by the young having lines of short, white spines along the back which are replaced by long, stiff hairs before they become adult. Tenrecs partially roll up when attacked. Their food consists of insects, beetles chiefly; but also includes frogs.

Tense (Old French *tens*; Lat. *tempus*, time). Verbal form which denotes the time of an action or state. The original Indo-European verb possessed three forms which did not indicate the time of an action but the character of it; continuous (present), completed (perfect), momentary (aorist). To express present, past, and future, different tenses were formed: the imperfect for the past of continuous action; pluperfect, the past of completed action; future; the preterite use of the aorist, which originally only denoted momentary action. English has only two simple tense-forms, present and perfect; the loss of the others is made up for by auxiliaries.

Tensile Strength (Lat. *tendere*, to stretch). In physics, stretching or pulling force per unit area of section which has to be applied to a material before it breaks, e.g. the breaking stress of copper is 22×10^8 dynes per sq. cm.

Tension (Lat. *tendere*, to stretch). In mechanics and engineering, a force causing or tending to cause an elongation of a body. A tension member of a bridge or other structure is a member to which a pull or tensile stress is imparted in the direction of its length as distinguished from compressive stress; such a member is said to be in tension. It is also a term used to denote potential difference of an electric current. Electric tension denotes the condition of an electrified body when each molecule repels its neighbour. See *Strain and Stress*.

Tent (Lat. *tendere*, to stretch). Portable shelter used by troops on the march, hunters on the trail, and by nomads as their dwelling. Among primitive people tents are made of skins or woven material sewn together and suspended over a ridge pole. Now they are generally of canvas stretched from

Tenrec. Madagascan mammal resembling the hedgehog

a pole, or over a framework, and are of various shapes and many sizes. Bell tents are hung from a centre pole fixed in the earth, the lower edge being pegged down in a

circle; for square tents the canvas is hung from horizontal bars supported by corner posts on to which a canvas cover is also adjusted. Some large rectangular tents have two or more poles along the centre; marquees, well framed with wooden supports, are made to a very large size, suitable for flower shows, balls, and other entertainments.

Tentacle (Lat. *tentare*, to feel or try). Zoological term to denote

Tent. Square tent, showing, A, method of passing guy ropes over the ridge pole, and, B, runner and loop as attached to tent peg. Top, bell tent, with door opened

thread-like or fleshy processes about the mouths of invertebrates, serving as tactile and food-finding organs. They may be seen in the sea-anemones, zoophytes, jelly-fishes, corals, sea-cucumbers, Polyzoa, cuttles, etc. In most cases when not in use they partially collapse and are folded inwards to protect the mouth opening. See Octopus; Slug; Squid.

Tenterden. Mun. bor. and market town of Kent, England. It is 53 m. by rly. S.E. of London. The 13th-century church of S.

Tenterden, Kent. Tower and porch of the 13th century church of S. Mildred, from the south-east

Mildred has a massive Perpendicular tower. On its N. side is an excludorium, or penitentiary, where Protestant martyrs were imprisoned in Queen Mary's reign. Near by is a house known as S. Benedict's Priory, built 1658. The town is an agricultural centre in the Weald district,

having two annual sheep and cattle fairs, in May and Sept. Tenterden, which belongs to the Cinque Ports, was made a borough in 1449. Associated with Tenterden were Horatia, daughter of Nelson and Lady Hamilton; and Ellen Terry, who lived and died here. Pop. est. 4,150.

Tenterden, CHARLES ABBOTT, 1st BARON (1762-1832). English lawyer. Born Oct. 7, 1762, at Canterbury, the son of a hairdresser, he entered the King's School, Canterbury, and won a scholarship at Corpus Christi, Oxford, 1781. He entered the Middle Temple, 1787, and practised for some years at the bar, being called from the Inner Temple, 1796. He rapidly obtained a large practice, greatly increased on the publication of his work in 1802 on the law relative to merchant ships and seamen, which also enhanced his reputation as an authority on marine and mercantile law. He was appointed a judge, 1816, and lord chief justice, 1818. Made a peer in 1827, he died Nov. 4, 1832.

1st Baron Tenterden, English lawyer After J. W. Wright

Tenterfield. Municipality in Clive co., New South Wales, Australia. A road junction on the main

rly. line from Brisbane to Sydney, 11 m. from Wallangarra on the border, it is the centre of a pastoral dist. on the New England Plateau. Pop. est. 3,000.

Tenth. In English history, a tax levied on personal property. It was closely associated with the fifteenth, and under Charles I both were replaced by the subsidy. See Fifteenth; Tithe.

Tenth-Metre. Popular name for the unit of length, 10^{-8} metre, described under Ångström Unit.

Ten Thousand, RETREAT OF THE. Military feat of Xenophon in bringing the Greek army from Sittace in Persia to the Black Sea. See Anabasis.

Tenure (Lat. *tenēre*, to hold). Terms upon which land is held in English law. In English legal theory a person cannot own land outright, but merely holds it as a tenant, i.e. on a tenure. If, however, he is a tenant in fee simple his powers are virtually indistinguishable from those of an owner. The reasons for this are historical. Under the feudal system after the Norman Conquest the king would grant certain lands to his supporters who held as tenants in capite on military tenure—i.e. in return for military services. These tenants might sublet the land or part of it to under-tenants, who might sublet to others also, in return for services. Sub-infeudation, as this was called, was abolished in 1290. There were six kinds of tenure—serjeantry, military service, socage, frankalmoin, and copyhold.

Tenants by serjeantry were required to perform certain services, usually of a personal nature—e.g. preside at the lord's court: tenants by military service were required to provide soldiers; tenants by socage paid a money rent; and tenants by frankalmoin, who were always churchmen, said prayers for the souls of the grantor and his heirs. These five tenures were free—that is, the rights of the tenants were protected in the royal courts. But copyhold tenure was unfree, being granted by some lord of lands within his own manor in return for services (later a money payment) and the rights of the tenant were not recognized in the royal courts, but only in the courts of the lord of the manor. Copyhold tenure depended not on the law of England, but on the custom of the particular manor.

In theory all these tenants held the lands only so long as they performed the services required by the particular form of tenure. It was

therefore true to say that they did not own the land.

Gradually all these forms of tenure have been abolished or fallen into disuse except socage (now called freehold). A money payment (scutage) was substituted for military service in the 12th century; in 1669 military tenure was abolished and converted into socage, the only other tenure then surviving being copyhold. Under various Acts of parliament copyhold land could be converted into socage, and in 1925 copyhold was abolished. See Copyhold; Feudalism; Freehold; Land; Leasehold; Serjeantry; Socage.

Teocalli (Mex., god-house). Pre-Columbian temple-pyramid in Mexico and Central America. Usu-

tion under Dr. E. Speiser in 1931 and subsequent years. Before excavation it was more than 70 ft. high, and the whole accumulation represents almost continuous occupation in the Neolithic, Chalcolithic, and Copper Ages, until the long history of the site came to an end in the early Bronze Age in the middle of the second millennium B.C. By that time the mound had become too high and too small at the top for further building. Its excavation provided unrivalled data concerning the prehistory of northern Assyria. Gawra VI, the city of the sixth stratum below the surface, belongs to the beginning of the Copper Age, i.e. about 3000 B.C., and shows commercial ties as far

was transferred to Germany in 1938, most of its inhabitants then being R.C. Germans. Pop. 45,301.

Ter. River of N.E. Spain, in the prov. of Gerona. It rises on the S. slopes of the Pyrenees, and flows S. and then E. past Gerona, discharging its waters by several mouths into the Mediterranean after a course of about 110 m.

Teramo. Maritime prov. of E. Italy. It is situated in the extreme N. part of the region of Abruzzi e Molise. It is bounded N. by the prov. of Ascoli, S. by Pescara, W. by Aquila, and E. by the Adriatic Sea. Mountainous along the W. border, the surface slopes gradually to the sea. The soil is fertile, well watered, and cultivated, grapes and olives being the chief products. Sheep and cattle thrive on the upland pastures, and the rearing of silk-worms is carried on. Pop. est. 300,000.

Teramo. City of Italy, capital of the prov. of Teramo. It stands on the river Tordino at an alt. of 875 ft., 26 m. N.E. of Aquila and 16 m. by rly. W.S.W. of Giulia Nova on the Adriatic coast and the Ancona-Brindisi line. The cathedral, founded in 1154 and rebuilt about the middle of the 14th century, has been modernised. An interesting edifice is the Gothic church of Sant' Agostino, and there are remains of Roman baths, theatre, gateways, etc. The manufactures include silk, pottery, straw hats, furniture, and leather. Pop. 33,796. Teramo was undamaged during the Second Great War; partisans gained control of it as the Allies advanced, to enter it June 16, 1944, and saved even its bridges.

Terang. Town of Hampden co., Victoria, Australia. It is at the W. end of the Great Valley, 137 m. by rly. W.S.W. of Melbourne, in a fertile farming dist. It is on the main road from Geelong to Warrnambool. Mt. Noorat, in the vicinity, is an extinct volcano. Pop. 2,350.

Teraphim. Hebrew word in the O.T. denoting an image or images. Plural in form and of obscure and varying meaning, it may have signified originally a household god (1 Sam. 19), a head or an image in human guise (Gen. 31), afterwards reduced in size and made of bronze.

Terbium. One of the rare earth chemical elements. Its symbol is Tb, at. no. 65, and at. weight 159.2. It was first discovered by Mosander, who gave the name erbia to its oxide. In 1905 Urbain prepared the first pure specimens of some of its compounds. Ter-

Teocalli. The pebble-built pyramid of the Sun at Teotihuacan, one of the largest examples of pre-Columbian temple-pyramids

ally a solid earth or stone four-sided step-pyramid, a winding ascent or a stairway on each side leading to a temple-crowned platform. The brick-built pyramidal mound of Cholula, near Puebla, 77 ft. high, covering 44 acres, recalls the Mississippi mounds and mound-builders. The five-terraced Aztec pyramid in Mexico City, 375 ft. by 300 ft., was surmounted by shrines of colossal deities. The Teotihuacan pebble-built sun-pyramid, 682 ft. square, was connected by an avenue of mounds with a smaller moon-pyramid. The discovery at this site of a still larger pyramid was announced in 1920. See Aztec.

Teotihuacan. Site of an ancient Mexican Aztec city. It is 24 m. S. of Mexico City, the name meaning the abode of the gods. The ruins cover about four sq. m., and the celebrated pyramids of the sun (216 ft. high) and moon (140 ft.) are the largest artificial mounds in the American continent. The sides of the pyramids are terraced, and wide stairs lead to the summits. There are temples of agriculture, the rain god, and the god of air and winds, past which runs the highway of the dead. There are many subterranean halls with coloured decorations.

Tepe Gawra. Mound in N. Iraq, 15 m. N.E. of Mosul, excavated by an American expedi-

tion under Dr. E. Speiser in 1931 and subsequent years. Before excavation it was more than 70 ft. high, and the whole accumulation represents almost continuous occupation in the Neolithic, Chalcolithic, and Copper Ages, until the long history of the site came to an end in the early Bronze Age in the middle of the second millennium B.C. By that time the mound had become too high and too small at the top for further building. Its excavation provided unrivalled data concerning the prehistory of northern Assyria. Gawra VI, the city of the sixth stratum below the surface, belongs to the beginning of the Copper Age, i.e. about 3000 B.C., and shows commercial ties as far

as India, Transcaucasia, and the Cyclades. It provides perhaps the earliest known example of an orderly town-plan and had a central open square and a good drainage system. The houses were of brick on stone foundations. **Tephigram.** Diagram on which can be entered the conditions of the atmosphere at different levels, expressed in terms of its temperature, represented by t , and entropy, represented by ϕ (Greek phi); hence the name t - ϕ -gram. See Entropy.

Tepec. Town of Mexico. Capital of the state of Nayarit, it stands on a plateau, 3,065 ft. alt., 28 m. E. of the port of San Blas, with which it is connected by rly. It is a health resort, the centre of a region producing gold and silver, and makes cigars and cotton goods. It was founded in 1531 by Nuño de Guzman. Pop. est. 15,000.

Teplíce-Sanov (Ger. Teplitz). Town in the Bohemian portion of the republic of Czechoslovakia. It is 78 m. N.W. of Prague by rly. Its people engage in cotton weaving, printing and dyeing textiles, and making chemicals, rubber goods, and sugar. The hot springs make the town a favourite spa. There are good deposits of lignite in the neighbourhood along the base of the Bohemian ore mts. It was part of the Sudetenland which

bium occurs in the mineral gadolinite, and is best separated from the other members of the group by fractional crystallisation of mixed bromates.

Terborch, GERARD (1617-1681). Dutch painter. Born at Zwolle, he was taught by his father, then

Gerard Terborch. Portrait of a Gentleman, by this Dutch "pocket Velasquez," now in the National Gallery, London

studied at Haarlem under Pieter Molijn, visiting England, 1635, later Italy, returning to his own country, 1641. He afterwards visited Munster, and went to Spain, where he studied under Velasquez. Returning to the Netherlands, he settled at Deventer, of which town he became burgomaster. He died there, Dec. 8, 1681.

With Pieter de Hooch, he is considered the greatest of the Dutch "little masters"; he painted the life around him, in pictures providing valuable information about the customs of his contemporaries whom he observed impartially and portrayed with truth. He used colours sparingly and glazed his canvases by degrees to a substance sufficient to produce a melting impasto. His Guitar Lesson is in the National Gallery, London. Other famous works are at The Hague, Haarlem, and Paris.

Terceira. Island of the Azores group. Lying about 50 m. N.E. of Pico, it is of volcanic origin, the mts. rising some 3,500 ft. in Caldeira de Santa Barbara. The chief products are wine and fruit. The capital is Angra do Heroismo. Area 322 sq. m.

Terebene. Colourless liquid with a pleasant smell resembling thyme and camphor. It is prepared by thoroughly shaking American oil of turpentine with successive quantities of sulphuric acid. The product is then distilled, a yellow

oil known as colophene being left behind in the still. Terebene is used as an inhalation in affections of the throat and lungs. Painters' terebene is a preparation added to paints to promote drying. It consists of manganese and lead soaps dissolved in oil of turpentine.

Terebinth OR **TURPENTINE TREE** (*Pistacia terebinthus*). Small tree of the family Anacardiaceae, a native of the Mediterranean region. Its height is about 30 ft., and the alternate leaves are broken up into two rows of oval-lance-shaped leaflets, which are red when young. The small, greenish flowers are without petals and in large clusters. From incisions in the bark, a resinous fluid is obtained, the Chian or Cyprus turpentine. Horn-shaped galls, useful for dyeing and tanning, are also obtained from this tree. *P. lentiscus* yields mastic, and the fruits of *P. vera* are called pistachio nuts.

Terebratula. Genus of brachiopoda popularly known as lampshells from the resemblance of the shells to an antique lamp. See Brachiopoda.

Teredo. Genus of marine bivalve molluscs, popularly known as shipworms. In these the valves of the helmet-shaped shell are small and gaping, and the worm-like animal is a foot or more long. For the protection of the eleven-twelfths that are not covered by the shell it secretes a chalky tube. Using the shell as a tunnelling shield, the teredo, with its foot, bores into submerged timber. Of the four species found in British waters, *T. navalis* played havoc with the timbers of wooden ships.

The larger *T. norvegica* prefers piers and other stationary timber, whilst *T. megalaria* is seldom found in British waters except on driftwood. A pair of siphons extend through the chalky tube and open into the water. Through one siphon water is inhaled to the gills, and then exhaled through the other, laden with the wood pulp

excavated by the foot. The burrow is made merely as a retreat, the mollusc living upon minute organisms brought in through the siphon. By studying the operations of the teredo the elder Brunel perceived how the Thames tunnel might be bored. See Mollusca.

Terebinth. Foliage and flower sprays of the turpentine tree

Terek. River of Caucasus in Daghestan A.S.S.R. Rising in the glaciers of the central heights of the Caucasus, near Mt. Kazbek, it discharges by a delta into the Caspian Sea, after a 400 m. course. The upper Terek valley was the farthest part of Russia reached by the Germans, Nov., 1942, during the Second Great War. See Russo-German Campaigns.

Terence (c. 194-159 B.C.). Roman comic poet, whose full name was Publius Terentius Afer. According to tradition a native of Carthage, he was brought to Rome, where he became the slave of the Senator Publius Terentius Lucanus, who had him well educated and presently set him free, when he assumed his benefactor's name of Terentius. Devoting himself to translating Greek drama into Latin, in 168 he read his first play, Andria, to Caecilius Statius, the most popular playwright of Rome, who at once acclaimed him as a new genius. The play was produced in 166 and its instant success admitted its author into the intimate society of a brilliant literary group, including Caius Laelius, Lucilius, and Polybius. Andria was followed by Hecyra 165, Heauton Timorumenos 163, Eunuchus and Phormio both in 161, and Adelphi 160. After the production of this last play Terence left Rome. He was generally supposed to have died in 159 or 158 B.C. of grief at

Terence, Roman comic poet

Teredo, 1/4th natural size. a, the bivalve shell; b, one valve of shell, showing its three-lobed form

the loss at sea of his translations of Menander.

A man of great refinement of mind and artistic skill, gifted with a singular felicity and purity of diction and a delicate humour very different from the broader comic power of Plautus, Terence is a great figure in Roman literature and in the history of the drama, on which his influence can be traced in innumerable later comedies both of life and of manners. There are editions by W. Wagner, 1869, and R. Y. Tyrrell, 1903, and English translations by George Colman, 1765, and by J. Sargeant in the Loeb Classical Library.

Teresa (1515-82). Spanish mystic. Of the noble Castilian family of Cepeda, she was born at Avila, March 28, 1515, and in 1534 entered a Carmelite convent, where she found that the rule of the order was very laxly observed. Experiencing a sudden conversion in 1555,

Teresa,
Spanish saint
After Rubens

she practised extreme austerities, was habitually entranced during prayer, and saw many visions. Resolved to reform the order, she founded with a few companions a new convent at Avila, dedicated to S. Joseph, in 1562. Bitterly opposed by ecclesiastical authorities at home and abroad, she was befriended by Philip II and other persons of influence, and with S. John of the Cross founded reformed Carmelite convents for men and for women. These were placed under a separate administration approved by the pope in 1580. Teresa de Jesus, as she called herself, died at Alva, Oct. 4, 1582. She was canonised in 1622, and declared patron saint of Spain in 1814.

S. Teresa, one of the greatest women Spain has produced, and one of the chief forces in the counter-Reformation, was a many-sided character, a great Castilian lady, an able organizer, a mystic whose influence has extended far beyond her own Church. She described her own spiritual experiences and life in *The Way of Perfection*, and *The Book of the Foundations*. *The Castle of the Soul* is a widely read manual of mysticism. Teresa was also a devotional poet of some note. See *Carmelites*; consult also *Life*, ed. G. Cunningham-Graham, 2 vols., 1894; *Letters*, with intro. by Cardinal

Gasquet, 2 vols., 1920-21; *The Eagle and the Dove*, V. Sackville-West, 1943; *Complete Works*, trans. and ed. E. A. Peers, 1946.

Terlizzi. Town of Italy, in the prov. of Bari. It stands in a fertile plain 7 m. from the Adriatic coast and 18 m. by light rly. W. of Bari. A large trade is carried on in wine and fruit, grapes, almonds, olives, etc., grown in the surrounding dist. Pop. 24,000.

Term (Lat. *terminus*, boundary line). Word used in many cognate senses. In English legal procedure, the legal year was divided into four terms or periods when the courts at Westminster were open. These were: Michaelmas, Nov. 2-25; Hilary, Jan. 11-31; Easter, April 15-May 8; Trinity, May 22-June 12. By the Judicature Act, 1873, terms were abolished so far as the administration of justice was concerned, but not for other purposes. Their place was taken by sittings. At the Inns of Court the old terms are still maintained. School and university years are also divided into terms.

Term of years in English law is a leasehold granted for a fixed number of years, as distinguished from a lease for life or lives. The latter is real property, being a freehold estate; while a term of years is personal estate.

In Scotland the word term is used for a day on which rent or interest is due, the two terms being the Scottish quarter days, May 15 (always called Whitsunday irrespective of the day on which it falls) and Nov. 11 (Martinmas).

In logic, terms are the concepts that form the subject and the predicate of a proposition; there are major, middle, and minor terms of a syllogism. See *Logic*.

Terminal. In art, ornamental finish to a fitting or piece of furniture; sometimes used as a synonym for finial (*q.v.*). A terminal figure is one in which the head and bust spring from a virtually plain block of material, and is of classic origin, representing the Roman god Terminus (*q.v.*).

Terminal Velocity. Velocity of a projectile on impact with its target; also the utmost velocity that a body, such as a bomb released from a great height, can attain. When an artillery projectile is fired from ground to ground, the terminal velocity depends upon the trajectory; the greater the one, the greater the other; but it always exceeds the initial velocity on leaving the muzzle of the gun (see *Muzzle Velocity*). For a bomb dropped by

aircraft, terminal velocity is maximum velocity and is constant for most of the descent. A 200-lb. bomb falling freely will reach the ground at a speed of about 200 ft. per sec.

Terminator. In astronomy, the line, ideally a semi-ellipse, separating the dark portion of the moon's disk from the bright part. It is not a well-defined line, because of irregularities of the moon's surface. The line of cusps, a straight line joining the two ends of the terminator, is always perpendicular to a line drawn from the moon to the sun, so that the cusps or horns are always directed away from the sun.

Termini Imerese. Seaport and spa of Sicily, in the prov. of Palermo. It stands on the N. coast, near the mouth of the San Leonardo river, 23 m. by rly. S.E. of Palermo. It has a cathedral and the Ospedale dei Benfratelli, an edifice housing a museum of antiquarian relics and paintings by Sicilian masters. There are remains of a Roman theatre, basilica, aqueduct, etc., also well-equipped baths for its hot saline springs, which have a temperature of 106° F. The town was founded by the Carthaginians in 407 B.C. Under the name of Thermae Himerenses it became important during Roman occupation owing to its mineral springs. The chief industries are tunny and sardine fishing, and the manufacture of macaroni. Pop. 21,200.

Terminos, LAGUNA DE. Inlet of the Gulf of Mexico, in the Mexican state of Campeche. It is almost entirely cut off from the sea by a number of islands, the largest of which is Carmen. It is 70 m. long and 40 m. broad, and lies at the N.W. end of the isthmus of Yucatan.

Terminus. In Roman mythology, a deity who presided over boundaries and frontiers. When a boundary was fixed, a sacrifice was made, and a trench dug, into which the body of the animal, together with other offerings, was put. A fire of pine branches was then lighted in the trench and the stone or emblem of Terminus was erected upon the ashes.

Termite (Lat. *termes*, a wood-worm). Insect of the order Isoptera (Gr. *isos*, equal; *pteron*, wing). Popularly called white ants, termites are pale-coloured, soft-bodied insects, nearest related to cockroaches. They undergo incomplete metamorphosis, and have no waist or constriction between the thorax and abdomen; in all these features they differ from true ants

(*q.v.*). Native to the tropics, they become scarcer in other regions, and only a few kinds occur in S. Europe. More than 2,600 species are known, all of which are social, living in large communities.

Each colony usually consists of winged and wingless reproductive males and females together with sterile workers and soldiers, also comprising both sexes. The nest is usually underground with conical projecting mounds above ground up to 20 ft. high; or it is tunnelled into wood or formed on a tree. At certain times winged males and females leave the nest in swarms and, after mating and casting off their wings, form new colonies. The females develop into huge whitish inert objects that may lay several thousand eggs daily. Supplementary reproductive males and females are wingless.

Workers are the most numerous individuals; they build the nest and feed the other occupants. The soldiers have huge heads and jaws, or a long funnel-like snout; they defend the colony, those of the second kind ejecting an acrid fluid some distance through the snout. Wood-feeding termites are highly destructive to woodwork and other materials, causing great monetary loss unless special precautions are taken. *Consult* Our Enemy the Termite, R. E. Snyder, 1935.

A. D. Imms

Termonde. Name sometimes used for the Belgian town also known as Dendermonde (*q.v.*).

Tern (*Sterna*). Genus of sea-birds of the gull family (*Laridae*). Characterised by their long wings, forked tails, and short legs, they feed mainly upon fish, which they snatch from the sea with great skill. They are poor walkers, and

Tern. Common species of the British long-winged sea-bird
W. S. Bertridge, F.Z.S.

Termite. A termite mound at Port Darwin, Australia. It is 18 ft. high
W. Saville Kent

when seen on land are mostly resting. The buff or greenish eggs, blotched and spotted with brown, black, or grey, are laid on rocks, islets, stacks, dunes, or shingle-banks, in a nest of grass and rubbish, or in a naked depression. Five species—common, Arctic, roseate, little, and Sandwich terns—breed in Great Britain, while several others are occasional visitors. *See* Wideawake.

Tern. River of Shropshire, England. It rises in the N.E. of the co., and flows S.W. to join the Severn at Atcham, 4 m. S.E. of Shrewsbury, after a course of 30 m. Its chief affluent is the Roden.

Terni. City of Italy, capital of a prov. with the same name, in Umbria. It stands on the river Nera, near its union with the Velino, 50 m. direct and 68 m. by rly. N.N.E. of Rome. The 13th century cathedral which had been much altered and restored was severely damaged by direct hits in the Second Great War, when Terni as a whole was the worst damaged city of Umbria. It was captured June 15 by Indian troops of the 8th army. Ancient relics of Terni are an amphitheatre, theatre, baths, temple, sculptures, and a necropolis. In the vicinity are the Velino waterfalls, described by By-

ron in Childe Harold, the "marble cascade" descending about 650 ft. in a series of leaps. These have been harnessed to generate power for Rome and a large part of Central Italy. Pop. 68,890.

Terpander (*fl.* c. 700 B.C.). Greek poet and musician. A native of Lesbos, he wrote lyrics of which only scanty fragments have survived, and is said to have been the first to set poetry to music. He improved the existing four-stringed lyre by the addition of three strings.

Terpenes. Hydrocarbons which form the chief constituents of the essential oils obtained from plants. The terpenes are all isomeric, possessing the molecular formula $C_{10}H_{16}$. They are colourless volatile liquids with the exception of camphene, which is a solid resembling camphor.

Pinene, one of the groups, is a constituent of American and French oil of turpentine. From it an artificial camphor is obtained. Limonene, another terpene, occurs in lemon, orange, bergamot, and caraway oil.

Terpineol. Thick liquid with a smell resembling hyacinths or white lilac. It is obtained by the action of dilute acids on terpine hydrate. It is used in compounding lily-of-the-valley, hyacinth, and may-blossom perfumes, and as a perfume for soap.

Terpsichore. In Greek mythology, one of the nine Muses. She presided over dancing. *See* Muses. *Pron.* Terp-sickory.

Terra or **TELLUS.** In Roman mythology, the deity whom the Romans identified with the Greek goddess Gē, the Earth. She was the personification of the fruitful power of the soil, represented in art as a matron with cornucopia.

Terni, Italy. The Marble Cascades, where the Velino falls from a height of 650 feet into the river Nera

Terrace (Lat. *terra*, earth). Raised level bank of earth. In geology terraces are stretches of rocks or land in shelf-like contours. Such steps or shelves are most noticeable along sea coasts, the shores of lakes and rivers, and they often appear in a series of two, three, or more rising steadily from the shore, the oldest being the highest. Terraces along river banks mark the previous levels of floor plains which have been dissected by the river deepening its bed; in lakes they show the way the level has fallen. They are of value in the history of man as being frequent sources of discovery of Palaeolithic implements. Terraced hillsides often occur in regions of flat-lying strata as a result of differential erosion, where harder beds form flat steps capping steeper slopes—outcrops of softer ones. A few terraces have been the result of volcanic action, etc., but none are so level and regular as those formed by the action of water.

Terrace Garden. Form of garden arrangement originally practised among the hillsides of Italy. It consists in excavating steeply sloping ground into a series of steps or terraces, so that level surfaces may be obtained for plants. In France, the gardens at Versailles represent terrace gardening in its most conventional form, while in England the terrace gardens at Longford Castle, Salisbury, and at Richmond, Surrey, are notable examples. See Hanging Gardens of Babylon.

Terracina. City of Italy, in the prov. of Rome. It stands on the coast, at the S. extremity of the Pontine Marshes, where the Volscian Hills reach the sea 58 m. direct and 76 m. by rly. S.E. of Rome. The old town lies on the higher slopes of Mt. Teodorico, formerly crowned by a temple of Venus, the reputed dwelling place of Theodoric. Situated on the Appian Way (*q.v.*), Terracina was important in Roman times. The cathedral is built into the remains of a temple; the market place now occupies the forum, whose pavement is in an excellent state of preservation. In the lower town, by the harbour, are traces of Roman baths, amphitheatre, and remains of Etruscan tombs and walls. The city is supplied with water by a Roman aqueduct. Anciently called Anxur, Terracina was for long the capital of the Volsci. A collection of coins and other small objects were looted by the Germans during the Second Great War, in which Terracina was captured

by U.S. troops May 24, 1944; the city suffered little damage. Pop. est. 8,000.

Terra-cotta (Ital., baked earth). Unglazed earthenware of fine fired clay, either red or yellow. In English use the term is rarely applied to pottery. The ancient Greeks employed terra-cotta extensively in architecture and statuary. Thousands of statuettes have been found deposited in tombs and temples, many 4th and 3rd century examples from Tanagra, Eretria, and Myrina being exquisitely beautiful representations of the daily life of women and children. Etruscan terra-cotta sarcophagi are often very fine. The Romans applied terra-cotta to a great variety of purposes.

In the 14th century architectural decoration in terra-cotta revived in Germany and N. Italy, and much

Terrapin. Species of water tortoise, used as food in the U.S.A.
W. S. Berridge, F.Z.S.

use was made of it in the Renaissance age. The terra-cotta reliefs and portrait busts of the great Florentine sculptors are among their best work. In the second half of the 19th century the material was much favoured for facing and decorating important buildings, partly because of its resistance to the corrosive action of the atmosphere of great cities. See Della Robbia; Peru.

Terramara (Ital., marl-earth). Term originally denoting an earthy fertiliser derived from artificial mounds in the Po valley, and since 1871 used for the mounds themselves and their culture. Dating from late Neolithic times (Theiss valley, Hungary), they were developed in the early Bronze Age, sometimes on marshy land, but mostly on dry foundations, by peoples familiar with the lake-dwellings (*q.v.*). A moat was formed round an earthwork lined with timber, the enclosure being filled with piles supporting a timber platform. This bore wattle-and-daub huts, arranged in streets, sometimes 50 ft. wide. One near Parma had a moat 100 ft. wide.

Terra Nova. Name of the vessel which carried the Antarctic expedition of Capt. R. F. Scott (*q.v.*), 1910. She was a wooden whaling-

vessel of Dundee, measured 187 ft. in length, and was rigged as a barque, with additional steam-power. See Antarctic Exploration.

Terranova. Seaport of Sicily, in the prov. of Caltanissetta. It stands on the S. coast, near the mouth of the river Terranova, 60 m. W. of Syracuse, and 74 m. by rly. S.E. of Agrigento. Mussolini restored to Terranova and its river the name Gela (*q.v.*), on the site of which ancient city it is built. It has some remains of antiquity, the most interesting being Greek terra-cotta vases and sarcophagi from its necropolis. Near Terranova U.S. troops landed July 10, 1943, and occupied the town, which they held despite strong German attacks in the vicinity. The town suffered little damage. Pop. est. 27,000.

Terrapin. Name applied to various water tortoises of the order Testudinata, but attaching specially to *Malaclemys centrata*, a native of the salt marshes on the E. coast of N. America. An omnivorous feeder and of amphibious habits, the terrapin is about 8 ins. long in the female and 5 ins. in the male. The upper shell or carapace is keeled along the middle line, of a brown or greenish tint with dark concentric lines; the lower shell or plastron is yellow. See Tortoise.

Terre Adélie. Antarctic territory belonging to France. See Adélie Land.

Terre Haute. City of Indiana, U.S.A., the co. seat of Vigo co. It stands on the river Wabash, 72 m. W.S.W. of Indianapolis, and is served by several rlys. It is the centre of an agricultural and coal mining region, with more than 200 industrial establishments. Federal troops occupied the city in 1935 when workers' unions called a general strike. Terre Haute, which dates from 1816, became a city in 1833. Pop. 62,693.

Terreplein. Technical term used in two senses in military engineering. In permanent fortifications the terreplein is the flat surface of the rampart, on the front portion of which the parapet is formed, and where the defenders stand concealed from the enemy's view. In field fortifications terreplein is occasionally used to define any prepared level base on which a battery is placed.

Terrestrial Magnetism. This subject is treated in the article Magnetism.

Terrier. Group of domestic dogs. Its name (Fr. *terrier*, a rabbit burrow) indicates the original use of these dogs for unearthing game,

and is used to include dogs such as the bull-terrier, and others whose relation to the true terriers is rather remote. All terriers have short, arched skulls and alert appearance, and possess a high degree of intelligence. *See* Airedale; Bull Terrier; Cairn Terrier; Dog, colour plate; Fox Terrier; Griffon; Irish Terrier; Scotch Terrier; Skye Terrier; Yorkshire Terrier.

Terrigenous Deposits. In geology, term applied to sediments formed of material derived from pre-existing rocks. Sandstones, shales, etc., are included, as they are formed from sands and clays washed down from land areas by rivers or eroded from shore-lines. Limestones of organic origin, and beds of rock salt, etc., which are chemical deposits, do not come under this heading. *See* Sedimentary Rocks.

Terriss, WILLIAM (1847-97). Stage name of the British actor, William Charles James Lewin. Born in London, Feb. 20, 1847, he

had a varied career as merchant-seaman, sheep-farmer, and tea-planter before adopting the stage as a profession.

He made his first appearance in London in T. W. Robertson's comedy, *Society*, in 1865, and scored his first considerable success as Squire Thornhill in Wills's *Vicar of Wakefield* at The Court, March 30, 1878. Having been in Irving's company at The Lyceum, 1880-85, he took the part of the hero in *The Harbour Lights* at the Adelphi, 1885. He was stabbed to death outside the Adelphi, on Dec. 16, 1897. His daughter Ellaline (wife of Sir Seymour Hicks, *q.v.*), b. April 13, 1872, won many successes in musical and drawing-room comedy.

William Terriss,
British actor
Downey

to take the field against a continental professional army.

In 1907 the volunteers and yeomanry were amalgamated to form the Territorial Force, and organized into a self-contained second-line army for home defence. The establishment was fixed at 265,000 officers and men contained in 14 infantry divs. and 14 cavalry bdes. with ancillary corps. The U.K. was divided into districts, and the counties taken as units, each co. having a territorial force association, under the lord lieutenant, with a council composed of military, representative, and co-opted members. The co. associations received a grant for the expenses of the force. Each infantry battalion was attached to a regt. of the line and numbered after the regt.'s special reserve battalions. Volunteer corps from universities and public schools became officers' training corps.

Men from 17 to 35 years of age were eligible for enlistment and engaged for four years. They undertook to serve in any part of the U.K. in event of invasion, could be embodied only after the army reserve had been mobilised, could serve only in their own units, and could not be used to supply drafts for the regular army. Units of the force could be sent overseas only after a special authorising Act of parliament, and such units could contain only men who volunteered for overseas service.

First Great War

At the outbreak of the First Great War, the territorial force was at full establishment, and when embodied most of the officers and men volunteered for service overseas. A number of infantry battalions were immediately drafted to India to replace regular regts. brought to France, and in the first four months of the war 70,000 territorials were abroad. Early in 1915 the first territorial divs. went to the western front, and before the war ended 21 territorial divs., totalling more than a million men, were serving in all theatres of war. The force suffered 541,245 casualties, of whom 115,576 were killed.

Immediately after the war most territorial units were placed in suspended animation. In 1921, a reconstruction was carried out and the title changed to Territorial Army. Establishment was fixed at 345,000, of which only 50 p.c. were to be recruited in peace-time, and officers and men engaged to serve in any part of the world on embodiment. The reconstruction

THE TERRITORIAL ARMY

David Le Roi, historian of the Territorial Army

Here is an account of the history and organization of the second line to the British regular army. See also Army; Auxiliary Territorial Service; Militia; Volunteer; Yeomanry

The Territorial Army is a British military organization in which personnel serve part-time in peace but are liable to mobilisation in war. Voluntary spare-time soldiering has a long tradition in Great Britain and from the earliest period national emergency inspired spontaneous offers of national service in defence of the realm. Most were on a strictly local basis and were constituted partly on the old Saxon fyrd, or compulsory militia, and partly on voluntary enlistment. One such was the trained bands raised in London by James I. A purely voluntary military body was the Fraternité of S. George formed in 1537 (*see* Honourable Artillery Company).

The territorial army derives from the unpaid yeomanry regts. first raised in 1761 for home defence and the suppression of riots. During the Napoleonic wars further yeomanry regts. were established, together with volunteer infantry regts. By 1803 a volunteer army of some 400,000 infantry and cavalry had been enrolled to resist the threatened French invasion. With the exception of the yeomanry, the volunteer troops were badly trained and ill-equipped and at the end of the Napoleonic wars were, except for a few yeomanry regts., disbanded.

In 1859, when there was renewed danger of French invasion, the govt. raised a number of volunteer rifle and artillery units for home defence. Volunteers had to supply their own uniform and equipment, and were unpaid, the govt. providing only their weapons. By 1860 more than 180,000 men had enrolled and the volunteers were placed on a permanent basis.

In 1872 the volunteers were incorporated formally with the regular regts. of their districts, the volunteer unit becoming the volunteer battalion of the regular regt. Nine years later the volunteers and yeomanry were clothed and equipped at govt. expense. By 1892 there were 250,000 infantry and artillery volunteers and 150,000 yeomanry.

During the S. African War, a force of 35,520 yeomanry volunteers served in S. Africa, together with 19,856 men drawn from volunteer infantry units who served either in service companies attached to their appropriate regular regts. or in the specially organized City of London Imperial Volunteers. Although the work of these troops won them high praise as individuals, a royal commission set up in 1904 criticised the volunteer and yeomanry organization as unfit

brought the force more into line with the regular army, and new units were introduced, such as signal and armoured car companies. Units of the territorial army continued to be administered by the co. associations, but their training was the responsibility of the military commands of the areas in which they were situated.

In 1935 the territorial army had a strength of only 130,000. In 1937 its establishment was raised to 200,000, and the territorial army was made responsible for the ground defence of the U.K. against air attack. By the end of the year its strength was 160,000.

After the Munich Crisis (*q.v.*) of Sept., 1938, its strength rose to 224,000 all ranks, of whom nearly 70,000 were in five A.A. divs. The strength of the territorial field army was doubled to 24 infantry divs. (six motorised) and two armoured divs. A women's corps, the Auxiliary Territorial Service, was also established.

Other reforms included the appointment of the director-gen. of the territorial army as a member of the army council, and a territorial officer as deputy director-gen. The command of divs. was opened to territorial officers. Increased grants were made for annual training, training bounties for men, and larger travelling expenses were allowed.

Second Great War

The calling-up of the militia led to a shortage of equipment and instructors for the territorial army, and when it was embodied at the outbreak of the Second Great War the territorial field army was only partially trained and equipped. Territorials immediately became part of the regular army, and all men enlisted for the duration became members of the territorial army. Consequently, most units and divs., although retaining their territorial army titles, were no longer composed exclusively of territorial personnel.

At the end of the war territorial units were placed in suspended animation until Jan., 1947, when the territorial army was re-formed. Its volunteer strength was fixed at 150,000 men contained in six infantry divs., two armoured divs., and one airborne div., besides independent infantry and armoured bdes., artillery and engineer formations, and A.A. bdes. The territorial army was given the main responsibility for home A.A. and coast defence, but all units became liable for overseas service in an emergency provided parl.

sanction were first obtained. In 1950 the Territorial Army absorbed for their obligatory part-time service the majority of the national servicemen who had completed their term with the regular army. At the same time a number of territorial units were amalgamated and others changed their arm of the service.

Volunteers for the territorial army must be between 18 and 40 years of age, with certain extensions up to 58 for service in static A.A. units. Initial engagement is for four years. Territorials must do 40 hrs. training a year and attend an annual camp for 15 days. The camp period may be reduced by attending extra drills. For training periods over 48 hrs. normal army rates are paid. Volunteers are eligible for commissions.

Territorial Efficiency Decoration. British military decoration awarded to officers of the territorial army. Instituted in 1930, it replaces the Volunteer Officers' decoration (1892), the Colonial Auxiliary Forces decoration (1899), and the Territorial decoration (1908). It is awarded for 20 years' efficient and meritorious commissioned service in the territorial army or auxiliary military forces throughout the Empire. War service counts as double, while half the time served in the ranks or in the ranks of a cadet force reckons towards the qualifying period. The medal consists of an oval oak wreath in silver, having in the centre the royal cipher and crown in gold. It is suspended from a green ribbon with a yellow central stripe. At the top of the ribbon is a brooch inscribed to denote whether the recipient served in the territorial army or an imperial auxiliary force. Recipients in the Honourable Artillery Company wear the medal suspended from a ribbon in the Royal racing colours, half red and half dark blue edged with yellow. This distinction was granted by Edward VII.

Territorial Efficiency Medal. Medal formerly awarded to other ranks of the territorial army. Instituted in 1908, it superseded the Volunteer Long Service medal, and was awarded to men who had completed 12 years' efficient service. After the Second Great War, the Territorial Efficiency medal was replaced by the Efficiency Medal (*q.v.* in N.V.).

Territorial Waters. Conception in international law. Such waters are adjacent to the shores of states and are deemed to be in-

cluded in their dry land jurisdiction. Territorial waters were first defined by convention towards the end of the 18th century between Great Britain and the U.S.A. It is said that the three-mile limit agreed on represented the range of the cannon of that time. Most nations accept 3 m., though Denmark, Norway, and Sweden claim 4 m.; Chile, Turkey, and Uruguay 5 m.; France, Portugal, and Spain 6 m.; U.S.S.R. 12 m. The distance is reckoned from low water mark. Within this limit all shipping can go about its lawful occasions; but to fish in the territorial waters of a foreign power is trespass. Cases involving fishermen come before courts of the state in whose waters the men have been arrested. A foreign ship in port is subject to the jurisdiction of the riparian state.

Territory (Lat. *terra*, earth). Land belonging to a city or state. The district over which a state exercises sovereignty is its territory. In a more specialised sense, the word is used in the U.S.A. for a district which has not received state rights. Of the existing states 28 were organized as territories before they became states. Canada and Australia, Argentina and Brazil, use the word in the same sense; Canada has the North-West Territories and Australia Northern Territory. See Federalism; Sovereignty; State.

Terror. Dormant volcano on Ross Island, South Victoria Land, Antarctica. It is situated in lat. 77° 30' S., and reaches an alt. of about 11,000 ft. It was discovered by Capt. (afterwards Sir) James Ross, Jan. 28, 1841. See Erebus.

Terror, TERN. Name given to a period in the French Revolution. It may be said to have begun on June 2, 1793, when a rising in Paris led to the supersession of the Girondist faction in the national convention by that of the Jacobins; and ended on July 28, 1794, with the execution of Robespierre and his associates. Thousands of persons, royalists, Girondists, soldiers, and publicists, men and women, were sent to the guillotine in Paris or otherwise put to death in such cities as Lyons, Bordeaux, Nantes, Arras. Taine enumerates 17,000 victims, but this figure is certainly low.

Terry, CHARLES SANFORD (1864-1936). British historian. After education at Lancing, and Clare College, Cambridge, he was lecturer in history at Durham college of science, Newcastle, 1890-98, then transferred to Aberdeen, as

Ellen Terry in some of the parts which made her famous. 1. Portia. 2. In title-rôle of Nance Oldfield. 3. Lady Macbeth

professor in 1903. He wrote extensively on Scottish history, his many books including *The Scottish Parliament*, 1906; *A History of Scotland*, 1920; and *The Jacobites and the Union*, 1922. He also became an authority on the music of Bach, and published several books on the work of that composer. Terry died Nov. 5, 1936.

Terry, EDWARD O'CONNOR (1844-1912). British actor. Born in London, the son of an actor, he went on the stage in 1863, and during 1868-75 was principal comedian at the Strand Theatre, London, making a special success in 1874, as Paul Pry in Poole's comedy of that name. He played in various burlesques at the old Gaiety Theatre, 1876-85, and in 1888 produced at the theatre called after his name Pinero's sentimental comedy, *Sweet Lavender*, which furnished him with his most famous part, that of the bibulous barrister, Dick Phenyl. Terry died in London, April 3, 1912.

Terry, DAME ELLEN ALICIA (1847-1928). British actress. Daughter of Benjamin and Sarah

Terry, popular provincial actors, she was born at Coventry, Feb. 27, 1847, and at the age of 9 made her first appearance, as Mamillius, at the Princess's Theatre, London, in Kean's revival of *The Winter's Tale*. In 1864 she married the painter, G. F. Watts. This marriage was soon dissolved, and Ellen Terry returned to the stage in 1867, when she played Katharine to Irving's Petruchio.

She retired from the stage for six years (1868-74). Then, joining the Bancrofts in 1875, she

scored several successes with them. Having married E. A. Wardell (Charles Kelly, who died 1885), she became in 1878 Irving's leading lady, and began the series of triumphs in Shakespearian and other plays which made her queen of the English stage. Her greatest rôles were Portia, 1879; Juliet, 1882; Viola, 1884; Nance Oldfield, 1891; *Madame Sans-Gêne*, 1897; *Clarisse*, 1899. In 1902 Ellen Terry and Mrs. Kendal appeared in *The Merry Wives of Windsor*, under Tree, at His Majesty's. She celebrated her jubilee on the stage in 1906, and the following year married an American actor, James Carew. In 1915 she toured the U.S.A., lecturing on Shakespearian heroines. She was created G.B.E. 1925, and died at Tenterden, July 21, 1928. *See Acting; consult also Life, C. Hiatt, 1898; Ellen Terry and Her Sisters, T. E. Pemberton, 1902; her own Story of My Life, 1908; Correspondence between E. T. and Bernard Shaw, 1931; Ellen Terry's Memoirs, E. and C. St. J. Craig, 1933.*

Terry, FRED (1863-1933). British actor. Born in London, Nov. 9, 1863, the brother of Ellen Terry, his first stage appearance was at the Haymarket Theatre in 1880. The next few years he toured with Ben Greet's and other companies, visiting America in 1885.

Two years later he settled in London, and was successively in the companies of Tree, Forbes-Robertson, Alexander, and Irving. He married the actress Julia Neilson (*q.v.*), and was the father of Dennis and Phyllis Neilson-Terry (*q.v.*). Fred Terry and Julia Neilson, who soon formed their own company,

made a reputation for romantic historical plays, noteworthy productions being *Sweet Nell of Old Drury*, Haymarket Theatre, 1900, and *The Scarlet Pimpernel*, New Theatre, 1905. In such plays, and in *Henry of Navarre*, they toured with great success, almost until Fred Terry's death, which occurred April 18, 1933.

Terry, SIR RICHARD RUNCIMAN (1865-1938). English musician. Born at Ellington, Northumberland, he was educated at both Oxford and Cambridge. He was organist successively at St. John's cathedral, Antigua, and Downside abbey, and in 1901 was appointed organist at Westminster R.C. cathedral, a post he held until 1924. He was also lecturer at Birmingham and Leeds universities, and examiner in music for many organizations. The composer of five masses, a requiem, and other church music, he did much to revive interest in 16th and 17th century composers both by performing their works and editing them for publication. A lover of sailing, a pastime he enjoyed with his uncle Walter Runciman (1847-1937, 1st Baron Runciman), Terry was in secular music the populariser of sea chanties (he insisted on spelling them shanties), collecting, editing, and publishing two

Heated

Fred Terry, British actor

vols. of these sailors' songs. Knighted in 1922, he died April 18, 1938. A memoir, *Westminster Retrospect*, by H. Andrews, appeared in 1948.

Terschelling. Island of the Netherlands, in the prov. of N. Holland. It lies between the islands of Vlieland and Ameland. The flat, sandy surface is cultivated in parts. Hoorn is the chief town; fishing is carried on from Westerschelling. Its area is 41 sq. m. See Frisian Islands.

Tertian Fever. Form of intermittent malarial fever in which paroxysms recur on alternate days.

Tertiary. Epoch of geological time between the end of the Cretaceous and the beginning of the Quaternary or Pleistocene periods. It was between 20 and 70 million years ago approximately. It is subdivided into the Eocene, Oligocene, Miocene, and Pliocene periods, the last-named being the youngest. The first two are sometimes together termed Palaeogene, and the latter pair Neogene. Eocene and Oligocene beds occur in England in the London and Hampshire Basins, which are downfolded (synclinal) areas separated by the Wealden dome. The sediments are still unconsolidated, and the two most important groups are the London Clay and the Bagshot Sands. The former is up to 500 ft. thick locally, and its impervious clayey character allows it to be tunnelled relatively easily: hence London's ramifying system of deep underground rlys. The Bagshot Sands form the sandy country N. of Guildford and Farnham; used for military training.

Miocene deposits do not occur in Great Britain, but they are extensively found elsewhere in Europe. This period is of great importance because in it took place the great mountain-building movements which formed the Alpine-Himalayan ranges, the Rocky Mts., and the Andes. The movements had already begun, but in this period they reached maximum intensity. In the Alps the sediments were thrown into enormous recumbent folds which were thrust one on top of the other forming nappe structures. In England the effect of the Alpine storm resulted in the folding of the beds in the London and Hampshire Basins, the Weald, the Isle of Wight, and in the Portland-Purbeck area of Dorset.

An early effect of these movements was the outbreak of volcanic activity in N.E. Ireland, N.W. Scotland, Iceland, and Greenland

during the Eocene period. The whole volcanic field is referred to as the Thulean province. The volcanic episode began with basalt eruptions from numerous fissures, which resulted in great floods of lava covering the pre-existing landscape. In Mull the charred remains of forest trees are still recognizable. This early phase was then followed by activity which was confined to individual centres. The remains of such great central volcanoes are known in Skye, Rum, Ardnamurchan, Mull, Arran, Slieve Gullion, and the Mourne Mts.

Pliocene beds are found in East Anglia. They are termed "*crag*s"—Coralline Crag, Red Crag, etc.—and consist of unconsolidated shelly sands, clays and gravels.

Life in the Tertiary showed the strong development of mammals and the dying out of the great saurians of the Mesozoic epoch. Ancestors of the horse and rhinoceros appeared early in the epoch; sharks were common. Ancestors of the elephant did not appear till the Miocene and were accompanied by the sabre-toothed tiger and the first deer and apes. See Cretaceous; London Basin; London Clay; Rock.

Gilbert Wilson, Ph.D.

Tertiary (Lat. *tertius*, third). Name applied in the R.C. church to a secular member of a religious order, who is so called as coming third to a professed cleric or woman of the order. The opening of the devout life to men and women living in the world instead of in a religious house, though older than the 10th century, was developed by S. Francis, who made tertiaries a branch of the order he founded, and other rules made provision for their admittance. The general points which tertiaries bind themselves to observe are abstinence from strife or mischief-making; frequent reception of the Sacraments; daily mass; the exercise of penance; and universal charity. See Oblates.

Tertis, LIONEL (b. 1876). British viola player. Born at W. Hartlepool, Dec.

Lionel Tertis,
British viola player

29, 1876, he studied at Leipzig and the R.A.M., where he was encouraged by Mackenzie to take up the viola. Hampered at first by the small amount of solo music

written for that instrument, he arranged much originally written for violin, and also performed works specially composed for him by Sir A. Bax, Bridges, and Cyril Scott. Acknowledged master of the viola, he toured Europe and the U.S.A. and gave regular recitals in London. He designed a newtype of viola, and wrote *Beauty of Tone in String-Playing*, 1938.

Tertullian (c. 155—c. 230). Christian theologian, whose full name was Quintus Septimius Tertullianus. The son of a Roman centurion, he was born at Carthage, was well educated, and probably became an advocate. Converted to Christianity about 190, he was ordained priest, and devoted his life to the defence of the faith. His anger at the worldly and temporising policy prevalent in the Church led him about 202 to adopt the Montanist heresy, and he became the leader of the Montanist sect in Africa. Of his many works the chief is the *Apologeticum*, a powerful defence of Christianity and indictment of paganism.

Tertullian was a man of vehement and uncompromising spirit, and attacked not only every form of vice, extravagance, and folly, but even innocent culture, in the spirit of a pleader rather than of a philosopher. His sincerity is beyond doubt, and his fervent zeal gives his language extraordinary force. The founder not only of the African school which was to culminate in Augustine, but of Christian Latin literature, he was a literary genius who broke away from the classical tradition, and with his copious vocabulary and amazing command of rhetorical devices created a new instrument for the new thought of his age.

Teruel. Inland prov. of N.E. Spain, forming the S. portion of Aragon. It is bounded N. by the prov. of Saragossa, W. by Guadalajara and Cuenca, E. by Tarragona and Castellon, and S. by Valencia. The surface is largely mountainous, and contains the Sierras de Gudar and St. Just, the Montes Universales, and other highlands. The Pico Javalambre, in the S., rises to 6,627 ft. The prov. is watered by the Guadalaviar, the Guadalupe, and other streams, and, though fertile, is backward in cultivation and commerce. There are minerals and forests, but communications are bad. Forestry, agriculture, mining, and weaving are the chief occupations. Beyond the capital, Teruel, there are no large towns. The area is 5,721 sq. m. Pop. 219,518.

Teruel. City of Spain, capital of the prov. of Teruel. It stands at an alt. of over 3,000 ft., on the river Guadalquivir and the Valencia-Calatayud rly., 70 m. N.W. of Valencia. An ancient walled town, with crumbling buildings and narrow, ill-paved streets, it still retains a medieval aspect. There are a 16th century Gothic cathedral and many interesting churches. Water is supplied to the town by a magnificent aqueduct. Pop. 13,584.

At the outbreak of the Spanish Civil War in 1936, Teruel declared for the Nationalists, and provided them with a valuable sallyport for an offensive towards the Mediterranean. On Dec. 15, 1937, the Republicans launched a determined attack against the place as part of their pincer movement to cut the Saragossa-Teruel road. After bitter fighting most of the city was occupied by Dec. 23, and it surrendered on Jan. 3, 1938. The fury and intensity of this attack upset the Nationalists' offensive plans and caused them to use up reserves intended for an attack on Madrid; but in Feb. they recovered Teruel.

Terza Rima (It., third rhyme). Italian verse form. Probably suggested by similar Provençal forms, it was perfected by Dante, and employed by him in *The Divine Comedy*. The line is iambic, in Italian with 11 syllables, and in English generally 10. The rhyme scheme is aba, bcb, cdc, ded, etc., continuing indefinitely, and closing with a rhymed couplet. Among English examples are Chaucer's *Complaint*; *The Triumph of Life* (Shelley); and *The Prophecy of Dante* (Byron).

Teschen (Czech. Tesin; Polish Cieszyn). German and best known form of the name of a town and area of Silesia, central Europe. The town stands on the right bank of the Olsa, a trib. of the Oder. The area, c. 350 sq. m. in extent, and once an independent principality, fell in 1625 to the crown of Bohemia, and in 1722 to Austria. The notable treaty which ended the war of the Bavarian succession was signed at Teschen, May 13, 1779. The pop. of the area is mixed: in 1910, the Austrian census showed 69 p.c. Polish; the Czechoslovak census of 1931 showed 34 p.c. Polish. In 1920 the conference of ambassadors gave the town to Poland, except the rly. station which, with the rest of the area, went to Czechoslovakia. At the time of the Munich crisis (g.v.) in 1938 Poland demanded the

whole area, and Czechoslovakia ceded it. After the Second Great War Czechoslovakia resumed occupation of the area awarded to her in 1920, and in March, 1947, entered into an agreement with Poland under which Poles in Czech Teschen were granted legal right to their own schools, etc. Among the industries of the area are coal mining, cloth weaving, flax spinning, tanning, and the manufacture of clocks, screws, and furniture. Pop. est. 25,000.

Teschenite. Igneous rock akin to gabbro and dolerite but containing analcite. It is found in Leicestershire, Scotland, and near Teschen. See *Igneous Rocks*; *Theralite*.

Tesla, NIKOLA (1857-1943). American inventor. Born at Smiljan, Serbia, and educated at Graz and Prague university, he was employed in the telegraphs department of Austria until 1881, when he joined an electrical company in Budapest. In 1884 he went to America, became naturalised, and for a time worked for Edison. He discovered the rotary magnetic field which resulted in the multi- and polyphase systems of electric current transmission. Tesla invented many electrical appliances and improvements, including the Tesla coil, oscillators, arc lamps, etc., and carried out remarkable experiments in alternating currents of high frequency and potential which proved beneficial in curing skin diseases. Later he did valuable work on electronics. He died Jan. 7, 1943.

Tessin, CARL GUSTAF, COUNT (1695-1770). Swedish statesman. He was born at Stockholm, Sept. 15, 1695, son of Count Nicodemus Tessin, a distinguished architect. Having been ambassador in Vienna, 1725, he became active in political life at home, notably as one of the leaders of the Hat party, which in 1738 began its long exercise of power that kept Sweden embroiled with foreign peoples. During 1739-42 he was ambassador at the French court; in 1744 he was sent on a special mission to Berlin; and during 1747-52 he was his country's chief minister. An admirer of French culture, Tessin was also an author, and his letters to Gustavus III were translated into English, 1755.

Tess of the D'Urbervilles. Twelfth novel of Hardy. Most of it appeared serially in *The Graphic* before its issue in volume form as *Tess of the D'Urbervilles*, a Pure Woman, in 1891. Tess, daughter of a Wessex rustic, Durbeyfield,

whose head is turned on being told that he is a descendant of the D'Urbervilles, becomes the victim of that discovery. Seduced as an ignorant girl by Alec D'Urberville, she marries the priggish Angel Clare, only to be left on her wedding day after confessing her past. Circumstances drive her back to her seducer, whom she kills on her husband's return, and she is hanged for the murder. The story impresses by its sense of tragic inevitability, of a fate against which the individual struggles in vain.

Test. River of Hampshire, England. It rises near Upton and flows S. past Stockbridge and Romsey to Southampton Water, which it enters near Totton. Near Fullerton it is joined by the Anton, and the united stream is sometimes known by that name.

Testacea (Lat. *testa*, shell). Term sometimes used for a group of invertebrate animals possessing a shell. See *Mollusca*; *Shell*; *Shellfish*.

Test Act. Act passed in 1673 ordering every office holder under the English crown to take the Sacrament according to the rites of the Church of England, and to declare against Transubstantiation. It was aimed mainly at the Roman Catholics, and was not repealed until 1828, but for many years before that it had been a dead letter as regards Protestant Non-conformists, for those who disregarded it were protected by an annual Act of Indemnity.

Testament (Lat. *testis*, witness). Word used for a solemn declaration, e.g. a will. Thus comes its use for the two parts of the Bible. One who leaves a will is called a testator. See *Bible*; *New Testament*; *Old Testament*; *Will*.

Testament of Beauty, THE. Philosophical poem by Robert Bridges. Completed in 1929, during the last year of the poet's life, when he was 85, it was dedicated to George V. It is in four books totalling 4,074 lines, mostly loose hexameters with an occasional pentameter, and, after an introduction, treats of beauty in terms of Selfhood, Breed, and Ethic. Argument and vocabulary are exceptionally subtle, and Bridges modifies spelling by such devices as doubling consonants and omitting a final *e* to indicate strong and weak syllables. The scale of the work entitles it to be called Bridges's masterpiece.

Testamentum Domini (Lat., Testament of the Lord). Apocryphal book, dating from about the

close of the 3rd century, or possibly later. It was first published in a complete form in 1899 by the patriarch of Antioch. It exists in Arabic and Syriac versions only, though originally written in Greek, and professes to record a number of the utterances of Christ after His resurrection. An English translation was published in 1902.

Testis. The essential male generative organ. In the human species the testes are two oval glands about $1\frac{1}{2}$ ins. long, suspended in the scrotum by the spermatic cord. Besides forming the spermatozoa, they give rise to an internal secretion which passes into the blood and has an influence upon the whole body. At puberty this so-called secondary secretion renders the animal male, deepening the voice and causing hair to grow on body and face. The testes are formed in the abdomen and pass into the scrotum shortly before birth. It is not rare for the testes to remain undescended, but they usually come down during the first year of life.

Orchitis is acute inflammation of the body of the testis, and may be the result of injury, or follow mumps or other fevers. A hydrocele is an accumulation of fluid other than pus or blood in the vicinity of the testes or cord. Varicocele is a varicose condition of the veins associated with the testis. See Castration.

Test Match. International cricket match. The term is also used in other sports, e.g. speedway racing, but it implies *par excellence* a cricket match between England and Australia. These contests began in 1876, and are now played normally about every fourth year in each country, five games constituting a rubber (see Ashes). After the 1948 season Australia had won 64 tests to England's 55, leaving 34 drawn—these mostly in England, because in Australia the games were for years played out irrespective of time. In England, Australia had won 19 and lost 21; in Australia, England had won 34 and lost 45. The biggest score in an innings over the series $\frac{1}{2}$ 903 for seven wickets, by England, in 1938; Australia's best total being 729 for six, in 1930. Lowest totals are 36 by Australia, 1902; 45 by England, 1886–87. D. G. Bradman (5,028) made the most runs for Australia and J. B. Hobbs (3,636) for England, while the most successful wicket-takers were respectively H. Trumble (141) and W. Rhodes (109). Test match grounds are Lord's, Kennington

Oval, Trent Bridge (Nottingham), Headingley (Leeds), Old Trafford (Manchester); Sydney, Melbourne, Adelaide, Brisbane. Test match captains have included: (England) W. G. Grace, A. E. Stoddart, A. C. MacLaren, F. S. Jackson, P. F. Warner, A. O. Jones, J. W. H. T. Douglas, C. B. Fry, A. E. R. Gilligan, A. P. F. Chapman, D. R. Jardine, G. O. Allen, W. R. Hammond, N. W. D. Yardley; (Australia) D. W. Gregory, W. L. Murdoch, P. S. McDonnell, M. Blackham, J. Darling, M. A. Noble, S. E. Gregory, W. W. Armstrong, H. L. Collins, W. M. Woodfull, D. G. Bradman.

South Africa really entered international cricket in 1907, and after the English tour of 1948–49 had won 12 tests to England's 34, with 28 drawn. In 1912 both this dominion and Australia sent sides over to play in a triangular tournament, but the experiment was not repeated. The longest test match on record entered the tenth day's play at Durban without result in 1939.

Here follow the dates on which other dominions first opposed England in representative cricket, with results up to Sept., 1950:

West Indies since 1928. England won 9 matches; West Indies 8; 8 drawn.

New Zealand since 1929. England won 4 matches; 14 drawn.

India since 1932. England won 6 matches; 4 drawn.

Test Paper or Indicator Paper. Specially treated paper impregnated with an indicator solution and carefully dried. Many types of test paper are used for

(colourless to pink), thymol blue (yellow to blue). Test papers used to indicate the presence of chemicals include lead acetate (hydrogen sulphide), mercuric chloride (arsenic), starch (iodine), and turmeric (ammonia).

Testudo (Lat., tortoise). Military formation employed by the Roman soldiers, especially in siege operations. They held their shields above their heads and overlapping those of their comrades behind, forming a firm and unbroken covering. Thus protected, the attacking party could approach close enough to place their scaling ladders against walls.

Tetanus. Infective disease caused by the *Bacillus tetani*. See Lockjaw.

Tetany. Spasmodic contraction of the muscles, most often of the hands and feet. This muscular irritability is due to an abnormal calcium chemistry resulting from deficient secretion of the parathyroid glands. It occurs in children suffering from rickets, and less frequently in adults after removal of the thyroid gland, or in the course of certain diseases. Spasms cause the limbs to assume a characteristic condition, the fingers being pressed together so as to make the hand more or less conical, while the wrists and elbows are bent and the arms folded over the chest. Treatment is directed towards adjusting the calcium-phosphorus chemistry of the body. Calcium gluconate may provide a cure, and the administration of vitamin D is valuable.

Tetbury.

Market town and rural dist. of Gloucestershire, England. It is the terminus of a branch rly. from Kemble, 7 m. to E.N.E. Tetbury marks the site of an ancient British camp. The parish church of S. Mary Magdalene replaced a Norman church,

pulled down in 1777 except the tower and spire. A grammar school existed in James I's reign. There are three annual fairs. Market day, Wed. Pop of dist., est. 6,750.

Tete or Nyungwe. Town in Mozambique. Situated on the Zambezi, 235 m. N.E. of Salisbury, Rhodesia, and about 260 m. from the sea, Tete is an important military station, where the Portu-

Tetbury, Gloucestershire. The old market house

testing alkalinity or acidity of fluids and for detecting presence of specific chemicals, e.g. litmus (red in acid and blue in alkaline solutions), brilliant yellow (yellow to orange), bromocresol purple (yellow to purple), chlorophenol red (yellow to red), congo red (yellow to violet), cresol red (yellow to violet), methyl orange (red to yellow), phenolphthalein

guesse have maintained a garrison since 1632. Here goods are transferred from river to road transport en route for N.E. Rhodesia. Gold, coal, asbestos, and uranium have been discovered in Tete district.

Tethys. In geology, name given by Suess (1831-1914) to an ancient elongated ocean which, including the present Mediterranean, stretched from Spain to the Himalayas. In it were laid down the deposits which later were folded to form the Alps, Carpathians, Balkan arcs, Caucasus, and Himalayas. This body of water persisted throughout the Triassic, Jurassic, Cretaceous, and early Tertiary periods, but disappeared, save for such remnants as the Mediterranean, Black, and Caspian Seas, when the Alpine-Himalayan mountain chains were upheaved. Tethys in Greek mythology was the daughter of Uranus and the wife of Oceanus.

Tetrachlorethylene OR **PERCHLORETHYLENE** (C_2Cl_4). Non-inflammable colourless liquid of ethereal odour. Widely used as an industrial solvent, it is an unsaturated halogenated hydrocarbon with physical properties not unlike those of carbon tetrachloride. It can be made by the action of chlorine upon ethylene. It has a medical use as a vermifuge against hookworm.

Tetrachord (Gr. *tetrachordos*, four-stringed). A succession of four sounds proceeding by step within the limits of a fourth. See Scale.

Tetrad. Biological term applied to a group of four similar units. Its most frequent applications are to the group of four spores formed from a mother cell after meiosis, and to the four chromatids which occur together during that process as a result of the synopsis of the pair of homologous chromosomes each longitudinally split.

Tetradymite (Gr. *tetradymos*, fourfold). In mineralogy, name given to a mineral consisting of an intermetallic compound of bismuth, tellurium, and sulphur— Bi_2Te_2S —with perhaps traces of selenium. The mineral has a metallic, steel-grey lustre, and is so-called from its common occurrence in twin crystals. It is often associated with gold-bearing quartz in veins formed at moderate to high temperatures; also in contact metamorphic deposits.

Tetragrammaton (Gr., of four letters). In a general sense, any sacred name of four letters, e.g. the Latin, *Deus*, God. The term is

specifically applied to the Hebrew JHVH (*Jod, He, Vau, He*), which the early Jews used in a mystical sense as a symbol of Jahveh or Jehovah (q.v.), and which early opponents of Christianity said that Christ employed to perform His miracles.

Tetrahedrite. One of the grey copper ores. A complex sulphide of copper and antimony, it frequently contains traces of other metals including silver, sometimes up to 30 p.c. Tetrahedrite occurs with other ores of copper, sometimes in lead-zinc deposits.

Tetrameter. In English verse, a line containing four feet, however the accents may fall. Rhymed iambic tetrameter has always been a favourite measure with lyric poets, e.g. Marlowe's *Come live with me and be my love*; also the whole of Tennyson's *In Memoriam* is written in it.

Tetrarch (Gr. *tettarēs*, four; *archein*, to rule). Ruler of one of four parts of a region. Losing its original meaning, the word came to be applied to minor rulers generally, and especially to the princes of Syria under the Roman emperors. Herod Antipas, to whom Christ was sent by Pilate, was tetrarch of Galilee (Luke 3).

Tetrazzini, Luisa (1871-1940). Italian singer. Born in Florence, she received an early musical education from her sister Eva, a musician, after which her unique voice was brought to perfection by Ceccherini. She first sang in L'Africaine at the Teatro Verdi in her native city, 1895, and sprang to fame in a night. Thereafter throughout her life she enjoyed unbroken success. On first appearing at Covent Garden in 1907, she sang Violetta in *La Traviata*. From 1908 to 1912 she was regularly at the Manhattan theatre, New York, and later moved to Chicago. Her last performance in England was at the Albert Hall in 1933. Tetrazzini was a prima donna in the great tradition, with a peerless voice in the coloratura style, charming presence, and vivid personality. She died at Milan, April 28, 1940. She published an autobiography *My Life of Song*, 1921.

Tetryl OR **TETRANITROMETHYLANILINE.** Service high explosive, commonly known as Composition

Exploding or CE. It is a yellow powder, melting at 131° C., made by the action of nitrating acid on a solution of dimethylaniline in concentrated sulphuric acid. Great improvements were made in the manufacturing process during the Second Great War, and to meet the increased requirement a continuous nitration and purification process was developed. Tetryl is more powerful and sensitive than T.N.T. and detonates fairly readily; therefore it is used almost entirely as a primer or booster. See Ammunition; Detonator; Explosives.

Tettenhall. Urban dist. and parish of Staffs, England, 2 m. W.N.W. of Wolverhampton, on the old London to Holyhead road. The church of S. Michael, of pre-Norman foundation, restored in the 19th century and badly damaged by fire in 1950, contains monuments of the Wrottesley family. Near Tettenhall a battle took place in 910 between Edward the Elder and the Danes. In the neighbourhood is Wrottesley Hall, the seat of Lord Wrottesley, whose family has owned it since the time of Henry II. The present building dates from 1696 and the park contains British remains. Tettenhall college is a nonconformist public school. Pop. 7,240.

Tetuan. Town in the N.E. of Morocco. It has lofty mts. in the background, is situated about 6 m. from the Bay of Tetuan, and is connected with its port, at the mouth of the Rio Martin, by a short rly. Another rly. runs to Ceuta, 25 m. Tetuan is the capital of the Spanish zone, and the h.q. of the Moroccan khalifa, who rules under the control of the Spanish high commissioner. There are Jewish and native colleges. Pop. 49,535.

Tetzel, JOHANN (c. 1460-1519). German friar. Born at Leipzig, the son of a merchant, he was edu-

Johann Tetzel,
German friar

cated there and became a Dominican in 1489. Eloquence as a preacher led to his employment in 1517 by the elector of Mainz as a seller of indulgences, half the proceeds being remitted to the pope towards the cost of building S. Peter's. Luther denounced this practice in his famous 95 theses, 1517. To these Tetzel replied with such extravagance as to involve himself in

obloquy and disgrace, and he retired to the Dominican convent at Leipzig, where he died July 4, 1519. See Indulgences; Luther; Reformation.

Teucer. In Greek legend, first king of Troy. Teuceri was an alternative name for the Trojans. Another Teucer was the half-brother of Ajax, and fought on the Greek side at the siege of Troy. He was the best Bowman in the Greek host. See Troy.

Teutoburger Wald. Forested mt. range in N.W. Germany. It extends S.E. through the *Land* of North Rhine-Westphalia for about 70 m., culminating in the Völknerstod, alt. 1,536 ft. The name of the range is a modern rendering of the Latin *Salvus Teutoburgiensis*, where Arminius (*q.v.*) ambushed and destroyed three Roman legions under Varus, on their march into winter quarters, A.D. 9. The identification is doubtful but the German victory is commemorated by a colossal statue of Arminius, completed 1875, which stands on the Grotenburg in the Teutoburger Wald near Detmold.

Teuton. Name denoting a group of peoples, of the Caucasian or white race, whose languages constitute the Teutonic sub-family of Indo-European speech. The word Teutonic, used by late Roman writers as synonymous with Germanic, is preferred in modern English because Germanic is liable to confusion with German, which has a narrower implication. It is derived from the tribal name of the Teutones (*q.v.*).

Even in the infancy of Teutonic speech a homogeneous Teutonic race can hardly be postulated. The Bastarnae, an E. tribe encountered by the Macedonian power a century before the Teutones entered Italy, and afterwards absorbed into the Goths, exhibited that Celtic strain which usually accompanied the appearance of the Teuton in Alpine Europe. If the Teuton be pictured as tall, blond, long-headed, long-faced, with narrow aquiline nose, blue eyes, and light hair, that is tantamount to identifying him with the Nordic branch of the European race, which developed its most typical form in Scandinavia (see Ethnology). But each of these characters exhibits among the Teutonic-speaking peoples marked divergences, partly through geographical environment, partly through admixture in varying degrees with the Alpine and Mediterranean stocks. The resultant physical complex tends here and there towards rounder heads, more brunet

complexions, shorter faces, broader noses, greyer or darker eyes, and browner hair. The British people, from the racial standpoint, is barely half Teutonic. During the last 1,000 years B.C. the Teutonic-speaking peoples spread S., S.E., and W. from their homes on both sides of the W. Baltic, displacing and absorbing the earlier populations, Celtic and other, of central Europe.

Archaeology throws much light upon the prehistory of N. Europe, and edda and saga illustrate its primitive society. But this evidence fails to determine how far the Scandinavian civilization, with which the early poetry is mainly concerned, was shared by the manifold Germanic peoples S. of the Baltic coast. The lowly cultural level portrayed by Tacitus pertained mostly to the W. region, and during the early conflicts with Rome became sensibly modified by contact with the Mediterranean civilizations.

The various national migrations, from the 4th century onwards, emphasised those distinctive types of village communities, folkmoths, law based on *vergild*, land inheritance, servitude and kingship, which found a congenial home in post-Roman Britain, and influenced its later institutions. Some of this culture, as much Celtic as Teutonic, was a blend, and that it followed no uniform pattern is clear from the individual history of Ostrogoths and Visigoths, Vandals and Burgundians, Alamanni and Bavarians, Franks and Lombards, Saxons and Jutes.

Primitive Teutonic Religion

Nor can the primitive Teutonic religion be reduced to a common formula. Eight centuries elapsed after the first Christian conversions in Moesia before paganism disappeared in the far north. As a consequence much Teutonic mythology, as in *Beowulf*, bears traces of the infiltration of Christian ideas. At heart Teutonic paganism was based on old neolithic nature-worships. From these there emerged, by local development or by assimilation, the recognition of a sky-god *Tiw*, a wind-god *Odin*, a thunder-god *Thor*, *Frigg*, and many another.

They were pictured amid a multitude of demigods, Balder and Loki, Midgard-worm and Fenris-wolf, besides subordinate agencies such as norns and valkyries, giants and dwarfs. Divination by rune and other magical rites were practised, and religious philosophy originated such conceptions as *Yggdrasil's* ash, *Asgard*, *Valhalla*, and *Ragnarök*. See Ethnology; Europe; Germany; Mythology;

Scandinavia; consult also *The Races of Europe*, W. Z. Ripley, 1900; *The Archaeology of the Anglo-Saxon Settlements*, E. T. Leeds, 1913; *The Religion of our Northern Ancestors*, E. E. Kellett, 1914.

E. G. Harmer

Teutones or **TEUTONI**. Tribe living in N. Europe, probably in or near Jutland, in the 2nd century B.C. In 103 B.C. they marched S. to assist the Cimbri (*q.v.*), who were fighting in Gaul, but they were overthrown by Marius in 102 at *Aquae Sextiae* or *Aix*. Although the Teutones are by some considered to have been Celts, the name Teutonic, which like the German *Deutsch* and English *Dutch* means national, has become a designation for the whole Germanic race.

Teutonic Languages. One of the great divisions of the Indo-European family, also called the Germanic languages. Their hypothetical common source, Primitive Germanic (*Urgermanisch*), was spoken by the barbarous tribes of N. and N. Central Europe. Belonging to the W. group of Indo-European languages, and intermediate between the Baltic and Italo-Celtic divisions, it developed three main dialects, aided by the formation of political and military confederations. These were: (1) E. Teutonic, comprising Gothic (*q.v.*), Vandalic, and Burgundian, all extinct; (2) N. Teutonic or Norse, comprising Icelandic, Swedish, and Dano-Norwegian; (3) W. Teutonic, including the Low German tongues, Old Saxon, and Old Frisian, the Anglo-Frisian group, intermediate between W. and N. Teutonic, and the High German group. From Old Saxon developed the modern Low German or *Plattdeutsch*; from Old Frisian, Dutch, Flemish, and certain German dialects; and from High German the modern literary German, which, however, contains elements from various dialects. Apart from a few Scandinavian inscriptions, the oldest Teutonic documents are the Gothic Bible, etc., of Uphilas, and the earliest Anglo-Saxon poems.

The chief characteristics of the Teutonic dialects are the sound-shiftings known as Grimm's and Verner's laws (*q.v.*), the development of the weak and strong adjectival forms and of the *terite* of weak verbs. Like other Indo-European languages, the Teutonic are inflexional, but have not escaped the general analytic tendency of most European dialects; this can be seen in Dutch and kindred languages, especially in English. See Europe; Language; Pronunciation.

Teutonic Order. Order of knighthood established in 1198. Originating in the charity of some German merchants who established a hospital during the siege of Acre, 1190, it was formally constituted in Jerusalem, 1198. Membership was confined to Germans of noble birth. Although its headquarters for a century (1191-1291) were at Acre, the order carried out its greatest work in Germany, where it undertook the conversion and conquest of Old Prussia.

Acquiring political importance, the order ruled large districts on the borders of Poland and Russia, owing allegiance to no power save the pope. Its seat was moved to Marienburg in 1308, and for another hundred years the grand masters there held court and ruled extensive territories. By its constitution of knights, priests, and servants, every function of the state government, civil and ecclesiastical, was provided for, and the order had become one of the most flourishing institutions of Europe when it was defeated by the Polish king Ladislas at Tannenberg, 1410.

This gave its subjects a chance of revolt. The Prussian League was formed in 1440, and in 1466 it helped Poland to wrest West Prussia from the knights by the treaty of Thorn. By this treaty the order held East Prussia as vassal of Poland, and half the knights were to be Poles. For another 60 years the order remained in this state of vassalage until, in 1526, its grand master Albert of Brandenburg became a Protestant and made the territories an hereditary grand duchy. The order continued to exist, with headquarters at Mergentheim, until 1809. It was revived as an Austrian order of knighthood in 1834. See Knighthood; Prussia.

Teviot. River of Scotland, in Roxburghshire (*q.v.*). It rises near the co. boundary and flows N.E. to join the Tweed near Kelso after a course of 37 m. There are fisheries for salmon and trout. The valley is known as Teviotdale.

Tewfik Pasha (1852-92). A khedive of Egypt. Son of Ismail Pasha, he was born Nov. 15, 1852, and in 1879 succeeded his father, who had been deposed, as ruler. The confusion into which Ismail's policy and extravagance had thrown the

country necessitated the intervention of Great Britain and France, and foreign influence occasioned the rising in 1882 of Arabi Pasha (*q.v.*). Tewfik's reign was marked by reliance on the advice of Baring (later Lord Cromer), and in 1884 he evacuated the Sudan. He died Jan. 7, 1892.

Tewkesbury. Mun. bor. and market town of Gloucestershire, England. Situated at the confluence of the Severn and Avon, near the Worcestershire border and 10 m. N. of Gloucester, it has a rly. station. Founded by the Romans, who named it Etocessa, Tewkesbury has always been locally important for its abbey, founded in 1102 on the ruins of an 8th century Benedictine establishment. The church alone survived

Tewkesbury arms

defeat at Barnet, Margaret, queen of Henry VI., joined the Lancastrian forces in the W., and, excluded from Gloucester, encamped on the slopes S. of Tewkesbury in a strong position with the little river Swillgate on the left. The duke of Somerset commanded the exhausted army. He was rash enough to abandon his strong defensive line to come down into the plain, and when the Yorkists, under Edward IV., who had followed rapidly from Cirencester, opened fight, the Lancastrians were routed and their cause was lost. Prince Edward fell, and Margaret was captured.

Texarkana. Name of a city of the U.S.A. It lies across the Texas-Arkansas border, and has two separate municipal govts., but forms a commercial, industrial, and social unit. Situated 165 m. N.E. of Dallas, Tex., 165 m. S.W. of Little Rock, Ark., 26 m. S. of the border with Oklahoma, and

Tewkesbury, Gloucestershire. Air view of the church of the old Abbey, a magnificent example of Norman architecture

the Reformation; this remains one of the finest Norman edifices in England. The central tower, N. porch, and W. front are perfect examples of the style. Other buildings of interest are the grammar school, founded 1576; town hall, corn exchange, and Tolsey Hall. There are many fine old houses in the town, which figures as Nortonbury in John Halifax, Gentleman. Dickens brought Pickwick to dine at the Hop Pole. The district was long noted for making mustard; Falstaff said of Poins, "His wit's as thick as Tewkesbury mustard." Market days, Wed. and Sat. Pop. 4,667.

Tewkesbury, BATTLE OF. Fought May 4, 1471, during the Wars of the Roses (*q.v.*). After her

28 m. N. of the border with Louisiana, Texarkana has a municipal airport and is served by the Missouri Pacific and other rlys. Situated in an agricultural and lumbering region, the city ships cotton and cotton products, garden produce, grain, and lumber. Industrial establishments include rly. repair shops, planing mills, cotton and cotton-seed oil plants, and textile mills.

The first permanent settlement was made in 1874; the Texas half of the city was incorporated in 1875, the Arkansas half in 1881. Pop. (1940) 28,840—17,019 in Tex. and 11,821 in Ark.

Texas. Largest state of the U.S.A. Approx. one-twelfth of the entire area of the Union, Texas has

Tewfik Pasha, Khedive of Egypt

some characteristics of the west, the south, and the central regions of that country. One of three states (the others being Vermont and Calif.) to have been an independent republic under its own flag before its entry into the Union, it has the unique distinction of having entered on its own terms and by a joint resolution of the U.S. congress.

In area 263,644 sq. m., Texas is considerably larger than France, Belgium, the Netherlands, and Switzerland combined; and than the six New England states with N.Y., N.J., Penn., Del., Md., Va., and W. Va. Its 254 cos. include 59 as large as, or larger than, Rhode Island, the smallest state. Texas ranks sixth among the states in pop.: (1945, est.) 6,786,740.

Plains, Prairies, and Mountains

Physiographically, Texas can be divided into four areas—the flat, alluvial coast-belt of the gulf plains in the S.E.; the prairies stretching W. to the 100th meridian; the great plains, an elevated plateau from 1,000 ft. to 5,000 ft. high; and in the extreme W., the Basin range, or Trans-Pecos prov., a mountainous region containing many peaks more than 5,000 ft. high, the highest point in the state being El Capitan (9,020 ft.), a peak in the Guadalupe mts.

A series of low, sandy islands lies along the coast. The Panhandle, the N. tip of Texas, is so called because on the map it looks like the handle of a huge pan. The Rio Grande, which separates Texas from Mexico, and the Pecos and Canadian rivers rise in the Rockies in Colo. and N.M. The other principal streams, all rising within the state, are the Red, forming part of the boundary with Okla., the Sabine, part of the boundary with La., the Colorado, the Brazos, the Guadalupe, the Trinity, and the Nueces. Their waters have formed many deep canyons.

The climate ranges from subtropical to temperate. Irrigation is extensive and has been responsible for the development of the "magic valley" in the lower Rio Grande region and for Texas ranking as the third citrus-fruit producer among the states. The huge earthen Denison (Lake Texoma) dam, on the Red river, 5 m. N.W. of Denison, was built to control floods and provide hydroelectric power.

Texas produces one-fourth of the cotton of the U.S.A., and one-seventh of the world's cotton. Among its other chief crops are maize, winter wheat, rice, pota-

toes, peanuts, tomatoes, onions, and fruit. Livestock, particularly beef cattle, sheep, goats, and mules, wool and mohair are other agricultural products. Texas is also the centre of U.S. petroleum production, 200 cos. having deposits (the E. Texas oilfield is the richest known), and ranks first in natural gas (its gas pipelines serve several other states). Almost all U.S., and 85 p.c. of the world's, sulphur, virtually all U.S. helium (controlled by the U.S. govt.), and one-fourth of U.S. mercury come from Texas. Asphalt, magnesium, clay, cement, and other mineral products are produced in great quantity. The state has also immense little-developed deposits of iron, bituminous and sub-bituminous coal, and lignite. The forests, about 50,000 sq. m. in extent, yield yellow pine and oak.

The industries are chiefly those derived from or supporting the exploitation of the state's natural wealth—petroleum-refining, slaughtering and meat-packing, processing of non-ferrous metals, and production of cotton, cottonseed oil, flour, feed, and grains, and oilfield machinery. Other industries, including aircraft and chemical production, were established during the Second Great War. Important ports are Houston, Beaumont, Texas City, Corpus Christi, Port Aransas, and Galveston. Cities of more than 50,000 pop. are, besides Houston, Dallas, San Antonio, Fort Worth, Austin (the capital), Beaumont, Corpus Christi, Amarillo, El Paso, Galveston, and Waco.

Texas has 84 institutions of higher education, including the state university of Texas at Austin. The state has a large Mexican and negro pop. Spanish is still spoken in the S.W., where the influence of the first (Spanish) settlers is strong. An international park consisting of land contributed by Texas and Mexico, along the Rio Grande, was projected in 1948. Two senators and 21 representatives are returned to congress.

Texas has existed under six flags, those of Spain, France, Mexico, the republic of Texas, the U.S.A., and the Confederacy. It was settled in the 17th cent., taking its name from an Indian term, *tejas*, meaning friends or allies, which was applied to the Indian tribes around the Spanish missions in E. Texas. When Mexico declared its independence in 1821, Texas was a part of it.

Following trouble with the tyrannical govt., in 1835, a move-

ment for independence made headway in Texas, where many Americans and Britons had settled. War ensued, the end being a declaration of Texan independence in 1836. Outstanding events of the war were the heroic stand at the Alamo, a Spanish mission in San Antonio, by 187 Texans who were vanquished by a force of 3,000 Mexicans and slaughtered to a man, and the battle of San Jacinto, 18 m. from the present Houston, six weeks later, where the Texans under Gen. Sam Houston defeated the Mexicans and captured their leader, Santa Anna. The Alamo became a hallowed shrine, and on the San Jacinto battlefield is a monument consisting of a 570-ft. shaft, with a museum at its base. Texas was a republic for 9 years and 301 days until in 1845 it entered the Union. Disputes over the boundary between the new state and Mexico led to war with Mexico, 1845-48 (*see* Mexico). Texas was not a Civil War battlefield, although the last engagement was fought on the Rio Grande, near Palo Alto, a month after the surrender at Appomattox.

Texas City. Port of Texas, U.S.A. It lies on the W. side of Galveston Bay, 4½ m. N.W. of Galveston by rly. With a pop. of 350 in 1900, 5,748 in 1940, 25,000 in 1947, in 1945 it ranked 13th among U.S. ports in volume of trade (8,696,711 short tons), five above San Francisco (7,530,007 short tons). Here in 1947 the French Liberty ship, the 7,176-ton Grandcamp, loaded with nitrates, caught fire and blew up, April 16. Explosions ashore, in a large chemical works and among oil tanks, followed; fires raged for 24 hours, the 6,214-ton High Flyer, loaded with nitrates and sulphur, and smaller ships and barges also blowing up. The waterfront was burnt out, houses up to two miles away were wrecked, and the explosions were felt 100 m. inland. Casualties included 512 killed and 3,000 injured. It was the worst disaster of the kind that had been experienced in the U.S.A.

Texcoco or **TEZCUCO.** Town of Mexico, in the state of Mexico. It stands on the E. shore of the salt lake of Texcoco, 24 m. by rly. E. by N. of Mexico City. Until the Spanish conquest it was the capital of a flourishing kingdom, allied with Mexico.

Texel. Island of the Netherlands in the prov. of N. Holland. The most westerly of the Frisian Islands (*q.v.*), it is separated from the mainland by the Marsdiep

channel. The surface is flat and often marshy. To the N. of the island is the dist. called the Eijerland, or Land of Eggs, where seabirds' eggs are collected in large numbers. Den Burg is the chief town. Off Texel the English fleet, under Monk, defeated Tromp, July 31, 1653. Its area is 71 sq. m. Pop. 7,620.

Textile (Lat. *texere*, to weave). Term for any woven material. The art of preparing and using various materials to produce cloth was already practised thousands of years ago, by the Chinese, the Sumerians, and the Egyptians. Textile manufacture ranks with agriculture, house-building, cooking, and metal-working as one of the basic activities of civilized man. From the 11th cent. to the 14th raw wool was England's chief export; from the 15th cent. to the 17th cloth made of wool was more important, impetus being given to the industry by waves of immigrants from the Continent who brought Continental processes with them. In woollen manufacture factories first developed, and the state regulation of industry began. The earliest craft guild was that of the weavers.

From the 17th cent. cotton gradually became more important than wool, both in the manufactures and in the foreign trade of England, and the inventions that led to the Industrial Revolution, and transformed industry from the domestic to the factory system, concerned cotton spinning and weaving. The new inventions were adopted in the wool industry also, though more slowly, and together these two textile industries accounted for much of the expansion of British foreign trade during the 19th cent.; and their prosperity was an important factor in the doubling of the pop. between 1750 and 1831 and later increases.

At the beginning of the 20th cent. textiles constituted almost 50 p.c. of British exports. They employed about 1.5 millions of the 16 millions of industrial workers. Cotton still predominated; "Manchester goods" were part of the idiom of world trade. But Japan became an important competitor in Great Britain's cotton markets in the Far East, India, and Africa; Indian companies, some financed by British capital, supplied much of the local demand. Artificial silk (rayon) began to replace cotton and caused considerable changes in textile fashions and textile technology. After the First Great War the cotton industry was never able

to export either in such volume or to such a value as formerly. The wool industry became relatively more important, although it also declined, principally because of the growth of manufacture overseas. In the third decade of the century unemployment in most branches of textiles was very heavy, almost one in five being unemployed. The value of the output of textiles shrank from £763 m. in 1924 to £446 m. in 1935.

During the Second Great War, as part of the policy of "concentration of industry," the number of those employed in textiles was deliberately reduced from 1,183,000 in 1939 to 661,000 in 1945.

W. M. Thackeray.
After Samuel Laurence

At the end of the war there was an immense and urgent need for textiles of all kinds at home and abroad. Japan was, for the moment at any rate, no longer a supplier of cheap cotton and rayon goods, and much of the textile manufacturing capacity of the Continent had been destroyed or disorganized. A determined effort was made to restore the textile industry in the U.K., but at the beginning of 1947 production of cotton was still 40 p.c. below that of 1939; the labour force numbered only 255,000 compared with 344,000. The consumption of wool was 80 p.c. of that in 1939, the number engaged in the industry 167,000 compared with 210,000. Rayon yarn output, however, was more than 50 p.c. above pre-war.

The Americas, Australia, New Zealand, and South Africa came, as the 20th cent. progressed, to produce more and more of the textiles they required—a huge cotton, wool, and silk manufacturing industry, greatly developed to supply war needs, grew up in the

U.S.A.; the countries of S. America, deprived twice by war conditions for years at a time of their normal imports of textiles from Europe, began to set up their own textile factories. The nations of the British Commonwealth did likewise. But in spite of this there remained a world demand for the fine quality textiles of the U.K., particularly cottons and woollens, which in the second quarter of 1948 represented £53 m. out of a total export of manufactured goods valued at £337 m. See Cotton; Jute; Rayon; Silk; Wool.

Thackeray, WILLIAM MAKEPEACE (1811–63). British novelist, humorist, and essayist. He was born at Calcutta, July 18, 1811, and was sent to England six years later. He was at Charterhouse from 1822, and in 1829 went to Trinity College, Cambridge, where among his contemporaries were Tennyson, FitzGerald, and Monckton Milnes, with all of whom he formed enduring friendships. He left the university in 1830, without taking a degree, and went to Weimar. In 1831 he entered the Middle Temple, but abandoned law for journalism. He purchased in 1833 *The National Standard*, which he edited for the few months it survived, and in 1836 went to Paris as correspondent for the short-lived *Constitutional*. That year he married Isabella Shawe (d. 1894); there were three children, including Lady Ritchie. In 1840 Mrs. Thackeray's brain gave way, and she never recovered. Thackeray now became a confirmed clubman, his favourite haunt being the Garrick.

He had long been on the staff of *Fraser's Magazine*, to which he contributed stories, essays, verses, caricatures, art criticism, and reviews. His principal contributions were *The Yellowplush Papers*, 1837–38, which attracted attention, and was pirated in the U.S.A.; *Major Gahagan*, 1838; *Catherine, A Shabby-Genteel Story*, 1840; *The Great Hoggarty Diamond*, 1841; *The Fitzboodle Papers*, 1842; and *Barry Lyndon*, 1844. *The Paris Sketch Book*, 1840, and *Comic Tales and Sketches*, 1841, were volumes of articles already published, but *The Second Funeral of Napoleon*, and *The Irish Sketch Book*, 1843, contained new matter. Thackeray first became known to a wider public by his contributions to *Punch*, *Jeames's Diary*, 1845, *The Snobs of England*, 1846–47.

Fame in the broader sense came with the issue of *Vanity Fair* in monthly parts during 1847–48.

He was then recognized as one of the great men of letters of the day, at least the equal of Dickens. *Pendennis* appeared 1848–50, and *Esmond*, which set the seal upon his reputation, was published in three vols. in 1852. The Christmas Books, Mrs. Perkins's Ball, 1847, Dr. Birch, 1849, The Kickleburys on the Rhine, and Rebecca and Rowena, 1850, showed versatility.

In 1852 Thackeray went to the U.S.A. to deliver lectures on The English Humorists of the 18th Century, which he had already given in England. On his return he published *The Newcomes*, 1853–55. In 1855, in which year was issued that splendid example of delightful fooling, *The Rose and the Ring*, he went again to America to lecture on *The Four Georges*, which series he presently gave in London and the provinces. He stood unsuccessfully for Oxford in the Liberal interest in 1857. He then went to his desk again, and wrote *The Virginians*, 1857–59. The *Cornhill Magazine* was founded in 1860, and Thackeray edited the first 23 numbers. He contributed to it *Lovel the Widower*, 1860, *Philip*, 1861–62, and many delightful *Roundabout Papers*, 1860–63. The fragment, *Denis Duval*, appeared posthumously in 1864, Thackeray having died on Christmas Eve, 1863.

Thackeray was one of the most versatile of writers. His light verse is often delightful, and *The Ballad of Bouillabaisse* and *The Mahogany Tree* retain their popularity. His humorous writings make agreeable reading, and his parodies, notably those of *Lever* and *Disraeli*, are among the best in the language. The *Roundabout Papers* are deliciously mature. Thackeray's fame, however, rests ultimately on his novels, especially *Barry Lyndon*, *Vanity Fair*, and *Esmond*, of which the first is an admirably sustained piece of irony, excelled only by *Swift*.

It is in atmosphere and characterisation that these books are pre-eminent; when writing them Thackeray lived in the period, and with his characters, who to him were living persons. The books are somewhat lacking in plot, except *Esmond*, and what story there is is frequently interrupted by the author in his favourite rôle of week-day preacher. Thackeray's humour is strongly tinged with satire, he has a keen sense of the frailties of humanity, but though occasionally bitter is never really cynical, and is a sentimentalist at heart. His style is simple, but no

situation ever found him wanting. He nearly always furnished sketches for his books, and as an illustrator he is admirable. See *English Literature*; *Esmond*; *Novel*; *Sharp, Becky*; *Steyne, Marquis of*; *Vanity Fair*.

Lewis Melville
Bibliography. Works, 22 vols., 1867–69; 13 vols., ed. Lady Ritchie, reprinted and enlarged, 26 vols., 1911; 20 vols., ed. L. Melville, 1911; *Lives*, H. C. Merivale and F. Marzials, 1891; C. Whibley, 1903; L. Melville, new ed. 1927; *A Consideration of Thackeray*, G. Saintsbury, 1931; T., a *Personality*, M. Elwin, 1932; T., a *Critical Portrait*, J. Dodds, 1942; *Letters and Private Papers*, ed. G. N. Ray, 1946; *Showman of Vanity Fair*, L. Stevenson, 1947.

Thaddeus. Alternative name for the disciple of Christ, mentioned only in John 14, as Judas "not Iscariot."

Thai. People of Mongoloid stock in the Indo-Chinese peninsula. Emanating from S.W. China, they descended the Indo-Chinese river valleys, driving the Mon-Khmer peoples before them. They include the Burma Shans, one million; the Assam Ahom; the Siamese and Lao of Siam, 7,500,000; the Lao of French Indo-China, with the Thai-speaking aboriginal Tho and Muong of Tongking; and some millions in S.W. China.

Thailand. Anglicised form of the name applied to their country by the people of Siam (*q.v.*).

Thais. An Athenian courtesan (4th cent. B.C.). She is said to have accompanied Alexander the Great on his Eastern campaigns, and to have persuaded him, during a drunken bout, to set fire to the old palace of the Persians at Persepolis, by way of reprisal for the destruction of Athens by Xerxes. Dryden's ode, *Alexander's Feast*, 1697, describes the event, which is probably unauthentic. *Thais* is also the chief character in a novel of the same name by Anatole France.

Thakin Nu (b. 1906). Burmese politician. Born at Wakewa and educated at Rangoon, with his friend U Aung San he developed a

Thakin Nu,
Burmese politician

strong nationalist bent, and staged a students' strike. He was imprisoned in 1940 for seditious activities, but was released by the Japanese invaders in

1942 and made foreign minister in the puppet government. In 1945, on the advance of British forces, he followed Aung San in changing sides, and helped to form the anti-fascist people's freedom league against the Japanese. After the war the govt. formed by this party was accepted by the British as the provisional govt. On the assassination of Aung San, July 19, 1947, Thakin Nu took over leadership of the executive council and the presidency of the A.F.P.F.L., and visited London on a "good-will" mission to sign the treaty which granted independence to Burma. As first premier of the Union of Burma, following a "Marxist-Leninist" policy, he had to contend with violent political disunity. More than once he announced a date for his resignation, but postponed it as often in the endeavour to gain control of a deteriorating situation.

Thalben-Ball, GEORGE THOMAS (b. 1896). British organist. Born at Sydney, N.S.W., he came to London to study at the R.C.M. Having played the organ at Whitefield's Tabernacle, 1911–14, and Paddington parish church, 1916–19, he was appointed organist to the Temple church and the Albert Hall. He was an examiner and council member of the R.C.M. and R.C.O., and from 1941 on the advisory staff of the B.B.C., as well as being a leading broadcast performer.

Thaler. German silver coin first struck at Joachimsthal, Bohemia, about 1519. The coin was current in Germany until the 19th century, and was the unit of the monetary union until 1873, when it was replaced by the mark. The thaler was divided into 30 silbergroschen of 12 pfennigs. The word dollar is a modern corruption of the word.

Thalés (c. 640–c. 550 B.C.). Greek philosopher, one of the seven wise men of ancient Greece. Born in Miletus, Asia Minor, and supposed to be of Phoenician descent, he was the first human being, so far as is known, to suggest a scientific as opposed to a mythological explanation of the universe. With him the history of speculative thought begins. Thalés held that water was the all-pervading principle of the universe, and that all material substances were variants of water. He also held that the universe is a living creature. Thalés is regarded as the pioneer in the

sciences of geometry and astronomy among the Greeks, and is credited with having foretold the eclipse of the sun which occurred in 585 B.C.

Thalia. In Greek mythology, one of the nine Muses, whose province was pastoral poetry and comedy. See Muses.

Thallium (Gr. *thallos*, green shoot). One of the chemical elements. Its symbol is Tl; atomic number 81; atomic weight 204.39; density, 11.9 gm per c.c.; melting point 302.5° C.; boiling point 1,457° C. It may occur in either cubic close packing or hexagonal close packing structures. Thallium was discovered spectroscopically in 1861 by Crookes while examining some selenium residues. It owes its name to the fact that its spectrum gives one bright green line. It occurs mostly in amounts ranging from 16 to 60 p.c. in a few rare minerals like crookesite; also in pyrite, marcasite, and lepidolite. From ores by acid extraction, or from flue dusts by extraction with water, it may be readily prepared, as also from its compounds by electrolysis or by precipitation with zinc. Thallium is a white metal with a blue tint; so soft that it may be marked with the finger-nail, and leaves a black spot on paper.

Two series of salts are formed, corresponding with the valencies of one and three, and these show many resemblances to those of near neighbours of thallium in the periodic table. The trivalent salts bear the closest resemblance to iron and aluminium. Although oxidation is slight at ordinary temperatures, thallic oxide is easily formed above 100° C., and at higher temperatures thallic

oxide. Soluble thallium salts are poisonous and will destroy pests. Adding thallic oxide to glass gives it a high refractive index, making it suitable for artificial gems. The oxysulphide is used in photo-electric cells.

Thallophyta. Division of plant-life which includes the two subdivisions, the algae and the fungi. See Algae; Fungus.

Thälmann, ERNST (1886-1944). German communist. As a youth engaged in transport work in Hamburg, where he was born April 16, 1886, he joined the Socialist party. A revulsion against the First Great War, in which he served, carried him over to its independent wing, and from 1920 he was a vigorous communist. In the Reichstag from 1924, he twice stood against Hindenburg for the presidency. As chairman of the German Communist party he was made an honorary member of the Moscow International. Immediately Hitler came to power Thälmann was interned at Buchenwald concentration camp. He certainly died there in 1944: the Nazis said he was killed by Allied bombs on Sept. 16 (when no enemy aircraft was near), but inmates of the camp later averred he had been shot by guards on Aug. 18.

Thame. River of England. It rises in the Chiltern Hills in Hertfordshire, N.W. of Tring, and flows generally S.W. through the Vale of Aylesbury, Bucks, then S. through Oxfordshire to the Thames, which it enters near Dorchester. Its length is c. 30 m. Thame is the largest place on it.

Thame. Market town and urban district of Oxfordshire, England. It stands on the Thame, 12 m. E. of Oxford, and is con-

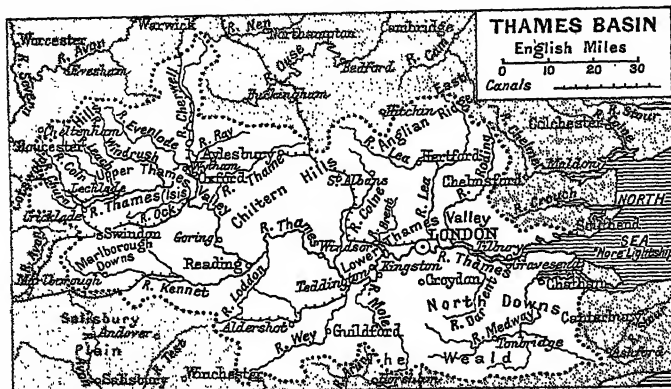

nected therewith by rly. and bus. The chief building is the church of S. Mary the Virgin, a large edifice mainly E.E., with remarkable tombs and other monuments. There are a town hall, and a grammar school founded by Lord Williams of Thame (d. 1559). Hampden is said to have died in a house in the town. Thame Park is a fine house standing in a large park; in its grounds are slight remains of a Cistercian abbey. Thame has an agricultural trade. There is an annual fair and agricultural show in Sept. Market day, Tues. Pop. 3,020. *Prom.* Thame.

Thames (Latin *Tamesis* or *Tamisis*). Longest and most important river of England. It rises on the E. side of the Cotswolds in four headstreams: Thames or Isis, Churn, Coln, and Leach, which unite near Lechlade. The waters of these streams and the tributaries Windrush, Evenlode, and Cherwell, accumulate at Oxford, at a gap in the Oxford heights. The main stream below Lechlade, and the Ray, a tiny affluent of the Cherwell, flow in a clay vale along a line parallel to the Oxford heights. Below Oxford, the Thames receives the Thame and leaves the Upper Thames basin through the Goring gorge. Below Reading, at the E. end of the gap, the Thames is the chief river of the London basin.

From the N., the Colne, Brent, Lea, and Roding reach the left bank; the Kennet, Loddon, Wey, Mole, Darent, and Medway flow in on the right bank from the S. So deeply has the Thames gouged out the Tertiary strata that at Cricklade it is little more than 250 ft. above sea level; it is 200 ft. at a point 119 m. from London Bridge,

Thames. Map of the estuary of the Thames below Tilbury, showing the many shallows which make navigation difficult

Thames. Map of the area drained by the river and its tributaries.

and 100 ft. 62 m. above the bridge. It is a lowland river, swinging in great arcs round Wytham and the other hills where the limestone or chalk obtrude into the clay vales, and meandering across the lower valley both before and during its passage through London.

But rarely has the Thames been left in a natural state as in its upper course above Oxford. Waterworks have necessitated weirs; traffic requirements and the danger of floods have caused the construction of embankments, locks, and a towing path. Thorney Island, on which Westminster was founded, has disappeared; and the London embankments have turned the river, in its passage through the county, into a canal. Above London, bridges are numerous, and the river forms a convenient highway and administrative boundary. The tide, which reaches Teddington Lock, is of double strength, the wave which has travelled up the English Channel meeting and reinforcing the wave of 12 h. earlier which has passed round the N. of Scotland. The exceptional strength of the tide, acting within a restricted channel, gives from 16 ft. to 20 ft. rise at London Bridge.

The length of the Thames from Lechlade, where it is connected with the Severn by a canal, to the Nore, 60 m. below London, is estimated at 120 m. direct, or 250 m. if allowance is made for windings. The width varies from 290 yds. at London Bridge, 490 yds. at Woolwich, and 800 yds. at Greenwich, to nearly 6 m. at the Nore, 8 m. below which it is put at 18 m. From London Bridge to Rotherhithe is the Upper Pool; thence to Cuckold's Point, the Lower Pool; below are Limehouse, Greenwich, and Blackwall reaches.

Above Richmond the Thames is a river of pleasure, boating, and

angling; below that point the tidal waterway is mainly devoted, except for yachting at the estuary, to commercial uses, boat building, with docks and wharves extending almost all the way to Tilbury. The chief docks are Victoria and Albert, Tilbury, Surrey Commercial, West India, Millwall, London, George V, and East India. Opposite Tilbury is Gravesend, where incoming ships take on pilots and customs officers.

Many historic processions have taken place on the Thames. On its waters the body of Elizabeth was brought from Richmond to Whitehall, that of Nelson from Greenwich to the same place, and that of Wavell from the Tower to Westminster. State prisoners were taken by boat to the Tower. Once famous as "the silent highway," in Stow's time it gave employment to 3,000 watermen with their wherries. The last civic water procession was in 1856. The river was praised by Spenser, Herrick, Dryden, Pope, Bridges and other poets. It was frozen over at London in 1564, 1608, 1634-35, 1683-84, 1715-16, 1739-40, 1789, and 1814, and at Teddington in 1940. On Jan. 7, 1923, there were serious floods drowning 10 persons sleeping in basements at Westminster, two at Putney, and two at Hammersmith. During 1948 plans for making 136 m. of towing path (no longer used for towing) between Teddington and Cricklade (the part of the river under the Thames Conservancy, *v.i.*) into a public footpath were discussed between the various authorities concerned. In the same year a river bus service between Greenwich and Putney was begun.

See Boat Race; Henley Royal Regatta; London; Police illus. p. 6549; Port of London Authority; Tilbury, etc.

Bibliography. Geology of the Valley of the Thames, J. Phillips, 1871; London to the Nore, W. L. Wyllie, 1905; Historic Thames, 1907, and The River of London, 1913, H. Belloc; The Thames Highway, F. S. Thacker, 2 vols., 1914-18; London River, H. M. Tomlinson, 1921; The Port of London, Sir J. G. Broadbank, 1921; Thames from the Towpath, E. K. W. Ryan, 1938; Thames Triumphant, S. R. Jones, 1944.

THAMES CONSERVANCY. In 1857 a body was appointed to look after all matters affecting the river—fisheries, ferries, locks, drainage, tolls, etc. Its powers were extended by various statutes, consolidated in the Thames Conservancy Act, 1894. In 1909 the Port of London Authority was formed to exercise jurisdiction over the river from Teddington to the mouth, leaving the conservancy with 136 m. of river between Cricklade and Teddington. The powers of the conservators were amended by the Thames Conservancy Act, 1932. For preventing pollution its powers cover a catchment area of 3,812 sq. m. in 15 counties. Acting also as the drainage board of this catchment area, the Thames conservators have jurisdiction along 2,382 m. of streams. They are 34 in number and have offices at 2-3, Norfolk Street, London, W.C.2.

Thames. River of Canada, in Ontario. It flows across the Lakes Peninsula, between Lakes Huron and Erie, and enters Lake St. Clair after a course of 160 m. London, and Chatham, which is at the head of navigation, are towns on its banks. Its broad valley, with willows and elms along the streams and clumps of oaks and maple interspersed among meadows, gives a general impression of an English landscape.

Thames. River, firth, county, and town of Auckland dist., N.Z. The river, also known as the Waiho, rises in Matamata co., and flows generally N. into the firth, which forms the S. portion of the Hauraki Gulf. Thames co. lies between this gulf and the Bay of Plenty and contains the Coromandel peninsula. The town, which includes Tararu, Parawai, Shortland, and Grahamstown, stands on the firth at the mouth of the river, S.E. from Auckland, 40 m. by steamer or 147 m. by rly. It has a school of mines and other educational establishments, government offices, and public library. Engineering works and iron foundries give principal employment to a pop. of 4,260.

Thames Ditton. Parish and residential riverside dist. of Surrey,

England. Part of the urban dist. of Esher, it is reached by electric rly. from London, 14 m. to N.E. Anglers frequent it, and there are numerous houseboats. The ancient church of S. Nicholas shows interesting brasses and monuments, and there are almshouses dating from 1720. Pop. 10,080. *See* Esher.

Thames Embankment. Wall of granite, with plane tree bordered footway, built in three sections along the banks of the Thames, 1864-74. The embankment was begun, by the metropolitan board of works, with the Victoria Embankment on the left bank of the river between Blackfriars and Westminster. It was completed in 1870, under the supervision of Sir Joseph Bazalgette, at a cost of £1,553,000. Extending for 1½ m., it includes a granite river wall 8 ft. thick, with foundations 16-30 ft.

wide, and is 4,300 ft. in length. A river wall, 1,700 ft. long, between County Hall and Waterloo bridge constructed 1949-51, bounding the Festival of Britain buildings, reclaimed 4½ acres from the river.

Thames Tunnels. There are several tunnels under the Thames in the London area. The first, Wapping to Rotherhithe, was projected by Sir M. I. Brunel, begun 1825, opened for foot passengers 1843, and cost £600,000. An inundation caused a suspension of the work of construction for seven years ending in 1835. Sold in 1865 to the East London rly. co. for £200,000, and since used for rly. purposes, it has sloping approaches and included two arched passages, 1,200 ft. long, 14 ft. wide, and 16½ ft. high. The crown of the tunnel is about 16 ft. below the river bed.

Thames Tunnels. Wapping end of the first tunnel, shortly after its opening by its designer, Sir Marc Isambard Brunel, March 25, 1843

From a contemporary print

below low-water mark, landing-stages, a roadway 100 ft. wide, with a separate road for trams, a footway, and public gardens. Under the footway are a low-level sewer, water and gas mains, and telegraph wires; under the roadway runs the underground rly., with the stations Westminster, Charing Cross (formerly called Embankment), and Temple. The Chelsea Embankment, about 1 m. in length, extends from Battersea Bridge to Chelsea Bridge, on the left bank of the river, and was made during 1868-74 at a cost of £250,000.

The Albert Embankment, on the right bank of the river, between Westminster Bridge and Vauxhall, was constructed on similar lines, during 1866-69, cost a little over £1,000,000, has a roadway 60 ft.

Other tunnels are used by foot and vehicular traffic. One goes from Rotherhithe on the Surrey side to Commercial Road, and another is the Blackwall tunnel (*qv.*). One between Greenwich and Poplar and another between the two parts of Woolwich are for foot passengers only.

Thana. District and town of the N. division, Bombay state, India, on the island of Salsette, to which (over a causeway) the rly. line passes from Bombay I., between Sion and Kurla. The dist. fringes the coast N. of Bombay; it has an annual rainfall of 100 ins. Rice is the chief crop. The town is 2 m. from Bombay and was the terminus of the first stretch of rly. opened in India. In earlier times the capital of a large kingdom, it was visited by

Marco Polo in 1298, and in the 16th century became a Portuguese settlement. By 1739, when it was taken from the Portuguese by the Mahrattas, the settlement was highly cultivated. In 1775 the British forestalled a Portuguese attempt to recapture it by taking it after a three-day siege. On March 6 1775, it was ceded with the island of Salsette to Great Britain by the treaty of Surat. The English church here was consecrated by Bishop Heber in 1825. In the 16th century the silk industry employed 6,000 people; it is now confined to one family. Area 3,526 sq. m. Pop., dist., 932,733; town, 23,000.

Thane or **THENG.** Name given in Anglo-Saxon England to a class of soldiers and landholders. The earliest thanes seem to have been the retainers or military followers of a king or other ruler, but after a time they appeared as holders of land also. As a class, they stood between the earl and the ceorl with a wergild (*qv.*) six times that of the latter. There were various classes of thanes; king's thanes with special privileges, bishop's thanes, and others. In course of time the word changed its meaning somewhat, but it always retained the idea of military service, which was often rewarded or purchased by grants of land. The rank of thane could also be attained by a successful man of lower degree. After the Norman Conquest the word disappeared in England, but in Scotland it remained some centuries longer to describe a certain class of royal tenants. In England the knights were the successors of the thanes.

Thanet. District and co. constituency of Kent, England. In the N.E. of the county, the "isle" of Thanet is about 9 m. long by 5 m. wide, and is separated from the rest of Kent by the Stour. This is the successor of a much larger river, the Wantsume, which was said to be a mile wide and which made Thanet an island. The Romans built Richborough and Reculver to guard the river crossings. Noted for its bracing climate, it is washed on three sides by the sea, and on it stand Margate, Ramsgate, Westgate, and Broadstairs. It contains also the N. Foreland, while inland are St. Peter's and Minster. On the island too is Ebbsfleet, the supposed landing-place of Hengist and Horsa, and later of S. Augustine. The district has other associations with the earliest days of English history.

Thanet Beds OR **THANET SANDS**. Name given by geologists to the lowest division of the Eocene in Great Britain. They consist of yellow to greenish sands, well developed in the Isle of Thanet, and contain a large number of marine fossils. See *Geology*.

Thanksgiving Day. National holiday in the U.S.A., annually proclaimed by the president and state governors for general thanksgiving. Religious services are held, and in New England especially the day is the great family festival, like the English Christmas. It was first celebrated in 1621, when the Plymouth colony appointed a day for thanksgiving after their first harvest, and celebration of a day of thanksgiving soon became general. Its observance as a national festival is said to have been suggested by Sarah Josepha Hale (1790-1879). In 1863 Lincoln proclaimed the fourth or last Thurs. in Nov. a day of national thanksgiving and a general holiday. In 1941 F. D. Roosevelt fixed the day as the fourth Thurs. in Nov.

Thann. Town of France, in the dept. of Haut-Rhin. It stands on the Thur, 22 m. S.S.W. of Colmar, and was an apanage of the house of Hapsburg in 1624, being frequently exposed to hostile attacks during the Thirty Years' War. Stormed by the Swedes in 1632, it was subsequently captured by the duke of Weimar and retaken by Austrian troops, only to fall at last into the hands of the French under Turenne, by whose orders the fortress castle of Engelburg was demolished. The fine 15th century church of S. Theobald has survived the ravages of war. Noted for its white wine, Thann has textile factories, machine shops, and chemical works. Pop. est. 7,500.

Thapsacus. Commercial city of ancient Syria. On the right bank of the Euphrates, it has been identified with the Tiphisah (Semitic, crossing) of the O.T. (1 Kings 4, v. 24), and formed the northern limit of Solomon's kingdom. From the earliest times it was the chief crossing-place of the river, and was used as such by Cyrus and the Ten Thousand, Darius Codomannus, and Alexander. Called by the Macedonians Amphipolis, the site is probably near Debsi.

Thapsus. Peninsula on the E. coast of Sicily, now known as Magnisi. In their attack on Syracuse, 414 B.C., the Athenians used it as a naval base. Tombs have been found containing Sicel objects (see Sicily) of the 10th or 11th century B.C. Salt works are situated here.

Another Thapsus, an ancient town of Africa, on the Mediterranean Sea, 100 m. S.E. of Carthage, was the scene of a defeat of the Pompeians by Caesar in 46 B.C.

Thar Desert. Arid region of the Indian sub-continent. It lies E. of the Indus valley, N.W. of the Aravalli Hills, and is a portion of the Indo-Gangetic plain, extending on its W. into Pakistan. The S.W. monsoon, loaded with water, blows across the heated surface, but deposits no rain until it reaches the Himalayas.

Thar Pärkar. Most easterly dist. of Sind, Pakistan. It includes, in the N., the S. portion of the Thar desert, and is the most scantily peopled dist. in the province. The rainfall is less than 10 ins. and nearly half the tilled area is irrigated. The crops are mostly food grains. Area, 13,649 sq. m. Pop. approx. 581,000.

Tharaud. Name of two brothers, French novelists. Jérôme was born on May 18, 1874, and Jean on May 9, 1877, both at St. Junien, Haute-Vienne. Working and living together at Versailles, they won the Goncourt prize in 1906 and in 1920 the grand prix of the Academy, to which both were elected—the younger in 1938, Jérôme in 1946. Their huge output, mainly fiction, began with *Le Colporteur Débile*, 1899. There are psychological novels such as *Dingley*, 1902; *L'Ami de l'Ordre*, 1905; *Les Bienaimées*, 1932; others dealing with the Jewish problem, e.g. *L'Ombre de la Croix*, 1917; *Le Royaume de Dieu*, 1920; *Quand Israël N'est Plus Roi*, 1933; travel books, such as *Les Moines de l'Athos*, 1904; *La Bataille de Scutari*, 1926; and biographies, e.g. of *Déroulède*, 1924; *Notre Cher Péguy*, 1926. Jérôme, who during 1905-14 was secretary to Barrès, wrote without his brother *Mes Années chez Barrès*, 1928;

otherwise their respective work is indistinguishable. *Pron.* Tah-ro.

Tharawadi. Dist. and town of Lower Burma. The dist. occupies the S. portion of the Pegu Range E. of the Irawadi. Rice is the only crop. The town is on the Prome-Rangoon rly and main road, 68 m. N.N.W. of Rangoon. Area, 2,863 sq. m. Pop., dist., 593,909; town, 9,000.

Thasos. Greek island of the Aegean Sea. It is 4 m. from the S. coast of Thrace and 30 m. N.N.E. of Mt. Athos. The island is reputed to have been colonised by the Parians about 700 B.C. Forested mountains almost cover it. Exports are timber, wax, honey, and oil. The capital, Thasos, is on the N. coast. Area 150 sq. m.

Thatched House Club. London social club. It originated in an inn near St. James's Palace, long known as the Thatched House Tavern, which had a great dining-room, with a ceiling painted to represent the sky, where the Dilettanti Society met. The old tavern was pulled down in 1814, and a newer building in 1843, after which the Conservative Club was built on the site. The name was given to another building in the street, and in 1865 the Thatched House Club was formed. From 1950 it shared the premises of the Junior Carlton Club, its own house at 86, St. James's Street, S.W.1, being taken over by the Union club.

Thatching. Agricultural process used to protect ricks and buildings. Straw, reeds, heather, gorse, and bracken are the materials chiefly used. Of straws the best for thatching are those of wheat and rye. Oat and barley straw, being softer in texture, are liable to absorb water. Reeds are superior as a thatch to any straw; a reed roof well laid will last for half a century without repair; but reed thatching is expensive. Heather or ling is much used for thatching summer-houses and ornamental buildings. Good heather thatch has lasted a hundred years or more in sound repair, but is much heavier than other kinds.

The thatcher's outfit consists of a bill-hook, a paring knife, a large, forked stick to contain the drawn straw, and a wooden rake with iron

Thatching the roof of a cottage. The thatcher has worked up to an angle of the roof, where he is forming the ridge

teeth. He has also a supply of tarred cord and wooden pegs, usually of split hazel or willow. The straw is first well moistened, then the heap is turned with a fork and afterwards lightly trodden. The thatcher draws his straw from the bottom of the heap, taking it by double handfuls. Drawn straws are usually called yealms, and this work of drawing was formerly done by the assistant or server. The straw being made into a bundle in which the individual straws lie fairly straight, the thatcher takes this bundle and puts it into place. He begins at the bottom or eaves and works upwards, securing each successive course with his pegs and twine. In S. England split hazel rods are frequently used in place of twine. Reaching the top, the straw is laid well up to form a point, and give a good pitch. It is often necessary to use bundles of tightly-tied straw to bolster up the ridge. *See Roof.*

Thaton. Dist. and town of Burma, in the Tenasserim division. The dist. lies N.E. of the Gulf of Martaban, along the lower course of the Salween. As rainfall is 215 ins. annually, rice is the only crop.

Thaton town is on the Rangoon-Moulmein rly. some distance from the coast. Buddhist missionaries from Ceylon arrived c. 240 B.C. This was the capital of the Talaing kingdom until destroyed in 1050 by Anaurata, when King Manuha and his court were carried off to build a new capital at Pagan. Area, 4,892 sq. m. Pop., dist., 592,638; town, 21,600.

Thaulow, FRITZ (1847-1906). Norwegian painter. Born Oct. 20, 1847, at Christiania (Oslo), he

studied at Copenhagen academy, under Gude at Karlsruhe, and in Paris. He returned to Norway and led the opposition to the stereotyped principles of German academic art which then prevailed in his country. He painted much Norwegian scenery, particularly effects of snow, in oils and pastel. A series of pictures of the Seine helped to assure him an international reputation, and in Great Britain he was known for remarkable colour etchings. Thaulow died Nov. 5, 1906.

Thaw. Term for the melting of ice. It is also used to indicate the break-up of a frost. In the British Isles the final disappearance of frost is generally a result of comparatively warm winds from the Atlantic replacing northerly or easterly Arctic air streams. The spring thaw is a regular feature of northerly latitudes; ice-bound seas again become open to shipping, and on land the winter snows melt. If the sun is sufficiently high in the sky and not obstructed by clouds, a partial thaw may occur at midday, even during protracted frosty spells. *See Frost; Ice.*

Thaw Case. American murder case. On the night of June 23, 1906, in New York, Harry K. Thaw, the son of a Pittsburgh millionaire, deliberately shot Stanford White, a leading architect, on the ground that he had insulted his wife. The trials lasted from

Fritz Thaulow,
Norwegian painter

Jan., 1907, until July, 1915. The case created a world-wide sensation for its revelations of life among the wealthy in New York, and for the long legal battle to save the life of the murderer, on the ground that he was insane at the time of the murder. Released on July 17, 1915, supposed to have recovered his sanity, Thaw was rearrested in 1917 and confined in a lunatic asylum for seven years. Thereafter his eccentric conduct drew attention to him. He died at Miami Beach, Florida, Feb. 22, 1947.

Thaxted. Village of Essex, England. It is 6 m. S. by E. of Saffron Walden, and is famous for its church, a large and beautiful Perpendicular building of the 14th and 15th centuries, with crocketed spire and notable buttresses, pulpit, and font. There is a guildhall dating from the 17th century, for Thaxted was a chartered town until 1688, having its own mayor and corporation. Samuel Purchas, the translator of Hakluyt, was born here. During the incumbency of the Rev. Conrad Noel (d. 1942) the church gained notoriety through his expression there of extreme pacifist and left-wing opinions. Pop. est. 1,600.

Thaya. River of Czecho-Slovakia, in Moravia. It rises S. of Iglau (Jihlava) and flows in general S.E. past Znaim (Znojmo) to join the March (Morava) after a course of 150 m. Its largest affluent is the Iglava.

Thayet-myo. Dist. and town of Burma, in the Magwe division. The dist. lies between the Arakan Mts. and the Pegu Yoma, and is crossed by the Irawadi. Rice and oilseeds are the chief products. In Japanese hands from 1942, the dist. was reconquered by the British 14th army in the last days of April, 1944. The town is a river port on the right bank of the Irawadi, 38 m. above Prome. Area, 4,750 sq. m. Pop., dist., 297,434; town, 14,000.

Theatines. R.C. religious order for men. It was founded in 1524 by Giovanni Caraffa, at that time bishop of Theate, near Naples, and afterwards Pope Paul IV, to extirpate heresy and reform the clergy.

Theatre (Gr. *theatron*, from *theastai*, to look on). Place or building in which dramatic and musical performances are given. In the earliest days of the Greek drama the theatre was merely the open place where the altar of Dionysus was set up, round which the chorus revolved and was addressed by a solitary actor from his place upon a wagon. Later a

Theatre. Plan of the ancient Greek theatre at Epidaurus. The stage (proscenion) and the stage buildings (skene) were added in later times. The parodos was a passage through which the chorus entered the orchestra. *See also illus. p. 3111.*

wooden building was erected, but this having been destroyed by fire, the first great stone theatre was begun in 500 B.C. within the

Megalopolis, Mantinea, Delphi, Oropus, and Delos, and there are remains of others in Asia Minor at Pergamum, Magnesia, and Priênē.

Theatre Royal, Bristol. Auditorium of this fine example of an 18th century theatre, the oldest existing theatrical building in the U.K. See text p. 8035

Lenaeum or enclosure sacred to Dionysus at Athens.

As finished, the theatre there was an immense semi-circular excavation in the S.E. side of the hill surmounted by the Acropolis. Round the concavity, seats for 30,000 spectators rose tier above tier, the whole topped by a balustraded portico. The lowest seats were appropriated to the priests and high officials, as being nearest to the orchestra, on the other side of which was erected the great permanent stage. Similar theatres were erected at Epidaurus, Aspendus in Pamphylia, Eretria, Sicily,

Drama was exhibited at Rome as early as 240 B.C., but permanent theatres were long prohibited as inconsistent with Roman tradition and morality, and it was not until the return of Pompey the Great from the Mithradatic war, 61 B.C., that the first stone theatre was built. The second, built by Cornelius Balbus, was opened a year or two after the battle of Actium, and the third, the theatre of Marcellus, was built by Augustus. These were the three great theatres of Rome, all built upon the Greek model. Notable

remains of Greco-Roman theatres outside the capital exist at Taormina, Syracuse, Segesta, Pompeii, and Fiesole.

The part of the theatre allocated to the actors is dealt with under Stage. The part allotted to the audience was called *cavea*, and was semi-circular with broad passages giving access to the tiers of seats rising successively above the orchestra (originally the dancing place, from Gr. *orkhēstēs*, dancer). Seats for the audiences gradually encroached upon the space originally allotted to the orchestra.

The medieval drama, consisting almost entirely of religious mysteries and miracle plays, was performed either in churches or in courtyards of inns, and no theatres were built until the end of the 16th century. One was built in Paris in 1548, others at Rome and Vicenza in 1580 and 1584 respectively. The first English playhouse was put up at Shoreditch in 1576 by Burbage, who in 1600 built at Blackfriars the first London theatre to have a roof. Meantime, in 1598, the Globe Theatre at Bankside, Southwark, had been erected, an hexagonal wooden structure partly open at the top, with three rows of balconies and a central pit without seats where the common public stood. Favoured persons were seated at the side of the stage.

Among noteworthy modern theatres may be mentioned the Paris Opera House, 1866-75; the Scala at Milan, and the San Carlo at Naples, two of the largest

1. Entrance. 2. Passage leading to pit. 3. Paybox. 4. Outside balcony. 5 and 6 Stairs to 8. 9 10, and 11. 7. Pit. 8. Dress circle. 9. First circle. 10. Balcony. 11. Gallery. 12. Stalls. 13. Boxes. 14. Pit Stalls. 15. Orchestra. 16. Stage boxes. 17. Stage. 18. Traps. 19. Gallery for stage hands to manipulate scenery. 20. Back cloth. 21. Scene painters' room. 22. Property stores. 23. Scenery stores.

Theatre. Sectional plan of a 19th century theatre showing seating accommodation in auditorium and the relatively large space occupied by the stage and its accessory departments

theatres in the world; the Court theatres of Dresden and Munich; and the immense building at Baireuth, with its fan-shaped auditorium, designed by Wagner for his own operas. A 20th century development is the revolving stage, used in large theatres. By its use two or more sets of scenery can be constructed simultaneously, and the change of scene carried out in a very short time. The leading English theatres are dealt with under their respective names.

Every building offering public performances of stage plays must be either authorised by letters patent or licensed. Patent theatres in London are Covent Garden and Drury Lane. Licenses are granted in Central London by the lord chamberlain, as they are in places where the sovereign occasionally resides. Elsewhere local authority prevails. Oxford and Cambridge universities have some control of licences for theatres within a 14-m. radius. See Acting; Actor; Covent Garden; Drama; Japan; Little Theatre; Repertory Theatre; Sagunto; Scala; Stage.

Bibliography. History of the Stage, E. Malone, 1821; Early London Theatres, F. Ordish, 1899; The Greek Drama, L. D. Barnett, 1900; History of Theatrical Art in Ancient and Modern Times, K. Mantzius, 1903-09; The Attic Theatre, A. E. Haigh, 3rd ed. 1907; The Exemplary Theatre, H. Granville Barker, 1922; The New Soviet Theatre, J. T. G. Macleod, 1943; The Theatre Through the Ages, J. Cleaver, 1946.

Théâtre-Français. National theatre of France, officially called the Comédie Française (*q.v.*).

Theatre Royal. The two theatres of this rank in London are described in this work under their more familiar names, Drury Lane Theatre and Haymarket Theatre.

Theatre Royal, Bristol. English theatre built in 1766 in King St., Bristol. It is at least 50 years older than any other theatrical building in Great Britain. The opening play was Steele's *The Conscious Lovers*, with a prologue specially written by Garrick, who was in the audience. Garrick was almost the only great actor during 150 years not to appear there; those who did range from Kemble and Mrs. Siddons to Irving and the Vanbrugh sisters. In the early 20th century the standard of performance dropped, though highly individual pantomimes continued to be played successfully each year. In 1942 it was proposed to convert the building into a ware-

house, but a fund was raised in Bristol to buy it and it was vested in a board of trustees. The theatre was leased to the Arts Council and reopened in 1943 as England's first state-aided theatre, with an Old Vic production of *She Stoops to Conquer*. It was the headquarters of the Bristol Old Vic Company 1946-49. In 1950 the Bristol city council voted £10,000 for the repair and upkeep of the building. See *illus.* p. 8034.

Thebaine ($C_{18}H_{21}O_3N$). Alkaloid contained in opium. Usually present in proportions smaller than 1 p.c., it is more poisonous than morphine, and resembles strychnine in the results of an overdose.

Thebes. The ancient capital of Upper Egypt. It is situated on both banks of the Nile, 450 m.

preserve the tombs of queens, XVIIIth dynasty officials, and XXVth to XXVIIth dynasty functionaries, including that of Pateamonapt, 862 ft. long, the largest private tomb in the world. Near the place were two magnificent terraced temples built to hold the remains of Mentuhotep II and Queen Hatshepsut. See *Deir el-Bahri*; Karnak; Luxor; Medinet Habu; Memnon; Tutankhamen.

Thebes (Gr. *Thēbai*). City of ancient Greece. From very early times the city was the most prominent and powerful in the dist. of Boeotia. In the legendary days, it was associated with the names of Dionysus, Hercules, and Cadmus. In historic times it held no honourable place in the Greek records until the 5th century B.C.

Thebes, Egypt. Terraced temple of Deir el-Bahri, built by Queen Hatshepsut about 1500 B.C., and afterwards used for many centuries as a Coptic monastery

upstream from Cairo, and a varying region N. and S. was called the Thebaid. The Biblical No-Amon (Nahum 3), it was the centre of Amon worship. Of prehistoric foundation, it provided the XIth and XIIth dynasty kings, and after the Hyksos expulsion flourished again under the Empire. It was reputed to have a hundred gates, and its stupendous monuments record Egyptian history from the Old Kingdom to Ptolemaic times. On the W. plain are numerous funerary temples and richly appointed rock-hewn tombs. The Biban el-Moluk valley contains the tombs of XVIIIth-XXth dynasty kings; in that of Amenhotep II, Loret found in 1898 a cache of seven royal mummies, now at Cairo. Other valleys

When the Persians invaded Hellas in 480 B.C., Thebes would take no part in the Greek struggle for liberty, but yielded submission and even aid to the invader. When the Peloponnesian War broke out in 431, Thebes was in alliance with Sparta. But Sparta, after her final triumph over Athens in 404, assumed an effective domination over the states which had, in theory at least, been her equal allies.

In 379 B.C. the Thebans, under Pelopidas, ejected their Spartan masters, and entered on the struggle for independence. Thebes made up for her previous deficiencies by producing one of the most admirable characters known in Greek history, the great general Epaminondas, who led her troops

to a triumphant victory over Sparta at Leuctra in 371 B.C.

Though Thebes could not maintain her supremacy, she yet joined with Athens in resisting the conquest of Greece by Philip of Macedonia; but the allied troops were crushed at the battle of Chaeronea in 338 B.C. After Philip's death, she made one more desperate attempt at defiance and revolted against the young king Alexander the Great, thereby bringing on herself final and utter destruction in 336 B.C. Nothing was left standing except the temples of the gods and the house of the one great poet, Pindar (*q.v.*) to whom Thebes had given birth. See Greece; Sparta.

Thecla. Saint and virgin of Asia Minor. A member of a noble family, she lived in Iconium, Lycaonia, and was there converted by S. Paul. She was much persecuted for her faith, but is said to have lived to the age of 90, dying in Seleucia. She is the heroine of the 2nd century Acts of Paul and Thecla, one of the earliest Christian Apocrypha. One of the missionaries who followed Boniface (*q.v.*) is also known as S. Thecla.

Theebaw (1858-1916). King of Burma, 1878-85. Son and successor of Mindon, who had maintained friendly relations with Great Britain. Theebaw inaugurated his reign by murdering all his relations who might jeopardise his power. Bad government and neglect of obligations soon strained his relations with Britain, and war was declared, Nov. 9, 1885. An expeditionary force entered Burma and Nov. 26 Theebaw submitted, the country being annexed by Great Britain, Jan. 1, 1886. The ex-king was sent to India, where he died Dec. 16, 1916. See Burma; Mandalay.

Theebaw,
King of Burma

Theft. Compensious term which covers many forms of acquiring property dishonestly. It is properly confined to the taking of money or goods, or securities for money or goods, feloniously. The most common form of theft is the taking away of the property of another with intent to deprive him thereof.

Another form is where a person has property committed to his possession, either for safe custody or to apply it in some particular fashion

for the benefit of the owner, and, with intent to defraud, appropriates it to his own use. When a servant takes his master's property out of the master's premises (*e.g.* money out of the till) it is larceny; but where, having received money on behalf of his master, he fraudulently appropriates it, it is embezzlement. See Larceny.

Theine. Word used as a synonym for caffeine (*q.v.*), a drug prepared from the dried leaves of plants.

Theism. In the widest sense, a term denoting a belief in the existence of a Divine Being or Beings. Theism may thus include both polytheistic and pantheistic conceptions of religion. In modern usage, however, the word has acquired a much more definite connotation. It is not only restricted to monotheism, but it implies as well a certain relationship between God and the universe. In this technical sense, theism is the belief in an infinite eternal spiritual Personality who is perfect in goodness and beauty, who is immanent in the universe yet infinitely transcends it. There are only three types of pure theism in the history of religion—Judaism, Christianity, and Islam.

It used to be maintained that theism represented the primitive form of religion, and that animism and polytheism were degenerate offshoots of it. That position, however, is now almost universally abandoned in favour of the theory that theism represents the climax of a long previous evolution, including animism and polytheism.

The chief problems of theism which interest modern thought are the questions, What is the basis upon which the belief in God rests? and What is the source of our knowledge of His person and nature?

Many answers have been given to these inquiries. Some have argued that the belief in God is a rational inference from the nature of the universe and of man. These inferences have taken different forms: (a) According to the cosmological argument, the universe is inexplicable apart from the belief in a creative power. There must have been a great first cause which at any rate provided the machinery of evolution, and set it in motion.

(b) The teleological argument proceeds much upon the same lines, though it lays the emphasis not on the beginning of the process, but rather on the character of the product. The beauty and harmony of the universe could not have been the result of the fortuitous concourse of atoms, but imply the presence of a guiding and moulding hand.

(c) The existence of conscience or of the categorical imperative, in Kant's phrase, is regarded as a witness in the human heart to the existence of God. In another form the emphasis is placed, not so much upon conscience as upon the presence of a moral ideal which, it is said, can come from no other source than God. This moral argument has made a wide appeal since Kant raised it to a dominant position. (d) The ontological argument assumes that the existence of God is a necessary implicature of thought. The very fact that man has the consciousness of God in his heart is assumed to imply the need for His existence. Anselm and Descartes are the great champions of this type of reasoning, and the argument was severely criticised by Kant, who said that the presence of the idea of God in the mind no more implied His existence than the idea of ten ducats in a man's pocket implied that he would necessarily find them there.

Another modern school of thought rejects the rational arguments as too cumbrous and uncertain, and thinks that the belief in God rests rather upon intuition or an immediate grasp of the Divine by the human soul. This theory, too, assumes different forms. (a) Sometimes the mind as a whole leaps intuitively to the thought of God. (b) In other forms the existence of a special faculty or organ of the mind is posited, the special function of which is to hold communion with the Divine. This organ, the spirit of man, is held capable of apprehending God without the help of the rational faculty.

(c) A third type places the organ of religion only in the feelings or emotions. It is by the power of feeling that man rises into fellowship with God. (d) A fourth theory denies that religion is confined to any faculty. It is not merely by the exercise of reason or feeling or the moral faculty or any other departmental activity that man reaches God. Knowledge of God is the work of the whole personality. Man has been created in the image of God, and therefore possesses divine affinity, and it is this divine affinity that forms the nexus which makes the knowledge of God possible. See Christianity; Deism; God; Religion; Theology.

Theiss (Hung. Tisza; Rum. Tisa). German name for river of Central Europe, before the First Great War entirely within Hungary. The longest affluent of the Danube, it rises in the Forest Carpathians in Ruthenia, Ukraine S.S.R.; it flows S. and then W., interlacing with the Rumanian frontier, and then passes into Hungary. From Csap it flows S.W. or S. across the Alföld past Tokay, Szolnok, Csongrad, and Szeged, S. of which it enters the Banát, Yugoslavia, and flows past Zenta to join the Danube below Titel. The river has an extremely tortuous course estimated to exceed 800 m. in length. Flood waters of the Danube dam the waters of the Theiss, which then floods its lower course, though this has been embanked and regularised. Steamboats reach Szeged, and small craft ascend the river as far as Tokay. *Pron.* Tice.

Thellusson, PETER (1737-97). British merchant. Born in Paris, June 27, 1737, son of the envoy of Geneva, he settled in London in 1762, and was naturalised. He acquired an immense fortune in trading with the Continent and the West Indies, and died July 21, 1797. His son Peter Isaac was created Baron Rendlesham, 1806.

Thellusson is chiefly notable for his will. After making some provision for his wife and children, he left instructions for the residue of his estate of over £600,000 to accumulate during the lives of his three sons and of their sons, and for the fortune thus accumulated to go to the eldest male descendant of his sons. This will was established by the house of lords in 1805, but the public disadvantage inherent in the principle of allowing property to accumulate indefinitely was recognized and led to the passing of the Accumulations Act of 1800. *See* Accumulation; Perpetuity. *Pron.* Tel-lusson.

Theme (Lat. *thema*). Subject set or proposed for discussion, a short essay. In music a theme is a definite melody which the composer intends to invest with special significance, and comprising one or more sentences. It is not quite synonymous with subject. The average fugue subject hardly attains to the dignity of a theme, while, on the other hand, a subject in a sonata or symphony may comprise more than one theme.

Themis. In Greek mythology, daughter of Uranus and Ga, the wife of Zeus before Hera. Among her children by Zeus were the three Horae (*q.v.*) or Hours, and

the Fates. Themis was the personification of law and order and presided over the oracle at Delphi before Apollo. *Pron.* Themmis.

Themistocles (c. 514-449 B.C.). Athenian statesman. In his early life, of which little is known, Athens

Themistocles, Athenian statesman

was one of the leading maritime cities of Greece, but no more; the genius of Themistocles realized the enormous capacity of the state for maritime development, and foresaw the imperial ascendancy which could follow only upon naval supremacy. Themistocles succeeded in procuring the ostracism or exile of the conservative leader Aristides in 483, and in bringing the direction of policy into his own hands.

In 480 the Persians invaded the Greek peninsula. The defence of Attica on the landward side became impossible after the forcing of the pass of Thermopylae; at the instigation of Themistocles, the Athenians evacuated their city, removed the non-military population to Aegina, and put every available man in the fleet, of which Themistocles was given command. By his ingenuity, the Persian fleet was brought to engage the Greek fleet in the Bay of Salamis, and it was primarily owing to the skill of Themistocles that the great Persian navy was there annihilated. The Persians thereupon evacuated Attica and prepared for a land campaign. The diplomacy of Themistocles compelled Sparta, through fear of the withdrawal of the Athenian fleet, to advance to the protection of Attica and win, in 479 against the Persians, the decisive victory of Plataea (*q.v.*).

It was again the energy of Themistocles which carried through the re-fortification of the Piræus before Sparta could take active measures to prevent it; and from

this time Athenian naval supremacy was assured. Athens became the wealthiest city of Greece, and Themistocles wisely remitted the tax on alien traders. He grew rich, of course, and in 471 was charged, though perhaps unjustly, with peculation, and was expelled from Athens. In his exile he was accused of treasonable intrigues with Persia, and he fled from his asylum at Argos to Asia. Whether he meditated revenge on his country is doubtful, but in Athens it was believed that he took poison through despair at the failure of his schemes. He died at Magnesia, where a vast memorial was erected. *See* Greece. *Pron.* The-miss-tokleez.

Thenardite. Natural form of anhydrous sodium sulphate found in saline residues of the alkali lakes of N. America.

Theobald, LEWIS (1688-1744). English Shakespearian editor. Born at Sittingbourne, son of a solicitor, he abandoned law for literature. He translated and emended many classical authors, published dramas and, dying in poverty, Sept. 18, 1744, was buried at St. Pancras. Theobald's fame rests on his edition of Shakespeare, 1734.

Theobald's Park. Mansion and park in Herts, England. The mansion, of red brick, built 1765-70, is 1 m. W. of Waltham Cross, and at one of the park entrances old Temple Bar (*q.v.*) was re-erected in 1888. The famous palace of Theobalds, built by Burghley, stood 1½ m. N.W. Frequently visited by Elizabeth, it was exchanged in 1607 for Hatfield (*q.v.*) by Burghley's son. James I died here. Dismantled in 1650, given at the Restoration to Monk, and granted by William III to the 1st earl of Portland, Theobalds was sold in 1762, and the remains of the palace disappeared in 1765. It gave its name to Theobald's Road, which runs from Southampton Row to Gray's Inn Road, London, W.C., part of the royal route from Whitehall to Theobalds; hence, also, Kingsway (*q.v.*). *Pron.* Tibbalds.

Theobald's Park, Hertfordshire. Main front of the 18th century mansion, built near the site of the historic house, a former royal residence

Theobromine ($C_7H_5O_2N_4$). An alkaloid occurring in the seed or bean of *Theobroma cacao*, from which cocoa is prepared. It is a white crystalline powder and is related to caffeine, the alkaloid of tea and coffee. The compound of theobromine and sodium salicylate is used as a diuretic.

Theocracy (Gr. *theos*, god; *kratein*, to rule). System of government under the immediate guidance of Divine power and wisdom; hence, a state so governed. The Israelites in their wanderings from Egypt until the establishment of the monarchy are the typical instance. See Divine Right.

Theocritus (3rd century B.C.). Greek poet. According to the best accounts he was born at Syracuse, but lived at Alexandria at the court of Ptolemy Philadelphus, and afterwards at Syracuse under Hiero II. A rude poetry in the Dorian dialect had been characteristic of the shepherds and rustics of his native Sicily, but Theocritus was the first to raise such poetry to the dignity of literary form. His epics, lyrics, and bucolics abound in passages of exquisite beauty, and show much dramatic skill in the character-drawing of the rustic interlocutors. Of some 30 extant poems known as Idylls (Gr. *eidyllia*, little pictures) attributed to Theocritus, half are purely pastoral. Theocritus has had many imitators: Virgil's Eclogues are closely modelled on the Idylls, and later imitators are Spenser and Milton. There is a good prose translation by Andrew Lang, 1880; one by Edmonds, with parallel text, in the Loeb Classical Library; and one of the Idylls by R. C. Trevelyan, 1947.

Theocritus,
Greek pastoral poet
From a bust

Theodicy (Gr. *theos*, god; *dike*, justice). Term for a vindication of the Deity in relation to the world. It was first used by Leibniz (*q.v.*), in his *Essais de Théodicée*, 1710, and has become current in many theological and philosophical writings since. Leibniz attempted to demonstrate design in God's relation to the world, and to vindicate Him from the charge of having done anything without purpose or against reason. Hence arose the doctrine, ridiculed by Voltaire in *Candide*, of "the best of all possible worlds." See Optimism.

Theodolite. Instrument for measuring horizontal and vertical angles, although some of the simpler forms measure only horizontal angles. It is commonly used in surveying to obtain a system of triangles in a horizontal plane and the positions of objects within the triangles. When altitudes are measured separately, they are generally applied to correct chain calculations.

Theodolite.
Instrument used by
surveyors
By courtesy
of W. F. Stanley
and Co., Ltd.

The instrument consists of a small telescope mounted to turn about a vertical axis passing through the centre of a horizontal graduated circle, and also about a horizontal axis, so that it may be set at any elevation. An instrument fitted with a vertical graduated circle, in which the telescope can be rotated end over end, is known as a transit theodolite or altazimuth. If levels are provided in addition to the telescope, it becomes a universal instrument. A surveyor's transit has a compass mounted at the centre of the horizontal circle. Angular displacements in the direction of the telescope are read off with a microscope comprising a microscope and a screw with a divided head.

At meteorological stations theodolites are sometimes used to follow "pilot balloons," i.e. small hydrogen-filled balloons, in order to obtain the velocity and direction of the upper winds. In this case the telescope is so mounted as to permit of rotation in both altitude and azimuth, and a right-angled prism is incorporated to enable the observer to look horizontally into the eyepiece irrespective of the altitude of the balloon. Greater accuracy is achieved by the use, simultaneously, of two theodolites, one at either end of a measured base line. See Map and Map-making; Surveying.

Theodora. Name of three Byzantine princesses. (1) Wife of Justinian I. Born in Cyprus or Constantinople, she was in turns actress, courtesan, mistress, and from 523 the wife of Justinian. She had great influence over her husband, was acknowledged as empress in 527 and supported the Monophysite heresy. By her courage and firmness she prevented

Justinian from abandoning the capital at the time of the Nika riot, 532. She died in 547. (See Circus.)

(2) Wife of the East Roman emperor Theophilus. After his death, 842, she administered affairs for her infant son Michael III. In opposition to her husband, she was a supporter of the worship of images, which was definitely restored at a synod convened by her at Constantinople.

(3) Last empress of the Macedonian dynasty. Sister of the Empress Zoë (d. 1050), she succeeded her brother-in-law Constantine IX and reigned 1055-56.

Theodore. Masculine Christian name. Of Greek origin, it means the gift of God. Dorothea is a feminine form; Theodora and Theodosia are others. Bearers of the name include two popes, Theodore I (642-49) and Theodore II (897). It has also been that of three rulers of Russia. Theodore I, tsar 1584-98, was son and successor of Ivan the Terrible, but ceded his power to Boris Godunov; Boris's son, Theodore II, was tsar in 1605, being murdered July 10; Theodore III, tsar 1676-82, carried through a number of reforms.

Theodore of MOPSVESTIA (c. 350-428). Biblical scholar of the Eastern Church. Born at Antioch, in 393 he became bishop of Mopsvestia in Cilicia. A leader of the literalist school of exegesis, he wrote a commentary on practically the whole Bible, but only sections are extant.

Theodore of TARSUS (c. 602-690). Seventh archbishop of Canterbury. He came from Tarsus

Theodora (centre), wife of Justinian I. From contemporary mosaic in the church of S. Vitale, Ravenna

in Cilicia, where he was a leader of the Eastern Church, to be appointed to the English primacy by Pope Vitalian in 668. He held the first synod of all the English clergy at Hertford in 673, appointed Earconwald and Trumwine bishops to the East Saxons and Picts respectively, and generally ranks high among organizers of the English Church.

Theodoret (c. 393–457). Syrian historian. Born at Antioch, he became in 423 bishop of Cyrrhus near that city. Being suspected of Nestorianism, he was deposed by the Robber council in 449, but was reinstated by the council of Chalcedon. He was the author of an ecclesiastical history, a continuation of Eusebius, dealing with events from the rise of Arianism in the reign of Constantine down to the death of his teacher Theodore of Mopsuestia; and a defence of Christianity against the charges of heathen philosophers.

Theodoric. Name of two kings of the Visigoths or West Goths. (1) Theodoric I, king 418–451, eldest son of Alaric I, was killed at the battle popularly known as Châlons (q.v.). (2) Theodore II, king 452–466, his brother, ruled over most of Gaul and Spain. He was murdered by another brother Euric.

Theodoric the Great (c. 454–526). King of the Ostrogoths or East Goths, and ruler of Italy, 493–526. He was born in Pannonia, the son of Theodemir, by whom he was sent as a hostage to Constantinople. On succeeding to the throne of his father in 473, he received signal favour from the East Roman emperor Zeno, who bestowed upon him high military command and the consulship. At first a loyal supporter of Zeno, Theodoric was driven by the distressed condition of his subjects to demand a share in the more fertile districts of Italy. Threatened by the danger of a Gothic attack upon Constantinople, Zeno gave him permission to attack Odoacer, Gothic ruler in Italy, and Theodoric won the battles of the Sontius and Verona, 489, and took Ravenna by siege. The treacherous murder of Odoacer left Theodoric master of Italy, which he ruled nominally as Zeno's vice-regent, in reality as an independent sovereign.

During his 33 years of rule Italy was at peace and prospered exceedingly. He did much to promote agriculture and commerce, and was a patron of arts and literature, although a man of little education. He reduced taxation,

improved the roads and communication, preserved the Roman institutions, and chose as his chief ministers Boetius and Cassiodorus. But his efforts to bring about a real union of Goths and Romans failed, chiefly because the orthodox Romans refused to recognize the Arian Goth as anything more than the delegate of the emperor at Constantinople. Naturally he was tolerant, but the persecution of the Arians rendered him suspicious of his most loyal subjects, and the greatest blot on his career was the execution of Boetius on the charge of complicity in a plot. Theodoric died Aug. 30, 526, and was buried at Ravenna in a splendid mausoleum, still to be seen. As Dietrich of Bern (Verona), he became the hero of a cycle of German legends. See Boetius; Cassiodorus; Goths; Odoacer. Consult Theodoric the Goth, T. Hodgkin, 1891.

Theodor von Neuhof (1686–1756). German adventurer. Born at Metz, Jan. 26, 1686, son of a Westphalian refugee nobleman, he was educated in the household of the duke of Orléans, served in the Swedish army, engaged in Jacobite plots, gambled in Paris in John Law's speculations, and at Florence entered into relations with Corsican refugees. In 1736 he obtained from the government of Tunis a vessel and munitions of war, sailed for Corsica, and on April 15 was proclaimed king under the title of Theodore I. Later in the year he visited the Continent to obtain further help against the Genoese masters of Corsica. Successive attempts to return failed, and Theodore died in London, Dec. 11, 1756. He had just been released from a debtors' prison, partly because of the great exertions of Horace Walpole.

Theodosia. Alternative spelling for the seaport of the Crimea entered in this Encyclopedia as Feodosia.

Theodosius I (346–395). East Roman emperor, A.D. 379–395. Probably born at Cauca, Spain, the son of Theodosius, a general of Valentinian I, he served under his father in Britain, and as commander-in-chief in Moesia, defeated the Sarmatians in 374. In 379 he was called to the eastern throne by Gratian, emperor of the West, just after the disastrous defeat of the Romans by the Goths at Adrianople, where the eastern emperor himself fell. Theodosius was equal to the emergency, and by 382 had cleared the Balkan peninsula of

the Goths. In 383 Maximus was proclaimed emperor by the troops in Britain, and after defeating Gratian, was acknowledged by Theodosius as ruler of Britain, Spain, and Gaul. When Maximus in 388 expelled Gratian's half-brother Valentinian II from Italy, Theodosius came with an army, and Maximus was defeated at Aquileia and put to death.

The reign of Theodosius was marked by the complete triumph of orthodox Christianity. His outlook was dominated by S. Ambrose and the result was seen in many enactments prohibiting pagan and heretical worship in both sections of the empire. The unnecessary severity with which he punished a riot in Thessalonica, some 7,000 citizens being massacred, brought down upon Theodosius the displeasure of the great churchman, who for eight months refused him an entrance into his cathedral until he had done penance. Theodosius died at Milan, Jan. 17, 395. See Ambrose.

Theodosius II (401–50). East Roman emperor 408–450. He succeeded his father Arcadius at the age of seven, being placed under the guardianship of his sister Pulcheria, a sincere but austere Christian, who completely dominated him. She chose for him as wife Eudocia (q.v.), whose banishment she afterwards secured. Theodosius took no part in wars against the Huns and the Persians during his reign, and his name is chiefly associated with the code of laws, Codex Theodosianus, begun in his reign and completed in that of Valentinian III.

Theodule Pass or **MATTERJOCH**. Mt. route of the Alps, between the Swiss canton of Valais and Piedmont, Italy. It leads from Zermatt to Valtournanche, traversing the saddle between the Matterhorn and the Breithorn, and reaching an alt. of 10,900 ft.

Theognis (c. 540–500 B.C.). Greek elegiac poet. A native of Megara in Attica, he belonged to an aristocratic Dorian family which had suffered from a democratic upheaval. A collection of some 1,400 verses, to which his name is attached, contains a bitter attack upon the bad citizens, the democrats, who are contrasted with the good, the aristocrats. Most of the poems are addressed to a young Megarian noble named Cynrus, and, in addition to a number of gnomes and sententious maxims, sing the praises of wine and club life. Much of the collection is of later date. See Gnome.

THEOLOGY IN MODERN THOUGHT

The Very Rev. W. R. Matthews, K.C.V.O., D.D., D.Lit., Dean of S. Paul's

In this connexion see the articles Christianity; Church; Religion; and those on related matters, e.g. God; Incarnation; Theism, etc. See Freethought; also Bible; Jews; Paul, Saint.

Theology is the science which deals with our knowledge of the nature of God and His relation with the world. There may be deep religious experience without any highly developed theology, but some kind of belief about the meaning of the world and the character of the Divine is implied in all forms of religion. Every religion, therefore, has a theology, explicit or implicit. The aim of theology is to give a coherent account of religious beliefs, to indicate their relations with one another, and to bring them into harmony with the general knowledge and thought of the time.

Change in scientific and philosophical conceptions must react upon theology and cause it to think out again its problems in this new light. The possibility of theology has been denied. Agnostics such as Herbert Spencer have held that the reality and the significance of the universe must be beyond our comprehension. It must be admitted that complete knowledge of God is unattainable, and therefore the conclusions of theology must always be inadequate.

Theology and Philosophy

There is a close connexion between theology and philosophy. Both agree in attempting to interpret the meaning of the world as a whole. Theology, however, although it pursues rational methods, lays stress on the importance of revelation, in which it finds its most significant material for the solution of the problems which it has in common with philosophy, and a large part of its task consists in interpreting revelation and vindicating its claim.

The present time is one of transition and reconstruction in theology. This is an inevitable result of new conceptions established in science and history. (1) The advance in literary criticism as applied to the Bible has given a new insight into the religious development of the Hebrews, and has forced theologians to reconsider the meaning of inspiration. (2) The idea of evolution has profoundly affected all branches of knowledge. It has necessitated a fresh consideration by theology of the doctrine of creation, and has also modified the manner in which the problems of religion are approached. (3) The advance of anthropology and sociology has forced

theologians to reflect on the place of Christianity in the development of religion. The main outlines of Christian theology, however, remain the same.

A common distinction is made between natural and revealed theology. This scholastic distinction has been widely adopted in modern thought, though the dividing line has been drawn in many different places. The truths of natural theology are those which are attainable by the human reason and may be reached by philosophy. Other truths which, though not contrary to reason, are not discoverable by its unaided power, are said to belong to revealed theology.

The value of this distinction is denied by some contemporary writers, but no definitely Christian theology pretends to do without revelation in some form. The idea of revelation in its widest sense implies a special manifestation of God for the purpose of imparting new insight into the meaning of the world and the purpose of life, and of confirming the highest intuitions of the human soul on these questions. That this is a reasonable idea is obvious if we postulate the existence of God. A difficulty arises when we ask what are the credentials of revelation. During most of the history of the Christian Church much importance was attached to the so-called external evidence, i.e. the miraculous.

At the present time the emphasis has altered. Though the miraculous has its value as evidence, a moral and spiritual revelation must be supported, in the first place, by moral and spiritual evidence. Thus the essence of revelation is found in the religious experience of great personalities. The general development of the religious consciousness of the Hebrews seems to afford a unique example of religious and moral illumination, an illumination which culminates in the teaching of Christ. This conception forbids us to confine it to one nation or race.

An important school of Protestant theology, represented by Dr. Karl Barth, would repudiate "natural theology" altogether and would confine the function of theology to the systematic statement of the contents of revelation. Revelation—the Word of God—is taken as the given, the

starting point of theology. It is not clear how these theologians suppose that revelation is recognized as such or what evidences of truth it brings, but they appear to hold that the Word of God is its own evidence; its witness is the "testimonium Sancti Spiritus," the testimony of the Holy Spirit, in Calvin's phrase.

THE IDEA OF GOD. The character of any system of theology is determined by its conception of God; and this is dependent upon the religious experience which the theology takes to be authoritative. Thus, although the idea of God has varied in the course of the history of Christian thought, all systems of Christian theology regard the teaching and experience of Jesus as of critical importance. The characteristic element in the Hebrew conception of God is that of holiness and righteousness. This thought is carried on and developed in the N.T., which insists that the essential nature of God is fatherhood and holy love. To defend this conception it must be held that God is personal, though not necessarily a person, otherwise He could not have any personal relation with men. Further, theology is concerned to vindicate both the immanence and the transcendence of God. God cannot be entirely distinct and separate from the world, otherwise there would be no possibility of real communion with Him. Nor, on the other hand, can He be merely immanent, since, in that case, it would be impossible to regard Him as personal, and difficult to maintain a real distinction between moral good and evil. Theology is thus led to the view that God is personal and both immanent and transcendent—neither identical with the universe nor completely outside it.

Doctrine of the Trinity

A characteristic doctrine of Christian theology is that of the Trinity. The motive which led to its development was the desire to vindicate the true divinity of Christ. The doctrine, however, found support in Platonic philosophy, and has been congenial to more than one school of modern philosophy. The fundamental significance of the doctrine is that there are distinctions within the Godhead—that the Godhead is a unity and not a bare unit. It is important to observe that the word person used in the formulation of the doctrine has changed its meaning and conveys to us a greater degree of separateness than was originally the case.

As for the relation of God to the world, Christian theology regards Him primarily as its creator. Other views are that God is identical with the world (pantheism), that the world is an emanation of God, or that God and the world are coordinate (dualism and pluralism). The doctrine of creation insists upon the thoroughgoing dependence of the world upon God and at the same time on the reality of moral freedom. Most theologians have held that creation implies an absolute beginning in time, but this is questioned by several contemporary Christian thinkers. Other topics which are dealt with by theology under this head are providence, the philosophy of history, and the miraculous.

THE IDEA OF INCARNATION. That there has been a supreme manifestation of God in the person of Jesus Christ is a fundamental conviction of Christianity, and it is part of the task of theology to interpret this belief to the understanding. The fact of the Incarnation is witnessed to by the records of the N.T., by the impression made by Jesus on the minds of the disciples, and by the religious experience of the Church. The doctrine of the Incarnation was definitely formulated under the stress of controversy, and more particularly of the Arian controversy. The orthodox doctrine is that Christ is of "one substance with the Father," and that He is two natures, divine and human, in one person. This statement was adopted in the councils of Nicaea, 325, and Chalcedon, 451. This formulation of the doctrine has been criticised by many liberal Protestants and by Catholic modernists, either because they cannot accept the full idea of incarnation, or on the ground that the formula is not in harmony with modern psychological and philosophical views. The doctrine of the Incarnation is one of the central battle-grounds at present in Christian theology.

All the higher religions are religions of redemption, i.e. they profess to point out a way of salvation from sin and misery. Christianity is from the beginning a redemptive religion. But there is no orthodox doctrine of redemption, and in the N.T. itself different presentations of the idea may be discerned.

The nature and destiny of man, the origin and meaning of sin, grace, and the means of grace are topics which have given rise to important controversies, which are now reopened by modern scientific knowledge. The idea of the Church

has given rise to a fundamental cleavage of opinion, the Protestant conception being in the main that of a voluntary association for religious purposes, while the R.C. is that of a supernatural society with a divinely ordained organization.

Workman, 1911; Protestant Thought before Kant, A. C. McGiffert, 1911; Manual of Theology, T. B. Strong, new ed. 1913; Doctrines of the Creed, O. C. Quick, 1938; God in Christian Thought and Experience, W. R. Matthews, 7th ed. 1947.

Theophany (Gr. *theos*, god; *phainesthai*, to appear). Theological term for the revelation of God to man—in the O.T. by sounds and symbols, in the N.T. through Christ, whose second coming is to be the completion of the theophany, or Christophany. See Epiphany.

Theophilanthropism. Name assumed for a species of naturalistic religion started by French deists in Paris during the Reign of Terror, 1793. It aimed at superseding Christianity by a form of faith and worship, whose leading feature was to be love of God and man. It appears to have been imitated from a form of deism started about 1776 by a Unitarian minister named David Williams, who officiated as a "priest of nature" at a chapel which he opened in Margaret Street, London. He had the support of Voltaire and Frederick the Great. In France the sect was led by La Révellière-Lépeaux, a member of the Directory, and the worship included offering flowers and fruit on an altar on which a perpetual fire burnt. The four "saints" whose festivals were observed were Socrates, S. Vincent de Paul, Rousseau, and Washington. The sect was suppressed in 1801, and soon afterwards died out. See Deism.

Theophilus (8th century). Traditional coadjutor bishop of Adana in Cilicia. Having been deposed from his position, he gave a bond to the devil exchanging his soul for immediate reinstatement in his office; then, overtaken by remorse, after long fasting and prayer he successfully prevailed on the Virgin Mary to intercede for him, and three days later died. The story, found in early Dutch, German, and Icelandic versions, appears to have become current in the West before the 10th century, and was an original element in the Faust legend.

Theophilus was also the name of an East Roman emperor, 829-842, who opposed image-worship and raised his court to a high level of culture.

Theophrastus (c. 372-288 B.C.). Greek Peripatetic philosopher. Born at Eresus in Lesbos, his original name being Tyrtamus, he studied at Athens under Plato and Aristotle. The latter persuaded him to change his name to Theophrastus (divinely eloquent), appointed him his successor in the presidency of the Lyceum in 322 B.C., and committed to him all his writings at his death. Theophrastus achieved such a reputation that his pupils numbered 2,000. Of his 200 writings, some twenty are extant in whole or in part. The best known is a moral treatise called *Characters*, brief and incisive sketches of various classes of persons, which found numerous French and English imitators in the 18th century. There is an admirable translation, with text and notes, by R. C. Jebb, 1870, rev. ed. J. E. Sandys, 1909. But his reputation chiefly rests upon his extant works, *History of Plants* and *The Origins of Plants*, which were regarded as authoritative during the Middle Ages. There is a translation of the *History of Plants* by A. F. Hort in the Loeb Classical Library.

Theophylline OR **THEOCIN** ($C_7H_8O_2N_4$). Isomer of theobromine occurring with caffeine in tea. Caffeine, theobromine, and theophylline are described as "xanthines," all of which possess a diuretic action. Theophylline may be used in the form of its powder, or combined with ethylene diamine (aminophylline), or with sodium acetate. It has been synthesised from dimethyl urea.

Theopompus. Greek historian. Born in Chios, 376 B.C., he was banished owing to his father's Laconian sympathies. He went to Athens, where he was a pupil of Isocrates, and returned to Chios in 333. Being again driven out by the anti-Macedonian party, he travelled extensively, practising as an advocate and delivering epideictic or show speeches in various towns. He was the author of *Hellenica*, a history of Greece from 410 to 394. In 1907 there was discovered a lengthy papyrus fragment which is considered by some to be part of this work. His *Philippica* in 58 books contained an account of the times of Philip of Macedon, with numerous excursuses.

Theorbo. Large lute with a double neck, having two sets of tuning pegs. The lower set applied

Theorbo of the
17th century

to the strings over the fretted fingerboard, tuned in 4ths, with a 3rd in the middle, while the upper held the bass strings, which were tuned in 2nds and were played as open notes (diapasons).

Theorem (Gr. *theorēin*, to consider). General proposition that is not self-evident but is demon-

strable by reasoning. An example of a self-evident proposition is $2 + 2 = 4$; of a theorem, that the angles at the base of an isosceles triangle are equal. In mathematics, physics, and geometry a theorem is something which has to be proved, while a problem has to be "done" or solved.

Theory (Gr. *theorēin*, to consider). As distinguished from practice, speculative knowledge without any reference to practical application; in this connexion an unfavourable sense, the idea of insubstantiality is often attached to it. In scientific language, theory is an explanation of phenomena, based on established principles, as contrasted with hypothesis, which merely assumes the operation of a principle. The theoretical method is deductive, proceeding from the general to the particular, from principles to facts. Theoretical knowledge, according to Aristotle, was superior to practical in that, as dealing with universals, it alone was real knowledge, whereas practical knowledge dealt only with particulars.

Theosophy (Gr. *theos*, god; *sophia*, wisdom). Name applied to various systems of mystical philosophy and religion, professing to derive special knowledge of the nature of God and His relations with man, either from deductive speculation or from revelation. Neoplatonism and Gnosticism are early forms of theosophy. From these and from the Cabbala (*q.v.*) modern systems from the 16th century onwards are in part derived. Paracelsus, Giordano Bruno, and above all Jakob Boehme, were prominent theosophists.

In a narrower sense the term is generally applied to a system propagated by H. P. Blavatsky and H. S. Olcott, who together founded

the Theosophical Society in 1875 in the U.S.A. The system aims at establishing a universal brotherhood by showing the unity of all religions, especially in their esoteric teaching, manifested by occult phenomena. Modern theosophy is an eclectic system, which critics declare to be a somewhat crude compilation of half understood elements in Buddhism and other systems. A fundamental doctrine is that of Karma, the law of retribution by which destiny is strictly determined by successive acts. The soul advances to Nirvana along the path of perfection through a series of incarnations. See Besant, A.; Blavatsky, H. P.; Buddhism; Karma; Mysticism; Nirvana; consult also Theosophy and the New Psychology, A. Besant, 1904; Key to Theosophy, H. P. Blavatsky, 1913.

Theotocopuli, DOMENICO (c. 1541-1614). Greco-Spanish painter. He was a native of Crete, and in Spain was called El Greco (the Greek). He became a pupil of Titian, and was influenced by Tintoretto, Bassano, and other Venetian masters. After painting in Venice and Rome, he left Italy c. 1576 to spend the rest of his life at Toledo, where he died, April 7, 1614.

At Toledo he identified himself with Spanish mysticism, and his earliest Spanish pictures include nine canvases for the church of S. Domingo el Antiguo, and the Espolio (the stripping of Christ) for the cathedral. His Dream of Philip II, at the Escorial, and the Martyrdom of S. Maurice, an intense expression of religious feeling, mark the transition to his later, best-known style. His finest qualities as a portrait-painter are exemplified in the Burial of Count Orgaz, and the Grand Inquisitor. In such later works as Laocoön, Baptism of Christ, The Opening of the 5th Seal, his linear stylisations gave rise to the legend of his madness.

El Greco's paintings of religious subjects, with their intense elongations and acrid colouring, are ecstatic visions, dream-like distortions of forms, released from earthly perceptions. His life and

reputation, having been neglected for some three centuries, were rediscovered by the Post Impressionists, acclaimed by Cézanne and his disciples, and later by the Expressionists. He is represented in the National Gallery, London, by Christ's Agony in the Garden, and The Cleansing of the Temple.

El Greco forms the subjects of many monographs and critical analyses. They include the standard work of Cossio, 1908, and those of Calvert and Hartley, 1909; M. Barres, 1911; J. F. Willumsen, 1927; F. Rutter, 1930; L. Goldscheider, 1938.

Thera. Ancient name of the Greek island in the Cyclades group, now known as Santorin (*q.v.*).

Theralite. Name given to a group of igneous rocks akin to gabbro and dolerite but containing nepheline. They are found in Lanarkshire, Bohemia, W. Alps, N. America, etc. See Igneous Rocks; Teschenite.

Theotocopuli (El Greco). Christ's Agony in the Garden, a painting in the National Gallery, London

Theramenes (d. 403 B.C.). Athenian politician. Born in the island of Ceos and trained in philosophy and rhetoric, he entered public life in 411, when he was active in setting up the oligarchy of the Four Hundred (*q.v.*) at Athens. Disapproving of their extreme measures, he went over to the democrats. After the Athenian defeat at Aegospotami, 404, he concluded a humiliating peace with the Spartan Lysander. One of the Thirty Tyrants set up by Sparta, his opposition to their excessive severity brought him into collision with Critias (*q.v.*), who declared him a traitor to the constitution. Theramenes defended himself with eloquence and with apparent success when, by the orders of Critias, he was dragged from sanctuary, and forced to drink hemlock. *Protr.* Theer-ammeneez.

Therapeutae (Gr. *therapeutēs*, worshipper). Egyptian branch of the Jewish sect of the Essenes (*q.v.*). They differed from the Essenes of Palestine in adopting a hermit life instead of one in community, were less influenced by Oriental philosophy, devoted themselves to contemplation, and assembled on the Sabbath for worship and a mystic meal.

Therapeutics (Gr. *therapeuein*, to treat medically). Branch of medicine which pertains to the treatment of disease. See under the names of various diseases.

Theresopolis. Town of Brazil, in the state of Rio de Janeiro. It stands at an alt. of 2,600 ft., 17 m. N.E. of Petropolis. Formerly capital of the state, it is now a summer health resort.

Therezina. Town of Brazil, capital of the state of Piahy. Situated on the right bank of the river Parnaíhyba, 220 m. from its mouth, and 60 m. S.E. of Caxias, it has several educational institutions, cotton and soap works, iron foundries, and a large sugar refinery. Pop. est. 64,000.

Therm (Gr. *thermē*, heat). In physics, name given to the British thermal unit of heat, generally abbreviated B.Th.U. It is the amount of heat required to raise one pound of water at its maximum density through 1° F. The calorie (*q.v.*) is the corresponding metric unit of heat. A therm equals nearly 252 calories. The term therm is used in the British gas industry for 200 cu. ft. of gas, which equals 100,000 B.Th.U.s. See Units, Electric.

Thermae. Name given to the elaborate bathing establishments of imperial Rome. See Baths.

Thermal Capacity. In physics, the quantity of heat required to raise a body through one degree of temperature. It may be measured in therms, calories, or joules, and is numerically equal to mass multiplied by specific heat. The thermal capacity of any particular body is usually expressed in terms of the quantity of water that has the same heat capacity.

Thermal Diffusion. Separation produced in a uniform mixture of two gases when a temperature gradient exists. The heavier molecules diffuse towards the cooler, and the lighter ones to the hotter, side of the enclosure. The greatest separation is effected if the components are of very different masses and sizes. The phenomenon has been applied to the separation of isotopes of uranium which is used in the form of uranium hexafluoride, a

vapour at moderately high temps. Some 4,000 stages are necessary to effect a 99.3 p.c. separation.

Thermal Neutrons. When ordinary high-speed neutrons are incident on a light material, *e.g.* water or paraffin, their energy will be reduced. Its value will approach $\frac{2}{3} kT$, corresponding to that of a particle in thermal equilibrium with its surroundings; k is the Boltzmann gas constant per particle, and T is the absolute temperature. Such neutrons are termed thermal or C neutrons, and at 300° abs. temp. the energy of such a neutron will be approximately 0.038 electron volts.

Thermidor (Gr. *thermē*, heat; *doron*, gift). Name of the 11th month in the year as rearranged during the French Revolution. It began on July 19 or 20. The rising against Robespierre in 1794 occurred on the ninth of Thermidor. See Calendar.

Thermionics. Subject concerned with the emission of electrons from substances under the action of heat, and therefore, through the thermionic valve, the basis of the science of electronics (*q.v.*).

Thermionic Valve (Gr. *therme*, heat; *ion*, going; Lat. *valva*, leaf of folding door). Vacuum bulb containing two or more electrodes. The basic principle of the thermionic valve was discovered by Edison, but no practical use was found for what was known as the "Edison effect" and it remained a laboratory curiosity until 1904, when J. A. Fleming (*q.v.*) produced the first thermionic valve, the Fleming diode.

The principle is this: the glowing tungsten filament of an ordinary electric lamp emits electrons into the surrounding vacuum. These make short journeys and eventually return to the filament. If, as in Fig. 1, a metal plate is sealed into the bulb and main-

tained at a positive potential, a stream of electrons is drawn across the vacuum from filament to plate; the electrons are minute particles of negative electricity and they respond to the very strong attraction exerted on them by the positively charged plate called the anode. Were the anode made negative it would repel the electrons emitted by the filament, or cathode, and no current could pass. In battery-operated valves

electron emission takes place from a filament heated by the passage of current through it. Emission in most mains-operated valves is from a cathode which is brought to the necessary temp. by the action of a separate heater. If the tungsten is treated with thorium, emission is obtained at a much lower temp. The thermionic valve obtained its name because it exercises the same effect on an electron stream as do mechanical valves (*e.g.* the valve of a bicycle tire, the inlet and exhaust valves of petrol and steam engines, the ball-tap of a cistern) on the flow of gases, steam, or liquids: all permit a current to pass in one direction only.

The diode is much used in radio, radar, television, and other apparatus. The majority of A.C. mains wireless receiving sets, for instance, have a diode rectifier, which can be arranged as in Fig. 2. Current passes only during the positive half of each cycle, when

the anode is made positive. The negative half-cycles are, so to speak, strained out and "spurts" of uni-directional current are delivered by the valve. These are smoothed by suitable circuits into steady D.C. This process is called half-wave rectification. In practice a full-wave rectifier is usual. This consists of a double-diode valve, which has two anodes and a common cathode. One end of the transformer secondary windings is connected to each anode. Every half-cycle thus drives one of the anodes positive and produces a flow of current. The diode also has many other uses. (See Electronics).

Lee de Forest developed the triode, or three electrode valve (Fig. 3). Between the cathode and the anode a grid (usually a helix of fine wire) is inserted. Since the grid is closer to the cathode than is the anode, potentials applied to it exercise a greater effect on the electron stream. It may, for example, be found that to increase the cathode-anode current by 2 mA the anode potential must be raised by 10 V., but that the same increase can be obtained by leaving the anode potential unaltered and

Thermionic Valve. Fig. 3. The triode

making the grid only one V. more positive. The efficiency factor, or mutual conductance (symbol g_m) of a valve is the

ratio of the change in anode current to the change in the grid volts. A one-V. change in the grid voltage produces a 2 mA. change in the anode current. The mutual conductance is thus 2 mA. per V., usually written 2 mA/V. If an alternating voltage reaching +1 V. at the crests of the positive half-cycles and -1 V. at the troughs of the negative half-cycles is applied to the grid of the valve, it will have as much effect on the anode current as would an alternating voltage rising to +10 V. and falling to -10 V. applied to the anode. In other words, a ten-fold amplification of voltages applied to the grid occurs at the anode. The amplification factor of a valve (symbol μ) is the ratio of the change in anode V. to the change in grid V. producing the same effect, here 10.

One other important factor is the anode resistance (symbol r_a) which is the ratio of the change in anode volts to the change in anode current which it produces. In making the calculation the anode current must be measured in Amps. A change of 0.002 Amp. (2 mA.) is produced by a charge of 10 volts. The anode resistance is thus $10 \div 0.002$, or 5,000 ohms.

The triode can do other things besides amplifying: it gives good service both as a detector and as an oscillator (see Radio). Any two conductors separated by an insulator, or dielectric, form a capacitor, or condenser. Such capacitors are formed in the triode by anode and grid; grid and cathode; anode and cathode. Alternating and oscillating currents can pass through capacitors; the higher their frequency, the smaller is the opposition to their passage offered by a capacitor of given value. The stray capacitances, as they are called, which are inevitable in the triode, may allow high frequency currents to leak into paths other than their proper ones and to produce highly undesirable effects.

The capacitance between two conductors can be reduced to zero by placing an earthed conducting screen between them. This is what is done in the screen-grid valve (Fig. 4). The screening

Thermionic Valve. Fig. 4. The screen-grid valve

grid is not directly earthed; but the large capacitor C offers so little opposition to the passage of high-frequency currents that it is as good as earthed, so far as they are concerned.

The chief virtue of the screen-grid, four-electrode valve, or tetrode, is that it allows enormous amplification at high frequencies. It has, however, one serious drawback. Suppose that we apply a fixed potential of, say, 80 V. to the screen and gradually raise the anode voltage, starting from zero. At first the anode current increases as the anode voltage is increased; then comes a point at which it begins to fall. This fall continues for some time as progressive increases are made in the anode voltage. Then the anode current begins to rise steeply again for a time, and again the rise becomes small, no matter how much the anode V. are increased.

What is happening during the unexpected fall is that fast-travelling electrons from the cathode knock other electrons out of the anode, and these secondary electrons are captured by the positively charged screen, the anode is robbed of electrons, and its current falls. Later, when the anode voltage is made higher than that of the grid, the secondary electrons are attracted back to the anode before they have gone very far. All this is avoided in the five-electrode pentode valve (Fig. 5), in which a suppressor grid, connected to the cathode, is

Thermionic Valve.

Fig. 5. The pentode

The pentode is a most useful valve with an amplification factor of 2,000 or more; its stray capacitances are very small indeed.

Hexode (6 electrodes), heptode (7 electrodes), and other complex valves are used for particular purposes. The diode-triode, the triode-hexode, and the double diode-pentode are really assemblies, with a common cathode, of two or more valves in one bulb.

Thermistor OR VARISTOR. Small device made from a carbon-like material, which has a high negative temperature coefficient of resistance, e.g. a typical element has a resistance of 1,500 ohms at

10° C. which falls to 1,000 ohms at 40° C. Because of their small size thermistors show a fairly rapid response to fluctuating temperatures, and therefore find use, as thermometers, for the measurement of thermal radiation, for thermostatic control, and for many biological purposes.

Thermit OR THERMITE. Mixture of magnetic iron oxide and aluminium powder used for the production of high temperatures. The mixture is placed in a crucible and the reaction started by means of a priming of barium peroxide and aluminium powder, into which a piece of magnesium ribbon is inserted and fired. A very violent reaction takes place, and a temperature of about 3,000° C. is obtained. The compound is used for welding iron or steel rails together, and can be employed *in situ*. It is also employed for repairing defects in steel castings. Alloys can be made with thermit by employing mixtures of oxides of the metals. In this way chromium, manganese, molybdenum, vanadium, and similar metals can be produced. These are used to harden iron and steel. Incendiary bombs contain thermit.

Thermit explosives is the name of a class of composite explosives in which one of the ingredients is a metal, or metallic compound, capable of being easily oxidised, which develops considerable heat on combustion. Reactions utilising aluminium and metallic oxides are sometimes called thermit reactions. See Incendiary Weapons; Welding.

Thermo-chemistry. Branch of chemistry which deals with the heat equivalent of chemical changes. Chemical reactions are almost always accompanied by changes of temperature. When heat is evolved the reaction is termed exothermic, and the compound formed an exothermic compound. When heat is absorbed it is an endothermic reaction. Violent reactions are generally exothermic, and exothermic compounds are usually characterised by great stability. The heat absorbed when a substance is split up into its components is known as the heat of decomposition, the heat of formation being that absorbed or evolved when a substance is formed. Heat changes are measured by means of an instrument known as a calorimeter, one form being that in which the reaction takes place in a large excess of water, while the other variety allows of the complete combustion of the substance in oxygen.

Hess stated as a law of thermochemistry that the amount of heat involved in a chemical change between definite amounts of different substances is always the same, provided that the initial and final products are the same in each case. This is, however, a corollary of the law of the conservation of energy. It has been proved experimentally; the same substance cannot be prepared possessing different proportions of chemical energy. If a particular substance is made by means of a series of reactions the algebraic sum of the heat absorbed or produced is the same. This is known as the law of constant heat summation. See Chemistry.

Thermocouple. A system in which an E.M.F. is generated by means of two wires of dissimilar metals, connected in series, which are subjected to the influence of a source of heat acting at their point of union, the remainder of the circuit being at a lower temperature. The E.M.F. is produced by a combination of the Peltier and Thomson Effects (*qq.v.*) and is commonly used as a means for measuring temperature (see Pyrometer). The metals from which the two wires are made are therefore chosen to give the maximum E.M.F. consonant with stable electrical conditions and ability to withstand the maximum degree of heat. The ideal combination is that in which increased temperature, by the Thomson effect, produces a uniform increase in potential in one wire and a uniform decrease in potential of the other, with the Peltier effect tending to give a uniform increase in the difference in potential between the wires. At the same time the wires should not melt or soften too much at their operating temperatures and should not oxidise or corrode too rapidly.

Thermodynamics (Gr. *thermē*, heat; *dynamis*, power). Science which deals with the relations between heat and work. Rumford and Davy, the former from observing the heat caused by boring cannon and the latter by melting ice by friction in a vacuum, concluded that there was a relation between heat and work. It was not, however, until the experiments of Joule that the mechanical equivalent of heat was determined. Previously, Carnot had developed the idea of a cycle of heat operations, and upon his researches and those of Joule are based the two fundamental laws of thermodynamics. The first law states that a definite quantity of heat is absorbed for

each unit of work produced, and conversely that a definite quantity of heat is produced by a given quantity of work. The mechanical equivalent of heat, *J*, expresses the fact that one gram-calorie is equivalent to 4.18×10^7 ergs of mechanical work. The second law, due to Clausius working on the Carnot cycle, states that it is impossible to convey heat from one body to another at a higher temperature by the agency of a purely self-acting machine. In other words, heat energy of itself always passes from high to low temperature. See Carnot's Cycle; Entropy; Heat; Ice-Making; Joule; Specific Heat.

Thermo-electricity. Study of electric currents caused by heat. Seebeck, in 1822, noticed that when a circuit was formed of two or more different conductors and the junctions of the conductors were at different temps., an electrical P.D. between the junctions was a function of the difference in temp. If the circuit is closed a current may be made to pass one way round the circuit or the reverse, according to the temps. of the junctions. By suitably choosing the metals of a circuit a considerable electro-motive force may be produced, and by coupling up alternate strips, say, of antimony and bismuth, an instrument known as the thermopile is formed, enabling very small temperatures to be measured, by observing the thermo-electric current. One such

thermopile was used in 1913 to measure the heat given out by some of the fixed stars. A couple made of copper and constantan wires gives a linear relation between E.M.F. and temp. between 0° and 100° C. For higher temps. platinum and platinum-rhodium couples are used.

Thermo-electric Pile. Device for detecting and measuring small amounts of radiant heat. It consists essentially of a number of wires or strips of two different metals or alloys, the ends being soldered together alternately in series, thus forming a battery of thermocouples. The effect produced by one junction is therefore multiplied by the number of thermocouples employed. Normally, the set of junctions exposed to the source of radiation are blackened to give the maximum absorption of heat. When the free ends are connected through a sensitive galvanometer the current flowing in the circuit as a result of the difference of temp. between the two sets of junctions is indicated. The sensitivity of such an arrangement is increased if the hot junctions are placed in a vacuum. The Moll type of surface thermopile, generally employed to provide continuous records of sun and sky radiation, is constructed of thin strips of manganin and constantan, the cold junctions being soldered to relatively large supports. Thermopiles can be calibrated in absolute values against standard radiation.

Thermograph.

Instrument for producing a continuous record of temp. variations. The sensitive element usually consists of either a bimetallic spiral ("Invar"-brass or "Invar"-steel) or a curved metal tube (Bourdon tube) filled with a liquid of low freezing point. One end of the element is fixed rigidly to a frame. In the first instance the bimetal coils or uncoils with change of temperature, and in the second the Bourdon tube alters its curvature. Since the free end of the element is

Thermograph. The instrument which produces a continuous record of temperature variations, showing its principal parts

connected directly or through a lever system to a recording pen, a trace is described on a suitable chart wrapped round a drum which is made to rotate by clockwork. Distant-recording thermographs are generally operated by a special form of Bourdon thermometer in which the change of pressure caused by the expansion of mercury in a steel bulb is communicated to the Bourdon tube by means of a steel capillary tube of fine bore, the bulb and capillary being coated with lead or copper for protection; electrical resistance thermometers and thermocouples are also employed where a very small thermal lag is required. Thermographs for meteorological use are exposed out of doors in a special screen, and sometimes the instrument is adapted to record wet-bulb temperatures as well. At certain meteorological observatories the registration is by photography, a beam of light being directed upon an air bubble in the mercury column of a long stem thermometer and focused on bromide paper.

Thermometer (Greek *thermē*, heat; *metron*, measure). Instrument for measuring temperature, usually by means of the change in vol. of a liquid. Descriptions of apparatus demonstrating the expansion and contraction of air when heated are found in the writings of Philo of Byzantium (3rd century B.C.), and Hero of Alexandria somewhat later. It would appear, however, that the thermometer was not used to measure temps. until the beginning of the 17th century. Its invention is generally attributed to Galileo, who improved its efficiency. These early instruments should be termed *thermoscopes*. They consisted of a glass flask with a long neck, inverted in a vessel of coloured liquid; some air was expelled from the flask by heating it, and the level of the liquid in the neck varied with the volume of the remaining air. The temp. was expressed by reading an arbitrary scale attached to the neck; but as it was subject to changes in pressure no two instruments read alike. This was overcome by Ferdinand, grand duke of Tuscany, who, about 1641, constructed a thermometer filled with alcohol, the stem being sealed at the upper end and marked in degrees.

In 1714 a new type of thermometer was made by Fahrenheit. He used mercury as a thermometric liquid, replaced the spherical by a cylindrical bulb, thus giving

greater sensitivity, and, most important of all, laid the foundation of a rational scale of temperature. Fahrenheit's scale was based upon three fixed points: the temps. of a mixture of ice, water, and salt, designated 0°; a mixture of ice and water, 32°; and the normal human body, 96°. The b.p. of water was observed to be at 212°. The modern Fahrenheit scale differs slightly from this, but the numbers 32 and 212 are retained for the two fixed reference pts. Later Réaumur devised a scale, from 0° to 80°, based upon the fact that a certain mixture of alcohol and water expands by 80 parts in 1,000 when its temp. is raised from that of freezing to boiling water. This thermometer could not be used up to the b.p. of water, but Réaumur's scale was applied to the mercury thermometer. Celsius, in 1742, proposed a scale with zero at the b.p. and 100° at the freezing point of water. Later it was reversed, producing the present-day Centigrade scale, used internationally in scientific work. Owing to the firm establishment of the Fahrenheit scale in the English-speaking countries, it has not been generally adopted. The Réaumur scale is still used for domestic purposes in some parts of Europe, but is rapidly becoming obsolete. The three scales are inter-convertible by means of the formula

$$C/100 = (F - 32)/180 = R/80.$$

The mercurial thermometer is by far the commonest. It is a glass tube of fine and uniform bore, with a cylindrical or spherical bulb blown or fused on to one end, and closed at the other. The bulb and part of the tube contain mercury; the upper portion may be a vacuum or filled with gas. When the thermometer bulb is immersed in the medium the temp. of which is required, both mercury and glass expand, and the mercury level rises in the tube, which is graduated in degrees. Better types of thermometer are calibrated with reference at least to one fixed point; usually the zero point is chosen. Since the expansions involved are not regular, and since it is rare that the capillary tube is truly uniform in cross-section, corrections have to be determined by separate comparisons, at a number of temperature levels, with an accurate standard.

Mercury has many advantages over other liquids, e.g. it remains liquid over a wide range of temps. (−40° C. to 356° C. under normal atmospheric pressure), can be used in very fine capillaries since it does

not "wet" the walls, and is easily visible. It is not possible to use a mercury thermometer in which the space above the mercury is free from gas to measure temps. above about 250° C., because the mercury boils and splits. This drawback is overcome by filling the space with a gas, usually nitrogen, under pressure; e.g. to extend the range of a mercury thermometer to 450° C., the nitrogen must be at a pressure of 15 atmospheres. For temps. below −40° C. mercury must be replaced by a low freezing-point liquid such as alcohol—generally used for thermometers reading as low as −80° C.—or pentane. Although for a given size of bulb and tube, an alcohol thermometer is more sensitive than a mercury one, it cannot be heated above about 60° C.; hence the upper fixed point cannot be determined directly.

Most thermometers used in meteorology are of the liquid-in-glass type, mercury being preferred when the instrument is not required to register below −30° F. The scale is graduated in whole degrees and is sufficiently open (roughly 15° F. per inch) to allow of estimation of the temperature to within 0.1° F.

Various types of maximum and minimum thermometers have been developed to record fluctuations of temp. The commonest maximum thermometer is that in which the bore of the tube is reduced near the bulb, either by drawing the tube or inserting a small piece of glass, thus offering considerably more resistance to mercury flow than the remainder of the tube. As the temp. rises the mercury expands and is forced past the constriction; a later fall of temp. causes a contraction of the mercury, and the thread breaks. The upper end of the part remaining indicates the highest temp. Clinical thermometers, used to find the temperature of the human body, use this principle, but cover only a short range. The minimum thermometer is a spirit thermometer with a dumbbell-shaped glass index in the capillary. With falling temp. the index is drawn by the spirit towards the bulb, but is left behind when the temp. rises.

Maximum thermometers are set by shaking, when the mercury column joins up again; minimum thermometers by tilting the bulb upwards until the index reaches the meniscus of the spirit.

The measurements of temp. by an ordinary thermometer give an arbitrary scale, and the necessity for some standard scale led Kelvin,

in 1848, to propose a thermodynamic scale, on which the absolute temps. corresponding with 0°C . and 100°C . are 273.1 and 373.1 respectively. It has been shown that a perfect gas, i.e. a gas which obeys Boyle's law exactly, between the two thermometrical fixed pts., expands by 100/273 of its volume at the lower point, provided that there is no change of pressure. The apparatus to measure the volume change is termed a gas thermometer, containing hydrogen or nitrogen, the behaviour of which is almost that of a perfect gas. Hence, if temp. be reckoned from a zero which is 273° (more exactly 273.1°) below the Centigrade zero, the volume of a gas, heated under constant pressure, is proportional to the temp. reckoned from this absolute zero of temperature, designated usually 0°K . (Kelvin), i.e. 273°K corresponds approximately to 0°C . The gas thermometer is, however, not convenient for ordinary use; it serves mainly as a standard for reference.

Metallic thermometers fall into several classes, and are described under Pyrometer, Thermograph, and Thermo-electric Pile. Electrical thermometers have the advantage that the recording scale (i.e. a galvanometer calibrated directly in degrees according to the corresponding temperatures) may be some distance away from the actual thermometer and substance whose temperature is being obtained. See Bolometer; Heat; Temperature; consult also Dictionary of Applied Physics, edited by Sir R. Glazebrook, 1922; Meteorological Instruments, W. E. K. Middleton, 1943.

A. J. Drummond, F.R.Met.S.

Thermoplastics. Term for one of the two main groups into which plastic materials are divided, the other being the thermosetting plastics. The former may be softened and re-softened indefinitely by the application of heat and pressure, provided that the heating is not intense enough to cause chemical decomposition. Natural resins and waxes, cellulosic plastics (e.g. ethyl-cellulose), bitumastic products, polystyrene are typical thermoplastics. The thermosetting plastics undergo chemical change on heating and become insoluble and infusible masses; examples of such materials are the phenolic, urea, and casein plastics. Alternative definitions of the two types of plastics are thermohardening and thermosoftening. See Plastics.

Thermopylae. Pass in Greece, leading from Locris into Thessaly,

between Mt. Callidromus and the sea. Thermopylae Pass afforded the only passage for an army from N. to S. Greece, and an heroic effort was made to hold it in 480 B.C. against the invading Persians by a small Greek force of some 1,000 men under Leonidas (q.v.), king of Sparta. As the result of treachery, the Persians were enabled to take the Greeks in the rear and shot them down to the last man. The defence of Thermopylae, although unsuccessful, exercised a great moral effect. In 279 B.C. the progress of Brennus and his invading Gauls was stayed at Thermopylae, but the Greek defenders were eventually taken in the rear. In 191 B.C. Antiochus III of Syria was defeated here by the Romans.

When the Germans invaded Greece in April, 1941, the N.Z. div. of the retreating British forces took up their position April 20 in the Thermopylae line, from the sea to the summit of the mts., covering the coast road, and held it until their turn came for evacuation, April 26. See Brennus; Greece. *Pron.* Ther-moppy-lee.

Thermostat. Automatic apparatus or instrument for regulating temperatures, or for giving warning of an undue rise of temperature. It is particularly a device in which the expansion of a metal or a volume of gas acts directly or indirectly through an electric circuit upon an alarm, or to control a source of heat. It is used in conjunction with fire-alarms, for regulating the positions of furnace dampers, controlling steam pressures, etc.

In one form for controlling the temperature of a furnace, it consists of a band of different metals having unequal coefficients of expansion, and carrying at one end an arm which, when in an operative position, engages one of a pair of contacts for opening and closing electric circuits controlling dampers. Variations in the temperature of the band, which is exposed to the source of heat, close one or other of the circuits to open or shut the dampers, and thus control the temperature of the furnace.

In another form, which is applied to a furnace, the movements of mercury in a tube pivoted in the centre of a balanced thermometer cause the thermometer to rise and fall, and thus indirectly control a damper or fire-door. Several other forms depend for their action upon the expansion and contraction of mercury which sets apparatus in motion by controlling electric cir-

cuits. A thermostat for giving an alarm, e.g. by ringing a bell, is termed a thermostatic alarm.

Théroigne de Méricourt, ANNE JOSEPHE (1762-1817). French revolutionary. Born in Luxembourg, Aug. 13, 1762, a farmer's daughter, she was living in Paris at the outbreak of the Revolution, took part in the storming of the Bastille, and was accustomed to attend meetings and festivals dressed as an Amazon. She became famous for her inflammatory speeches. She lived in Luxembourg and Liège, 1790, and was arrested for a time by the Austrians, 1791. Opposing Robespierre, she aroused the anger of the mob, being maltreated 1793 by a crowd whom she was haranguing. Losing her reason, she was an inmate of the Salpêtrière from 1794 until her death, June 9, 1817.

Theron. Tyrant of Agrigentum in Sicily. In alliance with his brother-in-law, Gelo of Syracuse, he won a great victory at Himera, 480, over the Carthaginians under Hamilcar. His victory at the Olympic games is celebrated by Pindar. A mild and capable ruler, he was worshipped as a hero after his death.

Thersites. In Greek legend, the ugliest man in the Greek army before Troy. He is represented as a man of the people who delighted in disputing with his superiors. Post-Homeric legend states that he was killed by Achilles for ridiculing that hero's regret at having slain Penthesilea, queen of the Amazons. Thersites has fine opportunities for railing in Shakespeare's Troilus and Cressida. *Pron.* Ther-sight-eez.

Thesaurus (Gr., treasury). Name given, particularly in the 16th-18th centuries, to certain lexicons or word-dictionaries, and also to collections of information on some special subject, e.g. Greek and Roman antiquities. An outstanding example is the English work of P. M. Roget (q.v.). See Anthology; Dictionary, etc.

Theseus. In Greek legend, the great hero of Attica and Athens. The unacknowledged son of Aegeus, king of Athens, he was brought up at Troezen by his mother. Aethra, who gave him his father's sword and sent him to Athens. Acknowledged by Aegeus as his son and successor, he slew the bull of Marathon, went to Crete, and, helped by Ariadne, killed the Minotaur. On the death of Aegeus, Theseus became king of Athens.

He led an expedition against the Amazons, and married their queen,

Hippolytē, who bore him Hippolytus. With Peirithous, Theseus overcame the Centaurs, and with him carried off Helen from Sparta. Failing to carry off Persephonē from Hades as a wife for Peirithous, Theseus was confined in Hades until released by Hercules. On returning to Athens he found that Helen's brothers, Castor and Pollux, had recovered their sister, while the Athenians had been seduced from their allegiance by Menestheus. Theseus retired to Seyros, and was there murdered by Lycomedes. His alleged bones were brought to Athens in 469 B.C., and a temple was built to receive them. See *Aegeus*; *Ariadne*; *Minotaur*.

Thesiger, ERNEST (b. 1879). British actor. Born in London, Jan. 15, 1879, and educated at

Ernest Thesiger,
British actor

Marlborough, he first appeared on the professional stage in Colonel Smith at S. James's Theatre, 1909. He scored a success in *A Little Bit of Fluff*, 1915, playing Bertram Tully more than 1,200 times; and was cast for first productions of plays by Bernard Shaw, e.g. as the Dauphin in *St. Joan*, 1924; and in *Too True to be Good*, Geneva, and in *Good King Charles's Golden Days*. Other memorable parts were in *Mary Rose*, 1920; *The Circle*, 1921; *A Sleeping Clergyman*, 1933; *A Man About the House*, 1946. In films Thesiger was usually a sinister villain. He published a vol. of reminiscences, *Practically True*, 1927; also *Adventures in Embroidery*, 1945. Of his brothers, Admiral Sir Bertram Sackville Thesiger (b. Jan. 14, 1875) was A.D.C. to George V in 1922; and Arthur Lionel Bruce Thesiger (b. Oct. 19, 1872) was a county court judge.

Thesmophoria. In Greek religion, an annual festival in honour of Demeter under her title of Thesmophoros, or bringer of ordinances. An agricultural mystery festival, it was celebrated by free-born women, chiefly at Athens, towards the end of Oct., at the time of sowing. Aristophanes's comedy, *Thesmophoriazusae*, i.e. the women keeping the Thesmophoria, produced 411 B.C., satirises Euripides. See *Demeter*; *Mystery*.

Thespieae. City of Boeotia, ancient Greece, situated on a slope

of Mt. Helicon. In the Persian invasion of 480 B.C. Thespieae and Plataea were the only two towns of Boeotia to join in the resistance to the invaders. At Thespieae was the famous statue of Eros, the god of the city, by Praxiteles.

Thespis (6th century B.C.). Founder of the Greek drama. He was born at Icaria in Attica, an early seat of the religious worship of Bacchus, in the drunken festivals connected with which Athenian tragedy and comedy originated. In order to give the Dionysian chorus some rest Thespis introduced an actor into these exhibitions, devising a linen mask so that the actor might sustain more than one character. Speaking a poem as the leader of the *Dithyramb*, and addressing speech to the chorus, which replied through its *coryphaeus*, Thespis thus invented the prologue and the dialogue of Greek drama, while by placing the actor upon a table so that he might be on an equal elevation with the chorus ranged upon the steps of the altar of Bacchus, he introduced the earliest form of the stage. Thespis also devised figures in the dances of the chorus which were known in the time of Aristophanes. See *Drama*; *Stage*.

Thessalonians, EPISTLES TO THE. Two of the Epistles of S. Paul, usually considered the earliest of his writings. S. Paul visited Thessalonica (Salonika) on his second missionary journey, and made many converts there; but the opposition of the Jews necessitated a hurried withdrawal to Berea. Later he sent Timothy to Thessalonica, and on his return the apostle wrote from Corinth the First Epistle to the Thessalonians. The Second Epistle was written from the same place, not long after the first, which it resembles closely, and both belong to the year 52 or 53. The two epistles are well authenticated.

They were written to strengthen the faith and love of the apostle's converts, at a time when the writer expected the Second Advent to occur in his own lifetime (1 Thess. 4, vv. 13-18). The theme of the speedy "coming of the Lord" is dwelt upon in the First Epistle, and with a view to removing misunderstandings, is further explained in the Second. 2 Thessalonians 2, vv. 1-12, describes events that are to herald the coming of Christ, and is written in a style resembling that of the Book of Revelation.

Thessaloniki. Ancient name revived by the Greeks in 1937 for

the Aegean seaport and city called Salonica (*q.v.*) in this work.

Thessaly (Gr. Thessalia). District of N. Greece, S. of Macedonia, between Epirus and the Aegean Sea. It consists mainly of the basin of the river Peneus, a depression roughly circular in shape and about 70 m. across, almost entirely surrounded by mts.; the Cambunian Mts. with Olympus, N.; Pelion and Ossa, E.; Ophrys, the modern Helloro, S.; Pindus, W. The only gap is the gorge of Tempe in the N.E. The central plain, though subject in places to floods, now partly controlled, produces much grain, and was famous in antiquity for horse-breeding. In the S.E. the peninsula of Magnesia encloses the land-locked Gulf of Volo. There is rly. communication with Athens and Salonika, and between the chief towns, Larissa, Trikkala, Karditsa, and the port of Volo. It is divided into the nomes of Larissa and Trikkala. Its pop. is 562,020, and area 5,208 sq. m.

Famous in legend as the home of the Argonauts and of Achilles, Thessaly was subdued by the Thesalians from the W. before 1000 B.C., the Aeolian natives becoming the subject class called *Penestae*. A group of military aristocracies governed the country, only combining when need arose under a *tagos* or military chief. Regarded as half barbarous in classical times, Thessaly favoured Persia, and rose to brief power only when it was united in 374 B.C. by the *tagos* Jason of Pherae, who was murdered in 370. His last successor was overthrown in 352 by Philip of Macedon, who in 344 annexed Thessaly. Thereafter it shared the fortunes of the rest of Greece. Occupied by Vlachs in the Middle Ages, it was called Great Wallachia. It was seized by Venice in 1204, and by Turkey in 1398. Most of Thessaly was ceded to Greece in 1881, and in 1897 it was the chief scene of the Greco-Turkish War.

Thetford. Mun. bor. and market town of Norfolk, England. It is situated at the union of the Thet and the Little Ouse, 14 m. N. of Bury St. Edmunds, and has two rly. stations. Formerly the capital of the kingdom of East Anglia, and later the seat of a bishop, it is an ancient town with several ecclesiastical ruins, including a Cluniac priory, 1104, and a Dominican

Thetford borough
arms

friary, 1340. A unique Saxon kiln was unearthed here, 1949. The grammar school (1556) stands on the site of the old cathedral church of the Trinity. Other buildings are the guildhall, mechanics' institute, almshouses, and in King Street an ancient flint house where Elizabeth and James I were guests. Thomas Paine was a native. The principal trades are making pulp and canning fruit and vegetables; there are also an iron foundry and agricultural machinery works. Adjoining the town is the state forest of Thetford Chase (about 44,000 acres). Thetford was incorporated in 1573, and in 1894

loss occurred because a torpedo-tube door had been left open when the vessel dived. The Thetis was subsequently repaired and recommissioned as the Thunderbolt, but after war service in the Arctic and Mediterranean was reported overdue on April 23, 1943, and presumed lost. Dependants of civilians lost in the Thetis won an action against the makers in 1943, but lost an appeal in 1944 and a further appeal to the house of lords in 1946.

Theuriet, CLAUDE ADHÉMAR ANDRÉ (1833-1907). French writer.

He was born at Marly-le-Roi on Oct. 8, 1833, and educated at Bar-le-Duc and in Paris, and was in the civil service, 1857-86. After publishing several volumes of idyllic verse, *e.g.* *Le Chemin des Bois*, 1867, he turned to fiction, and produced a long series of novels, *e.g.* *Le Mariage de Gérard*, 1875, Eng. trans. 1906; *Raymonde* 1877; *Le Fils Maugars*, 1879, Eng. trans. 1880, which are especially noteworthy for their descriptions of nature and rustic life. Theuriet became a member of the Academy in 1896, and died April 23, 1907.

Theydon. Name of three parishes in Essex, England. All are near Epping (*q.v.*). A fourth Theydon has long been known as Coopersale. Theydon Bois (*pron.* Boys) has a Central line station; its church, S. Mary's, 1851, contains relics of a Jacobean predecessor. Theydon Garnon (or Theydon Gernon) church, All Saints, contains old monuments and brasses, and has a brick tower dating from 1520. Theydon Mount church, S. Michael's, was built 1626; near is Hill Hall, a 16th cent. structure begun by Sir Thomas Smith (1513-77).

Thibaud, JACQUES (b. 1880). French violinist, born at Bordeaux, Sept. 27, 1880. He played the piano in public at six and made a sensational début as a violinist in 1892. Leader of the Colonne orchestra and a concert performer in Brussels, he excelled in chamber music and was particularly associated from 1905 with Alfred Cortot and Pau Casals in a trio.

Thibet. Alternative spelling for the country of Asia described in this work under Tibet.

Thielt. Town of Belgium, in the prov. of W. Flanders. It lies 20 m. by rly. S.W. of Ghent, and is a rly. junction. There are linen, woollen,

lace-making, and brewing industries, and a considerable local agricultural trade. Thielt was fortified in the 12th century, and was a busy centre of the Flemish cloth trade until a great fire in 1383. Pop. 11,611.

Thiépvall. Village of France, in the dept. of Somme. It is on the Ancre river, 4½ m. N.N.E. of Albert. The village, totally destroyed during the First Great War, was prominent in the battles of the Somme (*q.v.*), and a memorial has been raised there to 73,367 missing Allied soldiers.

Thierry, JACQUES NICOLAS ARGUSTIN (1795-1856). French historian. He was born at Blois, May 10, 1795, and after completing his studies at the École Normale Supérieure, acted for three years

Augustin Thierry, French historian

as secretary to Saint-Simon, under whose influence he wrote his first book, *De la Réorganisation de la Société Européenne*, 1814. He then became a contributor to the liberal journals, in one of which, *Le Courier Français*, appeared his *Lettres sur l'Histoire de France*, published 1827. The *Histoire de la Conquête de l'Angleterre par les Normands*, 1825, at once established his reputation. Though smitten by blindness in 1826, he continued his labours with unabated industry, his later works

Thielt, Belgium. The market place, showing the Cloth Hall with belfry, formerly the centre of a busy cloth trade

Thetford, Norfolk. Gateway of the Cluniae priory, now known as Thetford Abbey

was made the seat of a suffragan bishop in the diocese of Norwich. Market day, Sat. Pop. est. 4,450.

Thetford Mines. City of Quebec, Canada. It stands 70 m. S. of Quebec, on the Quebec Central rly. In the vicinity are asbestos mines (yielding almost 70 p.c. of the world's supply) and chrome iron mines. Pop. 12,716.

Thetis. In Greek mythology, one of the Nereids, or sea-nymphs. She was the wife of Peleus (*q.v.*) and the mother of Achilles (*q.v.*).

Thetis. British submarine. Of the Triton class, she had a surface displacement of 1,090 tons on a length of 275 ft. and was armed with ten 21-in. torpedo tubes. Her complement was 53 and she had a submerged speed of nine knots. Laid down in Dec., 1936, she was launched 18 months later. While undergoing trials in Liverpool Bay on June 1, 1939, she failed to surface after submerging, and of 103 men on board, only four survived. The vessel was located by salvage craft, but could not be raised until Aug. 28. At the subsequent inquiry it was established that the

including *Récits des Temps Mérovingiens*, 1840, and *Essai sur L'Histoire du Tiers-État*, 1853. He died May 22, 1856.

An ardent admirer of Scott, Thierry belonged to the romantic school of historians. But though he indulged freely in picturesque description and local colour, he did not sacrifice scholarship to effect. His ambition was to combine art with science, and to weave a dramatic narrative out of materials furnished by painstaking research. *Pron.* Tee-airy.

Thiers. Town of France, in the dept. of Puy-de-Dôme. Lying 24 m. E.N.E. of Clermont-Ferrand, it comprises an upper and a lower town, the latter situated in a nearly sunless gorge. Known as the Black City, it is the scene of a romance entitled *Ville Noire*, by George Sand. The upper town is quaint and picturesque, and crowns a granite hill, Mt. Besset, at the foot of which flows the Durdolle river. Here are the 11th century Romanesque-Gothic church of S. Genès, and the 7th century Romanesque church of Le Moutier. The town owes its industry to water power, which drives grindstones, hammers, paper mills, and forges. Pop. 15,409.

Thiers, Louis Adolphe (1797-1877). French statesman and historian. Born at Marseilles, April 14 or 16, 1797, of humble origin, he studied law at Aix, and becoming an advocate made his way to Paris, where he wrote for the *Constitutionnel*, attended political salons, and worked on his *History of the French Revolution*, the first volumes of which appeared in 1823. With Carrel he founded *Le National*, in which he fought for constitutional liberty, and after the revolution of 1830 proposed Louis Philippe as successor to Charles X.

Taking office under his friend Laffitte, the banker, Thiers made his mark as a debater and financier, while his literary status was recognized by election to the Academy in 1834. During 1832-36 as minister of the interior he took drastic measures against the revolutionaries. President of the council as leader of the Left Centre for short periods in 1836 and 1840, when his foreign policy brought Europe to

the verge of war, he was in opposition till the revolution of 1848. During this comparative retirement he added to his literary reputation with early volumes of his *History of the Consulate and Empire*. The *coup d'état* of 1851 involved his arrest and exile to Germany, but though he returned to Paris next year, he did not re-enter politics till 1860, when as a member of the Corps Législatif he came forward as a severe critic of policy at home and abroad.

After the fall of the empire, 1870, Thiers again came to the front, being elected to the assembly by 26 departments, with an aggregate vote of about 1,000,000. Regarded as France's only hope, at the age of 73 he visited neutral countries to urge their intervention, and also parleyed with Bismarck at Versailles, but in vain. As president of the executive government he faced the tremendous task of reorganizing France, putting down the Paris Commune, and freeing the soil from the invader by speedy payment of the war indemnity. Virtually dictator, he used his power wisely in the true interests of peace, loyally supporting the republic; but in May, 1873, not long before the final payment of the indemnity, he was driven from office by a Monarchist and Radical coalition, and retired into private life. Thiers died Sept. 3, 1877. *See* Bismarck. *Consult* The Government of Thiers, J. F. Simon, Eng. trans. 1879; *Life*, P. de Rémusat, Eng. trans. 1892; *Monsieur Thiers*, J. M. S. Allison, 1932. *Pron.* Tee-air.

Thiès. Town of Senegal, French W. Africa. Just E. of Dakar, it is a rly. junction for St. Louis on the coast and Kayes inland. Pop. 22,950.

Thimble (A.S. *thjmel*, thumb-stall, from *thūma*, thumb). Cap or cover for the finger to protect it in pushing a needle through material. Originally worn on the thumb, thimbles are now usually worn on the middle finger of the right hand. They are made of silver and other metals, bone, celluloid, plastic material, and are covered with small indentations to prevent the end of the needle from slipping. A tailor's thimble is open at the end.

A *thummel*, or sailmaker's thimble, is a heavy ring worn on the thumb, bearing a disk for pressing the needle. In nautical terminology, a thimble is a concave metal ring grooved on the outside so as to fit within an eye-piece. The term is used of many

Thimble. Portion of a sailmaker's thummel. Top, left, tailor's thimble; right, household thimble

mechanical appliances, e.g. a sleeve or tube through which a bolt passes, a ferrule to expand a flue tube, and a metal socket for fixing lead pipes to stone.

Thingvall Vatn. Lake of S.W. Iceland. Situated 24 m. E. of Reykjavik, the capital, it covers an area of about 30 sq. m. In the vicinity of the N. end is Thingvellir, where the ancient althing, or local parliament, assembled.

Thio-derivatives. Series of chemical compounds analogous to the alcohols, but containing sulphur in place of oxygen. These are known as thiols, thio-alcohols, or mercaptans. Thio-ethers, or alkyl sulphides, are liquids possessing an unpleasant odour of leeks. Thio-alcohols may be made by heating alcohol with phosphorus pentasulphide, the ethers being prepared by an analogous method.

Thionville (Ger. Diedenhofen). Town of France. In the dept. of Moselle, it stands on the Moselle, 17 m. N. of Metz, and is a rly. junction and a centre for the sale of agricultural produce. An important place in the days of the Franks, it was in the duchy of Lorraine, was acquired by France during the wars of Louis XIV, was taken by the Prussians in 1870, and remained German until 1918. During the Second Great War, possession of Thionville was violently disputed. U.S. forces advancing from Verdun secured the part of it W. of the Moselle by Sept. 14, 1944; but the part E. of the river remained in German hands until isolated on Nov. 15 by the linking of American troops which had crossed the river to the N.E. near Königsmaacher on the 9th, and to the S.W. near Uckange on the 13th. Pop. 17,596.

Of Thiers
(A. Thiers)

Thiophene (C^4H_4S). Colourless liquid which occurs with benzene distilled from coal tar. For the preparation of thiophene commercial benzene is shaken up with strong sulphuric acid, when a black acid layer is formed. This sulpho-acid is converted into the lead salt, mixed with ammonium chloride (sal ammoniac), and distilled. *See* Coal Tar.

Thiosulphuric Acid ($H_2S_2O_3$). Acid which has not been prepared in a pure state, but the salts of which are made. The most important is sodium thiosulphate, generally but erroneously called hyposulphite of soda, which is used in industry for destroying the last traces of chlorine after bleaching.

The property of sodium thiosulphate of dissolving silver chloride and iodide recommends it to photographers as a fixing agent. When a photographic plate is acted upon by light and developed, those silver salts which the light reaches are reduced to the metallic state. If now the plate is immersed in a solution of sodium thiosulphate, the unaffected silver chloride and iodide are dissolved away, and the metallic silver which is insensitive to light is left in the emulsion, thus fixing the negative. *See* Photography.

Third. In music, an interval comprising three letter names. It is of three kinds: major (four semitones), minor (three), and diminished (two):

The major and minor thirds are

important because their occurrence in the scale determines the mode of the key.

Third Degree. Colloquial term for methods used by police in the U.S.A. to extract confessions from arrested persons. It may take the form of continuous questioning over a long period, depriving of sleep, starvation, confinement in a dark cell, beating with a rubber hose or black-jack, or kicking in the stomach. The term is believed to have been suggested by the three degrees in the initiation of freemasons. Such practices are prohibited in the police forces of Great Britain.

Third Estate (Fr. *tiers état*). Name given to the class in France which, though neither nobility nor clergy, was entitled to send deputies to the states-general. The name is especially prominent in the history of 1789-90, when these deputies were helping to frame a constitution. *See* Estates; French Revolution.

Third International. The formation and history of this association of Communist parties is given under International.

Third Party. Term used in English law. Where there are two persons in a definite relation to each other, and someone else is brought on the scene, the latter is spoken of as the third party. Thus, if a principal and his agent are the two parties spoken of, and the agent introduces someone to do business with his principal, this last person is a third party. Third party insurance against certain risks is obligatory upon the user of a motor vehicle.

Third Programme. Broadcasting service inaugurated by the B.B.C. on Sept. 29, 1946. It was designed not exactly to supplement the existing home and light programmes, but as a cultural experiment, since the director-general of the B.B.C. acknowledged that its appeal would be to a minority of listeners. Not having to stop a feature at any given time in favour of e.g. a news bulletin, the third programme could run an entire opera or classical drama. It also revived much first-class but neglected music and poetry, and gave encouragement to contemporary composers and writers who had previously found radio an inaccessible medium.

Third Reich. Term applied to the Hitler regime in Germany, the word Reich being German for realm. The law which actually reconstituted the Reich was enacted Feb. 1, 1934. The word third alluded to the fact that Germany had been first a monarchist empire, 1871-1918, and then a federation of states under the Weimar constitution. *See* Germany; History.

Third Republic. Name given in France to the period from Sept. 4, 1870, to June 17, 1940. After the disasters of Metz and Sedan, Napoleon III was declared deposed and the republic was proclaimed. Its chief authors were Gambetta and Thiers. It ended with the capitulation of the French govt. in the Second Great War. *See* France; History; Gambetta; Napoleon III; Thiers.

Thirkell, ANGELA MARGARET (b. 1890). British novelist. She was born in London, Jan. 30, 1890, daughter of J. W. Mackail (*q.v.*) and Margaret Burne-Jones. Denis Mackail (*q.v.*) was her brother. In Australia she broadcast and contributed to magazines, and on her return to England in 1930 speedily made a name with amusing and sometimes slightly fantastic novels, often in an English village setting. Her first was *Three Houses*, 1931; the first to be widely praised was *Wild Strawberries*, 1934. Then came *The Brandons*, 1939; *Marling Hall*, 1942; *Peace Breaks Out*, 1946; *Love Among the Ruins*, 1948.

Thirlage (cognate with Eng. *thrall*, a slave). Term in old Scots law. It was applied to a tenure of land, the holder of which was obliged to have his grain ground at a specified mill, paying therefor a certain portion of the flour. Since

the end of the 18th century thirlage has been commuted for an annual payment.

Thirlmere. Lake of Cumberland, England. Lying under Helvellyn, 5 m. S.E. of Keswick, it is a narrow sheet of water about $3\frac{1}{2}$ m. long. On the W. side are the Armboth Fells. Since 1894 the lake has been one of the sources whence

Thirlmere. The Cumberland lake before it was made the reservoir for Manchester. The water level was raised 50 ft. by building a large dam at its foot, the area being extended as shown in the top picture

Manchester obtains its water supply. The heavy rainfall, 91 ins. annually, drains from 10,000 acres of land into the 800-acre lake. The water flows by gravitation to supply over 1,000,000 people 100 m. away. See Cumberland; Lake District; Manchester.

Thirlwall, CONNOP (1797–1875). British divine and historian. Born at Stepney, Jan. 11, 1797, he was educated at the Charterhouse

Connop Thirlwall,
British divine

and Trinity College, Cambridge, and, having been ordained, became in 1832 a tutor at Trinity. Here signed in 1834 because he had expressed himself in favour of the removal of religious tests. In 1840 he became bishop of St. David's, and remained in Wales for 34 years. He was the only bishop to refuse to censure Colenso. He died July 27, 1875, and was buried in Westminster Abbey. Thirlwall's History of Greece, 1835–47, is a standard work. Consult his Remains, ed. J. J. S. Perowne, 1877–78; Letters, ed. Perowne and L. Stokes, 1881.

Thirsk. Market town of the N. Riding of Yorks, England. It is 22 m. by rly. N.W. of York. The chief building is the beautiful Perpendicular church of S. Mary. There are works for making farm machinery, flour mills and tanneries; and cardboard boxes are made. Race meetings are held four times a year. Thirsk and Malton is the name of a co. constituency. Market day, Mon. Pop. 2,658.

Thirst. Sensation arising from the demand of an organism for water. It is felt chiefly in the regions of the throat and mouth, possibly because of evaporation from their surface. The sucking of a stone or hard sweet may ease the condition by local reaction, although no fluid is given.

Abnormal thirst may be caused by the fact that large quantities of substances such as salt or sugar have been swallowed. These alter

the concentration of the tissue fluids. It is also experienced in diseases which alter the fluid chemistry, e.g. diabetes, or which result in excessive loss of fluid, e.g. haemorrhage or diarrhoea. When the body fluids have been depleted, or when a man has gone for a long period without drink, fluid must be given drop by drop, or by a slow intravenous or rectal drip.

Thirty-Nine Articles, THE. Colloquial term for the Articles of Religion printed at the end of the Anglican Book of Common Prayer. They constitute a formulary of faith such as was found necessary by all Protestant bodies in the 16th century, having parallels in the Schwabach Articles, 1529; Augsburg Confession, 1530; and Confession of Württemberg, 1552. Like these, they were drawn up to combat the dogmas and claims of Rome, but were designed to prevent diversities of opinion within the Anglican Communion. All candidates for ordination subscribe to their contents as a whole, and they are regarded as binding on the lay members of the Church of England, and form part of the statute law of England, and of the canon law of the Church. Until 1871 subscription was obligatory on all taking degrees at Oxford and Cambridge.

Thirsk, Yorkshire. Parish church of S. Mary

Historically, the conditions which made such formalities necessary were similar to those ruling in the 4th and 5th centuries, when the whole Church Catholic formulated the Apostles' and Nicene Creeds. The XXXIX Articles were arrived at gradually. First came the Ten Articles of 1536. These were followed by The Institution of a Christian Man, 1537, called The Bishops' Book because it lacked other authority; The Thirteen Articles, 1538, drawn up by Cranmer on the basis of the Augsburg Confession; The Law of the Six Articles, agreed to by parliament and Canterbury through the in-

fluence of Gardiner in 1539; and The Necessary Doctrine and Erudition for Any Christian Man, 1543, known as The King's Book.

Of The Forty-two Articles issued with royal approval in 1553, a revision of those drawn up by Cranmer, 1549–51, six were virtually identical with parts of the Augsburg Confession. They were followed by The Eleven Articles of Archbishop Parker, 1559–60, and The Thirty-eight Articles of 1563, an episcopal revision of The Forty-two of 1553. Of the articles submitted in 1563, one, which dealt with unworthy reception of the Holy Communion, had been struck out by Elizabeth or by her authority. This was reinstated in the XXXIX, as finally revised in 1571, largely by Bishop Jewel. Parliament enacted the English, but not the Latin, version.

The declaration which precedes the Articles was drawn up by Laud in 1628, and enjoins their interpretation in a literal and grammatical sense; but since the Tractarian movement, while the High Church party holds that they are not religious tests, extreme Protestants contend for their literal interpretation.

Bibliography. Introduction to the Articles of Religion of the Church of England, G. F. Maclear and W. W. Williams, new ed. 1909; Lecture Outlines of the XXXIX Articles, A. J. Tait, 1910; The XXXIX Articles and the Age of the Reformation, E. T. Green, 2nd ed. 1912; The XXXIX Articles, E. C. S. Gibson, 10th ed. 1928; Principles of Theology, W. H. G. Thomas, 1930; Introduction to the XXXIX Articles, E. J. Bicknell, 1946.

Thirty-one. Card game played with a full pack, and by any number of persons up to 16. Three cards are dealt to each player, and an extra hand is laid face upwards in the centre of the table. Beginning with the elder hand, the participants exchange in turn one card for one in the spare hand, the object being to obtain a combination of three cards which shall make 31 points, or as near as possible, in any one suit, an ace counting 11, each court card 10, and the remainder according to the number of pips. After a player has "knocked," the others may change once each. Either the holder of the highest hand wins the pool, or the holder of the lowest loses a "life."

Thirty Tyrants, THE. Oligarchy established by Lysander (q.v.) at Athens after the taking of the city by the Spartans in 404 B.C., the last act of the Peloponnesian War (q.v.). This oligarchy, the leading and worst member of which was

Critias, proved most oppressive and cruel, causing hundreds of citizens to be thrown into prison without a trial. A democratic form of government was restored in the spring of 403. See Athens.

Thirty Years War, THE. European war which raged over almost all Germany from 1618 to 1648. Primarily it was a contest between the forces of Roman Catholicism and Protestantism, a civil war in the German Empire; it did not remain so exclusively, because the religious question was complicated by a purely political question, and because non-German powers participated.

In 1618 Bohemia rejected the succession of the future emperor Ferdinand II to its crown, offered it to the Calvinist Frederick, the elector palatine, and defied the imperial legates' authority. Frederick's acceptance opened the war. In its first phase this was a contest for the crown of Bohemia. Ferdinand was supported by the R.C. princes and by Spain, then in possession of the Netherlands.

The Protestants failed to combine in support of Frederick, who suffered a heavy defeat at the White Mountain, Nov. 8, 1620, and was driven out of the Palatinate. James I of England, after vainly attempting diplomatic intervention on behalf of his son-in-law, Frederick, sent a blundering expedition against the Spanish Netherlands, 1625.

It was left to Denmark to attempt in 1626 to organize and maintain Protestant resistance, since both Saxony and Brandenburg held aloof. For a moment it seemed that Ferdinand's position was insecure, that his army under Tilly would have too much on its hands. The position was saved by Wallenstein, who procured Ferdinand's authority to raise an army of his own, which under his leadership rapidly dominated the military situation and seemed likely to crush resistance. Great as were his successes, he was hampered by the action of the League, under pressure from whom Ferdinand in 1629 issued the Edict of Restitution, restoring all ecclesiastical sees to Roman Catholics.

In 1630 Wallenstein was deprived of his command, and in the same year Gustavus Adolphus, king of Sweden, landed in Pomerania to champion the Protestant cause. For a time he was held inactive by the persistent abstention of Saxony and Brandenburg; he was thereby prevented from saving the city of Magdeburg, which after

a famous resistance was stormed and sacked, May 20 (N.S.), 1631, with hideous savagery by Tilly's troops. At last Brandenburg and Saxony were driven to giving their adherence to Gustavus, who started upon a brilliant career of victory, overthrowing Tilly at Breitenfeld, Sept. 17, sweeping round through the W. and S. of Germany, and mortally wounding Tilly at the battle of the Lech, April 15, 1632. Ferdinand was again compelled to call Wallenstein to the rescue from his retirement. Gustavus met the latter at Lützen, Nov. 16, 1632, and fell there by an unknown hand, but the Swedes won the victory.

Confusion of Aims

From this time the war became a chaos. The Swedes, no longer led by an idealist, were mainly concerned with the acquisition of territory; Richelieu meant to turn the German war to French advantage by the extension of borders. German princes great and small were more interested in aggrandisement than in the common cause whether of Protestantism or of Roman Catholicism. The one really great personality left on the stage was removed by the assassination of Wallenstein in 1634. In 1637 Ferdinand II was succeeded by his son Ferdinand III. The most prominent of the Protestants, Bernard of Saxe-Weimar, died in 1639; and Alsace, of which he had just made himself master, passed into the possession of France. In the N. and E. the Swedes, under able commanders, Baner, Torstenson, and Wrangel, won victories but could not consolidate conquests. Condé and Turenne achieved fame in command of French troops in the Netherlands and in S. Germany.

But the welter of fighting had ceased to have any common objects at stake, and the whole evil business was at last brought to a close in 1648 by the series of agreements known as the treaty of Westphalia, which left German lands in the possession both of Sweden and of France, and largely redistributed the territories of German princes. See Europe; Germany; Gustavus II; Protestantism; Richelieu; Wallenstein; Westphalia, Treaty of.

Bibliography. Schiller's popular history, 1791, remains a standard work. Consult also that of S. R. Gardiner, new ed. 1900; Camb. Mod. Hist., vol. 4, 1906.

Thisbe. In Babylonian legend, heroine of the love tragedy of Pyramus and Thisbe. See Midsummer Night's Dream; Pyramus.

Thisted. Seaport of Denmark, in N.W. Jutland. It stands on the Liim Fjord (q.v.), 12 m. direct N.N.W. of Nykjöbing, and is connected by rly. with Aalborg. There are shipbuilding yards and cotton-spinning works. Pop. 9,425.

Thistle. Common name applied to many prickly plants, but more strictly to those of the genus

Thistle. Flower-head, spiny leaves, and bud of the red musk-thistle

Carduus of the family Compositae. These are perennial or biennial herbs, forming large rosettes of spiny leaves the first year, and developing prickly stems the second year. The small red or purple florets are all tubular, massed in an oval or a roundish head, which is invested in overlapping, rigid, and spiny bracts.

The seeds have each a tuft of silky hairs (thistledown) attached, which buoys them in the air and assists distribution. The most striking species are the nodding or musk-thistle (*Carduus nutans*) with drooping, musk-scented, crimson flowers; spear-thistle (*C. lanceolatus*) with long spines to the large, lance-shaped leaves, and purple flowers; the dwarf-thistle (*C. acutis*) with the stem more or less suppressed, and the crimson flowers in the centre of the flat rosette of leaves; and the field-thistle (*C. arvensis*) with thick creeping underground stem and dark purple flowers—one of the greatest pests of agriculture. The holy- or milk-thistle (*Silybum marianum*) has huge leaves netted with white veins, and rosy-purple flowers. See Carline-thistle; Cotton Thistle; Inflorescence; Pollen; Sow-thistle.

Thistle, ORDER OF THE. Scottish order of knighthood. It was founded in 1687 by James VII, although a much earlier origin is claimed. It consists of the sovereign and 16 knights. The knights wear a collar of thistles, alternating with double sprigs of rue in saltire

in their proper colours and pendant therefrom a golden star of eight rays, called the glory. There-

Thistle. Insignia of the Order

on is the figure of S. Andrew, in green and purple cloak, holding in front of him a white saltire. The ribbon is green and the motto is *Nemo me in pūne lacessit* (No one attacks me with impunity). The

order has a dean and a chapel in S. Giles's cathedral, Edinburgh. See Knighthood colour plate.

Thistlewood, ARTHUR (1770-1820). British conspirator. Born at Tupholme, Lincs, he served in the army, travelled abroad, and then settled in London, where he joined the malcontents who aimed at revolution. In 1816 he was arrested for his share in an unsuccessful rising, but was acquitted

Arthur Thistlewood, British conspirator

and forthwith continued his plots, though going to prison for a year for challenging Sidmouth, Home secretary, to a duel. In 1820 he organized the plot known as the Cato Street conspiracy (*q.v.*). On Feb. 23 he and his associates met in a room in Cato Street (now Horace Street), Edgware Road, to plan the murder of the cabinet ministers who were dining in a house in Grosvenor Square. The scheme was betrayed, and though Thistlewood escaped, he was taken the next day and with four others was hanged for high treason on May 1.

Tholen or TOLEN. Island of the Netherlands, in the prov. of Zeeland. It lies in the Schelde estuary, separated from the island of S. Beveland by the E. Schelde and from the mainland by the Eendracht. The island is about 10 m. long by 6½ m. broad, flat and low-lying. Tholen is the chief town and has a 15th century Gothic town hall and a Gothic church; Stavenisse and St. Maartensdijk are other towns. Fishing and spinning are carried on. Tholen in medieval

times consisted of numerous small islets which have been united artificially. In 1825 the island was completely submerged by a storm.

Tholuck, FRIEDRICH AUGUST GOTTFREY (1799-1877). German theologian. Born at Breslau, March 30, 1799, and educated there and in Berlin, he was appointed professor of Oriental languages in Berlin, 1824, and two years later was called to the chair of theology at Halle, where he died June 10, 1877. Author of Commentaries on Psalms, John, and the Romans, he was a great preacher and evangelical theologian.

Thomar or TOMAR. Town of Portugal, in the dist. of Santarem, Estremadura. It stands on the river Nabão, a tributary of the Tagus, 16 m. N.W. of Abrantes and 89 m. by rly. N.N.E. of Lisbon on the Oporto line. The town, which occupies the site of the ancient Nabantia, grew up round the castle of the Knights Templars, entrusted to them in 1159, and in a ruinous condition. The convent palace of the Knights of Christ includes two churches, three old cloisters, a chapter house, four new cloisters, extensive dormitories, and other buildings, the whole being an epitome of Portuguese architecture from the 12th to the 17th century. Water is conveyed to the town by a 3-mile aqueduct, dating from the end of the 16th century. Among other features of interest is the palace of Henry the Navigator. Alvaid died in the town. Thomar is noted for its wine. Pop. 8,500.

Thomas. Masculine Christian name. An Aramaic word, it means twin, and became popular because it was the name of one of Jesus Christ's disciples. There is a popular abbreviation Tom, and feminine variants of Thomasina.

Thomas. One of the twelve apostles. His name, which, like his Greek designation Didymus, means twin, is really an epithet, and his proper name is said to have been Judas. He showed courage in calling on the other apostles to follow Our Lord into Judaea in the face of danger (John 11, v. 16), and although he would not believe the resurrection without ocular demonstration, yet when that was granted he made a great confession of faith (John 20, vv. 19-29). According to tradition, he preached in Parthia, and was buried at Edessa. Later stories made him the founder of a church in India. The apocryphal Gospel and Acts of Thomas are Gnostic fabrications. His festival is Dec. 21.

Thomar, Portugal. A part of the Convent palace of the Knights of Christ, the whole including many cloisters and two churches

Thomas, ALBERT (1878-1932). French administrator. This baker's son, born June 16, 1878, at Champigny-sur-Marne, went to the École Normale Supérieure and won a travelling scholarship. In 1903 his book on German syndicalism attracted wide attention. Becoming a disciple of Jaurès, he was elected a Socialist deputy for Sceaux in 1910, specialising in matters relating to rlys., mines, and finance. Almost throughout the First Great War he was minister of munitions. He opposed French intervention in Russia after the 1917 revolution. In 1920 he resigned from the chamber to become director of the international labour office in Geneva. In this position he left a deep impression on international economic affairs, working to improve industrial conditions. Thomas died May 8, 1932. *Pron.* Toe-mah.

Thomas, ARTHUR GORING (1850-92). British composer. Born near Eastbourne, Nov. 20, 1850, he studied music in Paris and under Sullivan at the Royal Academy of Music, 1877-80. His operas include Esmeralda, produced at Covent Garden, 1883; Nadeshda,

A. G. Thomas, British composer

1885; and the comic opera, The Golden Web, posthumously produced in 1893. His choral ode, The Sun Worshipers, was presented in 1881, and his lyric gift was well displayed in songs. Thomas suffered from melancholia, and committed suicide by throwing himself in front of a train, March 20,

1892. A scholarship bearing his name was founded at the R.A.M.

Thomas, BRANDON (1849-1914). British playwright. Born at Hull, he worked as a shipping clerk in Liverpool and Hull before going on the stage in John Hare's company in 1879. He acted in comedy parts in England and the U. S. A., but was more successful as a playwright. His greatest triumph was his farce, *Charley's Aunt*, which, produced Dec. 21, 1892, ran for 1,466 performances, and was frequently revived, as well as being a favourite play for amateur performance. Among his other plays were *The Colour-Sergeant*, 1885; *A Judge's Memory*, 1906. Brandon Thomas died June 19, 1914.

Brandon Thomas,
British playwright

Thomas, (CHARLES LOUIS) AMBROISE (1811-96). French composer. Born at Metz, Aug. 5, 1811, he gained the *prix de Rome* in 1832, and in 1837 produced his first opera, *La Double Echelle*. Of his other pieces the best known are the overture to *Raymond*, 1851, and *Mignon*, 1866. *Hamlet*, 1868, was also popular, and in 1871 Thomas became director of the *Paris conservatoire*. His last opera, *Françoise de Rimini*, was produced in 1882, and he died Feb. 12, 1896. *Pron.* Toe-mah.

Thomas, SIR GEORGE ALAN (b. 1881). British chess and badminton player. He was born June 14, 1881, educated at Wellington, and succeeded to his father's baronetcy in 1918. Of international rank as a chess player, he won the British championship in 1923 and 1934 and could still finish runner-up in 1948. In English badminton championships he won the singles four years in succession from 1920, and nine doubles titles.

Thomas, GEORGE HENRY (1816-70). American soldier. Born in Virginia, July 31, 1816, and educated at West

George H. Thomas,
American soldier

Point, he served in the Mexican War, and on the outbreak of the Civil War, though a Southerner by birth, adhered to the Union, and was given

command of a brigade. His first success was the victory of Mill Springs in 1862. In 1863 he commanded a corps in the campaign of Middle Tennessee, and by his stand at Chickamauga neutralised the Confederate success. He succeeded Rosecrans in command of the army of the Cumberland, and in 1864 defeated Hood at Nashville. He died at San Francisco, March 28, 1870.

Thomas, JAMES HENRY (1874-1949). British politician and labour leader. Born Oct. 3, 1874, at Newport, Mon., of humble parentage, he began life as an errand boy at the age of nine, and became first a greaser, then a fireman and engine-driver on the Great Western rly. His union, the Amalgamated Society of Railway Serv-

J. H. Thomas,
British politician

vants, appointed him organizing secretary, and he became assistant sec. in 1910, the same year in which he entered parliament as Labour M.P. for Derby. He helped materially in the transformation of his union into the National Union of Railwaymen, acting as general secretary of the new body from its foundation in 1918 until 1931, except for the brief period of the first Labour govt., 1924. He served as president of the international federation of trade unions, 1920-24, and as president of the parl. committee of the T.U.C., 1920-21. Made a privy councillor in 1917, he declined office in Lloyd George's coalition govt., but was appointed secretary for the Colonies in the first Labour govt., 1924, and lord privy seal in that of 1929, with special tasks in relation to the problem of unemployment. Unsuccessful in his efforts to solve that problem, he went to the Dominions office in May, 1930. When the economic crisis of 1931 split the Labour party, he remained a supporter of MacDonald, as a member of the National Labour party, and continued as Dominions secretary in the National govt. His handling of the Irish land revenues antagonised the Eire govt. In the spring of 1936 an inquiry into Budget disclosures was held under the Tribunals of Enquiry (Evidence) Act, and as a result of the report Thomas resigned his office and seat, retiring from public life. He died Jan. 21, 1949. An autobiography, *My Story*, appeared 1937.

Thomas, SIR PERCY EDWARD (b. 1883). Welsh architect. He was born in Cardiff, Sept. 13, 1883, and joined a local firm of architects. In 1911 he secured a scholarship to Cardiff Technical college. He designed many public buildings, including Swansea civic centre and the temple of peace at Cardiff. He was president of the R. I. B. A., 1935-37 and 1943-46. In 1946 he received a knighthood.

Edward Thomas,
British poet

Thomas, (PHILIP) EDWARD (1878-1917). British poet and essayist.

Born March 3, 1878, to Welsh parents in London, he went to several schools, including S. Paul's, and published *The Woodland Life*, 1897, before going to Lincoln College, Oxford. For years he subsisted on hack journalism, but books he was commissioned to write, biographies or country subjects, revealed a fine prose style, e.g. *Oxford*, 1903; *The South Country*, and *Life of Richard Jefferies*, both 1908; *The Icknield Way*, 1913. Collected essays later appeared as *Rest and Unrest*; *Light and Twilight*. Edward Thomas turned to poetry, under Robert Frost's influence, only with the outbreak of war, and that at first pseudonymously as Edward Eastaway; and when he was killed at the third battle of Arras, April 9, 1917, probably a tithe of his potentiality had been realized. His pieces, sensitive, melancholy, of the slightest texture, follow direct speech rhythms as often as they are metrical; his subjects and moods are suggested by country names of plants or places. His longest and favourite poem was *Lob*; most quoted is *Adlestrop*; *Lights Out* is a gem. His bio-

S. G. Thomas,
British metallurgist

grapher is John Moore (Life and Letters, 1939); his widow, Helen Thomas, wrote *As It Was*, 1926.

Thomas, SIDNEY GILCHRIST (1850-85). British metallurgist.

Born in London, April 16, 1850, he early applied himself in his spare time to the study of chemistry. From this he was led to the important invention of his life, the

elimination of phosphorus in the Bessemer and Siemens-Martin processes of converting pig iron into steel. By careful study he evolved the basic lining to the Bessemer converter, an invention that was epoch-making. He died Feb. 1, 1885. *See* Thomas-Gilchrist Process.

Thomas, Sir William Beach (b. 1868). English writer. He was educated at Shrewsbury School and Christ Church, Oxford. He became widely known as a war correspondent during the First Great War. His book, *With the*

Sir W. Beach Thomas,
English writer

British on the Somme, appeared in 1917, and in 1925 *A Traveller in News*. He was made K.B.E. in 1920. Later he became widely known as the author of many articles and books on nature study and the topography of the countryside, contributing regularly on these subjects to the *Observer* and the *Spectator*. Among his books were *Village England*, 1935; *The Way of a Countryman*, 1944; *A Countryman's Creed*, 1946.

Thomas, Christians of Saint. Christian church in Malabar, S. India. Its existence is first reported by Cosmas Indicopleustes in the 6th century. It claims to have been founded by S. Thomas the apostle, and regards another Thomas who came from Jerusalem, A.D. 345, as its second founder. It is a Nestorian church, using a Syriac liturgy, and was probably a branch of the ancient church of Persia. The church of S. Thomas submitted to Rome in 1599, but became again independent in 1653, and soon after joined the Jacobite communion. By the 20th cent. its adherents were fewer than 500,000.

Thomas Coram Schools. Name of the institution founded as the Foundling Hospital (q.v.).

Thomas-Gilchrist Process. Modification of the original Bessemer process of steelmaking. Highly phosphoric pig irons can be refined by it to steel. It was devised by Sidney Gilchrist Thomas, a magistrate's clerk in London, with his cousin Percy Gilchrist, a chemist at Blaenavon, where the process was first tried about 1877. Often it is described as the basic Bessemer process, because the lining of the converter is basic in character, usually dolomite, com-

pared with the acid silica lining of the original.

The pig iron to be treated, which should be low in silicon and sulphur, but high in manganese and phosphorus, is poured molten into the converter, and air is blown through the metal to oxidise the impurities. The silicon is first removed, followed by carbon, while manganese is gradually removed. Oxidation of the phosphorus occurs in the "after-blow" period, and this must be carefully timed to prevent over-oxidation of the steel. After this the blowing of air is stopped, deoxidisers are added, and the steel is recarburised before tapping. The basic slag produced, high in phosphorus, is valued as a fertiliser. Although invented in Great Britain, the process was first used extensively on the Continent. The phosphoric ores of England were unsuitable because of their high silicon and sulphur content. The Brassart process of desulphurising pig iron by means of sodium carbonate has extended the use of the Thomas-Gilchrist process. *See* Bessemer Process.

Thomas the Rhymer OR **THOMAS RHYMOUR** (fl. c. 1270). Scottish seer and poet. He lived at Erceldoune, now Earlston in Berwickshire, whence he is also called Thomas of Erceldoune. He is supposed to have foretold the death of Alexander III in 1286, and a great mass of prophetic sayings became associated with his name; some are to be found in *The Whole Prophecies of Scotland* (Bannatyne Club ed. 1833). According to legend, Thomas was beloved of an elf queen, by whom he was carried off to Elfland, returning after three years with the gift of prophecy. This legend is the subject of *The Romance of Thomas of Erceldoune*, to which are added a number of prophecies; also of several beautiful ballads. Some critics ascribe Sir Tristram, a romance of the Arthurian cycle, to Thomas, but this is much disputed. *Consult* *Romance and Prophecies of T. of E.*, ed. J. A. H. Murray, 1875.

Thomond. Ancient dist. of Ireland, covering the N. part of the prov. of Munster. It gave its name to the earldom of Thomond, borne by the family of O'Brien, descendants of Turlough O'Brien, the 11th century king of Munster. Connor O'Brien became prince of Thomond in 1528, and was succeeded by his brother Murrrough (d. 1551) in 1540. The latter offered submission to Henry VIII, who made him earl of Thomond in 1543. Donough (d. 1624), 4th earl, an

able soldier, received the presidency of Munster, 1605. On the death of Henry, 8th earl, in 1741, the title became dormant. A marquessate of Thomond, created in 1800 for the earl of Inchiquin, died out in 1855. *See* Munster.

Thompson, Edward John (1886-1946). British writer and poet. Born Dec. 28, 1886, he was educated at Kingswood school, Bath, and London university. Entering the Methodist ministry, he went to India in 1910 as an educational missionary, being at Bankura College. Service as chaplain in Mesopotamia in the First Great War was to be commemorated in *These Men, Thy Friends*, 1927. He lectured in Bengali at Oxford, where later he held research fellowships in Indian history at Oriol College. He died at Bledlow, Bucks, April 28, 1946.

E. J. Thompson,
British writer

Poet, historian, novelist, and essayist, Thompson made notable translations of Tagore and wrote studies of his work; edited the series of brochures, *Augustan Poets*; issued his own collected poems in 1930. He published a *History of India*, 1927; *Rise and Fulfilment of British Rule in India* (with G. T. Garratt), 1934; *The Making of Indian Princes*, 1943; and in fiction is best known by *An Indian Day*, 1927; *Burmese Silver*, 1937.

Thompson, Sir Edward Maunde (1840-1929). British scholar. Born in Jamaica, May 4, 1840, he was educated at Rugby and University College, Oxford. In 1861 he became an assistant in the British Museum, and in 1878 was made keeper of manuscripts.

Sir E. M. Thompson,
British scholar

From 1888 he was chief librarian, and he retired in 1909, being made G.C.B. An authority on palaeography, Thompson wrote *An Introduction to Greek and Latin Palaeography*, 1912, and edited the writings of certain English chroniclers. During 1895-96 and 1905-06 he was reader in bibliography at Cambridge. He died Sept. 14, 1929.

Thompson, Francois (1859-1907). British poet. Born at Pres-

ton to R.C. parents, Dec. 18, 1859, he was educated at Ushaw College for the priesthood, but, abandoning this idea, he studied medicine at Owens College. Failing to qualify, he settled in London and fell into straits, his miseries being accentuated by the opium habit; he worked as a cobbler's assistant. He sent two poems on scraps of paper to Merrie England, whose editor, Wilfred Meynell, set to work with his wife Alice to rehabilitate Thompson. Further pieces won the praise of Patmore, and a first book of poems was issued in 1893, to be followed by *Sister Songs*, 1895, and *New Poems*, 1897. Thompson also contributed literary criticism to *The Academy* and *The Athenaeum*. He died of consumption, Nov. 13, 1907. Thompson uses a jewelled vocabulary and beautiful images, and sometimes strikes a note of mystical rapture forgotten since the 17th century. The *Hound of Heaven* has proved an inspiring poem; In *No Strange Land* is sung as a hymn; *The Heart* is a magnificent sonnet; yet this good Lancastrian could also write a little piece about cricket, *At Lord's*. A collected ed. of his poems appeared in 1946. There are *Lives* by E. Meynell, 1916; R. L. Méroz, 1927.

Francis Thompson,
British poet

Sir Henry Thompson,
British surgeon

Thompson, Sir Henry (1820–1904). British surgeon, born at Framlingham, Aug. 6, 1820. He was at first in business, but coming to London, was apprenticed to a doctor at Croydon, and in 1844 entered University College. In 1850 he was house surgeon, and next year started as a G.P. Made F.R.C.S. in 1853, he became professor of surgery at University College Hospital in 1866, and Hunterian professor at the College of Surgeons in 1883. He specialised in surgery of the urinary organs, on the diseases of which he wrote in 1868 a standard work.

Thompson was an astronomer, and built an observatory at Molesey. He exhibited paintings at the Royal Academy; he wrote novels and magazine articles. He was an

authority on diet, and one of the earliest advocates of cremation. His dinners for eight persons, with eight courses, at 8 o'clock, called octaves, were famous, and the 300th was attended by the prince of Wales, later George V. Thompson, knighted in 1869, made a baronet in 1899, died April 18, 1904.

Thompson, Sir (Henry Francis) Herbert (1859–1944). British Egyptologist, born April 2, 1859. He was educated at Marlborough and Trinity College, Cambridge; then abandoned the law for Egyptology, specialising in its Coptic and demotic branches, of which he became a leading authority. His publications included *Coptic Inscriptions* (in Quibell's *Excavations at Saqqarah*), 1907; *A Family Archive from Siut*, 1934. He edited the earliest extant copy of S. John's gospel from a Coptic papyrus, and made out a list of demotic papyri in the British Museum. He succeeded his father as 2nd baronet in 1904, and died at Bath, May 26, 1944.

Thompson, Lydia (1836–1908). British actress, born in London, Feb. 19, 1836. She went on the

Lydia Thompson,
British actress

stage as a dancer at Her Majesty's Theatre in 1852, and next year scored a success in the Haymarket pantomime, *Little Silverhair*. After a Continental tour, she took a company to America in 1868, touring with great success. In 1874 she returned to the London stage in Farnie's burlesque, *Bluebeard*. Other visits to America followed, and she finally settled in London in 1891, retiring from the stage in 1904. She died Nov. 17, 1908.

Thompson, Reginald Campbell (1876–1941). British archaeologist. Born Aug. 21, 1876, he went to St. Paul's school and Caius College, Cambridge. Assistant to Budge at the British Museum, 1899–1905, he made his earliest excavation at Nineveh in 1904 and his most important during 1928–31. An authority on Arab-speaking peoples and lost civilizations of the Middle East, he was *Shillito* reader in Assyriology at Oxford. His works included *Reports of Magicians and Astrologers of Nineveh and Babylon*, 1900; *Semitic Magic*, 1908; *Antiquities of Mesopotamia*, 1918; *The Assyrian Herbal*, 1924. He died April 25, 1941.

Thompson, Silvanus Phillips (1851–1916). British scientist. Born at York, June 19, 1851, he was educated at Bootham school, Pontefract institute, and the Royal School of Mines. He was professor of experimental physics at University College, Bristol, 1876–85, then principal and professor of physics in the City and Guilds technical college until his death on June 12, 1916. Thompson was a leading physicist of his time, best known for his work on electricity. He published in 1844 *Dynamo-electric Machinery*, a standard work for many years, as was *Elementary Lessons in Electricity and Magnetism*. His *Life of Lord Kelvin*, 1910, is a masterly account.

Silvanus Thompson,
British scientist

Thompson, William. Real name of the English prizefighter who always appeared under the name of Bendigo (q.v.).

Thompson, William Hale (1869–1944). American politician, commonly called Big Bill Thompson. Son of a real estate dealer, he entered politics in Chicago. He was elected mayor in 1915 and 1919, but his administration was so corrupt that he was defeated in 1923. In 1927 he once more became mayor with the slogan *America First*, his policy being to “make the king of England keep his snoot out of America.” Thompson dismissed Chicago's superintendent of schools on the ground that he allowed text-books containing pro-British propaganda. In 1931 the citizens sent Thompson back into private life. He died March 19, 1944.

Thompson Automatic Rifle. Light automatic or sub-machine-gun popularly called Tommy gun. Invented in 1921 by John T. Thompson, a Chicago police officer, it was specially designed for the use of police against gangsters. The gun can fire single or automatic shots of .45 calibre. It is operated by recoil, the spent cartridge striking the bolt face, automatically recocking the weapon, and bringing a new round into the breech. The magazine may be of the box or drum type; the former holds 20 rounds. The drum magazine, with 50 rounds, is placed in the vertical plane below the barrel and at right angles to the axis of the gun. It rotates with each shot to bring

the following round in line with the extractor.

The gun weighs 11 lb. 6 oz., the barrel is 12½ ins. long. Rifling is grooved with a twist of 1 in 16.

Maximum rate of fire is 1,500 r.p.m., and effective range 750 yds. Firing is practicable from hip or shoulder.

Large numbers of Tommy guns were used by British forces in the Second Great War, until they were displaced by the simpler and less costly Sten carbine (*q.v.*).

Thoms, WILLIAM JOHN (1803–85). British antiquary. A Londoner, born Nov. 16, 1803, he was

William J. Thoms, British antiquary

for 20 years in the secretary's office at Chelsea Hospital; clerk, 1845–63, then deputy librarian until 1882, of the house of lords; F.S.A., 1838, and secretary, 1838–73, of the Camden Society. He started and edited *Notes and Queries*, 1849–72. His publications include *Early Prose Romances*, 1827–28; *Lays and Legends*, 1834; *The Book of the Court*, 1838; *Stow's Survey of London*, 1842; *Reynard the Fox*, 1844; *The Longevity of Man*, 1873. He died Aug. 15, 1885.

Thomsen, VILHELM LUDVIG PEDER (1842–1927). Danish philologist. He was born, Jan. 25, 1842, at Copenhagen, where he became professor of comparative philology in 1887. He travelled extensively, and successfully deciphered the old Turkish inscriptions of Siberia and Mongolia. *Thomsen's Relations between Ancient Russia and Scandinavia* and *The Origin of the Russian State*, consist of lectures delivered in Oxford. He died May 14, 1927.

Thomson, CHRISTOPHER BIRD-WOOD THOMSON, BARON (1875–1930). British soldier and politician. Born April 13, 1875, he joined the R.E. in 1894 and served

in the Mashonaland and S. African campaigns. He was on the War office staff, 1911–14, then went to France; in 1915 became military attaché to Rumania, in which capacity he influenced that country to enter the war; and later served in Palestine. At Versailles he was military representative on the supreme war council. Military adviser to the Labour party commission which visited Ireland in 1920, he was secretary for air in MacDonald's first government, having been raised to the peerage in 1923. Given the same post in the govt. of 1929, he was killed when the airship R101 crashed near Beauvais, Oct. 5, 1930. A memoir by Princess Marthe Bibesco appeared in 1932.

Thomson, SIR BASIL HOME (1861–1939). British administrator. Son of William Thomson,

Sir Basil Thomson, British administrator

archbishop of York, he was born April 21, 1861, educated at Eton and New College, Oxford, and was called to the bar. Joining the colonial service, he served in Fiji, Tonga, and

British New Guinea, acting as prime minister of Tonga. His *Divisions of a Prime Minister*, 1894, refers to this episode. Entering the prison service in 1896, he became governor of Dartmoor and Wormwood Scrubs prisons in succession; secretary to the prison commission, 1908; assistant commissioner of metropolitan police,

and director of the C.I.D., 1913; and as a knight, chief of the intelligence dept. from 1919 to 1921, when he retired. He died March 26, 1939. Among Sir Basil's books of reminiscences are *Queer People*, 1922; *The Criminal*, 1925; *The Story of Scotland Yard*, 1935. In early life he wrote nautical tales and Grand Guignol pieces.

Thomson, SIR GEORGE PAGET (b. 1892). British physicist, son of Sir J. J. Thomson (*q.v.*). He was educated at the Perse school and Trinity College, Cambridge; appointed lecturer at Corpus Christi, he left for army service in the First Great War. In 1915 he transferred to the R.F.C. and worked on aeronautical research, returning to Cambridge in 1919. During 1922–30 he was professor of natural philosophy at Aberdeen, then took the chair of physics at the Imperial College of Science, where he carried out research work on electron diffraction and nuclear physics. In 1937 he was awarded, jointly with C. J. Davisson, the Nobel prize for physics, in recognition of his discovery of interference phenomena in the irradiation of crystals by electrons. Thomson, who was chairman of the first British committee on atomic energy in 1940, received a knighthood in 1943. During 1946–47 he was scientific adviser to the British delegate of the United Nations atomic energy commission.

Thomson, HUGH (1860–1920), British artist. Born June 1, 1860, in N. Ireland, he went to London about 1885, and at once found work on *The English Illustrated Magazine*. Specialising in the 18th and 19th centuries, he illustrated *The Vicar of Wakefield*, *Cranford*, *Quality Street*, and the works of Jane Austen, Thackeray, and Austin Dobson. He also did distinctive topographical drawings in black-and-white series. He died May 7, 1920.

Thomson, JAMES (1700–48). British poet. Born at Ednam, Roxburghshire, Sept. 11, 1700, son of the minister of the parish, he entered Edinburgh university with a view to entering the ministry. Divinity was not to his taste, and in 1725 he settled in London. In 1726 appeared his famous poem in blank verse, with the title of

Hugh Thomson, British artist

Winter. It was followed by companion poems, Summer, Spring, Autumn; the quartette being published as *The Seasons* in 1730. From 1734 he gave instalments of his poem *Liberty*, a complete failure. Several dramatic efforts such as *Sophonisba*, 1729, and *Agamemnon*, 1738, were equally unsuccessful; *The Masque of Alfred*, 1740, written in collaboration with David Mallet (c. 1705-65), is notable only as containing *Rule, Britannia (q.v.)*. Thomson's other poem of value is the allegorical *Castle of Indolence*, 1748. He was the first of his time to make nature the central theme of a poem. He died Aug. 27, 1748, at Richmond. *Consult* *Life*, G. C. Macaulay, 1908.

James Thomson,
British poet

Thomson, JAMES (1834-82). British poet. He was born at Port Glasgow, Nov. 23, 1834, and educated at the Royal Caledonian Asylum. After some years as an army schoolmaster, he was befriended by Charles Bradlaugh and wrote for *The National Reformer*, in which journal appeared, in 1874, *The City of Dreadful Night*, the gloomy but impressive narrative poem upon which Thomson's fame chiefly rests. A pessimist by temperament, Thomson lived a lonely life, the wretchedness of which was aggravated by his habit of intemperance. He died June 3, 1882. His other works include *Vane's Story*, which has been styled an autobiographical phantasy; a few striking lyrics, and some prose essays and criticisms. Thomson's pseudonym, *Bysshe Vanolis*, was made up from the second name of Shelley, whom he admired profoundly, and an anagram of Novalis. *Consult* *Poetical Works*, with *Memoir* by B. Dobell, 1895; *Biographical and Critical Studies*, 1896; *Life*, H. S. Salt, 1905.

James Thomson,
British poet

Thomson, JOHN (1778-1840). Scottish painter. Born at Dailly, Ayrshire, Sept. 1, 1778, he was educated for the Church at Glasgow and Edinburgh universities, studying painting, meanwhile, under Alexander Nasmyth. Ordained in 1800, he succeeded his father at

Dailly, and in 1805 he became minister of Duddingston. He died Oct. 28, 1840. Thomson exhibited romantic landscapes in the Scottish exhibitions from 1808 onwards.

Thomson, SIR JOHN ARTHUR (1861-1933). British scientist. He was born in East Lothian, July 8, 1861, and, after graduating at Edinburgh university, studied at Jena and Berlin. Though originally an arts student, he turned to biology and zoology, and became lecturer in those subjects at the Edinburgh school of medicine. In collaboration with Sir Patrick Geddes he wrote *The Evolution of Sex*, 1899, a book which soon became widely known. In the same year he was appointed professor of natural history in Aberdeen university, a post he held until 1930. A popular lecturer and a clear interpreter of scientific principles in his chosen subjects, Thomson, while he did little original research, acquired a large public with such books as *The Wonder of Life*, 1914; *Secrets of Animal Life*, 1919; *Science, Old and New*, 1924; *Science and Religion*, 1925; *The Outline of Natural History*, 1932. In his later years he attempted to reconcile science and religion. Knighted in 1930, he died Feb. 12, 1933. D. L. Thomson (b. 1901), professor of biochemistry at McGill university, was his son. Another son was A. L. Thomson (b. 1890), second secretary of the medical research council.

Thomson, SIR JOSEPH JOHN (1856-1940). British physicist. He was born near Manchester, Dec. 18, 1856, and educated at Owens College, Manchester, and Trinity College, Cambridge. In 1883 he became lecturer in mathematics at Trinity, and the following year, when only 27 years of age, became Cavendish professor of experimental physics. He carried out important work on electromagnetic theory, extending the work of Clerk-Maxwell, who had been an earlier Cavendish professor. Thomson was, however, soon concerned with the branch of physics which was to become peculiarly his own—the phenomena connected with the discharge of electricity through gases. Following the discoveries of Röntgen, Crookes, and others, he showed that the so-called cathode rays produced by electric discharges in

rarefied gases were made up of minute electrified particles. The discovery of these electrons was first made known by Thomson in a R.I. lecture in 1897. This revolutionary discovery led to many extensions of physical knowledge, and was the chief reason for many of his honours, the Nobel prize for physics, 1906, a knighthood, 1908, and the O.M., 1912. P.R.S., 1915-20, he became master of Trinity in 1918, holding this position until his death. Although pressure of other work compelled him to resign his Cavendish professorship in favour of Rutherford, he continued to work in the Cavendish lab. and was appointed hon. professor there. Besides many scientific publications he wrote an entertaining autobiography, *Recollections and Reflections*, 1936. Thomson died Aug. 30, 1940. *A Life*, by Lord Rayleigh, appeared in 1942.

Thomson, WILLIAM (1819-90). British prelate. Born at Whitehaven, Feb. 11, 1819, and educated at Shrewsbury and Queen's College, Oxford, he was ordained in 1842, and after holding several curacies returned to Oxford in 1847 as tutor of his old college, becoming provost in 1855. There he was a leading advocate of university reform. In 1861 he was consecrated bishop of Gloucester, and the next year became archbishop of York. He greatly strengthened the position of the Church in the N. of England. He found time also for theological writings, controversies, and ecclesiastical legislation. He died at Bishopthorpe, Dec. 25, 1890.

William Thomson,
British prelate

Thomson Effect. Physical phenomenon, discovered by William Thomson, later Lord Kelvin. During experiments on the relationship between heat and current in heated metal wires, Kelvin concluded that there must be reversible thermal effects other than the Peltier effect. He found that, when a current flows along a wire which varies in temp. from point to point, at any given point on the wire heat is liberated, if the current flows in one direction, and absorbed, if it flows in the opposite direction. This phenomenon, called the Thomson effect after him, is of great importance in pyrometry, as it affects the be-

Sir J. J. Thomson,
British physicist

haviour of thermocouples. See Peltier Effect; Pyrometer; Thermocouple.

Thomsonite. Member of the zeolite group of minerals. It is a complex hydrous silicate of calcium, sodium, and aluminium, occurring in snow-white columnar or radiating groups of crystals, in cavities and cracks in basalts, etc., and in certain classes of mineral veins. See Zeolite.

Thor. Norse god of thunder, son of Odin (the heavens) and Jord (the earth), husband of Sif (the cornfield); the friend of man and foe of giants. His red beard flaming, he drove to battle in a goat-drawn car. There are humorous stories of his dealings with the giants. His home is Bilskirnir, containing 540 halls. Thursday was originally Thor's day. See Mythology: Norse.

Thoracic Duct. In anatomy, the principal vessel of the lymphatic system. It receives the lymph from the smaller lymphatic vessels of the lower limbs, abdomen, left upper limb, and left side of the thorax, head, and neck. Passing upwards in front of the spinal column from the level of the second lumbar vertebra, it terminates by opening into the angle of union of the left internal jugular and left subclavian veins. The length of the thoracic duct is from 15 to 18 ins.

Thorax (Gr., breastplate). Anatomical name for the chest (*q.v.*). The thorax in man is conical in

Thorax. Sectional diagram of the human chest, showing position of the lungs and heart

shape, the front being formed by the breast-bone and cartilages of the ribs, and the sides and back by the ribs, the back being completed by the dorsal vertebrae of the spine.

In insects, the thorax, joined closely to the head and loosely to the abdomen, bears the legs and wings.

Thoreau, HENRY DAVID (1817-62). American author and naturalist. Born at Concord, Mass.,

July 12, 1817, the son of a manufacturer, he was educated at Harvard. He worked for a time as a teacher and a surveyor, but his tastes were those of a naturalist and a recluse. Deciding to live a

H. D. Thoreau, American author

contemplative life alone, in 1845 he took up his abode in a hut on the shores of Walden Pond; providing for his wants by casual labour, he found he could earn enough by six weeks' work yearly to pass the remaining 46 in ease, and stayed in the woods until nearly the end of 1847. He became remarkably intimate with animal and bird life, and then described his experiences in the celebrated *Walden, or Life in the Woods*, 1854. Thoreau had by then made his home with his friend Emerson, and died of tuberculosis at Concord, May 6, 1862. A dogmatic idealist, he also wrote *Excursions*, 1863; *The Maine Woods*, 1864; *Letters and Poems*, 1865. Among many lives, that by W. E. Channing, 1873, still holds the field.

Thorez, MAURICE (b. 1900). French politician. Son of a coal miner, he was born at Noyelles Godault, Pas-de-Calais, April 28, 1900, and left school at 12 to work in the mines. He moved over from the Socialist to the Communist party in 1920. Representing Ivry as Communist deputy, he led his party in the chamber during 1936-39. At the outbreak of the Second Great War he went into hiding to avoid military service, was deprived of his nationality, and condemned in absence by a military tribunal. Having spent some time in Moscow, he returned to France in 1944, became a member of the consultative assembly, and being pardoned in 1945 was minister of state under Gen. de Gaulle. Thorez was a member of successive cabinets until 1947 when, the Communists having voted against the govt. of which they were members, President Auriol decreed their removal from office.

Thoria. Thorium dioxide, ThO_2 . It is an amorphous white powder made from monazite sands. It has application as a medium for X-ray of the internal organs, but there is danger of injurious effects from radio-activity. See Thorium.

Thorianite. In mineralogy, name given to a rare mineral containing thorium, uranium, cerium,

and other rare earths. It occurs in Madagascar and Ceylon, associated with zircon, orthite, etc.

Thorild, THOMAS (1759-1808). Swedish author. Originally named Thoren, he was born at Kongelf. He was the first to break away from the artificiality of the French school of poetry, and his earliest poem, *The Passions*, 1772, started a famous literary controversy, which led up to his *Criticism of Critics*, 1791. In 1792, in a preface addressed to the regent, he expressed views which were considered so dangerous that he was sentenced to four years' banishment. He died Oct. 1, 1808.

Thorite. In mineralogy, a thorium silicate. Orange-yellow to dark brown in colour, with a glassy lustre, it is also frequently called uranthurite from the quantity of uranium oxide often associated with it. The mineral is chiefly found in Norway.

Thorium. Radio-active element, symbol Th; at. no. 90; at. wt., 232.12; density, 11.3 gm per c.c.; melting point, $1,680^\circ$ to $1,730^\circ$ C. It has a cubic close-packed crystal structure, emits α -rays (half-life 1.39×10^{10} yr.), and gives its name to the third series of natural radio-active elements. It was first found in a mineral now known as thorite by Berzelius in 1828. Thorite (ThSiO_4) is said to occur only in Norway; but thorianite, another rare mineral, is known in Madagascar and Ceylon. The main source of thorium is monazite sand, which is essentially a phosphate of the cerium earths containing associated thorium and occluded helium. Extensive deposits are found in Travancore and Brazil.

Thorium combines readily with hydrogen, nitrogen, oxygen, carbon, and alloys with other metals. This makes the preparation of the pure metal difficult, but good results follow reduction of anhydrous thorium chloride with sodium in a sealed tube. As thus prepared thorium is a dark grey powder, but in the massive form is white and soft. Of the salts, only the nitrate is of any commercial importance, being used in incandescent gas mantles. The fabric of the mantle is dipped in a solution of cerium and thorium nitrates mixed in such proportions that, after burning off the thoria and ceria will be present to the extent of 99 and 1 p.c. respectively. Metallic thorium shows promise for coating tungsten filaments in photo-electric cells, in glow tube electrodes, and also as X-ray targets.

Thorn. General term applied to shrubs or trees whose branches are armed with spines, or have some of their shoots hardened into thorns. Examples are hawthorn (*Crataegus oxyacantha*) and gorse (*Ulex europaea*). The thorns of the former are modified shoots, whereas in gorse they are formed from the leaves. In desert plants thorn-formation is associated with lack of water.

Thorn. This town of N.E. Europe is entered under its Polish name, Toruń.

Thornaby-on-Tees. Mun. bor. of the N. Riding of Yorkshire, England. It is situated on the Tees,

Thornaby-on-Tees arms

opposite Stockton, a bridge connecting the two places. It is served by rly., and has sugar and flour mills, iron foundries, and engineering works. Thornaby was incorporated in 1892. Pop. 21,233.

Thorn Apple (*Datura stramonium*). Annual herb of the family Solanaceae. It is probably a native

Thorn Apple. Faded leaves and prickly capsules of the plant

of Asia, but this is not certainly known, as the plant occurs in a semi-wild condition throughout the world. It is a rank weed with ovate leaves, whose margins are variously waved and toothed. The large white flowers are funnel-shaped, and are succeeded by large four-valved, prickly capsules. It is narcotic-poisonous, and the dried leaves are smoked for the relief of asthma.

Thorndike, DAME SYBIL (b. 1882). British actress. Daughter of a clergyman, she was born at Gainsborough, Oct. 24, 1882, and after studying as a pianist at the Guildhall school, joined Ben Greet's Shakespeare co., first acting professionally at Cambridge in *The Merry Wives of Windsor*, 1904. An American

tour was followed by a spell with Miss Horniman's co. in Manchester, and her London début

was at the Scala Theatre in *The Marquis*, 1908. She scored successes in *Hindle Wakes*, and *Jane Clegg*; played Shakespearean leads at the Old Vic during 1914-18; made an impression in Greek tragedy and *Grand Guignol* (q.v.); and became internationally famous by creating the part of S. Joan, 1924, in Bernard Shaw's play. Dignity, strength, and emotional range were revealed in the classical rôles of Hecuba, Medea, Lady Macbeth, Lady Teazle; in the modern drama *Lottie Dundass*, 1943; as Aase in *Peer Gynt*, 1944; in *The Linden Tree*, 1947. She achieved an unexpected success in the satirical *Advertising April*, 1923, and gave a brilliant performance as Edith Cavell in the silent picture *Dawn*. Sybil Thorndike married (Sir) Lewis Casson (q.v.) in 1908, and was created D.B.E. 1931. An outspoken left-winger, she often appeared at political meetings.

Her brother, Arthur Russell Thorndike (b. Feb. 6, 1885), was an accomplished actor and thriller writer, especially known for the Dr. Syn series. He published a biography of his sister, 1929.

Thorne. Market town of the W. Riding of Yorks, England. Standing on the river Don, it is 10 m. N.E. of Doncaster by rly. An agricultural centre, it also engages in barge building and rope making. The church, dedicated to S. Nicholas, dates from the time of Edward III. Pop. 14,606.

Thorne, GUY. Pen-name of Cyril Arthur Edward Ranger Gull (1876-1923), British novelist and journalist. His fame rests almost entirely on his novel *When It Was Dark*, which made a popular sensation in 1903 by the unconventionality of its theme, namely a conspiracy to render Christianity invalid by the pretended discovery of the remains of the body of Our Lord.

Thorne, NORMAN (1901-25). English murderer. Son of an engineer in a govt. dockyard, he started a chicken farm at Crowborough, Sussex, in 1922. He was involved in a love-affair with a neurotic girl, Elsie Cameron,

when he met another woman, whom he wished to marry. Elsie Cameron visited the farm on Dec. 5, 1924, and was never again seen alive. Thorne stated that she had not arrived, but she had been recognized by a neighbour. Police digging on the farm found first Elsie Cameron's attaché case and later her body, in three parts, buried there. Thorne's defence was that she had committed suicide by hanging, but the post-mortem examination revealed numerous bruises on her head, arms, and legs. Thorne was tried at Lewes assizes in March, 1925, and hanged on April 22.

Thorne, WILLIAM JAMES (1857-1946). A British Labour leader and politician. Born Oct. 8, 1857, the son of a Birmingham labourer, Will Thorne began at the age of six working 12 hrs. a day for a rope spinner at 2s. 6d. a week, then at week-ends for an uncle who was a barber, earning a further shilling. He had no schooling. A walk to London at 24 was the turning point in his career, for he joined the newly formed Social Democratic federation. Street corners made him an effective if rough orator. In 1889, with Ben Tillett (q.v.), he formed the organization which grew into the national union of general and municipal workers, and was its secretary for 45 years. He was president of the T.U.C. in 1912. On West Ham borough council from 1890, and its mayor in 1917-18, he was Labour M.P. for that borough (Plaistow div.), 1906-45, the freedom being conferred on him in 1930. The oldest M.P., he was made P.C. in the dissolution honours, 1945. He died Jan. 2, 1946. An autobiography, *My Life's Battles*, appeared 1925.

Thornea Island or **THORNEY ISLAND.** Former islet in the Thames marshes. About 40 acres in extent, it comprised the precinct of the abbey and palace of Westminster (q.v.).

Thornhill, SIR JAMES (1675-1734). British painter. Born at Melcombe Regis, he studied under Highmore, whom he was to succeed in 1720 as serjeant-painter to the king. He was employed by Queen Anne to paint the cupola of S. Paul's cathedral, which he decorated with eight scenes from

Sybil Thorndike, British actress

W. J. Thorne, British politician

the apostle's career. Thornhill had to paint while lying in a cradle, and nearly lost his life when stepping back along a plank to examine his work; an assistant threw some paint on it, causing the artist to spring forward. He carried out decoration of the painted hall at Greenwich Hospital during 1707-27, and left paintings at Hampton Court, Moor Park, and Blenheim, and altar-pieces at All Souls' and Queen's Colleges, Oxford. Hogarth, who married his daughter, was among Thornhill's pupils. Knighted 1715, and M.P. for Melcombe from 1722, he died May 13, 1734.

Thornhill, DAME RACHEL. British social worker, better known by her maiden name, Crowdy (*q.v.*).

Thornliebank. District of Glasgow, Scotland. It is 4 m. S. of the city proper, with a station on the rly. It owes its existence to the establishment of the cotton industry about 1770, and textile manufacture still provides the chief occupation. Pop. 2,289.

Thornton. Name of several places in Great Britain. One is a village, 4 m. W. of Bradford, Yorks; here the three Brontë sisters were born (*see* Brontë). Another is an urban dist., 5 m. N.E. of Blackpool, Lancs. Thornton, Fife, is a rly. junction, 5 m. N. of Kirkcaldy. Thornton-in-Craven is an industrial village of Yorks (W.R.), 6 m. S.W. of Skipton. Thornton-le-dale, near Pickering, is regarded as one of the prettiest villages in the same county. In Lindsey div. of Lincs is Thornton Abbey, with ruins of a religious house founded in 1139.

Thornton. Name of a family of English bankers. John Thornton (1720-90) was a prominent evangelical, a supporter of philanthropic causes, and a friend of Cowper and John Newton. John's two sons, Samuel and Henry, shared their father's religious views, being members of the Clapham Sect. Samuel (1755-1838) was M.P. for Hull, 1784-1806, and afterwards for W. Surrey, and a director of the Bank of England, 1780-1833. Henry (1760-1815) joined the banking firm of Downe, Free, and Thornton, and was M.P. for Southwark, 1782-1815. Later members of the family include Percy Melville Thornton (1841-1918), who was M.P. for Clapham, 1892-1910, a barrister, athlete, and writer; and Charles Inglis Thornton (1850-1929), noted as one of the greatest hitters known to cricket.

Thornton Heath. District of Croydon, Surrey, England. It lies to the N. of Croydon, adjacent to Norbury, and is served by train from Croydon, and by bus and electric rly. from London, with a rly. station on the main Brighton line from Victoria. Purley Way, the Croydon by-pass, diverges from the main road at Thornton Heath pond.

Thornycroft, SIR JOHN ISAAO (1843-1928). British naval architect. Born in Rome, Feb. 1, 1843,

Sir John Thornycroft, British naval architect

and educated at Glasgow university, he founded a shipbuilding works at Chiswick in 1866, and obtained a reputation for torpedo-boat construction. He introduced the turbine propeller, water-tube boilers, etc., and was knighted in 1902. The works were moved in 1906 to Southampton. Thornycroft died at Bembridge, June 28, 1928.

Thornycroft, THOMAS (1815-85). British sculptor. Born in Cheshire, he was educated at Congleton and studied in Italy. His work as a sculptor was diverted by his interest in mechanical projects, but several statues became familiar landmarks in Victorian London, *e.g.* that of Charles I in Westminster Hall, also the group of Commerce on the Albert Memorial, and Boadicea and her daughters at Westminster Bridge. His English Poets fountain (statues of Chaucer, Shakespeare, and Milton), in which he was assisted by his son Hamo (*v.f.*), erected at the junction of Park Lane and Hamilton Place in 1875, was removed in 1948. Other works were equestrian statues of the prince consort at Liverpool and Wolverhampton. Thornycroft died Aug. 30, 1885.

Thornycroft, SIR WILLIAM HAMO (1850-1925). British sculptor. Born in London, March 9, 1850, he was educated at Macclesfield and University College School. He assisted his father (*v.s.*) in the English Poets fountain in Park Lane; gained the R.A. gold medal in 1875; was elec-

Sir Hamo Thornycroft, British sculptor

ted A.R.A. in 1884, and R.A. in 1888. His Teucer was bought for the Chantrey collection in 1881. The Gordon statue which stood in Trafalgar Square until 1948 is a well-known example of his classic style. Knighted in 1917, he died Dec. 18, 1925. *See* Alfred; Cromwell.

Thorold. Town of Ontario, Canada. It is situated on the Welland ship canal, 9 m. N.W. of Niagara Falls, to which it is connected by electric rly. It is also served by the C.N.R. There are pulp, board, and paper mills, machine shops, and sawmills. Pop. 5,305.

Thorough. Name given in English history to the policy carried out principally by Strafford, with the cooperation of Laud in the interests of Charles I in England, Scotland, and especially Ireland. *See* Ireland; Strafford.

Thorough Bass. Bass which throughout a piece of music has the harmonies indicated by figures according to the intervals above it. An absence of a figure implied a common chord, 6 a first inversion, 4 a second inversion, and so on with other chords. It was invented probably in the 16th century, and composers of the new monodic school found it a convenient kind of shorthand. Accompaniments, instead of being written out, were left to the skill and taste of the accompanist.

Thoroughbred. Name given to a graceful breed of horses of mainly Eastern descent. With long, slender head and legs and short back, they all trace their ancestry to one of three sires, the Darley Arabian, imported in 1706; the Godolphin Barb, foaled in 1724; and the Byerly Turk, which carried its owner, Capt. Byerly, at the battle of the Boyne. The descendants of these three have had their pedigrees inscribed for 150 years in the general stud book. All the racehorses of the world have been derived from British stock. *See* Stud Farm.

Thorpe Bay. Part of the co. bor. of Southend-on-Sea, Essex, England. It lies at the mouth of the Thames estuary, about 2½ m. E. of Southend, and 1½ m. S.W. of Shoeburyness, and has a rly. station.

Thorpe, SIR THOMAS EDWARD (1845-1925). British chemist. Born near Manchester, Dec. 8, 1845, and educated at Owens College and Heidelberg and Bonn universities, he was appointed professor of chemistry in the Andersonian Institution, Glasgow, 1870; to the chair of chemistry

at Yorkshire College, Leeds, 1874; and at the Royal College (then Normal School) of Science, London, 1885.

He was later emeritus professor of general chemistry in the Imperial College of Science and Technology. Knighted in 1909, Sir Edward died Feb. 23, 1925. His chief research

Sir Edward Thorpe,
British chemist

was done on the paraffin hydrocarbons and the derivatives of fluorine and phosphorus; and his publications included Dictionary of Applied Chemistry, 3 vols., new ed. 1921; History of Chemistry, 2 vols., 1909-10; Alcoholic Tables, 1915.

Thorshavn. Capital of Faroe Islands, belonging to Denmark. Centre of the fishing industry, it lies on the E. side of Stromo, the largest island, on a well protected sound. During the Second Great War a R.A.F. flying-boat base was established here. Pop. est. 2,000.

Thorvaldsen, BERTEL (1770-1844). Danish sculptor. Born at Copenhagen, Nov. 19, 1770,

B. Thorvaldsen,
Danish sculptor

son of a carver of figures for ships' prows, he studied art from boyhood at Copenhagen academy. In 1793 he won a gold medal and a scholarship enabling him to pass three years abroad. From 1796 he was in Rome, where in 1809 he produced a Jason which won him fame. He was in Italy until 1819, and again, after a three-year visit to Denmark, until 1838. He died at Copenhagen, March 24, 1844.

Thorvaldsen was happiest in mythological statuary, wherein he reproduced with wonderful success the style and spirit of ancient Greek sculpture. The medallion reliefs Night and Morning are among his best-known works in this vein. Colossal sculptures of Christ and the apostles in Copenhagen cathedral are the most famous of his religious efforts. He also designed the Lion of Lucerne (*q.v.*).

Thoth. Egyptian deity. The name means measurer. As the divine scribe, Thoth recorded the result of the weighing of souls in

the underworld. Identified with the Greek Hermes, he was worshipped at Hermopolis, in the Delta, and Hermopolis Magna (Eshmunein), where there are ibis graves. He is represented as being ibis-headed, with the lunar disk and crescent; the cynocephalus baboon also became sacred to him. See Amenti; Egypt.

Thothmes or **THUTMES.** Name of four kings of Egypt of the XVIIIth dynasty. Thothmes I, son-in-law and successor of Amenhotep I, reigned for 25 years from about 1539 B.C. The first great Egyptian military commander, he invaded Nubia with river craft, fought a battle in midstream, and extended the Theban power to the 4th cataract. His Syrian campaigns carried Egyptian arms to the Euphrates, and resulted in immense booty, devoted to the embellishment of the Amen temple at Karnak (*q.v.*). His mummy and gilded coffin were preserved at Cairo.

Thothmes II was the son and successor of Thothmes I. He appears to have begun reigning in 1501 with his half-sister Hatshepsut as consort and co-regent. His mummy, at Cairo, shows him to have been about 30 years old at death, and 5 ft. 11 ins. in height.

Thothmes II. From
his mummy in the
Cairo museum

Thothmes III is usually regarded as the son of Thothmes II by Aset; or as son of Thothmes I. He also apparently became co-regent with Hatshepsut, and after her death in 1479 he reigned alone for 32 years. So much did he resent her treatment that he defaced her monuments, thus confusing the chronology. He undertook 17 foreign campaigns, marked by victories at Megiddo, Kadesh, and Carchemish, and established his power from Armenia to the

Thothmes III,
King of Egypt

Sudan. This mighty conqueror, administrator, and builder left his annals inscribed upon temple walls at Karnak. Modern scholarship tends to identify him, and not Rameses II,

with the Pharaoh of the Oppression. His mummy, at Cairo, shows him as a squat, thick-set man. (See Cleopatra's Needles; Papyri.)

Thothmes IV was the son and successor of Amenhotep II. He reigned for nine years about 1420 B.C. He undertook military expeditions to Nubia and Phoenicia, and maintained friendly relations with Babylon and Mitanni, taking from the Mitannian court his consort Mutemua—the first foreign alliance made by an Egyptian monarch. He carried out the removal of the sand-drift under which the great Sphinx at Gizeh lay buried. His tomb, opened by Davis and Carter in 1903, yielded his state chariot, adorned with fresco scenes recording his exploits.

Thou, JACQUES AUGUSTE DE (1553-1617). French lawyer and historian. Born in Paris, Oct. 8,

Jacques de Thou,
French lawyer

1553, he studied law there and at Valence, travelled in Italy, and in 1576 became councillor-clerk to the parlement of Paris. A trusted friend of Henry III, he carried on diplomatic negotiations in Navarre, 1581, and became councillor of state, 1588. He helped to draft the edict of Nantes, 1598, and later was one of the three finance controllers appointed by Marie de' Medici. His history of his own times, published 1604-08, was placed on the Index in 1609. He died May 7, 1617.

Thouars. Town of France. In the dept. of Deux Sèvres, it stands on the Thouet river, 52 m. from Tours. The river almost encircles the town. The chief building is the castle, the present building, which stands above the town, dating from the 17th century. S. Médard and S. Laon are two interesting churches. The buildings of the abbey of S. Laon were later used as the hôtel de ville. Thouars was the seat of the great family of La Trémoille, who built the castle and the fortifications, of which there are some remains. There are some manufactures and a trade in wine and agricultural produce. Pop. 10,422.

Thourout. Town of Belgium, in the prov. of W. Flanders. It lies in flat agricultural country, 11 m. by rly. S.W. of Bruges, and is a rly. junction. There is a busy agricultural trade, and industries

in cloth, tanning, lace-making, chicory, etc. Pop. 11,000.

Thousand Islands. Group of islands and islets in N. America. At the E. end of Lake Ontario, where the St. Lawrence leaves the lake, it is divided by the international boundary between Canada and the U.S.A., and extends for 40 m. with a breadth of the river of 4 to 7 m. Of the larger islands Wolfe and Howe belong to Canada, and Wells and Carlton to the U.S.A. Many of the islets are private property and contain fine villas. The whole group forms one of the beauty spots of N. America and is much frequented by summer visitors. The total number of islands in the group is 1,700.

Thrace (Gr. *Thrakē*; Lat. *Thracia*). In ancient geography, a country in the E. of the modern Balkan peninsula. It varied in extent from time to time, but its boundaries may be roughly stated as on the N. the Danube, E. the Euxine, S. the Aegean and Propontis, W. Macedonia. The Haemus or Balkan range traversed it from E. to W.; the chief rivers were the Strymon (Struma) and Hebrus (Maritza). The land, though fertile in parts, was little cultivated; but minerals abounded, and the gold mines of Mt. Pangaeus were the richest known to the ancient world. Trading possibilities led the Greeks to establish numerous colonies on the south and east coasts. Thrace was the reputed home of the semi-legendary Greek poets Orpheus and Linus, and of the cult of Ares. The inhabitants were chiefly occupied in war and the chase.

Subjected to Persia in the time of Darius, Thrace regained independence after the disastrous expedition of Xerxes. Its most flourishing period was under the rule of its princes Sitalces and Cotys in the 5th and 4th centuries B.C. Conquered by Philip of Macedon, and after the downfall of Macedonia under Roman sway, it became a province in A.D. 46. When Theodosius, at his death in 395, divided the empire, Thrace became part of the eastern empire.

Thrace was part of the district conquered by the Turks, and it remained in the sultan's empire until 1878. The northern part of it was then included in the state of Bulgaria, which country obtained the south-western section in 1913, as a result of the Balkan Wars. In 1919, after the First Great War, the whole of it was assigned to Greece, but by the treaty of Lausanne (1923) Turkey was given

eastern Thrace up to the Maritza. Bulgarians, invading Greece in company with the Germans, occupied Greek Thrace, April, 1941, and six months later annexed it. During their occupation, which lasted until the armistice between Bulgaria and the Allies, Oct. 28, 1944, they did all they could by closing schools, expelling teachers, lawyers, priests, doctors, and others, by massacres and other forms of terrorism, to "Bulgarise" the area, and give it a Bulgarian majority. Bulgarians were removed under the armistice; but these wartime activities contributed to the confusion and unrest in the area during the Greek civil war of 1946 onwards. Area of the Greek portion of Thrace, 3,315 sq. m.; pop. 354,889.

Thrale, HENRY (1728-81). English brewer. Son of Ralph Thrale of Offley, Herts, he in-

Henry Thrale,
English brewer

herited his father's brewery business in 1758, and in 1763 married Hester Salusbury. M.P. for Southwark, 1765-80, he is remembered chiefly as the friend and host of Dr. Johnson at Streatham Park. He died of apoplexy April 4, 1781. Mrs. Thrale later married Gabriel Piozzi, an Italian musician, and details of her life will be found under Piozzi. See also Johnson, S.

Thrasea Paetus, PUBLIUS (d. A.D. 66). Roman aristocrat. A senator of large means and philosophy temper, who was consul in 56, he became obnoxious to Nero by his openly expressed disgust for the new regime and regret for the old republic. He absented himself from the funeral of Nero's wife Poppaea Sabina, and refused to subscribe to emperor-worship. In 66 he was condemned to death on trumped-up charges. Thrasea married Arria, a daughter of the heroic Arria (q.v.), and was father-in-law of Helvidius Priscus.

Thrasybulus. Athenian statesman and general. He assisted in the overthrow of the tyranny of the Four Hundred in 411 B.C., but when the new oligarchy of the Thirty Tyrants was established by the Spartans after the capture of Athens in 404 he suffered banishment. With the help of the Thebans he collected a force for the re-establishment of the democracy at Athens, and by the autumn of 403 he had accomplished his ob-

ject. He met his death while in command of the Athenian fleet in the Aegean Sea (390-389).

Thread (A.S. *thraed*, that which is twisted). Two or more yarns of cotton, linen, flax, or silk tightly twisted together for use in sewing or weaving. The word is also used for the filament of any fibrous substance or of a flower, for the spiral part of a screw (q.v.), in mining of a very thin seam, and also of that which runs through a series of things, connecting them together, as the thread of an argument. See Cotton; Sewing Machine.

Threadneedle Street. London thoroughfare. It runs S.W. from Bishopsgate to the Bank of England, by the enlargement of which and the rebuilding of the Royal Exchange its length was curtailed. First mentioned by Stow, 1598, as Three Needle Street, and assumed to have been so called from a sign of Three Needles, it contains in addition to the Bank (famously called The Old Lady of Threadneedle Street), other fine buildings, including those of banks and the Sun Insurance co., while at No. 30 is Merchant Taylors' Hall. South Sea House stood on its N. side. In a house on the site of part of the house and hospital of S. Anthony lived the ancestors of Sir Philip Sidney.

Threadworm OR NEMATODE. Low form of animal life which may be found in water, damp earth, and decaying animal or vegetable matter. Nearly all examples are parasitic, but while some are so all their lives, others are free as larvae, and parasitic as adults. Nematodes are without any respiratory or vascular system, yet the sexes are usually separate, the female being larger than the male. Worms in dogs, strangulus in horses, cattle, and sheep, gapes in poultry, trichina in hogs, and many other diseases are caused by these pestilent parasites. Other varieties are responsible for diseases to which cultivated plants are subject, such as ear-cockles in corn, and the sickness of beet.

Threat. Term used in English law for pressure by intimidation. To demand any property, money, etc., by threats, with intent to steal the property, is a felony. To send a letter or writing threatening to accuse any person of a serious crime punishable with death or 7 years' imprisonment, or of a rape or an attempt to commit a rape, or of any infamous crime, is a felony; even to threaten verbally to accuse any person of an infamous crime with intent to extort money is also

a felony. It is a misdemeanour to threaten to publish a libel with intent to extort money, and it is a felony maliciously to send or to cause to be received any letter or writing threatening murder, or threatening to burn any building or any rick or stack of grain, hay, or straw, which is in or under any building, or any ship or vessel, or to kill, maim, or wound any cattle.

Magistrates have power to grant a summons to anyone who has been threatened by another with harm to himself, his wife, or child. On the hearing of the summons, if the threats are proved, the magistrates have power to bind the defendant over to keep the peace; and may also demand that he shall find sureties. *See* Surety.

Three-Card Trick. Trick in which three playing cards, one usually the queen of spades, are held face downwards, two between the fingers and thumb of one hand and one between those of the other, the backs of the hands being uppermost. The cards are exposed for a short time by turning or raising the hands and are then jerked quickly face downwards side by side on to a table or board. Punters are asked to "find the lady," i.e. to bet which card is the queen. Sharpers use many devices to mislead the victim.

Three Choirs Festival. English musical festival, normally held annually in Sept. in the cathedrals of Gloucester, Worcester, and Hereford in turn. The festival was started in 1724. The music of Elgar and Parry was particularly advanced by it.

Three Cities. Commercial centre of Hupeh prov., China. All on the Yang-tse, the cities are Hanyang, Hankow, and Wuchang, respectively in the S.W., N., and S.E. of a triangle. This vast metropolis is sometimes known to the Chinese as Wu-Han.

Three Kings of Cologne. Name sometimes given to Caspar, Melchior, and Balthasar, the wise men from the East who visited Bethlehem at the birth of Jesus. Their bodies are said to have been taken to Constantinople by the empress Helena in the 4th century; thence they were removed to Milan, and Frederick Barbarossa on taking that city in 1162 presented them to the archbishop of Cologne.

Three Men in a Boat. Humorous work of fiction by Jerome K. Jerome, published 1889. Though originally intended as a series of light essays on the scenic and historical aspects of the Thames, the author's sense of fun took control

from the start and it became a highly diverting personal account of the misadventures on a river trip of three high-spirited young men—Harris, George, and the narrator, J.—and, as the full title adds, "not forgetting the dog," Montmorency. The book established its author's reputation and became a classic of English humour. A further book introducing the same characters on a Continental holiday, *Three Men on the Bummel*, 1900, was less popular.

Three-Mile Limit. This conception in international law is discussed under Territorial Waters.

Three Musketeers, THE. Romance by Alexandre Dumas, in collaboration with Auguste Maquet. First published in 1844, it is based on the *Mémoires d'Artagnan* by Courtels de Sandras. With a background of French court life in the time of Richelieu, it has for its central figure the witty and resourceful D'Artagnan, who, with his three friends the musketeers, Athos, Porthos, and Aramis, has a succession of romantic and perilous adventures. Sequels were *Twenty Years After*, and *Le Vicomte de Bragelonne*. The *Three Musketeers*, based on Dumas' work, was one of Douglas Fairbanks's best films.

Three Rivers. City and port of Quebec, Canada. It is 86 m. N.E. of Montreal, on the N. side of the St. Lawrence, at its junction with the St. Maurice, the name being due to the fact that the latter has two mouths. The city is served by the C.P.R. and C.N.R., while a ferry gives access to the S. side of the St. Lawrence. It has a fine harbour and ample wharves, from which much lumber is ex-

Thresher. Shark of the Atlantic and Pacific Oceans, a visitor to the British coasts in summer, showing the long upper lobe to the tail fin
W. S. Berridge, F.Z.S.

ported; it makes pulp and paper, and has iron foundries and a cotton mill. The business part of the city was almost destroyed by fire in 1908, but rebuilt. Pop. 44,515.

Three Sisters, THE. Play by Chekhov. It concerns three girls who pass their youth in the restricted surroundings of a provin-

cial town where they are fated to lose their ideals of love and happiness. Produced by Stanislavsky at the Moscow Art Theatre, 1901, it was first given in London in Constance Garnett's translation at Barnes Theatre, Feb. 16, 1926, when it was produced by Theodore Komisarjevsky. Notable revivals were at the Fortune Theatre, 1929; Old Vic, 1935; Queen's, 1938.

Three Taverns. (Lat. Tres Tabernae). Former village of ancient Latium, Italy. Probably situated 3 m. beyond the modern Cisterna di Roma, a small town with a castle of the Caetani, 38 m. S.S.E. of Rome, it was a station on the Appian Way. It is mentioned in Acts 28, v. 15, as the meeting-place of S. Paul and his friends, who came to greet him on his way to Rome.

Threnody (Gr. *thrēnos*, lamentation; *ōdē*, song). Term used for a dirge or funeral ode. In classical times threnodies were often specially composed in honour of a dead man. *See* Ode.

Thresher or Fox-shark (*Alopias vulpes*). Shark of the family Lamnidae. It is a native of the temperate and tropical waters of the Atlantic and Pacific, commonly visiting the S. and W. coasts of England during the summer. It is a very dark blue on the upper surface, paling to whitish on the under-side; the body is cylindrical, the dorsal fin high, and the pectoral fins are long, while the upper lobe of the tail fin is equal in length to the head and body. The total length may be 15 ft. *See* Shark.

Threshing. Agricultural process separating the grain from the earncrops. It is usually done by machinery, but the flail is still used for threshing wheat in parts of the East. There also a weighted sledge may be pulled across the corn on the threshing floor.

In 1636 Sir John van Berg patented a threshing of several flails operated by cranks. In 1732 Michael Menzies invented a machine which, according to

him, in a min. gave 1,320 strokes or as many as 33 men threshing briskly. But not until 1786 was the first practical threshing machine evolved by Andrew Meikle of E. Lothian. The essential feature of this machine was a rotary drum fitted with fluted beaters, which worked in a concave.

Ties a striking and a rubbing motion were for the first time combined. These features were preserved in later threshing machines, which not only separate the grain from the ear, but clean it. By various blasts and riddles, the chaff is first removed; poppy and thistle heads are cleared away; then a seed riddle holds up the grain, but gets rid of small weed seeds such as charlock and dock.

After this process is complete, a further series of cylindrical wire screens separates the true seed into three grades, namely seed corn, seconds, and tailings. Clover seed requires not only careful threshing, but also rubbing or hulling, and as a rule two separate machines are used for the work. The seed of turnip and other cruciferous plants is extracted by laying the stalks on large sheets in the open, and drawing across them heavy iron rollers. Mangold seed is frequently threshed by machinery.

Formerly the threshing machine was usually driven by a steam engine. Now the common and less expensive practice is to use a tractor. Either method may result in threshing 80 sacks of wheat a day, but fine weather is essential, for not only does the dry grain come out from the ear in far better condition, but a wheat rick may be entirely ruined if wet weather comes on when it has been opened for threshing. Machines which cut and thresh corn in one operation, introduced in N. America, where harvesting almost invariably takes place in dry weather, have been adopted to some extent in the U.K. See Agriculture; Barley; Farm illus.; Flail; Oats; Wheat.

Thrift or **SEA-PINK** (*Armeria vulgaris*). Perennial herb of the family Plumbaginaceae. A native of Europe, Asia, N. America, and Chile, it forms cushion-like tufts on the rocks of sea-shores and high mountains, and has very slender,

Thrift. Rosy flower-heads of the Sea-Pink growing on cliffs

stiff leaves growing in bundles from the woody branches of the root-stock. The funnel-shaped rosy flowers are massed in half-round heads at the summit of a hairy scape. See Leaf.

Thring, EDWARD (1821-1887). British schoolmaster. Son of the rector of Alford, Somerset, he was born Nov. 19, 1821, and educated at Eton and King's College, Cambridge, of which he became a fellow. In 1846 he was ordained, and in 1853 chosen headmaster of

Edward Thring, British schoolmaster

Uppingham, where he remained until his death on Oct. 22, 1887. Under Thring Uppingham became one of the great English public schools, its 25 boys being increased to 300. His success was due to the introduction of new teaching methods, wider studies including art and music, and an emphasis on moral values. Founder of a school mission, the first of its kind, in London, he was an indefatigable worker for the benefit of teachers. Consult The Man Who Made a School, G. Hoyland, 1946.

Thrips. Group of minute insects, forming the order Thysanoptera (Gk. *thysanos*, fringe; *pteron*, wing). Few are longer than a millimetre. Four narrow bar-like wings, fringed on both sides by long closely set hairs, are characteristic, and the mouth-parts are for piercing and sucking. Feeding on plants, the pea thrips and onion thrips are very destructive.

Throat. In man, part of the body extending from the base of the tongue to the trachea or windpipe, which can be felt in the middle line at the lower part of the front of the neck. It is the organ for the production of sound; also it affords passage to food and drink on their way to the stomach, and air on its way to the lungs.

The beginning of the throat is presented on looking into the widely opened mouth. In the middle line above is the uvula, hanging from the soft palate. On either side the soft palate becomes continuous with the two pillars of the fauces, and, below, these again are continuous with the root or base of the tongue. Between the pillars of the fauces on either side are the tonsils. Above and behind the soft palate is the nasopharynx, into which the posterior ends of the nostrils open.

To carry out an examination of the throat a laryngoscope (*g.v.*) is needed. Projecting upwards in the middle line at the base of the tongue and just invisible without the aid of the laryngoscope is a leaf-like structure called the epiglottis. From each side of this two folds project backwards and touch one another behind, leaving a triangular interval, which is the entrance to the larynx or air passage. Behind the place where these bands join is a narrow chink, forming the entrance to the gullet or food passage. Food is prevented from entering the larynx by a muscular mechanism that completely closes

Throat. Diagram indicating position of the principal parts of the human throat. See text

the entrance to the larynx as it opens the entrance to the gullet.

The vestibule of the larynx contains two fleshy-looking bands, called the false cords, highly developed in the lower animals. Still deeper in the larynx are two thinner pearly-white bands. These are the true vocal cords, the essential organs of sound. They are enclosed in a more or less rigid box of cartilage, the front of which can be seen externally in the middle line of the neck and is popularly known as Adam's apple. The chink between the two cords is the narrowest part of the throat, and, below, it expands again to become continuous with the windpipe or trachea, which carries the air onwards into the lungs. See Anatomy; Diphtheria; Epiglottis; Larynx; Quinsy; Sound; Tonsil; Trachea; Voice.

Throgmorton or **THROCKMORTON**, SIR NICHOLAS (1515-71). English diplomatist. Son of a Warwickshire knight, and brought up at court, he entered parliament in 1545, and served in the Scottish campaign of 1547. Despite grave suspicions as to his loyalty at the time of the Lady Jane Grey episode, he gained the confidence of

Mary. Elizabeth sent him as ambassador to France, 1559-64, and in Paris he formed a friendship

Sir Nicholas Throgmorton, English diplomatist
After G. Vertuc

with Mary Stuart, whom he assisted to return to Scotland, and whose marriage with Darnley he was vainly dispatched north to prevent in 1565. Equally unable, two years later, to secure Mary's release from the nobles who had imprisoned her, he returned to England. He died Feb. 12, 1571. His daughter Bessie was the wife of Raleigh.

Throgmorton Street. London thoroughfare. It links Lothbury with Old Broad Street, and was named after Sir Nicholas Throgmorton. Drapers' Hall is on the N. side, and on the S. is the Stock Exchange (*q.v.*).

Thrombin. Proteolytic enzyme operating in the normal clotting of blood, when its action on fibrinogen (a soluble protein present in blood) gives rise to insoluble fibrin. Thrombin is not present as such in blood, but is formed by the interaction of prothrombin, thromboplastin, and calcium. Normally the activity of thrombin is checked by the presence in the blood of an antiprothrombin, but when external wounds occur a substance (thromboplastin) is released which neutralises the antiprothrombin and so permits clotting to take place. *See* Blood.

Thrombosis (Gr., curdling). Formation of a clot of blood in a blood-vessel, usually a vein. It may result from injury or inflammation of a vein; thickening of the coats of an artery in old age; or a drop in high blood pressure, when the slowed stream tends to bank up material against a damaged wall. Thrombosis of a vessel in the brain may lead to paralysis or loss of mental function. *See* Embolism.

Throne. Royal or episcopal chair of state. The use of a raised seat as a symbol of authority is almost universal and of great antiquity. The splendour and wealth of the state were therefore usually reflected in the magnificence of the chair upon which its monarchs were officially placed, *e.g.* Solomon's throne of ivory and gold; the peacock throne at Delhi, valued at several million pounds sterling. The royal throne in the house of

lords at Westminster is occupied by the sovereign only when opening or proroguing parliament. Episcopal thrones are placed in cathedral chancels and are occupied by the bishop of the diocese, whose official installation is usually known as his enthronement. *See* Coronation; King.

Thrum s. Name of a Scottish village as it figures in several books by Barrie (*q.v.*), *e.g.* *Auld Licht Idylls* and *A Window in Thrum*s. The prototype of Thrum is Kirriemuir, Angus, birthplace of the author, which has many features recognizable from the stories. Thrum is a term used in weaving for the offcuts from wool or other material left on the loom; they are often used for making rugs.

Thrush. Large family of songbirds (Turdidae), of which six species occur in Great Britain. These are the song thrush, missel thrush, blackbird, ring-ouzel, fieldfare, and redwing. The first three are to be met with all the year round; the ring-ouzel is seen only in summer; the fieldfare and redwing are winter visitors. *See* articles on each of the birds named.

Thrush. Inflammatory condition of the mucous membrane of the mouth due to infection by a fungus belonging to the yeast family. It is most often met with in children and usually results from improper diet, uncleanness of the mouth, or acid fermentation of remnants of food. Slightly raised white spots are seen on the tongue and inside of the mouth. These gradually extend and may coalesce. Treatment consists in cleansing the mouth with dilute solution of borax, potassium permanganate, or, best of all, sodium sulphite. The general health must also be attended to.

Thrust. In geology, name given to a type of fault or break in the earth's crust along which the rocks on one side have been pushed forwards and upwards relative to the rocks on the other side. The surface along which the movement occurred is called the thrust plane. It is usually gently inclined or nearly flat. The upper rocks in

Throne. Royal thrones in House of Lords. The consort's, right, is one inch lower than that of the Sovereign

some examples have been pushed many miles over those below the thrust plane. Thrusts are typically associated with mountain-building movements, *e.g.* in N.W. Scotland, Scandinavia, the Alps, the Appalachians, Rocky Mts. *See* Earth Movement; Fault; Moine Thrust.

Thrust. Term in ballistics to describe the pressure exerted on the base of a projectile by the gases generated through explosion of the propellant charge. It is expressed as $P = WV^2/2gL$ where P is the mean thrust in lb. on the base of the projectile; W , the weight of the projectile in lb.; V , the muzzle velocity in ft. per sec.; g , the acceleration due to gravity; L , the length of barrel in ft.

In aeronautics, thrust is the ability of an airscrew to grip the air, its degree depending on the circumference and pitch of the propeller. The term thrust is also used in mining to describe the tendency of the roof of a working to bulge as the coal is cut away; this is countered by propping.

Thucydides (c. 464-c. 404 B.C.). Greek historian.

Of wealthy Athenian family, he received an excellent education, for among his teachers are said to have been the philosopher Anaxagoras and the orator Antiphon. During the eighth year of the Peloponnesian War, 424, Thucydides was in command of an Athenian fleet detailed to

Thucydides, Greek historian
From a bust

protect the coast of Thrace, where he owned some gold mines. His failure to prevent Amphipolis from falling into the hands of the Spartans, attributed to his anxiety to save his own property, led to his exile for 20 years.

At the beginning of hostilities he had begun to write the history of the war, "believing that it would be great and memorable above any previous war." Events justified his judgement, for the Peloponnesian War proved to be a 27 years' fight to a finish between Athens and Sparta for the hegemony of the Greek world. Thucydides's history in eight books gives an account of the struggle to 411, though the war did not end until the surrender of Athens to Lysander in 404.

The work is characterised throughout by the most scrupulous accuracy. Thucydides took the utmost pains to verify the facts. Furthermore, the tone of the work is absolutely impartial throughout. The love of Thucydides for Athens, and his admiration for his native city as the intellectual light of the Greek world, did not blind him to her defects and mistakes, and he holds the balance equally between her and her enemies. But he is not content merely to give an accurate and impartial narrative; he endeavours to show the causes that underlay the events he describes.

In this respect he is the first and remains the greatest of philosophical historians. A notable feature of the work is to be found in the speeches which he puts in the mouths of prominent men on both sides, such as the magnificent funeral oration delivered by Pericles on the Athenians who had died in the first year of the war. Some of these speeches were undoubtedly the substance of what the speakers actually said; others are no more than a convenient means of giving expression to sentiments proper to the occasion and to the character of the speaker. The style of Thucydides is often harsh and obscure, yet as a work of literary art the history as a whole takes the highest place. Macaulay regarded the account of the Athenian expedition to Sicily as the finest prose composition in the world, and its author as the greatest historian. See Greek Literature; Peloponnesian War. *Pron.* Thew-siddy-deez.

Bibliography. History of the Peloponnesian War, Eng. trans. H. Dale, 1868, B. Jowett, 2nd ed. 1900; C. F. Smith, 1919; R. W. Livingstone, 1943; Ancient Greek Historians, J. B. Bury, 1909; T.

and the History of His Age, G. B. Grundy, 1911; T. and the Science of History, C. N. Cochrane, 1929.

Thucydides (5th cent. B.C.). Athenian statesman. After the death of Cimon in 449 B.C. he became leader of the aristocratic party, and thus the opponent of Pericles. He suffered ostracism (q.v.) in 443.

Thug (Hind. *thag*, deceiver). Term applied to a fraternity of murderers and robbers formerly infesting India, who strangled unsuspecting travellers with a noose, handkerchief, or turban, and then robbed and buried them. They were also called phansigars

It has a hexagonal close-packed structure. Discovered in 1879, it was not isolated until 1900. Thulium is found in ytterspar, euxenite, samarskite, and other minerals. It forms green salts and has a white oxide.

Thumbscrew or **THUMBKINS**. Instrument of torture for compressing or breaking the thumbs. It was much used in Spain during the Inquisition, and in Scotland during the persecutions of the Covenanters, for extracting confessions or recantations.

Thun. Lake of Switzerland, in the canton of Berne. Situated W. of Interlaken, and traversed by the

Thun. The Swiss lake with the town of Thun in the foreground

(noosers). Sometimes they used the datura, or thorn-apple, to stupefy their victims. Their secret jargon was called Ramasee. The early Thugs were Muslims, but later Hindus were initiated, and Thuggee became an institution in honour of and under the protection of the Hindu goddess of destruction, Kali. Systematic suppression started in 1830, and by 1848 organized Thuggee was stamped out.

Thulé. Name given by ancient writers to a remote land in the northern seas, often called Ultima Thule. It has been variously identified with the Orkneys, the Shetlands, Iceland, and even with Norway. First mentioned by Pytheas (q.v.) of Marseilles, it was said by him to be six days' sail from Britain. *Pron.* Thew-lee.

Thulite. In mineralogy, name given to a variety of zoisite. It is a basic calcium and aluminium silicate, rose-red in colour, and is sometimes used ornamentally.

Thulium. One of the yttrium group of rare earth elements. Its chemical symbol is Tm; atomic number 69; atomic weight 169.4.

river Aar, which issues from Lake Brienz, it is 11 m. in length, with a breadth averaging 2 m. Its maximum depth is 710 ft., and it lies at an alt. of 1,839 ft. At its W. extremity it receives the waters of the Simme. Area nearly 19 sq. m.

Thun (Fr. *Thoune*). Town of Switzerland, in the canton of Berne. It stands on the river Aar, about 1 m. from Lake Thun, 19 m. by rly. S.S.E. of Berne. Dominated by a 15th century feudal castle, it is a picturesque town, commanding views of the Bernese Oberland. It is the headquarters of the Swiss artillery. Pop. 20,239

Thunder. Noise which accompanies or follows a flash of lightning. It is due to vibrations set up by the sudden heating and expansion followed by the rapid cooling and contraction of the air along the path of the lightning discharge. Thunder is rarely heard beyond 10 m.; the distance at which the lightning occurs can be estimated by timing the interval between seeing the flash and hearing the thunder, reckoning 1 m. for every 5 secs. Rolling of thunder occurs

chiefly because the sound from different parts of the lightning channel reaches the observer at different times. *See* Electricity, Atmospheric; Lightning; Meteorology.

Thunderbolt. Name under which the British submarine *Thetis* (*q.v.*) was recommissioned.

Thunderstone. Name given to objects found in the ground, regarded in popular superstition as the material agents of lightning flashes and their accompanying thunder-claps. In Japan they are called thunder-mallets. They may be meteorites, nodules of iron pyrites, belemnites, and other fossil cephalopods, or prehistoric stone implements, especially arrow heads and axes. In various parts of Europe they are still preserved in the house as lightning protectors, or placed over the lintels of cowsheds and in water-troughs for averting disease. These amuletic and other magical uses are also widespread throughout Asia and Africa. *See* Belemnoides.

Thunderstorm. Violent disturbance of the atmosphere caused by powerful rising currents of air within fully developed cumulonimbus clouds. Thunderstorms, usually "heat" or "frontal," are due to marked instability in the atmosphere. Adequate moisture and a sufficiently large lapse rate of temp., extending to at least 10,000 ft. above the cloud base, are necessary conditions for the development of thunderclouds. As a result of the violent convective movements of air in a thundercloud, positive and negative charges of electricity accumulate in different regions of the cloud; a lightning discharge is initiated when the difference in potential reaches a sufficiently high value.

Heat storms, generally the most severe, are local and are most frequent over mountainous regions in tropical lats., *e.g.* at Buitenzorg, Java, thunder is reported on 260 days in the year. In the U.K. the main risk is during afternoon and evening in summer, especially in the E. and Midland cos., where convective activity in the prevailing westerlies is greatest. Frontal storms frequently sweep broadside over the country with the cold front separating the cold and warm air currents of a depression; at other times, they develop along a belt and move end on, occasionally lasting for several hours at one place. There are more depressions crossing the U.K. in winter than summer; hence frontal storms are more frequent there in winter. Warm-front

thunderstorms are less common. Heavy rain or snow showers and hail are typical features of thunderstorms; a frontal storm is usually accompanied by wind squalls, a sudden rise in barometric pressure, and a fall in air temp. It has been estimated that the earth experiences 16 million thunderstorms a year. *See* Lightning.

Thurber, JAMES GROVER (b. 1894). American writer and artist. Born Dec. 8, 1894, and educated

James Thurber,
American writer
and artist

at Ohio state university, he became a journalist and in 1927 joined the staff of the *New Yorker*. A master of humorous understatement, he attracted a British as well as an American public for articles and books in mock-serious manner illustrated by himself. His satire was kindly, and his witty pen drawings were distinguished by rigid economy of line and absence of detail. *Is Sex Necessary?* (with E. B. White) appeared in 1929; *The Owl in the Attic*, 1932; *My Life and Hard Times*, 1933; *Let Your Mind Alone*, 1937; *Fables for Our Time*, 1941; *Men, Women, and Dogs*, 1943. The Thurber *Carnival*, 1945, was a collection.

Thurgau (Fr. Thurgovie). Canton of N.E. Switzerland. It is bounded N. and N.E. by the Rhine and Lake Constance, W. by Zürich, and S. by St. Gallen. One of the least mountainous of the Swiss cantons, its surface is undulating, and it ranks among the most fertile regions of the country. It is traversed by the river Thur. The capital is Frauenfeld (*q.v.*), and the chief port is Romanshorn, on Lake Constance. Thurgau joined the Swiss confederation in 1803. Its area is 388 sq. m. Pop. 138,122.

Thurifer (Lat., incense bearer). Attendant in the R.C. ritual who carries the thurible or censer at ceremonial services. His chief duties are to keep the incense burning by swinging the censer, and to hand it to the priest for censuring the altar. *See* Mass.

Thuringia. Land of E. Germany. A free state from 1919 to 1934, a *Gau* under the Nazi regime, Thuringia was created by the merging of seven small duchies and principalities: Saxe-Weimar-Eisenach, Saxe-Meiningen, Saxe-Coburg-Gotha (partly), Saxe-Altenburg, Reuss, Schwarzburg-

Rudolstadt, Schwarzburg-Sondershausen. Its area was 4,540 sq. m.; pop. (1934) 1,670,759; capital, Weimar; university city, Jena; other towns, Eisenach and Meiningen. The Thuringians contain Frankish and Slavonic elements and are almost exclusively Protestant. Thuringia embraces a mainly mountainous area, with lower hills in the N. and W., between 380 and 3,200 ft. Its soil contains iron and copper ore, slate, kaolin, salt, and lignite, and traces of oil. The region is largely industrial, engaged in toy-making, glass, textile, and engineering industries, pottery, and making footwear and chocolate. Mining, once important, is nearly extinct, while agriculture is difficult and unrewarding. Thuringia is crossed by two main rly. lines, Berlin-Frankfort-on-Main and Leipzig-Cologne. Its chief rivers, the Werra and the Saale, leading respectively to the Weser and the Elbe, are not navigable here. There are famous health resorts.

History goes back to a Thuringian kingdom, which was destroyed by allied Franks and Saxons in 531 and under Frankish dukes until 1050. The Ludoving dynasty then established its rule on the Wartburg and in 1130 its chief was appointed landgrave of Thuringia. Ludwig IV (1217-27) was the husband of S. Elizabeth. In 1263 Thuringia fell to the Wettin (Saxon) dynasty, which split it into its several states between 1445 and 1547. These were abolished 1918 and merged 1920, with the exception of Coburg and a surrounding area which joined Bavaria. In Thuringia, in 1930, a Nazi (Frick) became for the first time minister of a German state. Taken by British and American forces 1945, Thuringia became part of the Russian zone of occupation. In 1946, enlarged by former Prussian territory, it was created a *Land*, with pop. 3,000,000.

Thuringian Forest (Ger. Thüringer Wald). Mt. range of Germany. It extends for 60-70 m. in a N.W. direction from the Frankensteinwald to Eisenach. The highest points are the Gross Beerberg (3,238 ft.) and the Schneekopf. Forested to the summits, the range is a favourite tourist resort. Iron, copper, manganese are mined.

Thurles. Market town of co. Tipperary, Eire. Situated on the Suir, it is 29 m. N. of Clonmel, with a station on the Eire state rlys. The castle was formerly a stronghold of the Butlers, and Viscount Thurles remains a title in

the family peerage of Ormonde. Thurles is the seat of the R.C. bishop of Cashel. Hurling championship matches are played here. Market days, Wed. and Sat. Pop. 3,300. *Pron.* in two syllables.

Thurloe, JOHN (1616-68). English politician. Son of an Essex clergyman, he was educated for the law, and became a member of Lincoln's Inn in 1647. After acting as secretary to a mission to Holland, 1651, he became secretary to the council of state in 1652, with a residence at Whitehall. Under Cromwell he was in charge of the intelligence department. After the protector's death Thurloe became Richard's chief adviser, and even after the Restoration was constantly consulted by Charles II. He died Feb. 21, 1668. The famous Thurloe Papers discovered at Lincoln's Inn are preserved partly in the Bodleian and partly in the British Museum.

Thurlow, EDWARD THURLOW, 1st BARON (1731-1806). British lawyer and politician. Born near Norwich, Dec. 9, 1731, the son of a clergyman, he was educated at Canterbury and Caius College, Cambridge. Called to the bar in 1754, he made his name in the case of Douglas v. Hamilton,

1st Baron Thurlow,
British lawyer

1769. Just before this he had entered parliament for Tamworth, and in 1770 he was made solicitor-general. In 1771 he was promoted attorney-general, and from 1778, apart from a short interval, he was lord chancellor until 1792, when he received a barony, but was dismissed a few days later for opposing Pitt's sinking fund bill. Thurlow died at Brighton, Sept. 12, 1806. A strong Tory, he was a patron of Johnson and Eldon and sarcastic towards the American colonists and all Radicals.

Thurn, HEINRICH MATTHIAS, COUNT VON (1567-1640). Bohemian Protestant leader, born Feb. 24, 1567. Having distinguished himself in wars against the Turks, he became a leader of the resistance against Rudolph II, and in 1609 helped to secure

Count von Thurn,
Bohemian
Protestant leader

the chief claims of the Bohemian Protestants. Giving the signal for the famous "defenestration" of Prague, May 23, 1618, Thurn precipitated the Thirty Years War, in which he led a Bohemian army into Austria, and laid siege to Vienna. Defeated at the battle of the White Mountain, 1620, he fled into Transylvania and served in the army of Gustavus Adolphus. In 1633 he was captured at Steinau but was released. He died Jan. 28, 1640. *Pron.* Toorn.

Thurn und Taxis. Name of a princely German family. It is descended from the originally Milanese family, della Torre, which was driven out of the city and settled at Tasso, near Bergamo. Both names were joined in 1650. In 1501 Francis von Thurn, or Tassis, obtained from the Hapsburg dynasty postal privileges between Vienna and the Netherlands; these being extended through the empire, the family gained great wealth and, under its German name, princely rank in 1695. After buying estates in central and S. Germany, with the rights of sovereign rulers, and receiving other territories as compensation for giving up part of their postal monopolies—the last in 1866, upon receiving from Prussia £450,000 and a principality in Poznan—they were endowed with hereditary seats in the Prussian, Austrian, Bavarian, and Württemberg first chambers, and in 1899 with the Bavarian rank of duke. Related to the ruling house of Bavaria, they resided at Regensburg until 1918, while a younger branch lived in Bohemia. They kept politically in the background during the Weimar and Nazi periods.

Thurot, FRANÇOIS (1726-60). French sailor. Born at Nuits, Côte d'Or, July 22, 1726, he learnt seamanship on privateers. A distinguished seaman during the Seven Years War, he harassed English shipping in the North Sea, and in 1760 landed at Carrickfergus, Ireland, but soon after was defeated by Hawke in Luce Bay, Wigtownshire, and fell in the action.

Thurrock. Urban dist. and co. constituency of Essex, England. The urban dist. was formed by an amalgamation of Grays, Tilbury, Purfleet, and the rural district of Orsett. The administrative centre is Grays, situated on the N. bank of the Thames, 20 m. E. of London. The area is served by rly. At Tilbury are docks of the P.L.A. Industries include the manufacture of cement, paper board, margarine,

footwear, and soap, and extensive petroleum refineries. Chalk, sand, and gravel are quarried in many parts of the area. Agriculture and market gardening are also valuable. Pop. 74,000.

Thursday. Fifth day of the week. The name commemorates the Scandinavian god Thor, whose association with thunder is seen in the German word for Thursday—Donnerstag. Thor was identified with Jupiter, and Thursday was called by the Romans Dies Jovis (day of Jove), *cf.* Fr. *jeudi*.

Thursday Island. One of the smallest of the Australian islands, in Torres Straits. It is 30 m. N.W. of Cape York, Queensland, and some 1,430 m. by sea from Brisbane. Port Kennedy, its harbour, is the port of call for British, Dutch, and Chinese steamers. It is a naval coaling station, and the headquarters of Queensland pearl and trepan fisheries. During the Second Great War the civilian population was removed. Pop. 944.

Thurso. Mun. burgh and seaport of Caithness, Scotland. It stands on the S. shore of Thurso Bay at the mouth of the Thurso river, 21 m. N.W. of Wick and 319 m. N. of Edinburgh by rly., and is the most N. town of Scotland. There are steamer services to the Orkney Islands and the E. coast of Scotland. There are ruins of an episcopal palace, burnt in 1222; the castle, seat of the Sinclairs; and Harold's Tower, which marks the grave of Earl Harold, killed in battle, 1190. Thurso was created a burgh in 1633. It was for long the chief port for trade with Scandinavia. In the 14th century the place was so important that its weights and measures were adopted for the whole country. Pop. 3,250.

Thurstan (d. 1140). English prelate. A priest of Norman origin, he entered the service of Henry I. In 1114 he was made archbishop of York, but as he refused to admit that York was under the authority of the archbishop of Canterbury he was forced to leave the country, and the quarrel involved king and popes. In 1119 he was at length consecrated, and in 1121 he returned to England. Thurstan was a leader at the battle of the Standard, and died at Pontefract, Feb. 6, 1140.

Thurston, ERNEST TEMPLE (1879-1933). British novelist and playwright. Born Sept. 23, 1879, he issued his first work, some poems, as early as 1895, and his first play, *Red and White Earth*, came in 1902. A succession of novels, attractively written, but

sometimes marred by over-sentimentalism, include *The Apple of Eden*, 1904; *Sally Bishop*, 1908; *The City of Beautiful Nonsense*, 1909; *The Greatest Wish in the World*, 1910; *The Forest Fire*,

E. Temple Thurston, British novelist

1919; *The World of Wonderful Reality*, 1920; and *Jane Carroll*, 1927. He dramatised a novel by his first wife, K. C. Madden, *John Chilcote*, M.P., 1903, and his other plays include *The Greatest Wish*, 1913; *Always Tell Your Wife*, 1913; *The Wandering Jew*, 1920; and *The Blue Peter*, 1924. He died March 19, 1933.

Thurtell, JOHN (1794-1824). British murderer. Son of a mayor of Norwich, he became a sporting and gambling bully who lived chiefly by his wits. He lost a large sum of money to William Weare, a solicitor of Lyon's Inn (q.v.), whom he shot, hiding the body at a spot now popularly known as Murder Lane, Radlett, Herts, with the aid of two associates, Probert and Hunt. These men turned king's evidence, and Thurtell was tried and found guilty, and hanged at Hertford, Jan. 9, 1824. Consult *The Trial of Thurtell and Hunt*, ed. E. R. Watson, 1920; *Murder at Elstree*, T. Burke, 1934.

Thurtle, ERNEST (b. 1884). British politician. Born of English parents in New York, Nov. 11, 1884, he had an elementary school education, and became an accountant. In 1912 he married Dorothy, a daughter of George Lansbury (q.v.). Having been severely wounded at Cambrai, he took a leading part in the ex-Service-men's movement, 1919-21. Labour M.P. for Shoreditch 1923-31 and 1935-50, thereafter for Shoreditch and Finsbury, he was for many years secretary of the Rationalist Press Association (q.v.). From 1941 to 1945 he was parliamentary secretary to the ministry of Information. His autobiography, *Time's Winged Chariot*, appeared 1945.

Thyatira. Town of Asia Minor, the seat of one of the seven churches of Asia mentioned in the Apocalypse. It is represented by the modern Ak-Hissar (q.v.).

Thyestes. In Greek mythology, brother of Atreus (q.v.).

Thylacine OR **TASMANIAN WOLF** (*Thylacinus cynocephalus*). Carnivorous pouched mammal, found

in Tasmania. It slightly resembles a wolf; but the fur is close and short, the tail is slender and tapering, and the loins bear black stripes on a greyish brown ground. It lives among clefts of rocks, and is seldom seen in the daytime. Owing to the havoc it works among the sheep, it has been almost exterminated in the more populous districts.

Thyme (*Thymus*). Genus of perennial aromatic plants of the family Labiatae. All the species contain an essential oil, and have very small flowers and leaves. The flowers are generally arranged in whorls, and are purple, reddish, or white. Common thyme (*T. serpyllum*), of procumbent habit,

Thyme. Spray of foliage and flowers of garden thyme. Inset, single flower

grows wild on British hills and in the colder parts of the E. hemisphere. Lemon thyme, so called from its scent, is a variety. Garden thyme (*T. vulgaris*), a plant of taller growth, is a native of the Mediterranean region, and was known in England in 1548. It is used for flavouring. From the flower-heads of several species a stimulant is obtained. Thymol (q.v.) is distilled from the oil. Thyme is easily cultivated in light soil in sunny positions. *Pron.* time.

Thymelaeaceae. A family of herbs, shrubs, and trees, natives of temperate and tropical regions. They have acrid juices and opposite or alternate, undivided leaves. The tubular flowers show no distinction between calyx and corolla, and the fruit is mostly a berry or of plum-like structure. The best known genus is *Daphne*; the order includes *Pimelia* and *Lagetta*.

Thymol. Solid phenol obtained synthetically or from the essential oils of *Thymus vulgaris* (thyme),

Thylacine. Wolf-like mammal of Tasmania, now almost exterminated as a marauder of flocks
W. S. Derridge, F.Z.S.

Monarda punctata (horsemint), and *Carum copticum* (ajowan). The most economical source is the ajowan plant, the seeds of which yield 3 to 4 p.c. of essential oil, which in turn consists of 30 to 40 p.c. of thymol. The substance forms large colourless translucent crystals. It is used in medicine as an antiseptic and anthelmintic.

Thymus Gland. Ductless gland found in children in the chest cavity lying behind the upper part of the sternum or breast-bone. It reaches its greatest size soon after birth, and from the second year begins to diminish. Its functions are not known. Enlargement may cause death under anaesthetic. See *Status Lymphaticus*.

Thyratron. Mercury- and gas-filled thermionic valve or relay which works on the same principle as the mercury-arc rectifier. By means of a grid control the thyratron can pass large currents when the grid itself is energised by a small potential.

Thyroid Gland. Ductless gland consisting of two lobes, one on each side of the trachea or windpipe, in the lower part of the front of the neck. The two lobes are connected by a narrow isthmus which stretches across the front of the neck. The function of the thyroid gland is to form an internal secretion which is passed into the sys-

Thyroid gland. Section of the human throat showing position of the gland and adjacent organs

tem and plays an important part in maintaining bodily health; in fact it was long considered the master gland, a rôle now assigned to the pituitary.

Hypothyroidism is reduction of the functions of the gland, such as may follow removal or disease, and produces a condition known as cretinism (*q.v.*) in children, myxoedema (*q.v.*) in adults. Hyperthyroidism is abnormal activity of the thyroid gland and leads to the condition known as exophthalmic goitre (*q.v.*), or Graves' disease. When the whole gland is much enlarged the condition is called goitre (*q.v.*). But the size of a gland is no indication of its functioning, and many people with a goitre are entirely normal, or the complaint may be associated with over- or under-secretion, the enlargement being caused by fibrous tissues strangling the gland tissue.

Thyrus. In Greek religion, the wand wreathed in vine leaves, carried by the god Bacchus and his attendants. *Pron.* Thyrus.

Thysanura (Gr. *thysanos*, fringe; *oura*, tail) OR BRISTLE-TAILS. Most primitive order of insects. It is composed of wingless species living in damp earth, under stones, etc., which undergo no true metamorphosis, the young resembling the adults. Antennae are long and many-jointed; mouthparts are of the biting kind; the abdomen bears traces of minute limbs and ends in long cerci or tail-feelers that are bristle-like. This last feature suggested the popular name. The best known is the silver fish (*Lepisma saccharina*) about $\frac{3}{4}$ -in. long, found in kitchens and cupboards. Its fondness for starches and sugars may cause harm if it is numerous. The related fire-brat (*Thermobia domestica*) occurs in bakehouses. These two species and the shore-inhabiting *Petrobius maritimus* are clothed with scales, and the body bears three tail-bristles. The white, eyeless species of *Campodea* occur in deep earth or decaying wood and are about $\frac{1}{2}$ in. long, including the tail-bristles (two in number). *Japyx*, found in S. Europe and in all continents, has the cerci replaced by a pair of forceps like an earwig. About 20 species of *thysanura* occur in England. *Consult* Outlines of Entomology, A. D. Imms, 1944.

Thyssen, August (1842-1926). German industrial magnate. Of Hungarian descent, he was born May 17, 1842. He established his first ironworks at Duisburg, and in 1871 founded that at Mülheim-am-

Ruhr which became the nucleus of one of the greatest iron mining and working concerns of Germany. The Deutsche Kaiser mine was a celebrated property of Thyssen's, and he had interests in associated manufacturing and transport concerns. He died April 3, 1926. *Pron.* Teessen-en.

Thyssen, August Fritz (b. 1873). German industrial magnate. A leading figure in German iron, steel, and coal industries, he became head of the great Thyssen steel combine. An early supporter of Hitler, he gave large sums to the Nazis, and in 1926 arranged the first lecture given by Hitler to industrialists of Essen. Later he was a member of the Reichstag and of the Prussian state council. He decided to leave Germany after the pact with Russia in 1939, and on the outbreak of the Second Great War fled first to Switzerland, then to the French Riviera. Deprived of German citizenship, he was placed in Dachau concentration camp in 1941. He was classed as a minor offender by a denazification tribunal 1948, 15 p.c. of his property being confiscated. He then went to Argentina.

Tiahuanaco. Ruined city of Bolivia, and centre of Inca culture. It stands on a plain, at an alt. of 12,900 ft., 38 m. W.S.W. of La Paz, near the S. end of Lake Titicaca. The modern town, built from the stones of the ruins, stands nearby. Only a few stones of interest have survived local vandalism. Chief of these is a famous monolithic gateway of trachytic rock, 18 ins. thick, 13 $\frac{1}{2}$ ft. high, and 7 ft. 2 ins. wide. It is believed that the builders were Aymarás of the pre-Inca period. *See* Inca.

Tian Shan, TIEN SHAN, OR THIAN SHAN. Mt. range of Central Asia, otherwise known as the Celestial Mts. Extending about 1,600 m. from S.W. to N.E., and from 100 to 300 m. across, it begins in Kirghiz S.S.R. and runs through the Chinese prov. of Sinkiang into Mongolia. The range forms the N. boundary of the Tarim basin; from its N. side flow the Ili and the Jaxartes or Syrdaria system. Heights of 23,000 ft. are attained. Soviet exploration has brought thousands of sq. m. into use for crops or pasture, and a geophysical station has been set up near Lake Issyk-Kul.

Tiara (Gr., a Persian head-dress). Ornate head-dress of various forms, especially the papal crown. Originally a kind of hat worn by ancient Persian kings, magi, and others, it was worn under the Roman empire by men and women, and became in medieval and modern times a lady's head-band, erect in front. As part of the Byzantine court costume, the tiara was worn by Greek

Tiara. Lower picture, a modern British example. Top, left, two ancient forms of tiara, from reliefs at Persepolis; right, the triple crown worn by the pope

clergy c. 700, when it was called *camelarucum*. It is worn by the pope as a sign of sovereignty, but has no liturgical character. At first a tall, pointed white cap, it was gradually elaborated. A circlet or crown appears on the tiara c. 1100 or earlier, a second crown c. 1200, and a third c. 1305.

Tiaret. Town of Algeria. It is 105 m. by rail E.S.E. of Oran, and is built on the slopes of the Jebel Guezul at an alt. of 3,550 ft., on the site of the Roman city of Tingartia. There are numerous Roman remains and 22 m. distant are the tombs, in the form of pyramids, known as the Jedars.

Tiber (Ital. Tevere). River of central Italy. Called Albula in early times, it is said to have been renamed after Tiberinus, an old king of Alba, who was drowned in its waters, and as a river-god was its patron deity. It rises in the Tuscan Apennines in Forlì prov., on the slopes of Monte Fumajolo, 4,160 ft. above sea level, and flows 245 m., generally S., to the delta on the Tyrrhenian Sea. Its tributaries were called Clanis, Clitumnus, Nar, and Anio. The city of Rome stands on both sides of the river 26 m. from the sea. Here the river

has been canalised for the use of small steamers. The alluvium of its flood waters, which have been the cause of inundations from the earliest times, has given it the name of the "yellow" Tiber. See Rome.

Tiberias. Town of Palestine, the modern Tiberiyah. Founded by Herod Antipas, it was the chief town of ancient Galilee, and long famous for its school of Jewish teachers. It lies on the W. shore of the Sea of Galilee, or Lake Tiberias, sometimes called the Lake of Gennesareth. During the First Great War it was occupied by the British in Sept., 1918. Excavations carried out in the vicinity in 1920 revealed ancient walls and columns believed to mark the site of the old town. Tiberias has a Presbyterian church, and near by are medicinal springs. Pop. 11,810.

Tiberius (42 B.C.-A.D. 37). Roman emperor, A.D. 14-37. Born Nov. 16, 42 B.C., he was the son

Tiberius, Roman Emperor
From a statue in the Vatican

of Tiberius Claudius Nero and Livia Drusilla, whom the emperor Augustus, having forced her to divorce her husband, married in 38 B.C. During the next few years the young princes who stood nearest to Augustus died, and in 2 B.C. he formally adopted his stepson as his heir. Tiberius had seen military service in Spain and acted as governor of Transalpine Gaul. In 12 B.C. he was compelled to marry Julia, daughter of Augustus and widow of Agrippa. In A.D. 13 Tiberius was invested with the tribunitian and proconsular powers, the possession of which gave almost imperial authority; thus, when Augustus died in 14, the succession of Tiberius to the principate was really a foregone conclusion.

Tacitus has presented Tiberius in the most detestable colours, but his conception of the emperor's character was derived from the later years of his reign, in the light of which, and of personal prejudices, he gives an unjust view of its earlier years. Through the greater part of the reign of Augustus, Tiberius had been employed on the ungrateful work of guarding the frontiers on the Rhine and the Danube. He had displayed the highest ability, but his character, naturally harsh and unattractive, had become morose and embittered. He accepted the imperial office with no satisfaction, and discharged it with a conscientious austerity. The provinces were excellently administered. Constitutional forms were strictly observed. Nevertheless, the deaths of popular members of the imperial family were attributed to the jealousy of the emperor, whose superstition, gloom, and melancholy increased year by year.

The only man whom he trusted was Sejanus, the captain of the praetorian guard. In 26 Tiberius retired from the capital to Capri, and Sejanus was entrusted with the exercise of virtually imperial powers, which he used to institute a reign of terror. At length in 31 Tiberius awoke to his treasonable designs and put him to death. But the reign of terror continued. A special treason court had been instituted, and charges of treason were equivalent to condemnation. Tiberius was possessed with a mania of suspicion, and also, though his life until he reached 60 had been ostensibly austere, with a passion for debauchery. Hideous tales, probably exaggerated, were told of foul doings on Capri where

Tiberius lived in growing seclusion; until at last the nightmare was dispelled by the murder of the emperor in 37.

Bibliography. *Tragedy of the Caesars*, S. Baring-Gould, 1892; *T. the Tyrant*, J. C. Tarver, 1902; *Tiberius Caesar*, G. P. Baker, 1929; *The Reign of Tiberius*, Marsh, 1931.

Tiberius. East Roman emperor, 578-82. Born in Thrace, he became commander of the palace guards of Justin II (q.v.).

Tibesti. Region of the Sahara. Lying about 360 m. N.E. of Lake Chad, on the Libyan border, it is largely mountainous, with summits reaching 8,000 ft. There are heavy occasional rains. In 1914 a French column occupied the country.

Tibet. Semi-independent Central Asian state. More than eight times the size of Great Britain, it occupies a region between India and China in which is the most enormous and the highest mass of mts. in the world—hence Tibet's popular name, the roof of the world. It has an area of about 470,000 sq. m.; its greatest length is 900 m.; its width varies from 250 m. to 600 m. Pop. 3,722,011.

The higher region is poorly drained, and a large part of it is occupied by lakes; the soil here is frozen solid for eight months of the year, and during the other four is mud. There is scarcely any vegetation, and few signs of life. Even in summer the noon temp. is seldom less than 16° below freezing point. The mean alt. of this part of Tibet is 16,500 ft. In the central region (mean alt. 15,000 ft.) a few animals feed scantily upon grudging pastures, but there is very little cultivation.

The S. zone is fairly fertile and well watered, and suitable for

Tibet. Map of the Central Asian state which separates India from China, and was for many centuries a land of mystery closed to all foreigners

growing varied crops, even rice and apricots; owing to its nearness to the equator these crops can be raised in valleys 11,500 ft. high. Here also there is a good deal of timber. But as a whole Tibet is a harsh and sterile country, where it is difficult to make a living off the soil. Rivers which rise in Tibet include the Brahmaputra, the Suttlej, and the Indus.

The people, of Turco-Mongol origin, are in general short of stature, spare in figure, with high, narrow forehead, prominent nose, large ears, thin features, high cheek-bones, light-brown eyes less almond-shaped than those of the Chinese, black hair, and slightly reddish skins.

Sheep and yaks are bred, the latter being crossed with other cattle and used both as beasts of burden and for food. Buffaloes, camels, and pigs are also bred. There are scarcely any manufactures. Commerce with China is considerable, and there is a trade with India.

Chief imports are tea and tobacco, cotton and silk goods, sugar, rice, household requisites, and articles of luxury; these go for the most part to the monasteries, in which dwell an enormous number of Buddhist monks.

The dress worn by men of all classes is a wide and very long gown, gathered up during the day so that it does not reach below the ankles of the leisured or literary class or the knees of the labouring folk. Women wear the same kind of gown, reaching to their ankles; in some districts they dress their hair elaborately and wear jewels in it, in others they plait it and let it hang down their backs.

The custom which ordained that a wife should be equally the property of her husband and his brothers is on the wane; but conjugal fidelity is not expected. Neither women nor men, except in the highest rank, take much care of their persons; they wash seldom, and their habit of covering their faces and hands with rancid butter is offensive.

Men follow their fathers' callings. The nobility own land and have the right to tax, to administer justice, and to requisition labour. The pariahs at the bottom of the social scale are butchers, undertakers, etc.; above them come the serfs, of whom there are a great many, in practice bound to the soil, though by legal fiction free. There are a few small farmers and traders. The whole

Tibet. 1. Fashionable lady from the south of the country. 2. A peasant.
3. Two women from the Mongolian frontier in full dress

of Tibetan lay society is dominated by a monastic hierarchy possessed of great wealth. The form of Buddhism practised is mechanical and materialistic. Praying wheels are in common use, the wildest superstitions flourish; the dead are cut up and thrown to beasts and birds of prey. Magic is practised in its most primitive forms.

Lamaism has prevailed in Tibet since the 8th century. Since 1270 the temporal power has been in the hands of the Dalai Lama, who is head of the church, or a regent during his minority. During the 17th cent. the Chinese established an ascendancy maintained in some degree until the revolution of 1912. In the 18th cent. friendly negotiations were carried on between the Dalai Lama and the British East India co., but were broken off when in 1792 a British general helped Nepalese (Gurkha) invaders. Then the Tibetans closed their frontiers against all foreigners for more than a hundred

years. In 1904 F. E. Younghusband (*q.v.*) penetrated to Lhasa, the capital, and secured a convention. Attempts by the Chinese republic to reassert Chinese authority by force were vigorously resisted by Tibet, but from 1939 a representative of the republic was permitted to reside in Lhasa. A Canadian anthropological expedition under William Dunning, which spent three months in Tibet in 1947, filmed Tibetan manners and customs. A Tibetan trade mission, the first of its kind, toured Great Britain and the U.S.A. during Aug., 1948. See Dalai Lama; Lamaism; Lhasa.

Tibia or SHIN-BONE. The inner and larger of the two bones of the lower leg. It is attached by ligaments to the fibula at its upper and lower ends. Above, the tibia articulates with the femur to form the knee-joint, and below with the foot, forming the ankle-joint. The prominence of the lower end, which can be felt on the inside of the foot, is known as the internal malleolus. Owing to the closeness of the bone to the skin in front, fractures of the tibia are frequently "compound," i.e. the skin is injured and a communication established between the fracture and the external air. See Leg.

Tibullus, ALBIUS (53-18 B.C.). Roman poet. A member of the equestrian order, he served under Messalla in Gaul and Coreyra, and then retired to Rome, where he devoted himself to literary pursuits. Four books of his Elegies are extant, all distinguished by a fastidious delicacy of mind and by a depth of pure emotion perceptible beneath singularly limpid and smoothly flowing verse.

Tic Douloureux. Severe form of neuralgia affecting the side of the face. See Neuralgia; Trigeminal Nerve.

Tichborne Case. In English law, a celebrated impersonation case. Roger Charles Tichborne (1829-54), heir to an ancient Hampshire baronetcy, sailed for Valparaiso in March, 1853. He wrote home constantly until April 20, 1854, when he sailed from Rio de Janeiro for Jamaica in the

Bella, which never reached its destination. From that date he was never seen or heard of again. In 1865, in response to world-wide advertisements issued by the dowager Lady Tichborne, "R. C. Tichborne" turned up at Wagga Wagga, Australia, in the person of an impecunious butcher, locally known as Tom Castro.

At Sydney he put on record that he was wrecked in the Bella and picked up by the Osprey, bound for Melbourne, and on Christmas Day, 1866, the claimant landed in England. Roger's mother professed to recognize him, as did several others. He became popularly regarded as the rightful heir, and bonds were issued to provide money for his claim, but his story contained too many discrepancies. Finally Castro was identified as Arthur Orton, the son of a Wapping butcher. His claim was nonsuited, March 6, 1872, after a cross-examination lasting twenty-two days by the solicitor-general, afterwards Lord Coleridge (*q.v.*).

After the longest criminal trial (April, 1873, to Feb., 1874) in British annals, presided over by Chief Justice Cockburn, Orton was sentenced, on two counts of perjury, to fourteen years' hard labour. Released on ticket-of-leave, 1884, he published a confession in a Sunday newspaper in 1895, which he subsequently recanted. He died in London in April, 1898. The defence of the family alone against the claim in this remarkable case cost more than £90,000. Consult *The Tichborne Case*, Lord Maugham, 1936.

Ticino (anc. *Ticinus*). River of S. Switzerland and N. Italy. It rises in two headstreams on Mt. St. Gotthard, flows S.E. and then S.W. through the canton of Ticino and Lake Maggiore; it then divides Piedmont from Lombardy and effects a junction with the Po a little below Pavia. It is 154 m. long and is navigable S. of Lake Maggiore. The chief towns on its banks are Pavia and Bellinzona. Hannibal inaugurated his campaign in Italy by defeating the Romans on its banks in 218 B.C.

Ticino (Fr. and Ger. *Tessin*). Canton of S. Switzerland. It is bounded N. and E. by Grisons, S. by Lombardy, and S.W. by Piedmont. Named from the river Ticino, it contains the upper part of Lake Maggiore and the larger part of Lake Lugano. On the S. slopes of the Alps, the lower parts are Italian in scenery, climate, etc., and the people are Italian in speech and mainly Roman Catho-

lic. Cattle breeding and dairy farming are the chief industries in the N.; in the S. oil and wine are produced and fruit and cereals grown. Bellinzona is the capital, and other places are Locarno, Lugano, and Chiasso. Ticino became a member of the Swiss confederation in 1803. Its area is 1,086 sq. m. Pop. 161,882.

Tick. Name given to certain members of the class *Arachnida* (*q.v.*), allied to the mites and

Tick. Left, dog or sheep tick; right, tick larva. Both highly magnified

grouped with the latter to form the order *Acarina*. They are blood-sucking parasites that attach themselves by means of a piercing rostrum to the skin of man and domestic or wild animals. The females swell greatly after a blood meal and, in many species, are of great importance in transmitting protozoan or other disease organisms. These are often transferred through the eggs to the progeny of the tick. Larvae of many ticks live among herbage, attaching themselves to passing animals. Some species live on a single host individual; but others require two or three hosts, and a single tick may sometimes transmit disease to each host. Among tick-borne diseases are Texas or red-water fever in cattle; piroplasmosis in horses and dogs; relapsing fever in man and animals; and tick-paralysis.

Tickell, THOMAS (1686-1740). English poet. Born near Carlisle and educated at Queen's College, Oxford, of which he became a fellow, he obtained several political appointments through the influence of his great friend Addison. His translation of the first book of Homer's *Iliad* appeared about the same time as Pope's, and Addison, with justice, praised it as the best, thereby offending Pope, who retorted by making Addison the subject of a satire. Nothing else that Tickell wrote is of particular in-

terest except the elegy lamenting Addison's death which he prefixed to his edition of Addison's works. He died at Bath, April 23, 1740.

Ticket Day. Term used on the London stock exchange to denote the day before settlement day or pay day of each fortnightly account. It is also called name day. On this day the broker of a client who has bought securities must pass to the jobber who has sold them the name and description of the buyer. If the jobber has sold from his own trading stock, he keeps the ticket; if not, he passes it to the broker of the client who has sold the stock. Sometimes a jobber sells in one transaction stock that he has bought in two or more transactions; in that case the ticket is said to be divided or split, *i.e.* the jobber makes out fresh tickets to a total value equal to that of the ticket received from the buying broker. On the day after ticket day, *i.e.* on pay day or settlement day, the transfer deeds are presented to the buyer's broker, who then pays for the securities that his client has bought, having previously received a cheque from his client in payment of the amount of the contract note sent to him when the bargain was made with the jobber. See *Stock Exchange*.

Ticket-of-Leave. In English law, name applied to a type of licence to be at large formerly granted to convicts. Granted upon certain conditions, it might be revoked for any infringement.

Ticket-of-Leave Man, THE. Drama founded by Tom Taylor on *Le Retour de Melun*, of MM. Brisebarre and Nuz. It was produced, May 27, 1863, at the Olympic Theatre, London, where it ran for 406 performances. The story is concerned with the troubles of a wrongfully convicted ticket-of-leave man who, unable to get employment, is tempted to become an habitual criminal. Hawshaw, one of the chief characters and one of the first stage detectives, is remembered for his astuteness of disguise and dramatic revelation of identity with the words, "It is I—Hawshaw, the detective!"

Tickhill. Town and parish of the W. Riding of Yorks, England. Situated on the Notts border, 6 m. S. of Doncaster, it has a large Early Perpendicular church of S. Mary, built about 1360, containing old tombs and some 14th century stained glass. There are also an old almshouse, the remains of a hospital of S. Leonard, founded about 1225, the ruins of an Augustinian

Thomas Tickell,
English poet
After S. Harding

priory, founded by Queen Eleanor, and a ruined Norman castle. Pop. est. 2,250.

Ticking (Lat. *theca*, case). Strong twilled linen or cotton cloth, often white with blue or pink stripes. It is used for mattresses, tents, and awnings, and sometimes as a ground for embroidery.

Ticknor, GEORGE (1791-1871). American literary historian. Born at Boston, Mass., Aug. 1, 1791, he

George Ticknor,
American historian

graduated at Dartmouth in 1807, and in 1815 went to Europe, visiting most of the capitals and studying at Göttingen. From 1819 to 1835 he was professor of

belles-lettres and of French and Spanish at Harvard. The next three years he spent in Europe, and in 1849 he published his magnum opus, *The History of Spanish Literature*, the fourth edition of which (1872) contains his last revisions. Further visits to Europe followed, and in 1864 he published his *Life of Prescott*. Ticknor helped to establish Boston public library in 1852, was one of its trustees until 1866, and its president in 1865, and bequeathed to it his library, which was particularly rich in Spanish and Portuguese authors. He died Jan. 28, 1871. *Consult* *Life, Letters, and Journals*, ed. G. S. Hillard, repr. 1909.

Ticknor, WILLIAM DAVIS (1810-64). American publisher. In 1832 he secured a partnership in the firm of Allen and Ticknor, at Boston, and developed the business with other partners, changing the name of the firm to Ticknor and Fields in 1854. They published *The North American Review* and *The Atlantic Monthly*, and their shop, the Old Corner Book Store, was long a resort of the literary men of the period.

Ticonderoga. Village of the U.S.A., in New York state. Situated at the N. end of Lake George, about 100 m. N. of Albany, its position on the waterway between Canada and the sea gave it strategic importance. Here in 1755 the French built a fort, called at first Fort Carillon, in allusion to the sound made by the waterfalls, and afterwards by the Indian name *Ticonderoga*. Attacked in 1758 by the British, who lost heavily, it was abandoned a few days later. Stevenson's ballad, *Ticonderoga*, alludes to this battle in

connexion with the story of the Appin Murder (*q.v.*). During the War of American Independence the place changed hands a number of times, and with the end of this struggle it fell into decay. The village manufactures paper, and graphite is found in immense quantities in the neighbourhood. Pop. 3,402.

Tic-Tac. Method of signalling in use on racecourses. Its chief object is to communicate the betting movements in Tattersall's to bookmakers in the smaller rings and on the course itself when outside betting is permitted.

The tic-tac is operated in a triangular manner, the betting movements in Tattersall's being communicated by one of the operators to a second stationed on the grand stand, who passes on the message to a third person, who, in turn, communicates the information to the bookmaker for whom he works.

The signs are made by touching various parts of the head, arms, and body, and although more or less universally used, are varied at times to deceive outsiders by introducing what is colloquially called the "twist," i.e., the signs are made the reverse way and the numbers assigned to horses on the race cards are reversed or otherwise altered. Customarily the signs used run from the right shoulder, over to the left shoulder, and up either arm, a few of them being as follows: One, right shoulder touched with right hand; two, right ear with right hand; three, right side top of head with right hand; six, left shoulder with left hand; ten, both hands placed together; 7 to 4 against, tips of left hand fingers with right hand; 5 to 2 against, breast pocket with right hand.

Tidal Power. Power available from the flow and ebb of the sea tides. The problem of harnessing it is in many respects related to that of harnessing flowing inland water. For many years engineers have been considering ways and means of utilising tidal power successfully; tide mills were, in fact, in operation at the beginning of the 19th century. The general principle is to construct a barrage across an estuary in such a manner that water flows into an enclosed area through openings, which are closed at high tide. When the tide falls, the difference in level between the impounded water and the sea below the barrage is utilised to drive turbines. This is known as single tide working; double tide working

implies the development of power by the rising as well as the falling tide. Allowance must be made for the variation of power output due to the fall of the tide twice a day and the advance by one hour daily of the time of high tide.

A large rise and fall of tide, and a suitable impounding area, provide the best conditions for a tidal power scheme, and special attention has been devoted to the practicability of harnessing the power of the river Severn (*q.v.*).

Tide. Rhythmic rise and fall of the oceanic waters. The movement is most marked on shores which shelve gradually. The average interval between successive high tides is 12 hrs. 25 mins., half the time between successive passages of the moon across a given meridian. The height of the tide varies rhythmically; highest, or spring, tides gradually change to the lowest, or neap, tides. The interval between successive spring tides is half a lunar month. Usually spring tides occur at or near the time when the moon is new or full, and neap tides when the moon is in the first or third quarter. These facts suggest that the moon is the main cause of the tide.

The mass of the moon attracts the oceanic waters, which, being fluid, make a little peak pointing directly from the earth's centre to the centre of the moon; this peak is held on the line of centres while the earth rotates beneath it. To observers on the earth the peak of water appears to move. At the antipodes of this peak, on the side of the earth remote from the moon, a second peak occurs, because the distant water is again attracted to the line of centres. These peaks are the successive high tides.

Lunar attraction is coupled with a similar attraction due to the sun, but only of four-ninths the magnitude. When the line of centres of the earth and moon approximates to the line of centres of the earth and sun, i.e. at full and new moon, the combined solar and lunar tides produce the spring tides. When the two lines of centres are at right angles, at the first and third quarters, the solar attraction reduces the lunar effect and produces the neap tides. The neap tides are, on the average, 5 : 13, i.e. $(9 - 4) : (9 + 4)$, of the spring tides.

This theoretical explanation of the outstanding tidal features merely details the phenomena as they would occur upon an earth with a film of ocean surrounding it. The interposition of the great

land masser, and the differences in the oceanic depths, cause variations in the tides along the coasts. When, for instance, it is high tide at noon at Liverpool, the preceding high tide has almost reached Peterhead.

At Ayr the spring tide rises 8 ft., at Greenock 10 ft., and at Glasgow 13 ft.; at Swansea it is 27 ft. and at Cardiff 36 ft., Bristol 33 ft., Newport and Chepstow 38 ft.

In the centres of the seas and in the open oceans it is not possible to detect the tidal movement except on the shores of oceanic islands, where a rise and fall of a few feet usually occurs. In the Mediterranean the range is about one ft.

High tide at any port occurs within a few minutes of a stated time interval after the moon crosses the meridian. The average interval, which differs at each port, is known as the establishment of the port; at London Bridge it is 1 hr. 58 mins.

The magnitude of the observed tide at a place may differ from the astronomical or predicted tide, the difference depending on the wind and atmospheric pressure. If this difference is such as to increase the effect, at or near high tide, coastal defences may be endangered. The disastrous floods of Jan. 6-7, 1928, in the Thames (q.v.) valley were attributed to previous heavy rain and melting snow followed by an abnormally high tide caused by a strong pressure gradient and an associated northerly gale over the North Sea.

Tidal effects, due to the moon, have been observed in the atmosphere. Records of barometric pressure at ground level at certain meteorological stations show two maxima and two minima in each lunar day, the amplitude of the waves being greatest in the tropics. In 1938 a series of radio measurements of the variations in height of the Heaviside layer (q.v.) at Cambridge revealed a lunar semi-diurnal oscillation of height.

Tidesman or **TIDE-WAITER**. Custom house officer. The name was given to one who watched the landing of goods and secured the payment of duties. See Customs.

Tideswell. Market town of Derbyshire, England. In the Peak district, it is 8 m. E.N.E. of Buxton. The chief building is the church of S. John the Baptist, a beautiful example of 14th century architecture, its tower being especially noteworthy. In the vicinity are lead mines, and near the town are Miller's Dale and other beauty

spots. Market day, Wed. Pop. approx. 2,000.

Tidikelt. Most southerly of the Algerian oases, E. of Tuat (q.v.), and containing the oases of Akabli, Aoulef, Tit, and In Salah (Ain Salah). The last is the chief town and about equidistant from Timbuktu, Mogador, Tangier, Algiers, and Tripoli. Tidikelt contains about 300,000 date palms. It was occupied by France in 1902.

Tidworth. Village and parish of Wilts, England. On the Hants border, 9 m. W. of Andover, it is on a branch rly. from Ludgershall. Tidworth camp is the headquarters of the southern command, and the principal training area of the Royal Armoured Corps. Both the Park and the Pennings have been used for training infantry, cavalry, and artillery. The tower of Holy Trinity church dates from 1360. Pop. 4,358.

Tieck, JOHANN LUDWIG (1773-1853). German critic, poet, and novelist. He was born in Berlin,

J. L. Tieck,
German critic

May 31, 1773, and studied at Halle, Göttingen, and Erlangen. In 1799 he joined the literary circle at Jena, where he became one of the leaders of the Romantic movement. He visited Italy in 1805, England and France in 1817, and in 1825 became director of the court theatre at Dresden. In 1841 he removed to Berlin and there died, April 28, 1853.

Tieck produced many volumes of fanciful fiction and valuable compilations, criticisms, and translations. Following three youthful novels, Peter Lebrechts Volksmärchen (Fairy Tales of Peter Lebrecht), 1797, was his earliest work of notable distinction; it was later revised and issued as Phantasia, 1812-17, five of the tales being translated by Carlyle. Early poetic plays, Genoveva, and Kaiser Octavianus, 1804, perhaps represent the best of Tieck's original work. He made a valuable collection of ancient poetry in Minnelieder aus dem Schwäbischen Zeitalter (Minstrelsy of the Swabian Era), 1803. A series of translations, Altenglisches Theater (Old English Plays), 1811, was followed by a similar collection of old German plays. He assisted Schlegel with his translation of Shakespeare's plays, wrote a novel on Shakespeare's life, Dichterleben, and a series of essays on the same

poet in Shakespeares Vorschule (Introduction to Shakespeare), 1823-29. Consult Collected Works, 28 vols., 1828-54; Critical Essays, T. Carlyle, 1840; L. Tieck in Dresden, A. Stern, 1879; L. T. and England, E. H. Zeydel, 1931.

Tied House. Public house or inn of which the licensee, by the terms of a contract (usually a mortgage) entered into with some brewery, or because the house belongs to brewery, may sell beer made by that brewery only.

Tiel. Town of the Netherlands, in the prov. of Gelderland. It lies on the right bank of the Waal, 19 m. S.E. of Utrecht, on the Nijmegen-Rotterdam rly. line. Industries are concerned with tobacco, fruit preserving, and agricultural implements, and there is trade in grain, cheese, and livestock. Tiel had a charter in the late 10th century, was sacked by the Normans, 1006, and held by the insurgent Dutch from 1579. The Kleiberg Gate is part of the old fortifications which defended the town. Tiel was in German occupation from May, 1940, until the end of the Second Great War. Pop. 12,370.

Tientsin. Former treaty port of China, in Hopei prov. Its name meaning the ford of heaven, it is situated at the junction of the Pei-ho and the Grand Canal about 70 m. from the sea and 70 m. S.E. from Peking. Railways connect it with Peking, Manchuria, the Kaiping coal mines, Hankow, and Pukow. The river is frozen from Nov. to April, yet the port receives most of the goods destined for Peking, has a great trade in salt, and is the point of departure of the tea caravans for Siberia and Russia.

The Chinese city is small. Formerly it was surrounded by walls 4 m. in circuit; these were razed after the Boxer Rising. It was opened to foreign trade in 1860. It is insalubrious, in striking contrast to the foreign city, 1½ m. downstream, with its fine buildings, and streets. Here the foreign pop. of some 2,500, and many Chinese merchants and business men, live under the government of an elected all-Chinese municipal council. Foreign concessions were accorded to Great Britain in 1860, France 1861, Germany 1895, Japan 1896, Russia 1900, Italy 1901, Austria-Hungary and Belgium 1902. The foreign city suffered severely at the hands of the Boxers (q.v.) in 1900. The Japanese bombed Tientsin from the air on July 29, 1937, destroy-

ing the university. The town was captured by Chinese communists Jan. 15, 1949. Pop. 1,718,000. See Treaty Port.

Tiepolo, GIANBATTISTA (1696-1770). An Italian painter, born April 16, 1696, in Venice. He studied under Gregorio Lazzarini, but his work appears to have been influenced more by Titian and Veronese. He began his career in Venice, where are the bulk of his frescoes and oil paintings; one may cite his Antony and Cleopatra series in the Palazzo Labia. During 1750-53 he was at Würzburg, employed with his sons on the decoration of the archbishop's palace; he worked also at Bergamo and Madrid, where, on March 27, 1770, he died. The National Gallery, London, has two of his altarpiece designs. *Pron.* Tee-ep-olo.

Tierce (Lat. *tertius*, third). In fencing (*q.v.*), the third position of the wrist. The word is also used for a cask containing 42 gallons, and for a sequence of three cards of the same suit. Ecclesiastically it is the third hour of the day and its office.

Tierney, GEORGE (1761-1830). British politician. Born at Gibraltar, March 20, 1761, of Irish stock,

George Tierney,
British politician

he was educated at Eton and Peterhouse, Cambridge, and was called to the bar. In 1789 he entered parliament for Colchester, and with a short interval he remained therein until his death. A prominent Whig, Tierney in 1803 became treasurer of the navy, thus breaking for a time with his party. In 1806 he was president of the board of control for a few months. Leader of the opposition from 1817, after ten years he became master of the mint. He died on Jan. 25, 1830. Tierney is best remembered for his bloodless duel with William Pitt on Putney Heath, May 27, 1798. A Life by H. K. Olphim was published 1934.

Tierra del Fuego (Sp., Land of Fire). Island at the S. extremity of S. America. Forming part of the Tierra del Fuego archipelago, it was discovered by Magellan in 1520 and is divided between Chile and Argentina. The coasts are deeply indented and the surface mountainous, culminating in the twin peaks of Darwin (6,800 ft.) and Sarmiento (7,200 ft.). The mountains are generally snow-capped or covered with stunted vegetation.

Chief industries are timber cutting, sheep raising, and seal fishing. The capital of the Chilean portion is Punta Arenas or Magallanes (*q.v.*), most southerly town in the world; that of the Argentine territory, which has only 4,921 inhabitants in 8,344 sq. m., is Ushuaia on Beagle Channel. The original Fuegians now number scarcely 1,000. See Staten Island.

Tietjens OR **TITTENS**, TERESA CAROLINA JOHANNA (1831-77). German operatic singer.

Madame Tietjens,
German singer

Born of a Hungarian family at Hamburg, July 17, 1831, she made her first appearance on the stage there, 1849, and by 1856 had become one of the foremost singers of her time.

Her mezzo-soprano voice and dramatic powers made her widely famous, among her best parts being Fidelio, Norma, Valentine, and Medea. Her success in Les Huguenots on her first London appearance, 1858, led her to make England her home. She died Oct. 3, 1877.

Tiffin. Word applied originally among Anglo-Indians to a light repast between breakfast and dinner. It is derived from tiff, a North Country dialect word meaning a small draught of liquor.

Tiffin. City of Ohio, U.S.A., the co. seat of Seneca co. It stands on the river Sandusky, 42 m. S.E. of Toledo, and is served by the Baltimore and Ohio and other rlys. It is the seat of Heidelberg university. Industries include the manufacture of iron goods, glass, pottery, woollen goods, and gloves. Settled in 1817, Tiffin was incorporated in 1835, being named after its first governor, and became a city in 1850. Pop. 16,102.

Tiflis. Historic name of Tbilisi (*q.v.*), capital of Georgia S.S.R.

Tigellinus, SOPHONTUS (d. A.D. 69). Favourite of the emperor Nero. A Sicilian of infamous character, he became prefect of the praetorian guards, and kept his position by pandering to Nero's vices and making himself the instrument of tyranny. Hated by the people, he was suspected of complicity in the burning of Rome. He deserted Nero on the eve of his fall, and was compelled to commit suicide on the accession of Otho.

Tiger (*Felis tigris*). Large carnivorous mammal, belonging to the

cat family. It is the largest of the cats, with the exception of the lion, and a fine male specimen will measure about six feet from the tip of the nose to the root of the tail, which is about three feet long. The female is about a foot shorter. The colour of the fur is a reddish fawn on the upper parts, with white under parts, and white markings on the face and ears. The transverse stripes on the body are black, but vary considerably in number and form. White and black animals have been found very rarely. The hair is short in Indian specimens, but long and woolly in the Siberian or Manchurian variety. In Malaya occurs a variety smaller in size, and so heavily striped as to appear considerably darker in colour.

The tiger is found throughout most parts of Central and S. Asia, from the Caucasus to Sakhalin. It occurs in most parts of the Indian sub-continent, but not in Ceylon. Its favourite haunts are jungles and forests, where its striped coat blends with the high-standing yellow grass, making it difficult to detect. The tiger keeps to its lair during the day, and preys at night upon cattle, deer, and other animals. It usually avoids man, and will make off if approached during the day, but if it once makes the discovery that natives are more easily caught than deer, it becomes a dangerous pest.

The tiger is solitary in its habits, though occasionally family parties consisting of the parents and their grown-up offspring occur. It consorts in the breeding season with only one female, and from two to five cubs are born in a litter. They become adult at three years; until that time they usually keep with their parents.

Tiger Beetle (*Cicindelidae*).

Extensive family of carnivorous beetles. Natives chiefly of the

Tiger Beetle. British green species, natural size

warmer regions, they include few British species; best-known of these is the green tiger (*Cicindela campestris*), which flies freely in sunshine over heaths in late spring. Coloured green and blue, with the long, thin legs a shining copper colour, it sparkles conspicuously as it preys on other insects. As a larva it is equally rapacious, already possessing the keen sickle-

shaped jaws that are so noticeable in the beetle. The larva inhabits a shaft in the ground.

Tiger Cat. Name vaguely applied to numerous species of wild cats. One, *Felis celidogaster*, is found in equatorial Africa, and is remarkable for the fact that the colour of its coat varies at different ages. In Central and S. America occur several species of arboreal cats which go by this name, notably *F. tigrina*, which is grey with black spots. See Margay.

Tiger Lily (*Lilium tigrinum*). Bulbous herb of the family Liliaceae. A native of China, it is much cultivated in Great Britain. It grows to a height of about 3 ft., and in late summer bears racemes of orange-red flowers spotted with purplish black. See Lily.

Tiger Moth. Brightly coloured moth of the family Arctiidae, of which there are six British species. The commonest is the garden tiger (*Arctia caia*), whose densely hairy caterpillar is popularly called a woolly bear.

Tiger's Eye. Natural stone, sometimes cut and polished on account of a deep golden-brown colour, due to alteration and silicification of crocidolite asbestos.

Tights or FLESHINGS. Skin-tight garments worn on the stage by acrobats, etc. Those of the acrobat, with their puffed breeches, correspond to the Florentine trunk hose of the early 16th century, just as the conventional figure of Punch owes his pease-cod-bellied doublet to the same century. See Costume.

Tiglath-pileser. The name of several Assyrian kings. The first, reigning c. 1100 B.C., extended Assyrian power into Armenia, Cappadocia, and Lebanon and rebuilt Asshur.

Tiglath-pileser III, from a bas-relief at Nimroud

Tiger. Full-grown male specimen of the powerful Indian variety. Top, the woolly-haired Siberian tiger. See opposite page

Tiglath-pileser III or IV (c. 745-727 B.C.), also called Pul (2 Kings 15), reorganized the army and the state, and subdued N. Syria, holding a court at Damascus attended by Ahaz of Jerusalem (2 Kings 16). His conquests ranged from Ararat to Elam, and in 729 he took Babylon. See Menahem.

Tigranes. Name of several kings of ancient Armenia. Tigranes the Great (121-55 B.C.),

Tigranes. Obverse and reverse of a coin of Tigranes the Great, the former bearing his likeness

variously ranked as I or II, spent many years in Parthia as a hostage. Purchasing release by restoring Parthian territory annexed by Armenia, he succeeded his father Artavasdes II in 95. Aided by his father-in-law, Mithradates the Great, king of Pontus, he regained the ceded lands, turned Syria and Phoenicia into a satrapy, and ruled W. Asia from Pamphylia to the Caspian, founding a new capital at Tigranocerta in the upper Mesopotamian plains. His reception of

Mithradates as a refugee aroused Roman enmity. In 69 Lucullus defeated him at Tigranocerta, and next year at the old capital Artaxata. In 66 Pompey inaugurated a campaign which resulted in the final subjugation of Tigranes, but on payment of 6,000 talents he was left in possession of Armenia Major until his death.

Tigré. Province of Abyssinia. Situated in the N. of the country, it was formerly an independent kingdom. The Tigré language is spoken also in Eritrea. Adowa (q.v.) is the capital of the prov.

Tigre, EL. Argentine watering-place in the prov. of Buenos Aires, much frequented by residents of the capital city, which is 17 m. distant. The township consists chiefly of quintas, or summer residences, and has hotels and boating clubs. It occupies an island formed by the streams of the Tigre and the Luján. Much fruit is grown in the district.

Tigridia. Small genus of bulbous plants, of the family Iridaceae, natives of Mexico and Central

Tigridia. Grass-like leaves and bloom of *T. pavonia*, the Tiger flower

America. *T. pavonia* was introduced into Great Britain in 1796; the plants are about 18 ins. in height, and the flowers are yellow, red, or violet. Tigridias flourish in

a cool greenhouse in sandy loam, but are not extensively grown, as the flowers last at their best only two days. In S. and W. England the tiger flower, as it is called, is hardly out of doors in a warm shady bed or border, but the bulbs should be lifted and stored in autumn, after flowering, in the same manner as dahlias and gladioli.

Tigris. River of Turkey and Iraq. It is formed by the union of several streams which come down from the mts. of Turkish Armenia and the Azerbaijan prov. of Persia. Upwards of 1,100 m. in length, it flows in a S.S.E. direction across Iraq to the Shatt-el-Arab, near Kurna. Its chief tributaries, the Great Zab, the Lesser Zab, and the Diala, join it from the E. Called by the modern Arabs Digla, the Tigris is the Hiddekel of Gen. 2, v. 14 and Dan. 10, v. 4. Several famous cities of antiquity stood on or near its banks. In the First Great War the Tigris played a prominent part in the fortunes of the Mesopotamia expedition. At the time of the British operations the navigability of the channel was vastly improved, steamers of some size being able to ascend as high up as Bagdad, and Basra being turned into an ocean port. See Amara; Bagdad; Euphrates; Iraq; Mosul; Nineveh.

Tikhvin. Town of R.S.F.S.R. It is in the region, and 110 m. N.E., of Novgorod, on the Tikhvinka, a trib. of the Syas. It gives its name to a type of river barge. On the rly. from Leningrad to Vyatka, it was held by the Germans Nov. 11-Dec. 8, 1941, isolating Leningrad. Pop. est. 14,000. See Leningrad, Siege of.

Tilburg. Town of the Netherlands, in the prov. of N. Brabant. It lies 13½ m. by rly. E. of Breda, being a busy junction. The town has woollen, bootmaking and tanning, and tobacco industries. Here is an R.C. commercial high school. In German occupation from May, 1940, Tilburg was entered by British tanks Oct. 27, 1944, after the Germans had left. Pop. 113,090.

Tilbury. Town of Essex, England, part of the urban dist. of Thurrock. On the N. bank of the Thames, Tilbury is 23 m. by rly. E. of London. E. Tilbury is 1½ m. S.E. and W. Tilbury ¾ m. W. of the station. W. Tilbury was a Roman fortress defending the Thames approaches, and in 1588 was the site of the camp for troops assembled to repel the threatened Spanish invasion. E. Tilbury was a town early in the 15th cent., when the present Tilbury Fort was built. Pop. approx. 20,000.

Tilbury docks are one of the five systems under the jurisdiction of the port of London authority. There are a main dock and three branch docks, with water frontage of over 3 m. A floating passenger landing stage, 1,142 ft. long, can accommodate the largest liners at any state of the tide. Among steamship lines sailing from here are P. & O., Orient, City, and Clan. Slightly damaged by German bombs in the Second Great War, the docks were one of the embarkation points for the Allied invasion of Europe 1944. Tilbury is connected with Gravesend by ferry.

Tilden, SAMUEL JONES (1814-86). American lawyer and statesman. Born at New Lebanon, N.Y., Feb. 9, 1814, and educated at Yale and New York universities, he was called to the bar in 1841. Mainly instrumental in breaking up the Tammany or Tweed financial ring, he was elected governor of his native state in 1874. At the presidential election in 1876, in which he was Democratic candidate, a dispute arose as to the legality of the votes of La., S.C., and Fla. A commission of investigation gave Rutherford Hayes the election by one vote. Tilden retired from public life and died at Greystone, N.Y., Aug. 4, 1886. John Bigelow wrote his Life, 1895.

Tilden, WILLIAM TATEM (b. 1893). American lawn tennis player. Born Feb. 10, 1893, at Germantown, Pa., he was one of the finest singles players his country ever produced, representing it in every Davis Cup final during 1920-30. He held the American singles title from 1920 to 1925 and in 1929; his Wimbledon record showed victories in 1920, 1921, and 1930. He later turned professional. In 1949, while in prison for violating probation terms imposed on a moral charge two years earlier, he received a further term for contributing to the delinquency of a minor.

Tile. Unit of burnt clay, fine concrete, glass, asbestos-cement, copper, etc. Tiles are made for roofing, for floor paving, and for wall lining, and to a small extent certain tiles are used for covering ceilings. Most tile units are small, but large units are made in asbestos-cement, glass, and metals.

ROOFING TILES. Burnt clay is processed, pressed in moulds of suitable shape, and then burnt in kilns to produce hard, durable tiles. They are slightly absorbent, and roofs covered with them, to be weatherproof, must be so constructed that rainwater runs

off before it can soak through the tiles. Some tiles are sand-faced to produce an interesting texture, and colours range from bright red to deep brown and blue.

Plain tiles are made in two sizes, 10½ in. by 6½ in. and 11 in. by 7 in. They are cambered in length so that when laid to lap the air gaps between tiles prevent capillary movement of water through laps. Each tile has two nibs at the head so that it can be hung on horizontal battens, and two holes for nails.

Pantiles are 13½ in. to 14 in. long by 9 in. to 11 in. wide. The cross section is of double curvature. This makes rainwater run off easily and protects the side laps. Where double cover is necessary in plain tiling, single cover is adequate in pantiling, and the roof pitch can be lower. Pantiles are hung to battens by a projecting nib and are also nailed. At ridges, eaves, hips, and valleys the space under the rising curve of each tile is filled with mortar and slips of plain tile.

Interlocking tiles, like pantiles, are of single cover. The sides, heads, and tails have grooves and projections which form a weather-proof interlock on the lap. There are several patterns. All have projecting nibs for hanging to battens and two nail holes for nailing. Best-known interlocking tiles are from Marseilles and Courtrai-du-Nord.

Pantiles and interlocking tiles of some types are made with the exterior covered with coloured vitrified glaze.

Asbestos-cement tiles of various colours are made in pantile form, and also in strips several feet long. Like clay tiles in appearance, they are much lighter.

Concrete tiles, both plain and interlocking and in a wide range of colours, are made of fine concrete with an admixture of pigment. In appearance they closely resemble clay tiles; they are highly durable.

FLOOR TILES. These are made in several hard or durable materials, including burnt clay, fine granite concrete, marble, and rubber bonded to an asbestos-cement base. They are laid in cement mortar on a concrete sub-floor. The joints can be butted closely together or put together in mortar ¼ in. to ½ in. wide.

Quarry tiles of burnt clay with a dense, smooth surface are widely used in kitchens, sculleries, and halls. The commonest sizes are 4 in. by 4 in. and 6 in. by 6 in.; red and blue are the commonest

colours. Coved skirting tiles are made to match.

There are several kinds of decorative floor tiles of fine burnt clays, made in a range of colours. These are usually of small size and are laid in patterns. A chequer pattern of black and white squares is a favourite.

Concrete tiles are made in a variety of decorative types. The aggregates used in manufacture are hard wearing—e.g. such as granite or marble. Coloured sands and pigments are used to give various coloured effects. In manufacture, they are pressed into metal moulds in hydraulic machines.

WALL TILES. These are generally of glazed clayware and are made in various sizes up to 6 in. by 6 in. There is a wide range of colours and mottled effects, though white is generally favoured for the main surfaces with narrow bands of black or colours. Special tiles are made with rounded edges and angles for the tops of dadoes and for internal and external angles. Concrete tiles with smooth surfaces, incorporating coloured sands and pigments, are also used for wall tiling. Glass tiles of coloured opaque glass are used in bathrooms where their high cost is not objected to. Wall tiles are bedded on a cement and sand mortar; for appearance's sake, the joints are usually closely butted.

Wall tiles of all kinds are used also for fireplace surrounds, and glazed clay tiles are used for hearths. Slabbed fireplace surrounds and hearths are made with glazed clay tiles on a backing of strong concrete.

Tile Fish (*Lopholatilus chamaeleonticeps*). Spiny-finned marine

Tile Fish. Edible fish found on the slope of the Gulf Stream at a depth of 60-75 fathoms
American Museum of Natural History

fish of the order Teleostei, native of the Gulf Stream slope off New England. Closely related to the sea perch (*Serranus*), it is about a foot long. Its dorsal and anal fins have a few feeble spines.

Tile Ore. Term sometimes given to a reddish-brown, earthy variety of cuprite, an oxide of copper. The mineral takes its name from its resemblance to red tile.

Tilhar. Town of the Uttar union, India, in Shahjahanpur dist., on the Oudh and Rohilkhand rly. Its battle-mented brick wall is now in ruins. Pop. 24,000.

Tiliaceae.

Botanical name of the lime family. These trees and shrubs (a few herbs) are chiefly natives of the tropics, though the typical genus, *Tilia* (the lime) is found in Europe, N. Asia, and N. America. All have alternate, undivided leaves with toothed edges, complete flowers with five sepals and five petals, and produce nectar. Fruits and seeds vary. The inner bark of the lime furnishes the bast of the gardener, and the fibres of *Corchorus* are the jute of commerce.

Till. Hardened boulder clay of glacial origin. The word is not commonly used nowadays, but from it is derived tillite, a rock name referring to ancient glacial deposits which are now consolidated to form hard rocks, and were formed in Ice Ages earlier than the last one. See Boulder Clay; Drift; Ice Age.

Till. River of Northumberland. It rises in the Cheviots and flows E. and then N. and N.W. until it joins the Tweed below Coldstream. Called in its upper reaches the Breamish, it is 32 m. long. Its chief tributary is the Glen, and it passes by Chillingham and the battlefield of Flodden.

Tillett, BENJAMIN (1860-1943). British labour leader. A Bristol boy, born Sept. 11, 1860, he went

Ben Tillett, British labour leader

to work in a brickyard at the age of 8 years, joined a circus, went to sea in a trawler, served in the navy and mercantile marine, and finally settled

Tiles. 1. Pantiles as laid on laths. 2. Section of pantile, showing nib which catches on lath. 3. Interlocking tiles, when laid. 4. Section of three interlocking tiles. 5. Italian tiling. 6. Plain tiles showing method of fixing

in the London dock district. There he organized the dockers' union, and later became secretary of the dock, wharf, riverside, and general workers' union. He was a leader of the great dock strike for 6d. an hour wages in 1889, and the organizer of others in 1911-12; also of the general federation of trade unions and the national transport workers' federation. Alderman of the L.C.C., he stood for parliament four times unsuccessfully before winning N. Salford for Labour, 1917-24 and 1929-31. The First Great War found Ben Tillett speaking strongly for the Allied cause to organized labour. An original member of the T.U.C. council, he was president of congress for 1929, retiring from union work two years later. His *Memories and Reflections* came out 1931, but he lived until Jan. 27, 1943.

Tilley, VESTA (b. 1864). Stage name of Matilda Alice, Lady de Frece, née Powles, British variety artist. Born at Worcester, May 13, 1864, she went on the stage as an infant and at 5 was giving impressions. As a male impersonator she won great popularity in the

provinces, and her earliest London appearance was in 1878 at the Royal, Holborn. In 1882 she played in the Drury Lane pantomime. She retired from the stage in 1920 after the knighting of her husband, Walter de Frece (d. 1935). Among songs she made famous was *Following in Father's Footsteps*. Her autobiography, *Recollections of Vesta Tilley*, appeared in 1934.

Vesta Tilley,
British actress

Tillicountry. Town of Clackmannanshire, Scotland. Situated on the Devon river, with a rly. station, it is 5 m. N.E. of Alloa. The principal industry is the manufacture of woollens, Tillicountry shawls, plaids, tartans, and tweeds being famed for their quality. There are several churches, and an orphanage. Pop. 2,953.

Tillotson, JOHN ROBERT (1630-94). English prelate. Born at Halifax, he was educated at Clare College, Cambridge. At first a Presbyterian, he accepted the Act of Uniformity, and held in turn the positions of rector of Kedington, preacher at Lincoln's Inn,

John Tillotson,
English prelate

chaplain to Charles II, dean of Canterbury, canon of S. Paul's, and in 1689 dean of that cathedral. When Sancroft the non-juror was deprived of the see of Canterbury, Tillotson succeeded him as archbishop in 1691. He died Nov. 22, 1694. A tolerant divine with Puritan sympathies, and a tactful controversialist, he was the author of *The Rule of Faith*, and *Lectures on Socinianism*. His published sermons are among the best examples of the pulpit oratory of his age, and he was long admired as a master of prose. *Consult Works*, 3 vols., 1752.

Tilly, JOHN TIERCLAES, COUNT OF (1559-1632). German soldier. Of a Walloon family, he was born at Tilly, in Brabant, and served with distinction as a young man under Parma in the Netherlands, and against the Turks in Hungary. In 1610 he entered the service of Maximilian of Bavaria, head of the Catholic League, whose army he commanded in 1620. Rejoining

the Imperial service, he was made commander-in-chief on the outbreak of the Thirty Years' War. Tilly's victory at the White Mountain, Nov. 8, 1620, was the first decisive blow struck in the war, in which he proved himself the ablest commander upon either side until the appearance of Wallenstein and Gustavus Adolphus. His most notable victories were at Wimpfen.

May 6, 1622, and Lutter, Aug. 27, 1626. Another success, the capture of Magdeburg in 1631, was stained by frightful massacres. Though an excellent general of the old school, Tilly met more than his match when pitted against the genius of Gustavus, who routed his forces at Breitenfeld, Sept. 17, 1631, in spite of superior numbers, and again at the passage of the Lech, April 15, 1632, where the old soldier was mortally wounded, dying on April 30 at Ingolstadt. *See Thirty Years' War*.

Tilly Seed. Alternative name of the seed of a small tree, *Croton pavana*. *See Croton*.

Tilsit OR SOVIETSKY. Town of N. Europe. Lying 60 m. N.E. of Kaliningrad (Königsberg,) it was in E. Prussia until 1945, when, a bastion of the German defences of that territory, it was taken by storm by troops of the 3rd White Russian army on Jan. 20, to be later annexed and renamed. It was the scene of the final defeat of the Prussians by Napoleon in 1805; and on a raft in the middle of the Niemen (Memel), Napoleon and Alexander I of Russia signed in 1807 the treaty described below. Tilsit, an important centre of the German cellulose industry, developed also before the Second Great War such industrial establishments as iron foundries, machine shops, and oil and sugar refineries. Pop. approx. 57,000.

Tilsit, PEACE OF. Concluded on July 7, 1807, between France on the one hand and Russia and Prussia on the other after the defeat of the Russians at Friedland. Napoleon found it convenient to treat Russia well, giving her a free hand in Sweden and Turkey, provided she maintained his continental system in regard to foreign trade. Prussia, on the other hand, lost her possessions W. of the Elbe, and the slice of Poland she had obtained in the partition of 1793-95;

a heavy indemnity was imposed, and her standing army was reduced to 42,000 men.

Tilting. Term applied to a form of jousting introduced into the tournament about 1440, in which the lists (or course) along which the competing knights rode at each other was divided longitudinally by a barrier, called a tilt. Each knight was thus obliged to keep his own side of the tilt during the whole course, and the lance of each would consequently be inclined at an angle when the contact occurred, so that no direct hit could be made. There was a tiltyard, much frequented by Queen Elizabeth, on the site of the present Horse Guards in Whitehall. Special armour was devised for tilting. A humbler form of tilting consisted in running with a pole at a quintain or suspended ring or other mark. From A.S. *tealt*, meaning unsteady, the word in modern usage indicates an attack, usually upon a stronger opponent or immovable object. Full tilt signifies headlong, at full speed. *See Eglinton Tournament; Quintain; Tournament*.

Timaru (Maori, Te-maru, place of shelter). Capital and seaport of the fertile dist. of S. Canterbury, N.Z. Timaru is 100 m. S. of Christchurch, beautifully situated upon sheltered Caroline Bay, on the main S. rly. line and main highway from Christchurch to Dunedin. It has a temperate climate with day after day of untroubled winter sunshine; its beach is safe and sandy; snow-clad mts. give a fine background.

There is a well-constructed artificial harbour and an airport less than 1½ m. away. Industrial plants include freezing works, flour and biscuit mills, a woollen mill, pottery works, iron foundries, timber yards and sawmills, a shoe factory, and breweries. Pop. 17,650.

Timber. Term used for wood of sufficient size for commercial purposes. There are more than 6,000 varieties of timber trees. Timber is either hardwood or softwood. Hardwood is from trees bearing broad leaves, softwood trees having narrow or pin-like foliage. There are, however, exceptions: e.g. the timber of the yew which, botanically softwood, is hard and close grained.

The principal hardwoods are mahogany, oak, and walnut, mahogany being probably the world's finest decorative timber. The finest mahogany comes from Central America, Cuba and Honduras mahogany being outstanding. Easily accessible sources of these

Count John Tilly,
German soldier

Timber. Sections showing graining of British trees used commercially. Left to right, oak, elm, larch, ash, Scots pine

timbers were exhausted during 1830-60, largely owing to the introduction of French polishing, and existing mahogany lies far inland in the American forests, whence it is difficult to remove it. This has led to the development of an enormous trade in the less beautiful African mahoganies.

European oaks used commercially in the U.K. are the English and the Austrian. English oak varies greatly. There are fine up-standing trees with boles of good length and girth without branches, the timber of which is mild, and much used in reproducing period furniture. Other trees are dwarfed and knarled, and virtually useless except for gate posts. Austrian oak, from Austria and surrounding countries, is large in growth, mild, and knotless. After use it matures to a nut brown colour. It is much favoured for high class joinery work. Other oaks come from America, and from Japan and the mainland W. of Japan, the last also known as Japanese oak. Light in colour, it is used in furniture of contemporary design and good quality. Its principal fault is the smallness of the timber. American red oak is much used for mass produced furniture. American white oak, from the Appalachian mts., the lightest coloured oak, is a hard, close grained timber, growing to large proportions. It is much used for veneers in mass produced furniture and is polished near to natural colour.

The principal European walnuts are French, English, and Italian, all three having the same botanical name (*Juglans regia*) and belonging to the same family (*Juglandaceae*). All three are deservedly used as veneers. The French is of upright growth, rich in its almost parallel lines of brown, and is much used for cross-grained bandings. The figure of Italian walnut is rich and wandering, English being similar, but not so wild.

Northern pine is by far the most important European softwood. It grows from the lat. approxi-

mate to the S. of England as far as the northern Arctic. The more southerly the site of growth, the more quickly the tree develops, and the lighter in weight is the timber. The vast Siberian forests of northern pine are the slowest grown. Winter being perennial, the lifelong growth of the tree is slow and hardy, and in normal times its timber costs more per sq. ft. than average examples of African mahoganies.

The values of northern pine lie in the great quantities available, in its large resin content, which makes it resistant to decay, and in the different gradings. The quicker growths are used for exposed structural work such as roofing and for outbuildings. These and the next best qualities are used for carpentry house fittings, such as doors and windows and their surrounds. Northern pine from the N.W. of Europe is used for the sounding boards of pianos and other musical instruments. This and Siberian pine is used in high class joinery work and for good quality carving.

New Furniture Timbers

During the 20th century interest in furniture timbers has much increased with the desire to see the wood rather than to allow it to be disguised by polish. This has encouraged the introduction of new woods, or the reintroduction of woods that had little encouragement in the past. Yew is one of the most beautiful. Used as a veneer it blends well with mahogany. It varies in colour from golden yellow to golden brown, often being figured with a dark streak. The pores are so small as to give it a metal-like appearance. Macassar ebony has a stripy figure, varying from black to brown, brownish yellow and green; the wood is impressive, hard in texture, and rather cold in tone. Indian silver greywood, a light timber, is from yellowish brown to greyish brown, with occasional darker streaks. Australian blackwood, dark brown in colour, is an interesting timber

when well selected for figure and colour; such parcels as are worth while used in veneer form give magnificent effect. Australian silky oak is pinkish-brown. Light in colour, its medullary rays are more elliptical than in other oaks. The timber is mild and has not the strong appearance of the ordinary oaks. Indian laurel is a superior timber, dark brown and hard, finishing with a lustre. It is best used in veneer form. Australian black bean is similar to better qualities of Australian blackwood, and best used as veneer.

Walter Coventon

Timbre (Fr., tone). Musical term indicating distinctive quality. It designates not only those properties which distinguish different instruments and voices, but also those more subtle properties which distinguish, say, one violin from another. Quality is due to the presence and prominence of certain upper partials and to the form of sound waves.

Timbrel. An ancient percussion instrument of the tambourine (*q.v.*) type, covered, like the tambourine, with skin. It was often square or oblong, though also sometimes round.

Timbuktu, TIMBUCTU, TIMBUCTOO, OR TOMBOUCTOU. City of French Sudan.

Situated on the S. edge of the Sahara Desert, about 8 m. N. of the river Niger, it stands on one of the most important trade routes in W. Africa. It is in communication.

Timbrel used in modern orchestra

Timbuktu, French Sudan. Gateway to one of the city's mosques, distinguished by the curious wooden projections

Timbuktu, French Sudan. Air view of the 11th century city, showing the market square, centre

by means of small steamboats on the Niger, with Koulikoro, the terminus of the rly. from Ambididi and Kayes, the farthest navigable point on the Senegal river. It was founded in the 11th century, but did not become known to Europeans until after the visit of Ibn Batuta in 1350, after which date it gradually acquired a fame out of all proportion to its real importance. It was occupied by the French in 1894. The pop., at one time much more, is some 6,000.

Time. One of the fundamental conceptions, the perception of the sequence of events. Attempted definitions are too controversial to permit of their being given here.

The measurement of time is, in some respects, easier than its definition, and has always depended upon the constant recurrence of certain phenomena, e.g. the rising and setting of the sun, stars, etc. The day, month, and year are natural units of time on the earth, the second, minute, and hour artificial subdivisions of these. The astronomical unit of time is the sidereal day, the time it takes for one complete rotation of the earth to bring a star to its highest point in the sky on two successive occasions. It is suspected that this interval is not precisely constant; but no better time-keeper than the rotating earth is known.

Civil time cannot be based on sidereal time because of its practical inconvenience, so the period of rotation of the earth relative to the sun (the solar day) is used, for it is the sun that governs daily life. The apparent solar day varies in length at different times of the year, so its average (mean) value is chosen to define civil

time, and it is this mean solar day that is divided into the hours, minutes, and seconds of clocks. The difference in time between the actual position of the sun and its average, or mean position, i.e. the difference between the time shown by a sundial and by a clock, is called the Equation of Time (*q.v.*). Accurate instruments have made it possible to measure the time between constantly recurring events with increasing accuracy. Pendulum clocks reached their summit of precision in about 1920 with the Shortt free-pendulum clock. More accurate still is the quartz crystal clock, in which the electronically maintained vibrations of a quartz plate oscillating 100,000 times a sec. drive a dial. All time standards must, however, be checked by observations of the stars.

Standard Times

The earth makes one complete rotation on its axis in 24 hrs., which is equal to 15° in 1 hr. Since the earth rotates from W. to E., a place 30° E. of Greenwich will have noon 2 hrs. before Greenwich, and a place 30° W., 2 hrs. later. To minimise difficulties caused by this variation, standard times have been agreed internationally according to longitudinal belts. Each meridian of longitude divisible by 15 is taken, and the belt bounded by meridians 7½° on each side takes its time from the central meridian. Thus the following meridians divisible by 15 cross Canada: 60°, 75°, 90°, 105°, 120°, and 135° W. long. Therefore there are six standard time-belts in Canada, having noon, 4, 5, 6, 7, 8 and 9 hrs. after Greenwich. In Europe, standard

time is taken from the meridians 0°, 15° E., 30° E., and in Australia from those of 120° E., 142½° E. (the 135° passes through an area of sparse population), and 150° E.

The twelfth time zone reckoning eastwards from Greenwich would, on this system, keep time 12 hrs. fast on Greenwich. The same zone reckoned westwards would be expected to keep time 12 hrs. slow on Greenwich. There is therefore a discontinuity of a day on the 180th meridian, and at the international Date Line (*q.v.*), ships travelling E. drop a day from their reckoning, while ships travelling W. count the same day twice over. See Calendar; Clocks; Relativity; Sidereal Time; Space.

Time. In music, the measurement based on the periodicity of the accents, and classified according to the subdivision of the beats. It is not the same as tempo (*q.v.*). The instinctive desire for rhythm and proportion, which is as evident in music as it is in verse, gives rise to regularity of accent. If the accent occurs on every other beat, the time is duple; if once in three, then it is triple; and if once in four, it is quadruple. A bar-line is drawn through the stave or staves immediately before the accented beat, and hence it is commonly said that the accent falls on the first of the bar. If each of the beats is divisible into two lesser values, the time is simple; if divisible into three (the beat being dotted), it is compound. See Harmony; Music; Signature.

Time. American weekly news-magazine. First published March 3, 1923, under the joint editorship of Briton Hadden and Henry Luce (*q.v.*), it attempted to make the news of the day readable in narrative form. The journal rapidly became popular in the U.S.A., built up a news-gathering organization of its own all over the world, and started an edition which, printed in Paris, was sold in most countries of Europe.

Time and Motion Study. Method of attaining industrial efficiency, especially in mass production industries. It is applied by carrying out a careful analysis of all the movements involved in a particular operation. The layout of plant and equipment is then planned so as to eliminate unnecessary movements and thus to allow workers to carry out each operation in the minimum of time and with the minimum of fatigue.

Time and Tide. British weekly review of politics, literature, and the arts. It was founded in

1920 by Lady Rhondda (*q.v.*), who also edited it, and in it gave scope for serious contributions by women as well as men. Distinguished men and women invited to contribute to its *Notes on the Way* are allowed to express themselves freely irrespective of editorial policy. E. M. Delafield was on its staff, and her *Diary of a Provincial Lady* first appeared in its pages. Originally independent and non-party, from the 1930's it tended to veer to the right in politics.

Time Base. Device for the accurate measurement of time. A time base consists usually of an indicator which travels repeatedly over a fixed scale, starting its journey from a zero mark on the scale and making it always in the same time. At any instant the distance travelled by the indicator from its starting point is a measure of the time that has elapsed since the journey began. A time base thus converts time into straight-line or angular movement, making it possible to measure it with a foot-rule or a protractor, as the case may be.

The most familiar time bases are formed by the hands and the dials of clocks and watches. Starting from 0 (or 12) o'clock, the hour hand sweeps through 360° of angle every 12 hours, or 30° every hour. The hours can thus be indicated by marks 30° apart. A second time base indicator, the minute hand, travels over the same scale in one hour, passing through 6° of angle every minute. If the dial had no mark except that indicating zero, the time

signed to measure very small intervals of time with exactness. A micro-second is one-millionth of a second, and an express train travelling at 60 m.p.h. spends more than 900 micro-seconds in moving forward one inch. Yet the physicist requires time to be measured accurately to a small fraction of a micro-second. Operators without laboratory training can measure time to one-third of a micro-second when using radar equipment.

This is made possible by the application of time-constant (*r.f.*) circuits to the cathode-ray tube. A typical radar use of a time base is shown diagrammatically in the accompanying figure. The time-constant of R and C is, say, 300 micro-seconds. The arrival of the synchronising pulse from the transmitter causes the relay, which contains a 300-micro-second time-constant circuit, to apply a strong negative potential for that length of time to the grid of the time base discharge valve V. This closes the valve down. As no anode current is flowing, there would be no voltage drop across R, and the anode potential would rise to 4,000 v. at once, were it not for the capacitor C, in series with R. Since the anode is tied to the junction between C and R, its potential at any instant is governed by the time-constant of C and R. This is 300 micro-seconds. The positive potential on the X₂ plate of the cathode-ray tube is that of the anode. Hence this potential increases for 300 micro-seconds, drawing the spot across the screen of the C.R.T. The distance which the spot has travelled across the screen is at any instant a measure of the time that has elapsed since it started its journey. By making the returning echo apply a brief negative potential to the Y₂ plate the spot is caused to make an upward movement for the duration of the echo pulse. The "break" in the trace caused by this movement serves as the indicator. The distance from the start or "origin" of the trace at which it occurs makes it possible to measure the time that has elapsed with great precision.

There are innumerable other applications of the time base, both in the physical laboratory and in everyday life. When, for instance, a motor-car crosses the bumper bar set in the road at some distance from an automatic traffic signal, it brings a time base into action. The time-constant of this is

adjusted to a suitable number of seconds. At the end of that time the charge across the capacitor is sufficient to trigger a relay which operates the switching of the lights. See Cathode-Ray Tube; Radar.

R. W. Hallows

Time Bomb. Popular term for a bomb with a delayed action. See Fuse.

Time-Constant. Conception in physics. If a capacitor and a resistor, arranged in series, are connected to a source of current, as by turning the switch in Fig. 1 to position A, current flows into the capacitor and begins to charge

Time-Constant. Fig. 1. See text

it. To start with, current flows in without encountering much opposition and the charging rate is high. But as more and more electrons enter the capacitor, a potential is built up which opposes the E.M.F. driving the current in. The position is much the same as that encountered when one is inflating a flat tyre. To begin with there is no pressure in the inner tube to oppose the entry of the air pumped in. But as the tube fills the opposing pressure increases and the work becomes harder. Substituting lbs. per sq. in. for volts, the increase in the pressure in a tyre under inflation by hand would, if plotted against time, be represented by a curve shaped very much like that of Fig. 2.

In a capacitor under charge the E.M.F. built up by the inward flow of current develops a similarly increasing opposition. Rapid at first, the charging current tails off. Similarly the E.M.F. built up across the capacitor rises steeply at first and then shows a slower and slower build-up. The charging curve of the capacitor (Fig. 2) is exponential. No matter what the applied E.M.F., the capacitor always charges to 63 p.c. of this voltage in a time in secs. equal to the capacitance (in farads) multiplied by the resistance (in ohms).

Time-Constant. Fig. 2. See text

Time Base. Diagram illustrating how time-constant circuits may be used to produce a time base which enables very small intervals of time to be measured

could be determined accurately by means of a protractor. Clocks have also been made with straight-line scales and indicator movements. If such scales were ungraduated the time could be found with a foot rule.

The term time base is, however, most commonly used to describe electrical devices de-

Suppose that in Fig. 1 the battery has an E.M.F. of 100 v.; the capacitor, a capacitance of 2 micro-farads, and the resistor a resistance of 100,000 ohms. Expressed in farads, 2 micro-farads equal 2×10^{-6} . Therefore the voltage across the condenser is 33 v. in $2 \times 10^{-6} \times 10^5 = 2 \times 10^{-1}$, or 0.2 sec. This is the time-constant of the circuit. Given stable components, a circuit can be made up which will display any required time-constant indefinitely.

An inductance coil and a resistor in series have also their time-constant. In practice the leads to any capacitor or inductance coil (as well as the plates of the one and the windings of the other) must contain some resistance. It follows that, even if no actual resistor is used, every capacitor and inductance coil in a circuit must have its time-constant.

Time-constants have important applications in time base circuits. Their effects may also be of considerable moment in electrical circuits in which alternating or oscillating currents are present.

R. W. Hailows

Time Fuse. Type of fuse designed to explode in the air at a certain time after discharge. It is used mostly with shrapnel shells, which explode above the target. The working of the principal kinds of time fuses depends upon varying the length of a channel of gunpowder which, ignited at one end by the force of discharge, communicates at the other with the detonating charge. See Ammunition; Artillery.

Times, THE. British newspaper. Founded Jan. 1, 1785, by John Walter, it was for a short time known as *The Daily Universal Register*, and for many years enjoyed no eminence over its competitors. Its greatness began when John Walter II took over its management in 1803. His father died in 1812; he was then 36, and between then and his death in 1847 he gave his journal a place of its own, outpacing every rival. He organized a system of foreign correspondence which made *The Times* the principal source of information about international affairs throughout the world. It was the model upon which other journals fashioned their sheets; its news and articles were widely copied. Someone described it as "the raw material of journalism," implying that most other newspapers lived by adapting its contents to their own particular needs.

Journalists had been dependent mainly upon the government for information about foreign affairs. The second John Walter saw how important it was for city men to hear quickly all that was going on abroad; and he beat the government with the news of many great events, such as the battle of Waterloo. There exists in most foreign capitals the idea that *The Times* is also the organ of the British government; that has never been true since the second John Walter took command. Nor was it only in the contents of the paper that *The Times* led the way. John Walter III revolutionised the methods of printing. He was the first to print by steam, and the Walter press, first used in 1869, formed the basis of improvements later introduced.

It was John Walter II who appointed the most famous editors of *The Times*, Thomas Barnes in 1817 and John Delane in 1841. Barnes was the pioneer of independent, impersonal journalism, and the greatest editor of the century; the creator of the "Thunderer." Delane was much helped by his example, and extended the paper's acquaintance with everyone of political note. After Delane came Thomas Chenerly, G. E. Buckle, Geoffrey Dawson, and Wickham Steed. In 1923 Dawson again was given charge. From 1941 R. M. Barrington-Ward was editor, and on his death in 1948 he was succeeded by W. F. Casey.

The *Times* has always been ready to attack abuses and denounce frauds. By a tablet in the office in Printing House Square is commemorated the exposure of a conspiracy to defraud London bankers in 1841. The bankers offered to refund the expense to which the paper had been put, but that offer was declined and the money went to found scholarships at Oxford and Cambridge. When John Walter III died in 1894 he left the paper to his second and eldest surviving son, Arthur, but by this time the property had been divided up among many. A little later Lord Northcliffe acquired a controlling interest, and under his energetic influence *The Times* regained the reputation it lost during the Parnell lawsuit of 1889. After his death in 1922, control passed to J. J. Astor and John Walter IV, who, by the creation of a trust, made arrangements to prevent the paper from being sold as a commercial undertaking.

One prominent feature of *The Times* for more than a century has been the letters to the editor, which gave rise to the saying, "I must write to *The Times* about it." Thus the paper has always been the national forum of discussion and, although its price has at times been high, an organ of opinion that no well-informed person can afford to neglect. The price has varied a good deal. It began at 2½d., and rose by stages to 1s. in 1806; then it dropped by stages to 3d., at which price it remained from 1861 to 1913. In 1914-16 it was 1d.; 1917, 2d.; in 1918, 3d. It fell in 1922 to 1½d., but next year was raised to 2d., and in 1941 to 3d.

Other publications issued from the same offices are *The Times Weekly Edition*, *The Times Literary Supplement* (weekly), *The Times Educational Supplement* (weekly), *The Times Review of Industry* (monthly), and *The Times Law Reports* (fortnightly). See Barnes, T.; Blowitz; Delane; Journalism; Newspaper; Northcliffe; Steed, H. W.; Walter, John. *Consult History of The Times*, vol. I, 1935; vol. II, 1939; vol. III, 1947.

Time Signal. Broadcast of exact Greenwich time by the B.B.C. The signal, which consists of six "pips" or dot seconds, is received from Greenwich observatory and radiated to listeners at regular intervals throughout the day. It is the final dot which indicates the appropriate point of time, which it does with a normal accuracy of within one twentieth of a second.

Times Square. Locality in New York City. The actual square is at the junction of Broadway, Seventh Avenue, and W. 42nd Street, but its name is applied to a district filled with theatres and other places of entertainment. Here the crowds gather on such occasions as New Year's Eve and the night of a presidential election. The illuminated advertisements here are famous.

Timgad. A ruined city of Algeria. It is 24 m. N. of Batna, and is situated at the intersection of six Roman roads. The Thamugas of the Romans, excavations here have uncovered the forum, the theatre, baths, temple of Jupiter, and numerous other buildings. The arch of Trajan is one of the best preserved of Roman triumphal arches.

Timis. Rumanian form of the name of the river described under its Hungarian form *Temes*.

Timisoara (Hung. Temesvar). Town of Rumania. Capital of the Banat, it was formerly a royal free city of Hungary. It stands on the Bega canal, 72 m. N.N.E. of Belgrade. The chief buildings are the 18th cent. R.C. cathedral, the Greek Orthodox cathedral, and the arsenal (built on the site of a castle erected by Hunyadi in 1442 and destroyed in 1849). A university was founded here in 1945. It has flour mills, breweries, tobacco, leather, cloth, and paper factories. During the Second Great War Russian and Rumanian troops captured Timisoara from the Germans, Sept. 19, 1944. Pop. 108,296.

Timmer. A comet, discovered by means of photographs taken at the Vatican observatory in Feb., 1946, and named after the Jesuit astronomer who first photographed it near the Great Bear constellation.

Timmins. Town of Ontario, Canada. Lying 450 m. N. of Toronto, it is served by the Ontario Northland rlys. and Trans-Canada airways. Centre of the Porcupine gold mining area, it has saw and planing mills. Pop. 28,790.

Timne or **Timni**. Negro people in Sierra Leone, and in adjacent dists. of French Guinea. They are the chief rice growers in Sierra Leone. Each village has its chieftain, and some dists. are placed under the authority of kinglets but controlled by the British administration. Political and social life is directed by a Poro secret society resembling that of the Mendi people S. of them, with elaborate initiation ceremonies in three degrees. There is a widespread practice of witchcraft.

Timok. River of Yugoslavia. Rising between Pirot and the

Stara Planina, it flows N. for about 100 m., to join the Danube, which it enters on the Bulgarian boundary. A battle was fought here between Bulgarians and Serbians, Oct. 11-28, 1915, beginning three days before the Bulgarian declaration of war. On Oct. 28 the Serbians fell back to a new line.

Timoleon (c. 411-337 B.C.). Greek soldier, the liberator of Sicily. Born at Corinth he was party to the murder of his brother when the latter endeavoured to make himself tyrant of the city. In 344, in response to an appeal from Syracuse in Sicily, originally a colony of Corinth, Timoleon led a small force to assist the Syracusans against the tyrant, Dionysius the younger, and against the Carthaginians. The latter were defeated outside Hadranum, and Dionysius offered to give up his Syracusan stronghold. Timoleon gained possession of the whole of the city, and re-established democratic government.

He then turned his attention to other Sicilian cities oppressed by tyrants, but meanwhile the Carthaginians had landed in immense force at Lilybaeum in 339. Timoleon signally defeated it, with a very much smaller force, however, on the Crimissus, and was then free to proceed with the liberation of Sicily from the tyrants. A peace was concluded with the Carthaginians in 338, by which the boundary of their dominion was fixed at the river Halycus. His work accomplished, Timoleon divested himself of all authority, and became a private citizen of Syracuse. He is the subject of one of Plutarch's Lives.

Timon. Athenian misanthrope of the 5th century B.C. He was so

disgusted with the conduct of his friends when he lost his fortune that he retired into seclusion, shutting himself up in a tower, into which nobody was admitted except Alcibiades.

Timon of Athens. Tragedy by Shakespeare. It tells how Timon, ruined by lavish entertainment of his friends, and deserted by them in adversity, becomes a bitter misanthrope, and retires from the world to die alone. Composed about 1607 and first published 1623, the play, of which part was written by George Wilkins, or by some other hand than Shakespeare's, is drawn from Paynter's Palace of Pleasure, Plutarch's Life of Mark Antony, and possibly Lucian's dialogue, Timon, or The Misanthrope, and Boiardo's comedy, Il Timone. It contains 2,358 lines, including 1,560 of blank verse and 596 prose. The play was fairly popular in the 18th century, but nowadays revivals are rare (Court Theatre, 1904; Old Vic, 1922; Westminster Theatre, 1935). It lacks dramatic appeal, and is valued only for the soliloquies of the chief character, which have been described as a "dictionary of imprecations."

Timon of Phlius (c. 325-235 B.C.). Greek sceptic, called Sillographer, writer of silloi, satirical poems on philosophers, dead and alive and their Tenets. Our perceptions and opinions, he says, are neither true nor false, therefore not to be trusted. It is not the phenomenon, however, but what is, that is in doubt. "I do not assert that honey is sweet, only that it appears so."

Timor. East Indian island, easternmost of the Sunda Islands. The N.E. half and the Ocussi en-

Timgad, Algeria. A southward view across the ruins of the ancient Roman city. To the left is the arch of Trajan, probably on the site of what was the city's western gateway. The colonnades, seen in the middle distance, are those of the market place, while the two columns on the right belong to the temple of Jupiter, and the two seen between are those of the Capitoleum. See facing page

slave are Portuguese, the remainder belonging to E. Indonesia (formerly Dutch). Portuguese territory covers 7,330 sq. m.; the main portion being 6,325 sq. m., Ocussi 950 sq. m., and the island of Kambirg 55 sq. m.; the E. Indonesian area is 24,449 sq. m. Pop., E. Indonesian, 1,657,376; Portuguese, 463,996.

The island is traversed by a series of parallel mountain chains, which culminate in Ramelau, 9,000-10,000 ft. Most of the coast is lined by coral reefs. The porous limestone causes much of the land to be sterile; the rivers are short, and useless for navigation or irrigation. Malaria has been common on the coast marshes. The people are said to be Belonese, with affinities to the Papuans, in the centre and E., and Timorese, related to the Malays, in the W. Dilly and Kupang are the respective Portuguese and E. Indonesian capitals.

The native crops are maize, rice, sugar-cane, bread-fruit, and bananas. Coffee, cocoa, and copra are produced for export. Horses and buffaloes are reared. Sandalwood, for which possession of the island was sought in the 17th cent., is still obtained from the forests. Pearl shell and bêche-de-mer are exported.

The Portuguese settlement dates from the 16th cent.; the Dutch occupied Kupang in 1618, and until 1851 there was continuous friction, especially as the respective territories were ill-defined. Treaties were made in 1860, 1893, and 1902 between the two powers, with indifferent results until the territorial question was determined by a convention in 1904, ratified in 1908. Portuguese Timor was made independent of Macao in 1896, and became an overseas prov. of Portugal in 1950.

During trade talks in 1941 between the Japanese govt. and the Netherlands authorities, the former demanded special facilities at the Timor aerodrome, refused by the Dutch. Shortly after Japan attacked the E. Indies, Japanese submarines were off the coast of Portuguese Timor, into which, on Dec. 18, 1941, Dutch and Australian forces moved since it was defended only by an ill-equipped company of native infantry. Although she had agreed on Nov. 4, 1941, that she would accept British protection here in the event of a threat of Japanese invasion, Portugal immediately protested against the Australian-Dutch action, and dispatched a

force to take over. Before this reached Timor, however, the Japanese had landed at Dilly and Kupang, Feb. 20, 1942, and soon occupied the whole of Timor. Survivors of the Allied troops, with native guerrillas, formed Sparrow Force (*q.v.*). Japanese installations and airfields were bombed from time to time by Allied aircraft, but no attempt was made to retake the island by force, and the Japanese remained in occupation until the general surrender of the forces in the Netherlands Indies at Morotai on Sept. 9, 1945.

It was on Timor that Bligh landed in 1789 after seven weeks in an open boat. *See* Bounty, Mutiny of the; Indonesia.

Timorlaut or **TANIMBAR ISLANDS**. Group of coralline islands in the Malay Archipelago. It lies 260 m. E.N.E. of Timor. Yamdena, Selaru, and Larat are the chief islands. Maize, coconuts, bananas, and sweet potatoes are the chief products. The Japanese occupied Timorlaut after some resistance in July, 1942, and remained there until the general surrender of their forces in the Netherlands Indies at Morotai, Sept. 9, 1945. The group forms part of the state of E. Indonesia. Its area is 2,060 sq. m. Pop. 25,000.

Timor Sea. Name given to that portion of the Indian Ocean lying between the island of Timor and the N. coast of Australia, and leading to the Pacific by the Arafura Sea. *See* Indian Ocean.

Timoshenko, **SEMYON KONSTANTINOVICH** (b. 1895). Russian soldier. Son of a peasant, he was born at Furmanka, Bessarabia, and in 1910 joined the tsarist army as a machine-gunner, serving with the cavalry in the First Great War. He went over to the Red army at the outbreak of revolution in 1917, and earned reputation as a guerrilla leader. After the Polish war he studied strategy at the Soviet military academy, and then held district commands in White Russia, Kiev, N. Caucasus, and Kharkov.

During the Russo-Finnish war of 1939, Timoshenko built a replica of the Finnish Mannerheim Line where he rehearsed his troops before launching a successful attack on the fortifications. On July 11, 1941, three weeks after Germany's invasion of Russia, he was appointed to command the W. front, comprising White Russia and Poland. Although forced to give ground, he

held the Germans from Moscow by repeated counter-attacks until winter immobilised their mechanised forces. In 1942 he led the offensive that freed the Kerch peninsula; next year was in command on the northern front; and in 1944 was given charge of the 2nd and 3rd Ukrainian fronts.

Timotheus (fl. 354 B.C.). Athenian sailor and soldier. Son of Conon (*q.v.*), he held his first command in 378, and, after serving by sea and land against Sparta and Persia, in 354 was prosecuted for having failed to relieve Samos with the Athenian fleet in 356. He was condemned and sentenced to a heavy fine. Not having the money to pay, he was compelled to go into exile, and died soon after at Chalcois, in Euboea.

Timothy or **TIMOTHEUS**. Companion of S. Paul. The son of a Gentile father and of Eunice, a Jewess of Lystra, he was probably converted to Christianity during Paul's first visit to that city. His ordination by Paul and the elders is recorded (1 Tim. 4, v. 14; 2 Tim. 1, v. 6), and the apostle circumcised him in order that his ministry might not be unacceptable to the Jews (Acts 16, v. 3). Timothy accompanied S. Paul to Europe, and was with him at both Athens and Corinth, on his third missionary journey, and in his imprisonment at Rome. He became bishop at Ephesus, where he is said to have been killed in a riot.

Timothy, **EPISTLES** to. Two N.T. epistles ascribed to the apostle S. Paul, and belonging, with the Epistle to Titus, to a group known as the Pastoral Epistles, because they are addressed to pastors and deal with matters relating to the ministry. The two Epistles to Timothy, one of S. Paul's disciples and companions, purport to be written by the apostle; but external and internal evidence in support of the claim, in a complete sense, are considered weak by many scholars. It is urged against their authenticity that they are not included in the Canon of Marcion; that it is very doubtful whether any references to them are found in the writings of the earliest Church fathers; that it is difficult to fit them into the life of S. Paul; that the language and style differ considerably from his, and that the presupposed organization of the Church implies developments later than his time.

Thus it is held that, while the Epistles may contain genuine fragments of S. Paul's writings, on the

whole they appear to have been written in the name of the apostle, rather than by him. It is possible, however, to make out a strong case for the authenticity of the Epistles. Thus C. P. T. Grierson contends that the difference in style between the Pastoral Epistles and the other Pauline writings is due to the circumstance that, while the earlier epistles were addressed to churches at an early

stage of their development, the pastorals were written to individuals who presided over well-established Christian communities.

Timothy Grass. Hard grass cultivated in Europe and N. America for permanent pasture, also called Cat's-tail Grass (*q.v.*).

Timur Beg (1335-1405). Oriental conqueror, more familiar as Tamerlane (*q.v.*), the Anglicised form of his name.

and arsenides to oxides, which can then be leached out of the concentrates. Sometimes a chloridising roast is followed by leaching. Tungsten and iron can be removed by magnetic separation, the cassiterite being non-magnetic, while at some plants flotation lifts the sulphides and the cassiterite remains in the cell tailings.

The final concentrate may be smelted either in a blast furnace or, more commonly, in a reverberatory furnace. Reduction is by carbon, from coke, coal, or charcoal. To prevent heavy losses by dusting, the material must be briquetted or sintered before it is smelted in a blast furnace, and this makes the process expensive. A water-jacketed blast furnace is used. The principal difficulty in reverberatory smelting is that SnO_2 is amphoteric, i.e. will act either as a base or as an acid. Thus, whether the slag is basic or acidic in nature, it will hold up a considerable proportion of tin, so the volume of the slag is reduced to a minimum by having as rich a concentrate as possible. The slag, which contains more than 10 p.c. Sn, is then re-treated, the final slag containing less than $1\frac{1}{2}$ p.c. Sn. The tin from this re-treatment is impure and contains a high proportion of "hard-head," the alloy of tin with iron.

Processes of Purification

Crude tin varies widely in purity; further purification can be effected by liquation, followed by "poling," "tossing," or "boiling." In liquation, the tin is heated to just above its melting point on a sloping hearth, so that it melts and runs away from the higher melting point impurities. The product is then remelted and wooden poles are inserted beneath the surface, so that the melt boils, giving ready access of air to oxidise the remaining impurities, which float to the surface and are subsequently removed as a slag. A similar effect is secured by tossing the tin in ladles and splashing it back into the melt. The molten tin is then held for some time to allow any heavy impurities to settle to the bottom. Electrolytic refining has been used, but is not common practice. The tin of commerce has a purity of 98.7 to 99.99 p.c., and in order that a brand of tin may be registered as standard at the London metal exchange it must assay at least 99.75 p.c. and be of good merchantable quality. Banks and Billiton crude tin assays more than 99.9 p.c. Sn without refining.

TIN: THE METAL AND ITS USES

F. D. L. Noakes, Lecturer in Metallurgy, Imp. Coll. of Science

Sources, method of extraction, properties, and principal uses of tin, are here described. See also Alloy; Blast Furnace; Bronze; Metallurgy; Pewter; Reverberatory Furnace; Roasting; Tin Ores; Tinplate

Tin has been known from prehistoric times, but one of its first uses, for making bronze during the early Bronze Age, occurred almost certainly by chance; mixed copper and tin ores were probably smelted together, giving a direct production of bronze. It is believed that the Phoenicians and ancient Greeks were familiar with tin, and it is probable that the builders of King Solomon's temple knew it. The Bible indicates its use in the time of Moses. In the later stages of the Bronze Age it seems certain that tin was smelted separately, because bronzes containing definite and distinct proportions of tin had specific uses. Methods of smelting were crude: tinstone was thrown periodically on to the glowing embers of an open fire built over an open trench; the molten tin ran into the well of the fire and was later scooped out. Later, bellows were used to give a forced draught and the blast furnace developed.

No native tin was found by the ancients, but the oxide occurs in surface deposits and it is very easily reduced to metal. The ancient Britons were familiar with slagging operations, but tin must have been scarce in Greece and Rome until Julius Caesar's conquests gave him access to the Cornish tin mines. The oriental bronze industry is very ancient, flourishing in China from 1800 to 1500 B.C., so that tin must have been known to the Chinese.

This silver-white, lustrous metal is very ductile and malleable, takes a high polish, is a poor conductor of electricity, and is not easily acted upon by the air. The element, chemical symbol Sn (from Lat. *stannum*, tin), has an atomic no. of 50; atomic weight, 118.70; density, 7.29 gm per c.c.; resistivity, 11.3 ohm cm.; melting

point, 232°C .; boiling point, $2,270^\circ\text{C}$.; crystal structure: of grey tin, diamond type, with lattice constant $a = 6.461$; of white tin, tetragonal, being a highly distorted diamond type, with lattice constants $a = 5.8194$ and $c = 3.1753$. The two different crystal forms are allotropic modifications of tin, the grey tin being stable only at temps. below 13.2°C . Usually much lower temps. are needed to bring about the conversion, which is inhibited by very small amounts of impurities, and the grey form is rarely seen.

More than 60 p.c. of the world's tin comes from the alluvial deposits of Malaya, Burma, Siam, and Indonesia; similar deposits in China, Nigeria, and the Belgian Congo provide a further 12 p.c. The lode deposits of Bolivia provide 18 p.c., those of Cornwall 1 p.c. Total annual production exceeds 200,000 tons of the metal; its price (1948) is more than £550 per ton. Placer deposits are mined by dredging or by hydraulic methods, followed by sluicing.

Method of Extraction

The process of extraction of tin from its ores is relatively simple. As much purification as possible is effected by gravity methods, before smelting. The gravity separation is straightforward: cassiterite has a s.g. of about 7, compared with quartz 2.6, so that by the use of jigs, tables, and similar concentrating devices, rich concentrates, containing more than 60 p.c. Sn (pure cassiterite contains 78.6 p.c. Sn) can be produced. Lode tin often contains appreciable amounts of other metals as sulphides and it is easier to remove these before smelting than by later refining. After crushing and grinding, followed by jig concentration, the ore is roasted to convert sulphides

The purest forms of tin are required for the tinplate industry, which consumes more than 40 p.c. of the world's output. The pure metal is soft and can be rolled into foil or extruded into tubes merely by pressure. It has a low tensile strength of about 1 ton per sq. in. and a Brinell hardness of about 4. If a bar of tin is bent, it emits a characteristic creaking sound, called the "cry" of tin, caused by the chafing of the crystals against one another. Chemically tin has good resistance to air and water corrosion, which accounts for its use as a protective coating for other metals. It is readily soluble in hot hydrochloric or boiling sulphuric acids, and it also dissolves in hot solutions of the caustic alkalis, giving stannates. It forms two oxides, SnO and SnO_2 . Apart from tinplate, the chief uses of the metal are in alloys, the most important being solders, bronzes, white bearing metals, pewter, type metals, and Britannia metal for cutlery and kitchen wear. The chlorides are used as mordants for dyeing calico and the natural and artificial silks used for stockings. The oxide is used as an opacifying agent for white enamels and glazes, and stannic sulphide is the commercial mosaic gold, used for gilding and imitation bronze work.

Tin, ORES OF. In nature tin occurs chiefly as the oxide, cassiterite (*q.v.*). Other tin-bearing minerals are so rare as to have little economic importance. The vein deposits of Bolivia contain small amounts of stannite, $\text{Cu}_2\text{S}_2\cdot\text{FeS}\cdot\text{SnS}_2$, cylindrite, $\text{Pb}_2\text{Sb}_2\text{Sn}_2\text{S}_{11}$, and franckeite, $\text{Pb}_2\text{Sb}_2\text{Sn}_2\text{S}_{11}$. Tin does not often occur in the metallic form in nature. There are two groups of tin ore, the vein or lode deposits and the alluvial or placer deposits.

Tin ores are always associated with acid igneous rocks, such as granite, in quartz veins and pegmatites, associated with topaz, tourmaline, chlorite, and fluorite. The enclosing rock is commonly altered to greisen (*q.v.*). Tin ores are generally found near the contact of the parent granite, this zone being surrounded by outer zones carrying copper, lead-zinc, silver, and iron. This zonal arrangement is well seen in Cornwall. Tungsten and tantalum ores are often closely associated with tin mineralisation.

Tinaina. Group of families of minute moths. Among numerous British species are the clothes moth, corn moth, and others

which are domestic and commercial pests in the larval stage.

Tinamou (*Tinamus*). Genus of S. American birds belonging to the small family Tinamiformes. It is nearly related to the game birds, but is thought to have affinities with the *Ratitae* or flightless birds. In general appearance they are rather like partridges, and they are usually found among the long grass in the plains. They run like rails, and when hard pressed fly swiftly, but are soon exhausted. Tinamous are highly valued for the table, and this has led to their virtual extermination in many districts.

Tincture. Tinge or shade of colour. In medicine, it is the solution of active principles of drugs in alcohol. In heraldry, it is applied to the two metals (or and argent), to the seven colours (gules, azure, vert, sable, purpure, tenné, and murrey or sanguine), and to the three chief classes of fur (ermine, vair, and potent).

Tindal, MATTHEW (c. 1653-1733). English deist. He was born at Beer Ferris, Devon, and

Matthew Tindal,
English deist

educated at Lincoln College, Oxford, was elected a fellow of All Souls in 1678, and in 1685 became an advocate at Doctors' Commons. About this time he joined the Church of Rome, but returned to the Church of England in 1688. He wrote controversial works, including *The Rights of the Christian Church Asserted*, 1706, which the house of commons ordered to be burnt, and *Christianity as Old as the Creation*, 1733. Critics of these works maintained that Tindal's profession of Christianity was purely politic. He died at Oxford, Aug. 16, 1733.

Tinder. Inflammable material consisting of half-burned linen, decaying wood, amadou, touch-paper, etc. Such material is easily fired by means of a spark from a flint, and it was widely used for making a light before the advent of the friction match, a tinder-box being a compact portable arrangement of flint and tinder, a larger ancestor of the modern automatic petrol lighter. See *Firemaking*.

Tinea. Disease of the skin due to a fungus. See *Ringworm*.

Tinfoil. Thin lead or tin sheet used for wrapping tobacco, sweets,

etc. The term foil is used of many metals when in extremely thin sheets. See *Foil*; *Tinplate*.

Tinnevely. Dist. and town of Madras state, India. The dist. lies between Travancore and the Gulf of Manaar. Rice, cotton, native food grains, and pulses are the main crops. Area, 4,342 sq. m. Pop. 2,244,543. The town is on the rly. from Tuticorin to Quilon. Pop. 60,676.

Tinos or **TENOS**. Island of the Grecian Archipelago, one of the Cyclades group. Separated by a narrow channel from the island of Andros, immediately to the N.W., it is 17 m. in length, with an average breadth of 5 m., the area being about 80 sq. m. Its surface is mountainous, rising in Mt. Skhionia to 2,340 ft., but there are fertile valleys. The chief products are marble, wine, cereals, and figs. The principal town is Hagios Nikolaos (S. Nicholas), built on the site of the ancient Tenos. Ruins of a famous temple of Poseidon or Neptune were revealed by excavation in 1902.

Tinplate. Thin sheets of mild steel (formerly wrought iron), coated with tin. The substance is favoured for food containers, chiefly because tin does not give rise to poisonous substances when in contact with most foods. The tin coating on the steel is of pleasing appearance, and also facilitates soldering.

In the older method of manufacture, mild steel ingots were hot-rolled to bars, usually 8 ins. wide. These bars, cut into suitable lengths, were then hot-rolled to sheets in the tin mill. The steel was rolled as a composite pack, formed by laying the sheets on top of one another (matching), and also by folding them (doubling). After hot rolling, the packs of sheets were sheared to size, the sheets separated, pickled in acid to remove scale from the surface, and annealed. They were cold-rolled between polished rolls to impart a good surface, and then annealed and pickled to give "black plate." Next came the hot dip coating operation, passing the black plate through flux into the pot of molten tin, and finally through palm oil. The tinned sheet was passed through rolls to distribute the still molten tin, then through bran and polishing rolls to remove excess palm oil and impart a bright surface. This has been the method of tinplate manufacture in S. Wales for years.

It is being superseded by the production of tinplate in continu-

ous strip form, by utilising continuous hot and cold strip mills, and electrolysis for the tin coating. The steel strip is passed through tanks containing an electrolyte of stannous chloride and anodes of tin, and receives a tin coating which is dull in appearance. Then the coating is temporarily melted by the passage of an electric current, and the strip allowed to cool in air. About 600 ft. per min. passes through the electrolytic tinning line. Most of the development of this process was done in the U.S.A. British tinplate was first produced in this way at Ebbw Vale in 1947.

Tinplate Workers' Company. London city livery company. Originally associated with the

Tinplate Workers' co. arms

Wire-workers and Pinners, with whom it combined with the Girdlers in 1569, it was granted a charter in 1671. It has done much to promote the interests of the tin and wire-work industries. The offices were at Bakers' Hall, Harp Lane, E.C., but on their being destroyed in the Second Great War the co. moved its headquarters to 3, Albany Court Yard, W.1.

Tinsel (Fr. *étincelle*, Lat. *scintilla*, spark). Highly polished sheets, strips, or disks of metal foil used chiefly for ornamental purposes. The metals mainly used are copper and brass. The strips are generally lacquered in bright colours, or silver-plated on one side to add to their effect.

Tintagel. Village and parish of Cornwall, England. Situated on the coast, 5 m. N.W. of Camelford, it is one of the most picturesque places in the county and has many historic associations. The parish church contains tombs and early remains. Tintagel Castle, the reputed birthplace of King Arthur, stands on a ridge of rock connecting Tintagel Head to the mainland; much has been destroyed by action of the sea, but the 13th century walls remain in parts, and near by is a small chapel of the same

period. The castle has been the theme of many medieval romances, of poems by Tennyson, Swinburne, and others, and of a musical tone-poem by Sir A. Bax. It probably existed in pre-Saxon times, and is spoken of by contemporary writers as being in ruins in the early part of the 16th century. Parts were restored in the 19th century.

Tintern Abbey. Ruined abbey on the Monmouthshire bank of the river Wye. It is beautifully situated 5 m. N. of Chepstow. A Cistercian house was founded here by Walter de Clare about 1131. The magnificent building was mainly erected between 1269 and 1287 by Roger Bigod, earl of Norfolk. Cloisters were added about 1470. The chief remains are the ruins of the cruciform church, 228 ft. long by 150 ft. broad. The east and other great windows are especially noble; less remains of the chapter house, refectory, and other spacious buildings. The abbey, dissolved in 1537, was long the property of the duke of Beaufort, but in 1900 was acquired by the crown, and extensive repairs were undertaken. A sight of Tintern Abbey inspired one of Wordsworth's great poems. Near the village is a rly. station. See Abbey illus. p. 7.

Tintometer. Apparatus for determining the depth of a tint of colour by comparison with standard tints. One apparatus consists of a combination of standard coloured glasses so arranged that all side light is obscured. The colour under examination is compared with various tints, obtained by different combinations of the glasses, until the correct tint is reached.

Tintoretto (Ital., little dyer). Popular name of Jacopo Robusti (1518-94), Italian painter. Born in Venice, Sept. 16, 1518, son of a dyer, he was apprenticed to Titian, and was influenced by Michel-

angelo, but largely taught himself by studying anatomy and modelling. His first important work

was the *Miracle of S. Mark*, 1548, painted for the Scuola di San Marco, later placed in the Venice academy. In 1558 he married Faustina dei Vescovi. Venice possesses the most famous of Tintoretto's paintings: over 60 works in the Scuola di San Rocco, the decoration of which he began in 1560; others in the church of San Rocco, the Collegio, and the doge's palace. Examples in the National Gallery, London, and at Hampton Court.

While engaged in the Scuola, he painted three pictures yearly, and received an annual salary of 100 ducats. His genius was veritably a tremendous capacity for work. The great Crucifixion picture in the refectory of the Scuola has been acclaimed his masterpiece, as illustrating at their best his extraordinary draughtsmanship, resonant colour, and sense of dramatic composition; but his Presentation in Madonna dell' Orto, and many more, are hardly less arresting. By sheer sweep of design and courage in conception he takes rank among the world's greatest painters. His last work of importance was the Paradise, in the doge's palace, supposed to be the largest painting ever executed. It measured 74 ft. by 30 ft., and was considered by Tintoretto the crowning work of his life, which ended on May 31, 1594. See Italy: Art; Venice; consult Four Great Venetians, F. P. Stearns, 1901; Tintoretto, E. M. Phillips, 1911.

Tiny Tim. Character in Dickens's story, A Christmas Carol. He is the crippled, youngest, and favourite child of Bob Cratchit, the poor clerk. In Scrooge's vision of the future the child dies, a prospect which helps as much as anything else in the vision to melt his flinty heart. Tiny Tim's toast, "God bless us, every one," is famous.

Tip Cat. Outdoor pastime. It is played with a piece of rounded wood about 4 ins. long, pointed at both ends, which is called the cat, and a staff similar to a rounders club. A circle, usually about 6 ins. in diameter, is drawn 8 or 10 ft. from a point chosen as the pitcher's base or wicket. From his base the pitcher attempts to throw the cat into the circle, the striker being

Tintoretto. Self-portrait by the Italian painter

Tintagel, Cornwall. The rocky ridge, crowned by the ruins of the castle which, according to tradition, was the birthplace of King Arthur

out when he succeeds. Should the cat lodge on the line of the circle, the striker is permitted to make one stroke at it. In the kind of tip cat called piggy, the player hits a pointed end of the cat downwards so that it bounds into the air, and then attempts to strike it away from him.

Tippecanoe. River of Indiana, U.S.A. It rises in the N. of the state, and flows about 200 m. S.W. and S. to join the Wabash 10 m. above Lafayette. On Nov. 7, 1811, General Harrison defeated the Indians near the mouth of the river.

Tippera. Dist. of Pakistan, in the Chittagong division of E. Bengal. It lies E. of the Surma river on the edge of the Ganges delta, and is an alluvial lowland, four-fifths of which is cultivated, mainly for rice and jute. The area is 2,531 sq. m. Annual rainfall, 84 ins. This is one of the most densely populated districts in Bengal. Seven-tenths of the pop. of 3,860,139 are Muslims.

Tipperary. County of Munster, Eire. An inland county in the S. of the country, its area is 1,643 sq. m. The centre is mainly level and fertile, but on the borders are hills: the Knockmealdown Mts. on the S.W.; Keeper Hill on the W.; Devilsbit Mt. on the N.; the Slieveardagh Hills on the S.E. Another range is the Galty Mts., with Galtymore, 3,015 ft., highest point in the county, one branch of which is called the Tipperary Hills. The chief river is the Suir, while along the N.W. boundary flows the Shannon. In the W. is the fertile Golden Vale. Agriculture is the chief industry, the most flourishing branch being dairy farming, but coal, copper, and slate are worked. The Eire state rlys. serve the county. Clonmel is the co. town; other places are Tipperary, Cashel, Thurles, Carrick-on-Suir, Caher, Roscrea, and Nenagh. Tipperary became a county palatine in 1328, the Butlers being its lords, and they retained their exceptional rights therein until 1715. In the S.W. are some interesting stalactite caverns. For administrative purposes Tipperary is divided into two counties, N. and S., each with its own council. The co. returns seven members to the dail. Pop. 135,981.

Tipperary. Market town and urban dist. of co. Tipperary, Eire. It is 110 m. S.W. of Dublin and 23 m. S.E. of Limerick by the Eire state rlys. The buildings include R.C. and Protestant churches. Tipperary is an agricultural centre, having a large trade in farm and dairy produce, and works for mak-

ing condensed milk. It was made a borough in 1310, having grown up around a castle built by the English. It had also an Augustinian monastery, of which there are remains. The town was prominent during the land struggle in Ireland, New Tipperary being founded 1890 for evicted tenants. Pop. 5,266.

Tipperary. Short name for a popular song. It's a long, long way to Tipperary. Written and composed by Jack Judge in 1911, it had an extraordinary vogue in the autumn of 1914, when the troops mobilised for the First Great War used it as a marching song. That the song had nothing to do with the war is evident from the date of publication, and the character of the words, which simply tell of an Irishman's longing to be with his sweetheart. The song remains associated with the "Old Contemptibles" of the First Great War. From 1915 to the end of the war it was scarcely heard in the army; but it remained a popular community song throughout the Commonwealth.

Tippermuir, BATTLE OF. Fought Sept. 1, 1644, on a plain 3 m. W. of Perth, between the Scottish Covenanters and a Royalist force commanded by Montrose. A force from Ireland having been landed to aid the Royalist cause, Montrose called the clans to arms. His troops numbered only about 3,000, but with these he boldly attacked and completely defeated the Covenanters, of whom there were 7,000 foot, and from 700 to 1,000 horse with nine guns. Some 2,000 Covenanters were slain, many were taken prisoners, and Montrose was able to occupy Perth. This was the first of his six celebrated victories for the Stuarts.

Tippet. Cape of fur or other material for the shoulders. Tippetts are an item in the official costume of judges and clergy, and frequently form part of the outdoor livery of coachmen and footmen. Anciently the tippet was the pendant part of the hood or sleeve. See Costume; Hood.

Tippett, MICHAEL KEMP (b. 1905). British composer. Born in London, Jan. 2, 1905, he was educated at Stamford grammar school, studied composition under Charles Wood at the R.C.M., and became a conductor to L.C.C. organizations. From 1940 he was musical director at Morley College. His oratorio, *A Child of Our Time*, first performed 1944, of which he wrote text as well as music, was based on an incident in the Nazi persecution of Jews. Tippett's

music, evocative and lyrical, was deeply expressive of the tragedy of the contemporary scene, and notable also for its sense of restraint. He wrote much for strings, e.g. three quartets, and a concerto for double string orchestra. A symphony was first played in 1945, and variations for piano and orchestra in 1942.

Tippoo Sahib (1749-99). Sultan of Mysore. Son of Haider Ali (q.v.), whom he succeeded in 1782,

Tippoo Sahib, Sultan of Mysore

he fought during the first Mysore War, concluding the treaty of Mangalore in 1784. Two years later he declared war on the Mahrattas, and in 1789 attacked Travancore, a state allied with the British. This occasioned the second Mysore War, which ended in Tippoo's defeat in 1791. Founding a secret confederacy of all discontented native rulers, and strengthened by the promise of French help, Tippoo planned vast schemes for the expulsion of the British and his own exaltation. But the plot was discovered, Wellesley made a rapid advance on Seringapatam, and Tippoo was slain in the capture of the city, May 4, 1799. See Seringapatam; consult also Haider Ali and Tipu Sultan, L. B. Bowring, 1893.

Tippoo Tib. Name by which Hamed ben Mohammed, African slave-trader, was known. Of mixed Arabian and African blood, he traded in Equatorial Africa, especially in Upper Congo. Aiding Cameron in 1874, and Stanley in 1886, and taking part in the Emin relief expedition of 1887, he was given the governorship of the Stanley Falls district of Upper Congo. Consult Tippu Tib, H. Brode, Eng. trans. 1907.

Tipstaff. Official of the English high court of justice. The name is derived from the staff of office, which is tipped with metal or with a small crown. Tipstaffs are appointed to the chancery and king's bench divisions, and their duty is to make arrests, in the precincts of the court, of such persons as are committed for contempt or other offences. See Bailiff.

Tipton. Mun. bor. of Staffs, England. It is 8 m. N.W. of Birmingham, and has six rly. stations. Chief industries are motor engineering and manufacture of

electrical equipment, furniture, machine tools, toys, glass, etc. The parish church of S. Martin has the oldest church registers in England, starting in 1513. With Rowley Regis, Tipton forms a bor. constituency. Pop. 38,884.

Tiraboschi, GIROLAMO (1731-94). Italian literary historian. He was born at Bergamo, Dec. 18,

Girolamo Tiraboschi,
Italian historian

1731, and after being professor of rhetoric at Milan was appointed in 1770 librarian to the duke of Modena. His chief work, *Storia della Letteratura Italiana*, 13 vols., 1772-82, is the standard history of Italian literature down to the beginning of the 18th century. He died at Modena, June 3, 1794. *Pron.* Teera-boskee.

Tirach Mir. Mt. of Pakistan. It is the culminating point, 25,426 ft., of the great S. spurs of the Hindu Kush, which penetrate into Chitral in the N.W. Frontier province.

Tirah. Dist. of Pakistan, in the N.W. Frontier province. It comprises all the glens on the S. side of the Safed Koh Range, of which the drainage is united into, and flows by, the Bára river into the Kabul. It falls within the tribal territories of the prov. The tribesmen, Afridis and Orakzais, are diligent cultivators of the lower slopes and valley floors, and in the summer the Afridis retire from the malarious lower valleys to the elevated glens.

Tirah Campaign. British expedition against the Afridis and Orakzais, 1897-98. British posts in the Khyber Pass garrisoned by Afridi militia having been overwhelmed by Afridi insurgents, a force of 35,000 men under Sir William Lockhart was sent to operate in the Tirah and Mastura Valleys. The operations, based on Kohat, began by the capture of the Dargai heights, Oct. 20, 1897, followed by the storming of the Sempagha Pass leading into the Mastura Valley, Oct. 29, and of the Arhanga Pass leading out of it into the Tirah country, Oct. 31. The latter region was then scoured by brigades, many walled villages being destroyed, in spite of the resistance of the Afridis, who on several occasions inflicted considerable loss on the British columns. Saran Sar was captured by Gaselee's brigade, Nov. 11, and the Waran and Rajgul valleys were

cleared by Kempster's and Westmacott's brigades respectively. The force returned to India by two routes and, a junction having been effected near Peshawar, the Khyber forts were retaken. The Afridis then sued for peace, terms were imposed, and the expeditionary force was dispersed, April, 1898.

Tirana. Capital of Albania. It lies 20 m. E. of the Adriatic coast at Durazzo, at the S. end of the plain of Kruja, overlooking the Rushka valley. Gloriously situated, Tirana is a picturesque rather than a comfortable or organized place, dating from the 17th century. Most of its pop., est. 31,000, are Muslims. There is a court of cassation. After the Italians occupied Albania in April, 1939, they built a military airfield near the capital, which itself remained in Axis hands until Nov. 18, 1944, when the German garrison withdrew before advancing Allied and partisan forces. It was badly damaged in the course of the war. Tirana gives its name to a prefecture of Albania which has a pop. of 57,808.

Tiraspol. Town and region of Moldavia S.S.R. It is on the left bank of the Dniester and the Odessa-Kishinev rly., 70 m. N.W. of Odessa. There are horticultural and tobacco-growing industries and others concerned with tallow and soap. Taken by the Germans during their advance on Odessa in the summer of 1941, Tiraspol was recaptured April 12, 1944, in a night assault by the 3rd Ukrainian army. Pop. approx. 35,000.

Tire or TYRE. Hoop, band, or air filled tube on the rim of a wheel. The steel tire of a wooden carriage or cartwheel binds the felloes and spokes tightly together,

Tire. Section of beaded edge cord tire showing two diagonal layers of cord

and takes the wear of usage. The tire is made rather smaller than the wheel in the first instance, is expanded by heat till it will pass

over the felloes, and is allowed to cool. The rolled-steel tire of a railway locomotive, carriage, or car wheel is shrunk on to the cast iron or steel centre in a similar way. A projecting lip on the outer face, and a ring forced into a groove at the other side, make it impossible for the tire to move laterally should the shrinkage grip prove insufficient. The shrinkage allowance is about $\frac{1}{1000}$ in. for every in. of diameter; thus a tire for a 50-in. wheel centre would have, before the heating, an internal diameter of about 49.950 ins. Railway vehicle tires are 5-5½ ins. broad, at least an inch thick, and made of the best steel. The tread is coned to an angle of 1 in 32 towards the outside edge. Flanges are 1 in. deep and 1 in. wide. If a locomotive has a large number of driving wheels coupled together, some of the tires may be extra wide and flangeless, to facilitate travels on curves.

The width of road locomotive and vehicle tires, relatively to the weight carried by the wheel and the wheel's diameter, has been made the subject of legislation in many countries.

The invention of the bicycle led to the introduction of a solid rubber tire, which was held on to the rim by a wire or wires embedded in it or by beads engaging with the flanges in the rim. The pneumatic tire, adopted universally for cycles, motor cars, transport vehicles, tractors, and aircraft, was invented by Thomson in 1846, but was first put to practical use by Dunlop, who in 1888 fitted a bicycle with a crude form. In the pneumatic tire are two separate parts: an air container of rubber, the inner tube; and a cover with cotton, rayon, nylon, or steel composition, protected by a plain or patterned tread of compounded rubber. The cotton, rayon, nylon, or steel cords are insulated with specially compounded rubber. A complete tire may have one or more layers of cords. It is held in position on the rim by coils of high tensile insulated steel wires. See Dunlop; Motor Vehicle; Rubber.

Tiree or TYREE. Island of the Inner Hebrides, Argyllshire, Scotland. Situated 3 m. S. of Coll and 15 m. W. of Mull, it is 14 m. from N. to S., and averages 3 m. in breadth. There are two small harbours, Scarinish Bay in the N.E. and Hynish in the S. A pink marble spotted with green is found. The chief occupation of the crofters is rearing and exporting

horses, cattle, and poultry. The island forms a parish which includes Skerryvore, famous for its lighthouse, some 10 m. to the S.

Tiresias. In Greek legend, a soothsayer of Thebes. He was blind from childhood because, according to one story, he had seen Athena bathing. Athena, having been entreated to restore the sight of Tiresias, gave him instead the gift of prophecy, which he exercised until he died at a great age. He also understood the speech of birds. He appears in many legends, including those of Hercules and Oedipus, and Odysseus consulted him in Hades. Tiresias is the title of a poem by Tennyson.

Tiridates. Name of several Parthian and Armenian kings. (1) King of Parthia, 32 B.C., and successor of Phraates IV, against whom his subjects had revolted. Driven out in his turn, he took refuge with Augustus, who refused to hand him over, but would not reinstate him. (2) Grandson of Phraates IV, brought up in Rome and set up as king of Parthia by Tiberius, A.D. 35. (3) Brother of Vologaeses I, by whom he was made king of Armenia about 54. Severely defeated and more than once driven out of Armenia by Nero's general Domitius Corbule, he gave up his crown, which was restored to him by Nero in 66. (4) King of Armenia in the 3rd century, twice expelled by the Persians and definitely restored by Diocletian after the peace of Nisibis, 298.

Tirlemont. Town of Belgium, in the prov. of Brabant. It lies on the Grande Gette river, 11 m. by rly. S.E. of Louvain, and is a junction on the Brussels-Liège rly. There are sugar, brewing, and tanning industries, and a busy trade in grain. The church of Notre-Dame-du-Lac, with 13th century choir, has remarkable panelling and stalls in 17th century baroque style, and was damaged in the First Great War; that of S. Germain combines Romanesque and Gothic work. Pop. 20,662.

Tirnovó OR TRNOVO. Town and former capital of Bulgaria. It stands on the Yantra, N. of the Balkan Mts., on the rly. from Rustchuk to Stara Zagora, 60 m. S.E. of Plevna. It is the seat of a bishop, and has dye works and manufactures copper goods. Here in 1908 Prince Ferdinand declared the complete independence of the

country and assumed the title of king. Pop. 12,750.

Tiro, MARCUS TULLIUS (c. 95 B.C.-A.D. 5). Freedman and secretary of Cicero. He was himself an author, writing a work on grammar and a Life of his master, and he collected and edited Cicero's works. He was also credited with the invention of a system of shorthand, called Notae Tironianae.

Tirol OR TYROL. Western province of Austria. With an area of 4,886 sq. m., it lies between Bavaria on the N., Switzerland and Italy on the S., and has the Austrian provs. of Salzburg on the E. and Vorarlberg on the W. Before the First Great War the prov. extended S. to Lake Garda, but the treaty of Saint Germain-en-Laye gave S. Tirol or the Trentino (*q.v.*) to Italy.

Austrian Tirol comprises a series of Alpine ranges on the N. side of the main chain of the E. Alps. Between the Ötztal Alps and Hohe Tauern on the S. boundary to the Alps of Algau and the Bavarian Highlands on the N., a width of about 50 m., is the long, narrow valley of the Inn, which rises in Switzerland and flows into Germany, flanked by minor ranges, the Stubai and Tuxer Alps. The Ötz, Ziller, and other small affluents flow through short, narrow valleys from the S. frontier, which is part of the water-parting between the drainage areas of the Adriatic Sea and the Danube. The N. boundary is crossed by the Lech and Isar, affluents of the Danube. The W. boundary is mountainous, communication is limited almost entirely to the Arlberg pass and rly. tunnel. Almost the only way S. into Italy is by the Brenner pass.

The rly. system centres on Innsbruck, the capital; lines go

E. by the Innthal to Salzburg, W. by the same valley to the Arlberg pass, S. to the Brenner, and N. to Bavaria. The main occupations are primary in character, lumbering in the extensive forests, cattle grazing and dairy farming on the Alps, and mining for lead near Landeck and for salt near Hall. Pop. 422,812.

In Roman times Tirol was part of the Roman Rhaetia which was conquered in 15 B.C. After being overrun by the barbarians it was cut up into a number of petty states; the German portion finally coming to the counts of the Adige or Tirol, from whom it passed to Austria in 1363. Ceded to Bavaria in 1805, Tirol was restored to Austria by the treaty of Paris in 1814. At the end of the Second Great War, 1945, Tirol came into the French zone of occupation in Austria. See Austria; Trentino.

Tirpitz, ALFRED FRIEDRICH VON (1849-1930). German sailor. Born at Küstrin, March 19, 1849, and educated at Frankfurt gymnasium, he entered the Prussian navy in 1865. He was Prussian minister for the navy from 1897 and in 1903 became grand admiral of the German navy and head of the naval staff. The policy of Tirpitz was to compete with Great Britain in naval power and the mercantile marine, but scarcely to seek war. Here revolutionised the administration on board ship and worked out systems of defensive tactics and mass use of torpedo boats. When war came, Tirpitz tried to bring about a naval battle in which his big ships might be used advantageously, but he was blamed by Bethmann-Hollweg for neglect-

Tiridates II,

German sailor

Tirol. Three Tirolese peasants of this western province of Austria

ing the submarine, and this helped to cause his retirement in 1916. He thus had no responsibility for Jutland or the unrestricted submarine campaign. Tirpitz published his memoirs in 1919, founded the Fatherland party (hostile to Great Britain), and sat in the Reichstag from 1921. He died March 6, 1930.

Tirpitz. German battleship. A sister ship of the Bismarck (*q.v.*), she was laid down in 1936 and completed in 1941. Displacing 45,000 tons on a length of 792 ft. and a beam of 118 ft., she had a speed of 30 knots; she was armed with eight 15-in., twelve 5.9-in., and sixteen 4.1-in. guns, and carried four aircraft. She took part in the German invasion of Norway, where she remained for some time. Based on Alten Fjord, she came out to attack Allied convoys to Russia, so that her existence was a constant threat. On March 9, 1942, she was attacked by torpedo-carriers of the Fleet Air Arm, and thereafter was frequently damaged from sea and air. On Sept. 22, 1943, three midgeet submarines of the R.N. penetrated the boom defences in Alten Fjord and scored several torpedo hits, putting her out of action for months; on April 3, 1944, torpedo-bombers dropped 40 tons of H.E. on her; and on Nov. 12 a force of 29 R.A.F. Lancasters sank the Tirpitz in Tromsø Fjord, whither she had been removed, with 12,000-lb. bombs.

Tirupati. Town of Madras state, India. In Chittoor dist., it is 84 m. N.W. of Madras. On a hill 2,500 ft. high stands a pagoda which only Hindus may enter, with copper statues of Krishnaraja and his two queens, and an idol of Vishnu which attracts crowds of pilgrims. Pop. 19,500.

Tirupatur. Town of Madras state, India, in Vellore dist. It is situated W. of the Javadi Hills on the rly. from Madras to Calicut, and is an important road centre. It was taken by the British and recaptured by Haider Ali in 1767.

Tiruvannamalai. Town of Madras state, India, in Vellore dist. Situated in the S. of the dist. on the rly. from Vellore to Pondicherry, it occupies a strategic point where roads converge on the Chengama Pass through the E. Ghats. Between 1753 and 1791 it was besieged on ten occasions. A fire festival is held annually at the temple. Pop. 25,100.

Tiryns. Ancient Greek city of Argolis, in Peloponnesus. Accord-

ing to the legend, its walls were built for Proetus, king of Argos, by masons from Lycia in Asia Minor called Cyclopes, whence the term Cyclopean architecture. Like Mycenae (*q.v.*), Tiryns played no part in Greek history and was similarly destroyed by Argos (468 B.C.), but its archaeological remains are of the highest interest.

Tiryns was older than Mycenae, which may have been originally set up by the rulers of Tiryns as a barrier against invaders from the

Tiryns, Greece. Ruined walls of unhewn blocks of stone, which surround the ancient city. Top, one of the galleries in the southern walls

north. The acropolis was built on a rocky, oblong hill, some 50 ft. in height, on which were three terraces or platforms. The walls which surrounded it are still standing, and on the south side, where the hill is highest, Schliemann and Dörpfeld in 1804 discovered the ruins of a large palace, its walls covered with curious mural decorations, which in general structure exhibits a remarkable correspondence with the descriptions in the Homeric poems. It is distinguished, like later Greek dwelling-houses, by the separation of the chambers for men from those intended for females. A peculiarity of the surrounding walls is a number of galleries and chambers, probably store-rooms. See Aegean Civilization.

Tisa. Rumanian form of the name of the river described in this work under Theiss.

Tiselius, ARNE WILHELM KAVERN (b. 1902). Swedish biochemist, who in 1948 was awarded the Nobel prize for chemistry. Born Aug. 10, 1902, he took his doctorate in philosophy at Uppsala in 1931. There he worked as an independent professor on absorption analysis and the nature of serum proteins. In 1943 he was elected to the New York academy of science.

Tishri. Seventh month of the Jewish sacred year, and the first month of the civil year. It begins some time in Sept. or Oct. The first day of it is observed as Rosh Hashanah, or feast of the New Year; the Day of Atonement (Yom Kippur) is on the 10th; the feast

of Tabernacles, or harvest festival, on the 15th. See Calendar.

Tisio, BENVENUTO (1481-1559). Italian painter, commonly called Il Garofalo. Born at Ferrara, he studied there under Panetti and at Cremona; he also worked in Rome and Mantua. He returned home in 1501, and was associated with the brothers Dossi in paintings for the Borgias' court. He was again at Rome in 1509, when he came under the influence of Raphael, but in 1512 he appears to have settled at Ferrara. Blind from 1550, he died on Sept. 6 or 16, 1559. Good examples of his art are in the National Gallery, London, but most are at Ferrara and Rome.

Tiso, JOSEF (1887-1947). Slovak politician. He was ordained priest in 1909, and became a professor of theology. After the First Great War he joined the movement for Slovak autonomy and was a leading figure in the fascist Hlinka guard. When his people were granted self-government as a result of the Munich pact, 1938, he became prime minister; removed from office, he was reinstated by the Germans, and on Slovakia's being declared independent he was elected first president, Oct. 26, 1939. During the Second Great War Father Tiso allied himself with the Germans, repressed socialists, and helped to quell partisan revolts. Arrested by U.S. troops, 1945, he was imprisoned as a traitor by the reconstituted Czechoslovak govt., tried at Bratislava, found guilty, and hanged on April 18, 1947.

Tissaphernes (d. 395 B.C.). Persian satrap. In 414 B.C. he was made satrap of Lower Asia. During the latter part of the Peloponnesian War he toyed with the Spartans by holding out promises of help, his real policy being to let both the Athenians and the Spartans wear themselves out. After the battle of Cunaxa, 401 B.C., where he was one of the four generals of Artaxerxes, he treacherously murdered the leaders of the 10,000 Greeks. From 400 to 395, as governor of the coast of Asia Minor, he carried on war with the Spartans, but his failure caused Artaxerxes to give orders for his execution. See Cyrus the Younger; Xenophon.

Tissot, JAMES JOSEPH JACQUES (1836-1902). French painter. Born at Nantes, Oct. 15, 1836, he studied under

James Tissot,
French painter

Flandrin and Lamothe. His early years during which he painted mostly contemporary genre, were passed in Paris; but after the Franco-Prussian War he removed to London, where he produced clever etchings in the studio of Seymour Haden, and worked as a portraitist and caricaturist. His paintings of English social life in the '70s are of documentary interest. In the midst of his career he suddenly abandoned all secular art in order to devote himself to illustrating the life of Christ. About 1884 he set out for Palestine to collect materials for this work. Returning to Paris in 1895, he exhibited some 350 water-colour drawings of N.T. subjects marked by over-scrupulous historical realism. They were shown in London and published in Paris. Tissot was engaged in France on a set of O.T. drawings when he died, Aug. 8, 1902. Consult Vulgar Society, J. Laver, 1936. Pron. Tisso.

Tissue. In biology, aggregation of cells which have common origin and function. Thus the muscles of animals consist of cells making up muscular tissue, the brain and nerves of nerve tissue, the soft parts of plants of ground tissue, the veins of leaves of vascular tissue, and so on. Each tissue consists of one or more kinds of cell structurally suited to perform its relevant function.

Tisza. Hungarian name for the river referred to under its German name Theiss in this work.

Tit. Five species of the small British bird. 1. Black-headed marsh tit. 2. Great tit or ox-eye. 3. Little long-tailed species. 4. The rare bearded tit. 5. Blue tit on a broken coconut
W. S. Berridge, F.Z.S.

TIT OR TITMOUSE. Family of small, rather long-tailed, arboreal birds (Paridae), of which seven species occur in Great Britain. Of these, the blue tit (*Parus caeruleus*), often called the tomtit, is the best known, a little bird measuring 4½ ins. in length, with a blue crown, white cheeks, greenish back, blue wings and tail, and a white breast crossed by a blue line. It is found in most parts of the British Isles, and is a familiar visitor to gardens.

The bearded tit (*Panurus biarmicus*) is extremely rare, and occurs only in the neighbourhood of the Norfolk Broads. It is 6½ ins. long, and has light brown plumage with a little black and white. The head is bluish grey, and from each cheek grows a tuft of black feathers from which the bird derives its name. It is found among beds of reeds, where it climbs about like a small parrot. The long-tailed tit (*Aegithalos caudatus*) is one of the smallest British birds. The plumage is in the main black and white, with slight tinges of red. It occurs freely in England and Ireland, but is not common in Scotland. It is found in woods and generally goes in small parties, visiting hedges and trees in search of insects. The nest is domed and made of felted hair, moss and lichens, lined with feathers. Over two thousand feathers have been found in a single nest.

The great tit (*Parus major*), or ox-eye, has a black head and throat, greenish back, white cheeks, and

yellow under parts, and is 6 ins. long. It occurs locally in woods and

orchards, but is nowhere abundant. It feeds mainly on insects, but has a distinct liking for carrion.

The marsh tit (*P. palustris*) has a black head, grey wings and back, with white cheeks, throat, and breast. It is common in England, rare in Scotland, and absent from Ireland. The crested tit (*P. cristatus*) is distinguished by its pointed crest of black and white feathers. The cheeks are white, the throat black, the under parts white, and the rest of the plumage reddish brown. It is extremely rare, being found only in certain pine forests in the N. of Scotland. See Coal Tit; Eggs, colour plate.

Titaghur. Town of W. Bengal, India, in the dist. of the 24 Parganas. It is situated on the Hooghli, 14 m. N. of Calcutta, and has paper and jute mills employing most of its 57,416 inhabitants.

Titan. Sixth Saturnian moon in point of distance from the planet. It was the first to be discovered, being detected by Huygens, March 25, 1655. Its diameter is a little under 3,000 m., exact estimate being difficult owing to irradiation. It varies slightly in brightness between the 8th and 9th magnitudes, and it is believed that its period of rotation is equal to its period of revolution about the planet, 15 days 22 hours 41 mins. Photo-

Titanic. The White Star liner, the largest vessel of her time, as she appeared before her maiden voyage to New York, during which she sank with the loss of over a thousand lives

graphy of the spectra of Titan proved that its atmosphere contains methane and ammonia.

Titan. In Greek mythology, a family of giants, the progeny of Uranus and Ge. They were 12 or 13 in number, and the best known are Oceanus, Hyperion, Cronos, Rhea, and Themis. At the instigation of their mother, Ge, the Titans rose against their father, Uranus, mutilated him, and made Cronos ruler of the universe in his stead. When Zeus became king of the gods the Titans refused to acknowledge his authority and carried on a 10 years' struggle with him.

Titania. Queen of the Fairies, in Shakespeare's play *A Midsummer Night's Dream* (q.v.). Wife of Oberon, she has quarrelled with him over possession of an Indian page. In revenge he casts a spell over her while she sleeps which compels her to fall in love with Bottom the weaver, after Puck has given him an ass's head. The healing of the quarrel and Titania's restoration to Oberon's affection is one of the charming themes of the play. See Bottom.

Titanic. British steamship sunk in the Atlantic, April 15, 1912. Belonging to the White Star Line, she was at the time the largest ship in the world and reputed unsinkable. Her details were: length, 852 ft.; beam, 92.6 ft.; gross tonnage, 46,328; engines, 70,000 i.h.p.; and speed, 21 knots. While on her maiden voyage from Southampton to New York the Titanic collided with a sunken iceberg. She struck this at 11.40 p.m. on April 14, 1912, and sank in a calm sea at 2.20 a.m., more than 1,500 lives being lost. Among those who perished were W. T. Stead, Jacques Futelle, the French novelist, J. J. Astor, and G. D. Widener. The Carpathia, reversing her course in response to the wireless signals of distress, picked up about 700 survivors. An inquiry into the disaster was held in London the same year, presided over by Viscount Mersey (q.v.), as the result of which several improvements in life-saving appli-

ances at sea were introduced, and the insistence upon routine boat drill on all passenger ships dates from this inquiry. Consult The Sinking of the Titanic, L. H. Beesley, 1912. An early British talking film, *Atlantic*, was based on the Titanic disaster, and Noel Coward placed one of the scenes of his play *Cavalcade* on the deck of the Titanic just before the disaster.

Titanite or **SPHENE.** A silicate of calcium and titanium, CaTiSiO_6 , occurring in lozenge-shaped crystals or grains. It is usually found as an accessory constituent of acid igneous rocks, sometimes in important amounts in lime-rich rock.

Titanium. Chemical element. Its symbol is Ti; atomic number, 22; atomic weight, 47.90; specific gravity, 4.5; m. p., 1,800° C. It has a hexagonal close-packed structure. This metal was discovered by Gregor in 1789 in a sample of Cornish iron ore. Although often regarded as rare, it is one of the nine most abundant elements in the earth's crust. It

from Travancore and Norway; both these ores can be brought into solution by fusion with alkali and extraction of the melt with acid.

Metallic titanium is prepared only with difficulty because of its high m. p., and the ease with which it combines with oxygen, nitrogen, carbon, and hydrogen, and with other metals to form alloys. Reduction of the tetrachloride with sodium in a sealed bomb at red heat gives a product containing a trace of iron but no other detectable impurity. Amorphous titanium is a dark grey powder. In the massive state it is bright and sufficiently hard to scratch quartz. It is stable in the air but when heated in oxygen at 600° C. it burns with a brilliant flame to form the dioxide TiO_2 , and at 800° C. it begins to burn in nitrogen to form the nitride TiN . It is the only element known to burn vigorously in nitrogen. It combines directly with the halogens and most other non-metals.

Titanium forms three series of salts corresponding to valencies 4, 3, and 2. Compounds are used in electric arcs, as mordants for dyeing, and for ceramic colours. The trichloride is a powerful reducing agent in the laboratory, and the tetrachloride produces artificial smoke screens. The dioxide is a paint pigment, being unaffected by sulphides. Addition of titanium to steel is usually in the form of ferro-titanium, made by reducing ilmenite or rutile in the presence of iron in an electric furnace. As there is high resistance to shock, such steel is used for rails.

Titanotheres (Gr. *Titan*, giant; *thēr*, wild beast). Extinct fossil family of ungulates resembling rhinoceroses. The animals, which

is found as the oxide, which occurs in three different crystalline forms, rutile, brookite, and anatase. It is also found as ilmenite, FeTiO_3 , and as titanates of iron, calcium, aluminium, etc. Commercial sources are rutile and ilmenite

Titanotheres. Reconstruction of a specimen of the *Teleoceras* genus; top, left, skeleton of *Brontotherium gigas*, member of another genus

American Museum of Natural History

flourished in the Oligocene (*q.v.*), had bony growths on the maxillary bones above the snout.

Tit-Bits. London weekly paper. First of a long succession of periodicals designed to amuse and instruct, it was established, Oct. 30, 1881, by (Sir) George Newnes (*q.v.*). An instant success, it was the first paper to insure purchasers against rly. accidents. Its first serious rival was *Answers* (*q.v.*).

Tithe (A.S. *teolha*, a tenth). Originally the tenth part of an income payable for the maintenance of the parish priest. The practice was commanded by Moses, but seems not to have been continued by Christians of the Apostolic Age. In Great Britain the earliest record of tithes seems to be that of Bede. In 750 Egbert, archbishop of York, directed his clergy to teach their people to pay tithes.

to the average price of corn during the preceding seven years, this being periodically determined by rather involved tables.

Changes in prices during the First Great War caused much inconvenience, and in 1918 tithe rent charge was fixed for the seven years to 1925. In the latter year provision was made for its extinction in 85 years, by a sinking fund. This was considered inadequate, and in 1936 the charge was abolished, the owners receiving compensation in the form of govt. stock, while those liable to pay were required to contribute to a redemption annuity for 60 years. The amount of the redemption annuity is far less than that of the former tithe rent charge.

Tithe Barn. Medieval storehouse for grain and fodder payable to the church in kind. Usually

Tithing. In old English law, a group of ten householders and their dependents regarded as acting together for purposes of ensuring peace and good behaviour under a system of frankpledge (*q.v.*). The individual members of a tithing were held as surety for the good conduct of the others. The chief of the unit was known as the tithingman, a title used for an elected police official in the early New England colonies. *See* Hundred.

Tithonus. In Greek mythology, the son of Laomedon, king of Troy, by a river nymph. The goddess Eos or Aurora fell in love with him, and he begot by her the hero Memnon. Tithonus begged of Eos to give him immortality, but forgot to ask for perpetual youth, so that although the goddess granted his request, the older he grew, the more decrepit he became. Eventually, he begged Eos to revoke her gift, and the goddess changed him into a grasshopper. Tennyson wrote a poem called *Tithonus*.

Titian. Anglicised form of the name Tiziano Vecelli (d. 1576), Italian painter. He was born at Pieve, of an old family in the district of Cadore; but the date of his birth has been disputed, different authorities giving it as 1477 and 1489. He learned painting in Venice, probably at first with Zaccato, a worker in mosaic. He then studied under Gentile Bellini, eventually attaching himself to Giorgione, whose sense of glorious colouring and of romance he shared.

By the time Giorgione died at 32, Titian had become a great name in Venice. One of his earliest allegorical compositions, *Sacred and Profane Love*, exemplifies his skill as a colourist, and strength in composition. In 1513 he applied to the council in Venice to be made their official painter, and three years later obtained his request. From that time he was the supreme head of the Venetian school.

The greater part of his life was spent in Venice, but he was well-known at Ferrara, Mantua, Bologna, Augsburg, and Milan, his work being in great demand, and members of the imperial court sending for him to carry out their commissions. In 1545 he was in Rome, carrying out commissions for Pope Paul III, and while he was there he made the acquaintance of Michelangelo. Returning to Augsburg he produced the por-

Tithe Barn. A fifteenth century example preserved among the ruins of a Benedictine abbey at Abbotsbury, Dorset

These were of three kinds: predial tithes, the produce of the soil; personal tithes, the profits of handicraft or merchandise; and mixed tithes, often included in predial tithes, the produce of animals, including butter and eggs.

Where the income from tithes was more than sufficient for local needs, tithes were often appropriated to cathedrals and monasteries. The greater tithes appropriated to monasteries often found their way into secular hands, as is shown by the existence today of lay vicars and rectors. With the rise of nonconformity in the 18th and 19th centuries there arose an agitation against the payment of tithes, and, refusing to pay, many persons were imprisoned.

By the Tithe Commutation Act of 1836, and subsequent amending Acts, tithes were replaced by an annual rent charge. The par value of tithes was fixed according to their amount at the time, and on the assumption that a certain number of bushels of corn were worth £100. But the real value was to vary each year, according

to the average price of corn during the preceding seven years, this being periodically determined by rather involved tables. Changes in prices during the First Great War caused much inconvenience, and in 1918 tithe rent charge was fixed for the seven years to 1925. In the latter year provision was made for its extinction in 85 years, by a sinking fund. This was considered inadequate, and in 1936 the charge was abolished, the owners receiving compensation in the form of govt. stock, while those liable to pay were required to contribute to a redemption annuity for 60 years. The amount of the redemption annuity is far less than that of the former tithe rent charge.

Titherage, MADGE (b. 1887), British actress. Born in Melbourne, Australia, July 2, 1887, she was educated in England, and made her London debut in *The Water Babies* at the Garrick Theatre, 1902. She joined Lewis Waller's co. in 1908, and in 1911 became a star by her performances in *A Butterfly on the Wheel*. In 1912 she first played on the New York stage. Excelling in comedy, she was at her best in *Bluebeard's Eighth Wife*, 1922; *The Queen Was in the Parlour*, 1926; *Theatre Royal*, 1934; and *Mademoiselle*, 1936.

Titian, Italian painter
Self-portrait at Windsor

trait of Charles V, now at the Prado, one of the noblest works of the 16th century. He also painted several portraits of Philip II of Spain. Titian died of plague, Aug. 27, 1576.

Titian's art is the highest perfection of sensuous beauty, not of spiritual loveliness nor of intellectual mysticism; frankly materialistic, frankly decorative. His work is the high-water mark of superb colour, and as a portrait painter he is usually regarded as in certain respects the greatest of all times, not equal to Velazquez in his magnificent evidence of truth, but superior to him in grandeur of style and in sumptuousness of colouring. His work can best be studied in Venice and Madrid.

The Louvre also possesses many works by Titian, and others of almost equal importance have been permanently exhibited in Florence, Dresden, the Villa Borghese, Rome, and Vienna, while almost all the galleries of Europe, such as those of Milan, Munich, Leningrad, London, and Antwerp, contain fine examples by his hand. See Aretino, P.; Ariosto, L.; Clement VII; Jesus; Medici; Philip II; Pole, Reginald.

Bibliography. Life and Times of Titian, J. A. Crowe and G. B. Cavalcaselle, 1887; Earlier and Later Work of Titian, Sir O. Phillips, 1897-98; Titian's Drawings, D. V. Hadeln, 1927.

Titicaca. Largest lake of S. America. It lies on the boundaries of Peru and Bolivia, between the main Andean range and the Cordillera Real, at an alt. of 12,500 ft. It has a length of 130 m. from N.W. to S.E., an average width of 40 m., a depth in places of over 800 ft., and an est. area of 3,200 sq. m., being the loftiest lake of its size in the world. Its shores are indented by numerous bays, and there are many projecting promontories. It is fed by the Lagun-

illas and the Asangaro on the N. shore, and is drained from the S. end by the Desaguadero (*q.v.*), which flows to Lake Aullagas. This is now the only outlet of the lake, which is said to have formerly occupied a far larger area. There is steamboat communication between the towns of Puno, Juli, and Chucuito, the former being connected with Mollendo on the Pacific slope.

Titlark (*Anthus pratensis*). Name sometimes applied to the meadow pipit (*q.v.*), a common British bird.

Title. In general, an appellation or name. Derived from Lat. *titulus*, an inscription on an altar or tomb, the word came to mean a distinguishing inscription, and hence an appellation of dignity given to persons, as well as retaining its original sense as an explanatory inscription, *e.g.* the title of a book or picture. It is also used in connexion with the ordination of deacons and priests in the Church of England; such must have a title, *i.e.* a promise of a curacy or living, before being admitted to ordination.

Titles are borne by persons holding high office or hereditary dignities and positions, and are generally divided into hereditary and non-hereditary. The hereditary titles in the peerage of the U.K. are duke, marquess, earl, viscount, and baron. Courtesy titles are borne in Great Britain by children of peers, *e.g.* the eldest son of a duke, marquess, and earl is called by his father's second title. See Address, Forms of; Aristocracy; Baron; Baronet; Duke; Earl; Esquire; Knight; Peerage; Precedence; Rank.

Title. In English law, the right of ownership, especially in regard to property in land. The purchaser of such must see that his title to the property is a good one, *i.e.* that he cannot be molested in its possession. To secure this, various

documents are examined and further documents conveying the land are drawn up. Registration of title to land by the state was introduced under the Land Registration Act, 1925.

Title deeds embrace all those deeds and documents by which the owner proves his ownership, a mortgagee his mortgage, a lessee his lease, and the like. The Larceny Act, 1916, makes it a felony for anyone, with fraudulent intent, to destroy, obliterate, cancel, or alter any document of title to land. See Conveyancing; Land Laws; Land Registration.

Tito. This is the name assumed by Josip Broz (b. 1890), Yugoslav soldier and statesman. Son of a village blacksmith, he was born of Croat and Czech parentage at Kumrovec, near Zagreb, then in the Austro-Hungarian empire.

Marshal Tito,
Yugoslav soldier and
statesman

He grew up amid national and social discontent, served in the First Great War, was a prisoner of the Russians during 1915-17, joined the Red Army, fought against anti-Communist forces, and returned to newly created Yugoslavia to organize the Communist party there. Repeatedly arrested, he was sentenced to six years' imprisonment in 1928, and on release went to Moscow, helping to arrange the transport to Spain of volunteers joining the international brigades.

Secretary-general of the Yugoslav Communists from 1937, Broz inspired and led guerrilla forces against the Germans in the Second Great War, beginning his campaign in Bosnia. In 1942 he first used the pseudonym Tito, becoming president, 1943, of the new national liberation council, and c.-in-c. of the people's army of liberation with the rank of marshal. He was recognized Dec. 22, 1943, as a full Allied commander. He refused to agree to the return of King Peter II until after the holding of an election. This, held in Nov., 1945, gave Tito an overwhelming victory and led to the proclamation of a republic. Expulsion of Yugoslavia from the Cominform in 1948 failed to affect his policy, or his hold on his country. Consult Whirlwind, S. Clissold, 1949; Eastern Approaches, F. Maclean, 1949.

Titicaca. View of the largest lake in S. America, on the boundaries of Peru and Bolivia, showing the Island of the Moon

Titograd. Name given in 1948 in honour of Marshal Tito to the Yugoslav town Podgorica (*q.v.*).

Titration (Fr. *titre*, standard). Method of chemical analysis. It consists in ascertaining the strength of a chemical substance by noting the quantity of a solution of known strength that is required to complete a definite chemical reaction. The reaction may, for instance, be the neutralising of an alkaline solution by an acid; the formation of a precipitate, as in titrating sodium chloride by a standard solution of silver nitrate, or by oxidation and reduction methods, as in the estimation of an iron salt by means of a solution of potassium permanganate.

Sometimes, to render the final reaction visible, an indicator is used. The estimation of an acid or alkali requires litmus or phenolphthalein to indicate by change of colour the state of the liquid—whether acid or alkaline. The indicator used in the analysis of iodine solutions is starch-paste, which turns blue when there is free iodine present. It may happen also that the end point of the reaction is indicated by an incipient precipitate, as in the titration of hydrocyanic acid by means of silver nitrate.

Titulescu, NICOLAS (1883–1941). Rumanian statesman. He was born at Craiova, became a barrister and in 1905 professor of civil law at Bukarest, and entered parliament, 1913. A Liberal, he was minister of finance in 1917, helped to carry through agrarian reforms, and in 1921 introduced income tax. He was a principal architect of agreements with Czecho-Slovakia and Yugoslavia by which those countries and Rumania formed the Little Entente. For most of the period 1922–32 Titulescu was ambassador to London. A strong supporter of the League of Nations, determined to resist Italian encroachment in the Balkans, he incurred the hostility of the Iron Guard and other pro-fascist groups while foreign minister from 1932. Long sojourns in W. Europe weakened his prestige at home, and he was removed from office in 1936. He died at Cannes, March 3, 1941.

Titus. Companion of S. Paul. A Greek by birth, and perhaps converted by the apostle in Asia Minor, he is first mentioned as accompanying him from Antioch to Jerusalem, where a church council, which discussed the position of Gentile Christians, decided that he need not be circumcised

(Gal. 2, v. 1). On three occasions he was working in Corinth. S. Paul, who addressed a short epistle to Titus, left him in Crete, where he had charge of the Church, apparently as its first bishop. He was with S. Paul in his second imprisonment at Rome (2 Tim. 4, v. 10). See Paul, S.

Titus, FLAVIUS SABINUS VESPASIANUS (40–81). Roman emperor, 79–81. Eldest son of Vespasian,

Titus,
Roman emperor

he was born in Rome, Dec. 30, 40, received an excellent education, and served as military tribune in Britain and Germany. During the war with the Jews he took command after his father had returned to Italy, and ended the war by taking the Temple of Jerusalem in 70. More than a million Jews were said to have perished in this terrible siege and 100,000 to have been sold into slavery. This campaign of Titus is celebrated by the arch at Rome which bears his name. When he succeeded his father, he proved in his short reign to be one of the most popular emperors, and exerted himself nobly to relieve suffering after the disaster at Pompeii. Titus died at his Sabine villa, Sept. 13, 81. See Colosseum.

Titus Andronicus. Tragedy by Shakespeare. The hero of this name, a mythical Roman general who has defeated the Goths, sacrifices the first-born son of Tamora, their queen.

secures the mutilation of Titus and his daughter and the beheading of two of his sons. Titus bakes the heads of two of Tamora's sons in a pasty, serves them up for her to eat, stabs her and his daughter, is stabbed himself, but avenged on the instant by his surviving son, the play ending in a carnival of slaughter. First acted and printed anonymously in 1594, mentioned by Meres, 1598, and included in the 1623 folio, the play appears to have been based on Titus and Vespasian, probably by Kyd, with some aid from Greene or Peele, and acted in London

in 1591. Usually considered too crude for revival, it contains 2,525 lines, including 2,328 of blank verse. Consult Did Shakespeare Write Titus Andronicus?, J. M. Robertson, 1905.

Titios. In Greek mythology, a giant who attempted to offer violence to the goddess Artemis. For this he was killed by Apollo, brother of Artemis, or, according to others, by Zeus. Consigned to Tartarus, he lay on the ground, covering nine acres, with two vultures perpetually tearing his liver.

Tiverton. Mun. bor. of Devon, England. It is situated where the Lowman joins the Exe, 14 m. N. of Exeter, and is a rly. junction. The town lies on both sides of the rivers, which are here spanned by stone bridges. S. Peter's church has fine brasses and other monuments, and a doorway of the original Norman building. The castle, which dates from about 1100, has been largely rebuilt. Here is Blundell's school (*q.v.*); also grammar schools and technical schools for boys and girls. The industries include the manufacture of lace, flour, and beer, and there is a trade in agricultural produce. The bor. had its own M.P. 1618–1885; it now gives its name to a co. constituency. In the 16th and 17th centuries it was noted for its woollen goods, especially Tiverton kerseys. Pop. est. 11,000.

Tivoli (anc. Tibur). City of Italy, in the prov. of Rome. One of the most ancient towns of Latium, it is said to have been founded by the Siculi. Situated on a slope of the Sabine Hills, 25 m. by rly. E.N.E. of Rome,

Tivoli, Italy. General view of the Sabine town, showing the waterfalls of the Anio

Tivoli, Italy. The graceful Temple of Vesta, on a rock overhanging the falls

on a rocky eminence 750 ft. high, by which flows the river Teverone (Anio), Tivoli has been a celebrated summer resort from antiquity. The chief Roman remains are the beautiful circular Temple of Vesta; the temple of the Sibyl; the villas of Hadrian and Maecenas; and mausoleums, aqueducts, baths, etc. The Villa d'Este, part of which was demolished by a direct hit during the Second Great War, dates from 1549. The castle of Pius III, built about 1460, is now a prison. The falls of the Anio, 350 ft., supply electric power for Rome. French troops of the Allied 5th army captured Tivoli June 5, 1944. See Este; Hadrian's Villa.

Tizard, SIR HENRY THOMAS (b. 1885). British scientist. He was born Aug. 23, 1885, and educated at Westminster and Magdalen College, Oxford. While a Fellow of Oriel (1911-21) he was seconded for duty with the R.F.C., later R.A.F., being assistant controller of research, 1918-19. During 1927-29 he was permanent secretary to the dept. of scientific and industrial research, and then successively rector of the Imperial College of Science, 1929-42, and president of Magdalen until 1946. Knighted in 1937, Sir Henry acted as chairman of the aeronautical research committee in 1933-43, and with Sir R. Watson-Watt stimulated research on radar in Great Britain. The govt.'s chief scientific adviser on defence, he was in 1948 president of the British Association.

Tlaloc. Ancient Mexican deity. The god of rain and thunder, he was said to inhabit the snow-clad range dominated by Popocatepetl.

Tlaxcala. Smallest state of Mexico. It lies E. of the state of Mexico and covers an area of 1,555 sq. m. Its surface has a general elevation of about 7,000 ft., and reaches an alt. of 13,480 ft. in Malinche. Pop. 224,063.

Tlaxcala. Town of Mexico, capital of the state of Tlaxcala. It

is situated at about 7,350 ft. alt., and is 60 m. by rly. E. of Mexico City. Its chief features are the state-house, the old bishop's palace, and remains of the ancient Indian capital. A trade in grain and hides is carried on.

Tlemcen. Town of Algeria. In the Oran div., it is 68 m. from Oran on the rly. from Oran to Morocco. The Pomaria of the Romans, it was occupied by the French in 1842. It exports olive oil, alfa, and blankets. It contains many relics of the time when the city was the Moorish capital of North-West Africa, and occupied a high place in Arabic culture. There are many fine mosques dating from the 12th-13th centuries, some ornamented with rich sculpture and carving; a fortress where the Moorish sultans formerly lived; and a museum of local antiquities which contains the epitaph of Boabdil, king of Granada, and the standard cubit measure of Mahomedan commerce. Pop. 71,400.

Tlingit. American Indian tribal stock. They are found on the S.E. coast of Alaska, having migrated from a region farther S. A tall, brown, talented people, they have acquired from their Eskimo neighbours bone spear-throwers and lip-ornaments, while their skilfully carved timber houses and canoes, hot-stone cookers, and other cultural elements point to ultimate Polynesian contact.

Toad (*Bufo*). Large genus—over 100 species—of batrachians, of world-wide distribution, with the exception of Australia and Madagascar; most abundant in tropical America and the Indo-Malayan region. Closely related to the frogs (*Rana*), they differ from them in their flatter upper side, broader head, shorter limbs, and in the skin being very dry and pimply, with glands which secrete an acrid fluid. In addition, the toads are toothless, and the tip of the tongue

is not divided. They pass through a larval ("tadpole") stage similar to that of the frog, but the eggs, which vary from 700 to 2,000, are extruded in a double chain enclosed in a string of jelly, which is wound around water plants. The tadpoles are smaller and darker than those of the frog. The genus is represented in Great Britain by two species; the common toad (*B. vulgaris*) and the natterjack (*B. calamita*); but the former does not occur in Ireland.

The common species has on its upper side some tint of brown or grey, varying with its surroundings; and the under parts are whitish, more or less spotted with

Toad. Common species, *Bufo vulgaris*, found in all parts of Britain

black. It seeks drier situations than the frog, and is inactive during the day, coming abroad in the dusk and feeding upon insects, worms, and snails: large individuals on occasion catching small mice. One toad will in a night's foraging consume vast numbers of insects, so that its cooperation is always to be encouraged by gardeners. From ancient days the toad has been the subject of numerous erroneous beliefs, e.g. the possession of a jewel in its head, the power of ejecting venom, and of living for centuries entombed in solid stone or the heart of a tree. The toad hibernates, retiring in autumn to holes in dry ground or other suitable retreats, and on awakening in spring immediately seeks the ponds or ditches for mating and egg-laying. See Animal colour plate; Natterjack; Surinam Toad.

Toadflax (*Linaria*). Genus of herbs of the family Scrophulariaceae. Natives of Europe and W. Asia, the flowers are tubular, with a hollow spur, and the mouth is closed by lips, which can only be opened by strong insects, like bees. The best known species are the yellow toadflax (*L. vulgaris*) and the ivy-leaved toadflax (*L. cymbalaria*). The first named is com-

Toadflax. Clustered flowers and leaves of *Linaria vulgaris*

mon in dry wastes, and the dense clusters of bright yellow flowers are similar to those of the snapdragon. *L. cymbalaria* trails down over old walls, and has slender branches, lobed, kidney-shaped leaves, and small blue-purple flowers.

Toadstool. Term popularly applied to mushroom-shaped fungi to indicate their supposed poisonous character. As a matter of fact, very few of this order of fungi (the Hymenomycetaceae) are known positively to be poisonous, and a fair percentage are known to be as wholesome as the common mushroom (*Psalliota campestris*). See Amanita; Blewits; Botany; Flyagaric; Fungus; Mushroom.

Toala. Aboriginal tribe in S.W. Celebes, Indonesia. They are a medium-headed, wavy-haired, thick-lipped people, short, dark, and slender; they represent a primitive caucasoid type allied to the Vedda and Sakai, with Melanesian elements. Inhabiting rock-shelters, they are hunters, using stone knives and arrow-heads, and bone lance-heads and whistles.

Toast (Lat. *tostus*, scorched). Bread dried and browned before a fire. When bread is exposed to heat the surface becomes caramelised, and the starch transformed into dextrin. Toast is therefore beneficial to people who are unable to eat much starchy food, especially if the bread is cut very thin and toasted slowly till it is hard throughout. See Bread.

Toast. Term used for drinking a health and for the health drunk; it was originally applied only to a lady, who was known as "a toast." This use of the word is usually referred to the story of a gallant at Bath in the reign of Charles II, who, seeing an admirer of a famous beauty drinking her health in a glass of the water in which she was standing, threatened to plunge into the bath, vowing that, "though he liked not the liquor, he would have the toast," in allusion to the old custom of putting toast in a glass of wine to improve the flavour. See Health; King over the Water.

Toastmaster. Official at public banquets who announces the healths. A stentorian voice is essential, and toastmasters are usually selected from those officials of such institutions as Lloyd's whose duty it is to "call" members. A toastmaster should be fully acquainted with the order of precedence and styles of address.

Toba. South American Indian tribe in the Gran Chaco, N. Argentina. Of Guaycuru stock, they are

tall and muscular, hostile to whites, superb horsemen, and use spears for fishing. They wear paint and feather-ornament rather than clothing.

Tobacco (Sp. *tobaco*). Popular name for plants of the species *Nicotiana* (family Solanaceae), and for the narcotic prepared from certain species for smoking. The Spanish word *tobaco* came from *tobago*, native name of the Y-shaped stick used for inhaling smoke through the nostrils by the ancient Carib inhabitants of what is now the Dominican republic. Columbus noted the smoking of the *tobago* in 1492. Incense made from tobacco leaves and blown from a type of pipe was used in their religious ceremonies by the Maya, and burial mounds found in the Mississippi valley, and believed to date from 700, contained smoking pipes.

Francesco Fernandez, a physician, introduced the tobacco plant into Europe in 1558, when he brought plants to Philip II of Spain. In 1561 Jean Nicot (*q.v.*) presented Catherine de' Medici with tobacco plants grown from seed which he had acquired while ambassador to Portugal. Both Fernandez and Nicot were interested in the use of tobacco medicinally as snuff, for poultices, etc., and it was from England that the custom of smoking spread to the Continent. Ralph Lane, first governor of Virginia, was the first person to introduce tobacco in quantity into England, and Raleigh made smoking popular.

At that time tobacco was believed to be a remedy for indigestion, scurvy, and gout, and a cure for the disease of horses called the staggers. It was supposed also to ward off the plague, and it is recorded that boys at Eton college were whipped for failing to smoke their morning pipes. James I of England, however, was an opponent of smoking, and not only published his Counterblaste to Tobacco but also raised the duty on imported tobacco from 2d. to 6s. 10d. a lb., and prohibited its growth in England. Louis XIII prohibited the sale of tobacco in France except on the order of a physician; Pope Urban VIII issued a bull excommunicating all who took it into church.

Charles II maintained the prohibition on the growth of tobacco in England to keep up import duties, and this prohibition contributed much to the early prosperity of tobacco growers in America. During the War of

Independence tobacco could not be imported from Virginia and was again cultivated in England, but the law prohibiting it had not been repealed, and the enterprising planters were fined £30,000 and sent to jail, while their crops were publicly burned by the hangman. Tobacco grown in Scotland, which did not come under the Act, was forcibly bought by the govt. at 4d. per lb.

In 1886 the British govt. permitted experiments in tobacco growing, soon abandoned since the results were not very good, and the same duty was charged on home grown as on imported tobacco. Under the Finance Act, 1908, tobacco growing was permitted under licence from the commissioners of customs and excise. A tobacco dealer in the U.K. must be licensed.

There are more than 50 varieties of the tobacco plant, the three most commonly used in manufacture being: (1) *Nicotiana tabacum*, a native of central America or the West Indies, which bears pink or rose-coloured flowers and grows to 6 ft. or higher; (2) *Nicotiana rustica*, a smaller plant with yellow flowers which originated in Mexico and is now grown in Turkey and the Levant; (3) *Nicotiana Persica* (Persian tobacco), used for smoking in a hookah.

CULTIVATION. The seeds are sown in seed-beds, and the plants set out in the field when they are 6 to 8 ins. tall. In the northern hemisphere the seeds are sown from the beginning of Jan. to early in April, according to the lat., planting in the N. being later than in the S. The beds are carefully prepared, and are sterilised by burning wood over them or by steaming, and manured. The seed is very small—about 300,000 to one ounce; one ounce is usually sufficient for 100 sq. yds. of seed-bed. The seed is often sown with a pepper-pot, or by hand mixed with ashes, sand, etc.

In seven or eight weeks the plants are ready for transplanting by hand or by machine; they are set out on ridges from 2½ ft. to 4½ ft. apart, with 1 ft. to 3½ ft. between plants, according to type. Turkish tobacco is set closer than this. The closer the setting, the thinner will be the leaf. Plants of tobacco grown for cigars are usually set 12 ins.—18 ins. apart.

In two months the crop starts to flower, and the buds are pinched off, or "topped," to allow all the nutriment to go into

the remainder of the plant. For cigar and cigarette types from 15 to 20 leaves are left on the plant, for the heavy pipe varieties from 10 to 12 leaves. After topping, fresh shoots, called suckers, which appear in the axils of the leaves, are removed. In another month's time the leaves have turned from a dark to a lighter yellowish-green colour, and are then ready to be harvested by either priming or cutting. In priming, the leaves are picked individually from the stalk, starting with the lower leaves, which ripen first. About three leaves are taken off a plant at each priming. The bottom, or sand, leaves are in most types discarded. The leaves to be used are transported to the barn, where they are suspended from sticks, ready for curing. In cutting, used for the heavier types of pipe tobacco, where only 10 to 12 leaves remain on the stalk, the whole plant, as soon as the middle leaves have ripened, is cut down and split. After the leaves have been allowed to wilt for a short time in the field, the plants are removed to the barn where they are straddled across sticks, ready for curing.

The yield varies considerably, and may be as little as 600 lb. an acre, or as much as 1,500 lb.; 800–1,000 lb. per acre is probably average for most types of tobacco.

CURING. The three chief methods of curing are by air, fire, and flue. Air-curing is probably the original method, flue-curing is the most recent. All cigar tobaccos are air cured, i.e. are allowed to cure naturally by air. The plants or leaves normally take some wks. to dry, weather conditions at the time being the governing factor. When it is cured, the leaves of cut tobacco are stripped from the stem.

In fire-curing fires are lit under the suspended tobacco in the barn, the smoke usually effecting curing in a shorter time than without it. Fire-cured tobacco, which is darker in colour and has a fired smell, is used in stronger types of shag, roll, etc. Only varieties grown in certain districts of Kentucky, Tennessee, Virginia, and parts of the British Commonwealth, and cut, are cured in this way. Hickory, oak, and gum are the woods most commonly used for firing.

Flue-curing was introduced during the second half of the 19th cent. It produces the bright yellow-coloured tobacco used for cigarettes sold in Great Britain.

Most of the tobacco thus cured is primed. Heat from wood fires is conducted through flues running along the bottom of the barns, which are smaller than those used for air-curing. No smoke reaches the tobacco. In the first stage (yellowing) the heat is raised to about 110° F. for 24 to 36 hrs. In the next (fixing the colour) it is raised to about 135° F. for 10 to 18 hrs. In the last stage (killing the stem) the last of the sap is dried out of the stem at 170° F. to 180° F. The whole process takes four to five days, and considerable experience is necessary in determining the various temps. A more expensive method is to use oil burners; coal is sometimes used.

GRADING AND MANUFACTURE.

After the tobacco has been cured, the farmer takes it from the barn early in the morning, when it is slightly moist, and stacks it in his pack-house. It is then graded and tied into "hands"—10 to 15 leaves tied together with one leaf. Leaves of cigar tobaccos are placed in a bulk and artificially fermented. Turkish tobacco leaves, being small, are not tied in hands.

In the U.S.A. and some Commonwealth countries tobacco is sold in baskets or bales on the warehouse floor by auction to the manufacturers and dealers. In Canada, where there are no auctions, buyers bid direct to the farmer for the tobacco hanging in the barn. The tobacco is re-graded in re-drying factories and put into re-drying machines, in which it is dried, cooled, and "ordered" (i.e. put into condition for packing); the last process being done by steam. It is then packed into casks (or tierces) containing up to 900 lb., and shipped. Other packings used are

excise duty is paid. It may be manufactured into cigarettes, cigars, snuff, or pipe tobacco mixtures, e.g. flakes, shags, roll, twist, cut plugs, navy cuts, spun cuts. It is blended very carefully. Not only are the various types and grades blended together, but also the different crops, so that an even blend is maintained from year to year. In making snuff the leaf is ground, carefully fermented for some weeks, and flavoured to produce the greatest possible amount of free ammonia, free nicotine, and other aromatic scents.

PRODUCTION. The U.S.A. produces more than a million tons of tobacco a year, India more than 400,000 tons. Other large producers are China, Russia, Brazil (116,000 tons), Turkey (68,000), Canada (63,000), Greece (48,000), Cuba (38,000), Bulgaria (37,000), Indonesia (27,000), Argentina (26,000), S. Rhodesia (21,000), Mexico (14,000), Korea (14,000), Persia (12,000), S. Africa (10,000), Paraguay (10,000), Philippines (10,000).

Tobago. Island in the British W. Indies, included administratively with Trinidad. It lies 21 m. N.E. of Trinidad, has an area of 116 sq. m. and is 26 m. long and 7½ m. wide. Of volcanic formation, the conical hills and ridges do not rise higher than 1,800 ft. The cultivation of rubber, cotton, and tobacco is established, but the main exports of the island are copra and cocoa. Scarborough, on the S. coast, is the port and chief town. Discovered by Columbus in 1498, it was successively Dutch, British, and French, finally becoming British in 1814. Pop. 25,358, mainly negroes.

Tobermory. A seaport and parish of Argyllshire, Scotland. It stands on the bay of the same

Tobermory, Argyllshire. Harbour and quays of this fishing port

hogsheads (more than 900 lb.), cases and bales, 200–400 lb.

On arrival in the U.K. the tobacco is stored in bonded warehouses, where it matures for two to four years. When it is cleared from bond into the factory, the

name, 30 m. from Oban, and has a good harbour, protected by an island. The place was founded as a fishing station in 1788.

After the defeat of the Armada in 1588 a Spanish galleon, believed to be the *Almirante de Florencia*,

put into Tobermory Bay, but after an explosion sank about 80 yards from the shore, in about 66 ft. of water. The galleon was believed to contain treasure to the value of over £300,000, and to have gone down with about 350 officers and men. Having settled down into the sea-bed, she was covered by 20 ft. of silt. In 1912 salvage operations recovered silver goblets, dishes, and coins. Royal Navy divers in 1950 located the galleon and recovered a few medallions. The wreck belongs to the dukes of Argyll. *Consult* State Papers of Scotland, 1888.

Tobias. Character in the book of Tobit. He is chiefly remembered for the appearance to him of the angel Raphael (5, vv. 2-8), an incident which was treated flippantly in James Bridie's play *Tobias and the Angel*, 1931. Of Hebrew origin, the name means God is good, and is used as a Christian name.

Tobit, Book of. One of the O.T. Apocrypha, composed probably by an Egyptian Jew in Aramaic towards the end of the 3rd century B.C. It is a kind of religious romance recounting the adventures of a pious Jew named Tobit, who with his wife Anna and his son Tobias (*v.s.*) had been carried captive to Nineveh by Shalmaneser. It has been suggested that the author was indebted to four main sources: the O.T., the Story of Ahikar, the fable of the Grateful Dead, and a tractate of the Egyptian god Khons of Thebes.

Tobogganing. A snow sport. The word represents the American Indian *odabaggan*, which was used by the Indians of N. America for transporting goods across the snow. The Canadian and American toboggan is a sled with a flat bottom, sometimes fitted with low iron runners from 4 to 8 ft. long and about 2 ft. wide, accommodating up to six persons. The runs, or

slides, in Canada and the U.S.A. down which the toboggans glide, are straight and divided into chutes or slides by low banked walls of snow, so that several toboggans can descend side by side without danger of collision.

The most modern form of tobogganing is obtained in the Engadine, Switzerland, during the winter season, notably on such runs as the Buol at Davos Platz and the Cresta at St. Moritz. The racing machines consist simply of round steel skeleton runners about 4 ft. long and 6 ins. high, with just a centre board on top along which the rider lies face downwards. Iron spikes are fixed to the toe of each boot, with which the tobogganist guides and brakes his machine.

On the Cresta the pace in places reaches nearly 70 m. per hour. The surface of the track is composed of compressed snow, over which water is thrown to make a glazed surface of ice. Bobsleighing is a simpler form of tobogganing. See Bobsleigh.

Tobol. River of W. Siberia. It rises in the Urals, and after a N.E. course of about 800 m., during more than half of which it is navigable, joins the Irtysh in the territory of Tobolsk. The river is frozen from Nov. to May at Kurgam, Tobolsk, and other places in the neighbourhood.

Tobolsk. Town of R.S.F.S.R., in the region of Omsk. It is situated 500 m. N.W. of Omsk, at the confluence of the Irtysh with the Tobol. The inhabitants are mainly occupied in tanning, tallow and soap boiling, shipbuilding, match-making, distilling, and fishing. Nicholas II of Russia was imprisoned here after the revolution of 1917, and the town was the scene of considerable fighting in 1919 between the Bolsheviks and Koltchak's forces. Pop. est. 25,000.

Toboso, El. Town of Spain, in the prov. of Toledo. Situated in La Mancha, 12 m. N.E. of Alcázar de San Juan it was immortalised by Cervantes in Don Quixote as the dwelling-place of the peerless Dulcinea.

Tobruk (anc. Antipyrgos). Seaport of Cyrenaica. Occupied by the Italians Oct. 4, 1911, it is situated on the best harbour on the coast of Cyrenaica; indeed one of the best on the Mediterranean. The harbour is protected by a rocky peninsula about 3 m. long, but is open to the S.W. winds. Tobruk is 60 m. W. of Bardia.

DEFENCE OF TOBRUK. This harbour was of the utmost strategic importance in the Libyan campaigns of the Second Great War, for it lay athwart the lines of communications of any army advancing upon or retreating from Egypt along the coast. Shortly after Gen. Wavell began his westward drive against Graziani's Italian forces in Dec., 1940, preparations were made to capture Tobruk and utilise it as a supply base. The town was defended by a perimeter of gun emplacements, minefields, and anti-tank ditches, although the last were not deep enough to be effective. The harbour was protected by coastal and A.A. guns.

After a preliminary bombardment by the R.N. and the R.A.F., a combined air, sea, and land assault was launched early on Jan. 21, 1941. The main elements of the land forces were the 7th armoured and the 6th Australian infantry divs., three regts. of artillery, and machine-gun battalions of the Cheshire regt. and Northumberland Fusiliers, together with some Free French infantry. By nightfall the W. and S.W. portion of the perimeter, about one-third of the whole, had been taken with little opposition, except at Palestina. The attack

Tobruk, Cyrenaica. Air view showing the harbour, 1942. The pall of smoke is caused by burning petrol dumps
British Official

was resumed next morning and the town entered without resistance. Some 30,000 prisoners were taken as well as artillery, armour, vehicles, and stores. The Italians had damaged the harbour and shore installations.

Arrangements were immediately made to clear the harbour and stock the town with military stores for Wavell's army, which hoped to reach Tripoli. In April, however, German reinforcements reached the hard-pressed Italians, and the Axis forces made a counter-attack which forced Wavell to yield most of his territorial gains. As they advanced down the coast towards Egypt they by-passed Tobruk, intending to capture it later. The town was held by a British and Imperial garrison which had little difficulty in repelling land attacks; and made sorties against the Axis lines of communications, inflicting severe losses on the enemy. In Aug.-Sept. came repeated bombing attacks on the town and harbour, but although the garrison lost heavily in men and material, British local command of the sea enabled reinforcements and stores to be put in and the wounded removed. In eight months of defence 29,000 troops and 34,000 tons of stores were landed at Tobruk and 33,000 men taken off to Egypt. These operations were always carried out under cover of night.

When in Nov. the reorganized British force in Africa attacked, troops from Tobruk sallied out to join it at Sidi Rezegh. The 8th army drove on as far as El Agheila; then came the disaster at Knightsbridge, and Rommel broke through to force a British withdrawal on Tobruk. On June 14, 1942, the 8th army resumed its retreat to Egypt, but it was decided to hold Tobruk. As that had not been part of the original British plan, the perimeter had been left extremely vulnerable. The S. African 2nd div. and British 23rd armoured bde. were left as garrison under Gen. Klopper.

On June 20, after a preliminary air and artillery bombardment, the German 90th light div. attacked, overran the perimeter defences, and entered the town next morning. Two companies of Coldstream Guards and two of S. African infantry managed to fight their way out to rejoin the 8th army, but 28,000 men were taken. The fall of Tobruk was a severe shock to Allied public opinion; drastic changes in the N. African command resulted.

Throughout its German occupation, Tobruk was repeatedly raided by the R.A.F. On Sept. 13 there was a landing by a Royal Marine commando, but faulty timing marred success and cost two destroyers. When the 8th army advanced from Alamein, Tobruk was recaptured by Gen. Pienaar's S. Africans on Nov. 13, the German forces withdrawing without offering serious opposition. See N. Africa Campaigns.

Toby Jug. Small jug or mug. It is shaped somewhat like a stout man wearing a cocked hat, the three corners of which form spouts. These jugs were used for holding beer, but are now mostly found in collections. Introduced into England early in the 18th century they became very common and were also known as filpots.

Tocantins. River of N. Brazil. Rising in the S. part of the state of Goyaz, it flows N. through Pará and discharges into the Atlantic through the long, wide estuary called the Rio Pará. It is about 1,700 m. long; two portions of some 400 m. each are navigable, continuous navigation being barred by cataracts and rapids. It is tidal to Alcobaca, nearly 300 m. from the Atlantic. In its upper reaches it is called the Maranhão. Near its entry into Pará it is joined by the Araguayá (*q.v.*), its principal affluent. There is communication with the Amazon on the W., the land cut off forming the island of Marajo, or Joannes.

Toccata (Ital., touched). Piece for organ or pianoforte in the style of a prelude. It is characterized by numerous short notes; hence its name, signifying that the keyboard is lightly touched. Bach's organ and Schumann's pianoforte works of the kind are the most notable.

Toc H. Association of men and women pledged to Christian fellowship and service. During 1915-18 Talbot House provided rest and recreation in Poperinghe for British troops of all ranks serving in the trenches of the Ypres salient in the First Great War. It was named in memory of Gilbert Talbot, son of

Bishop Edward Talbot, and run by the Rev. P. T. B. ("Tubby") Clayton, who in 1919 founded the movement, its name being the army signaller's version of the initials of Talbot House. Members are pledged to befriend others, give personal service, and think and act without prejudice, challenging their generation to seek the will of Christ in the solution of all problems. There are 20 residential houses and 1,500 branches in all English speaking parts of the world. Toc H women's section works on similar lines. H.q. are at 47, Francis Street, London, S.W.1.

Tocharian. Ancient people in Central Asia. Originally Tarim basin town-dwellers, whose culture and speech were absorbed by the Altaian nomad Yueh-chi, their combined migration to the upper Oxus region of Tocharistan, and afterwards to Bactria, resulted in the Indo-Scyth Kushan kingdom. Lecoq and Stein brought from the Turfan documents in a dialect comprising an Aryan vocabulary of W. type, allied to Hittite, with Turkic constructions. Provisionally called Tocharian, it is now designated Kuchean.

Tocopilla. Coast town of Chile, in the prov. of Antofagasta. It stands on Algodon Bay, about 125 m. N. of Antofagasta city, and is connected by rly. with Santa Fé and by highways with Antofagasta and Iquique. Sulphur and borax are found in the vicinity, and there are smelting furnaces. Tocopilla exports nitrates, sulphates, iodine and copper ore. Pop. 17,287.

Tocqueville, ALEXIS CHARLES HENRI MAURICE CLÉREL DE (1805-59). French politician and writer. Born at Verneuil, Seine-et-Oise, July 29, 1805, he was called to the bar in 1826, and became a judge 1830. Having visited the U.S.A. he published his famous study of *La Démocratie en Amérique*, 1835. Deputy for Valogne, 1839-48, he was a member of the moderate opposition, a man of open and liberal mind, with a wide knowledge of democratic institutions. Elected to the constituent assembly, 1848, he soon became minister of foreign affairs. A protest against Louis Napoleon's *coup d'état*, 1851, led to a short imprisonment. Tocqueville lived abroad for several years, dying at Cannes, April 14, 1859. *Consult Complete Works*, 1860-65; *Recollections*, Eng. trans. A. Teixeira de Mattos, ed. J. P. Mayer, 1948.

Toda (Tamil, herdsmen). Pastoral tribe in the Nilgiri hills, S. India. Numbering a few hundred,

Toby Jug modelled by Walton, early 19th century
British Museum

they are tall, brown, and long-headed, and resemble the Ainu in hairiness. They speak a Draavidian dialect, and are polyandrous.

Todd, MARGARET (1859-1918). British doctor and author. She was educated at Glasgow and Berlin, and at the Edinburgh school of medicine for women, where she took her medical degrees in 1894. Under the name of Graham Travers she published *Mona Maclean*, a novel dealing with the life of a woman doctor, 1892; *Fellow Travellers*, 1896; and *Windyhaugh*, 1898. The chief literary work of her later years was her *Life of Dr. Sophia Jex-Blake*, 1918. She died Sept. 3, 1918.

Toddy. Primarily an intoxicating drink obtained by drawing off the sap of the coconut palm, or other similar trees. It ferments rapidly, and from it by distillation arrack is obtained. In Scotland toddy is the name given to a mixture of whisky, sugar, and hot water. The word is derived from a Hindustani one for a palm tree.

Toddy Palm (*Caryota urens*). Tree of the family Palmae. It is found native in India and Ceylon.

Toddy Palm. Crown of leaves and clustered, drooping flower spikes. Inset, single spike

It grows to a height of 50 or 60 ft., with a crown of curving, much-divided leaves which are 12 to 20 ft. long. The wedge-shaped leaflets have their broad, upper ends irregularly notched, and the base of the leaf stalk embraces the stem. The flowers are in drooping spikes, 10 or 12 ft. long, and the fruits are small, purple-skinned berries. The juice of the flower spike is known as palm wine or toddy, and when boiled it yields jaggery, or palm sugar, and sugar candy. The central parts of the stem yield a kind of sago; and the fibres of the leaf-stalk constitute kittul fibre, which is used for brooms, brushes, and ropes.

Todhunter, ISAAC (1820-84). British mathematician. Born Nov.

23, 1820, he was educated at University College, London, and St. John's College, Cambridge, of

Isaac Todhunter, British mathematician

which he became a fellow. He is chiefly known for his many mathematical text-books, the most successful of which was his *Euclid*, first published in 1862. His *Algebra*, 1858, *Trigonometry*, 1859, *Mechanics*, 1867, and *Mensuration* 1869, were for long standard text-books. He died March 1, 1884.

Tödi. Group of mountain peaks of Central Switzerland. They are situated on the borders of the cantons of Glarus, Uri, and Grisons, the loftiest summit being Tödi or Piz Rusein, with an alt. of 11,886 ft.

Todi (anc. Tuder). City of Italy, in the prov. of Perugia. It stands on a hill, alt. 1,494 ft., overlooking the Tiber, 23 m. S. of Perugia. Surrounded by vineyards and olive groves, it still retains its Etruscan and Roman walls. Notable buildings are a fine Romanesque cathedral, two medieval palaces, the Palazzo del Governo and Palazzo Comunale, and remains of Roman temples. The town, except for windows of the Renaissance church of Santa Maria della Consolazione, was uninjured in the Second Great War when it was captured by the 8th army June 15, 1944.

Todleben or TOLLEBEN, FRANZ EDUARD IVANOVITCH, COUNT (1818-84). Russian military engineer. Born at Mittau of German descent, May 20, 1818, he entered the Russian army in 1836. He served as an engineer in the Caucasus, 1848-51, but his fame rests upon his organization of the defences of Sevastopol in the Crimean War. Wounded during the siege, after it was over he was made chief of the engineers. He wrote an account of the defence of Sevastopol in five volumes, 1864-72. In the Russo-Turkish War of 1877-78 the reduction of Plevna was chiefly due to Todleben's engineering skill. He died July 1, 1884.

Todmorden. Mun. bor. and market town in the W. Riding of Yorks, England. It is situated on the river Calder, 19 m. by rly. N.E. of Manchester and is served by rly. and canal. The buildings include the modern Christ Church

and a town hall erected in 1875.

The chief industries are cotton spinning and weaving, and there are also machine works and foundries. There is coal in the neighbourhood. Todmorden was incorporated in 1896. Pop. est. 18,600. *Pron.* with stress on the first syllable.

Todos os Santos Bay (Port., All Saints' Bay). Large opening of the Atlantic Ocean on the Brazilian coast of the state of Bahia. Sheltered by the island of Itaparica and a promontory, on which is situated Bahia, or San Salvador city, it is some 95 m. in circuit, and can harbour the largest fleets.

Todt, FRITZ (1891-1942). German engineer. He was born at Baden, Sept. 4, 1891, and, after serving in the First Great War, joined the Nazi party in 1923. When Hitler assumed power in 1933, he made Todt inspector-general of roads. Todt's first great

Fritz Todt, German engineer

task was to build the *Autobahnen*, Germany's new motor highways, and the Siegfried Line (*q.v.*). Made minister of munitions in 1940, he headed the Todt organization, which conscripted hundreds of thousands of workers in Germany and the occupied countries for work on fortifications, strategic roads and rlys., U-boat pens, air-raid shelters, etc. His death in an air accident was announced Feb. 8, 1942.

Tody. Bird belonging to the sub-family Todinae. Allied to the kingfisher, it is peculiar to the Greater Antilles. The W. Indian species *Todus viridis* is a native of Jamaica, but has allied species in Cuba, Haiti, and Puerto Rico, the largest specimen not exceeding 4½ ins. in length. Conspicuous for its bright, grass-green plumage, varying little with the sex, and red throat, the tody feeds on insects, and constructs burrows in which to lay its white and translucent shelled eggs.

Toga (Lat. *tegere*, to cover). National outer garment of men in ancient Rome. A woollen cloak, of elliptical or in later times crescent shape, with pointed ends,

Todmorden arms

about four or five yards long, it was worn over the tunic, and wrapped round the body in various ways, but generally with one end hanging in front to the ankles, and the other drawn round the back under the right arm, and thrown over the left shoulder, where the weight kept it in place. The use of the toga was forbidden to slaves and foreigners, and when under the late republic it was replaced for ordinary wear by other garments, it remained a ceremonial and official robe until the 5th century A.D. The *toga candida*, whitened with chalk, was worn by candidates for office, and the embroidered *toga picta* by generals at their triumphs, while the *toga praetexta*, with a purple hem, was the dress of free-born boys and of curule magistrates. Emperors wore purple togas. See Rome.

Toga. Statue of M. Maximus, a Roman senator, wearing the toga
Naples Museum

Toggenburg. Valley of the Upper Thur in N.E. Switzerland, in the canton of St. Gall. Over 30 m. long, it is fertile and of sub-alpine character. The chief occupations are agriculture, fruit-growing, and dairy farming. The persecution of the Protestants by the abbots of St. Gall led to the Toggenburg war in the early years of the 18th century. The dist. was ruled from the Middle Ages by the counts of Toggenburg, but in 1469 was purchased by the abbots of St. Gall. See Goat.

Toggle-Joint. Form of knee-joint used in machines for applying pressure or producing oscillating motion. In a simple form, as applied to a punching machine, the hinged pair of arms, A, B, is arranged vertically; B is connected to the punch rod, and A is pivoted to the hinge-point of A and B so that, when moved horizontally, this third arm will tend to straighten the knee-joint and cause the

Toggle-Joint. Diagram illustrating its construction. See text

punch rod (D) to move downwards. By actuating the pull-rod (C) by an eccentric, a continuous up-and-down motion can be transmitted to the punch-rod or ram; this type of action is used in stone-breakers. A toggle-joint was used in early hand-printing presses, replacing the slower action of a screw in bringing down the platen upon the type-forme. Toggles are used in modern presses for forging, punching, or drawing, and a toggle lever forms part of many other classes of machine.

Togliatti, PALMIRO. Contemporary Italian politician. A journalist and a communist, he left fascist Italy for Moscow in 1929, and under the pseudonym Ercole Ercoli was Italian member of the executive of the Comintern until its dissolution in 1943. He arrived back in Italy, March 28, 1944, and immediately assumed leadership of the Communist party there, persuading it and the other parties in the national council of liberation, then at loggerheads with Badoglio over the future of the monarchy, to leave this question on one side and enter in April an all-party interim govt. under Badoglio's premiership. Vice-premier in this and the Bonomi cabinets, he became minister of justice under Parri, June, 1945, and Gasperi until the elections June, 1946, when the Communists secured 104 out of 556 seats. Himself a successful candidate, he thereafter devoted himself to organization of the Communist party. An unsuccessful attempt was made on his life July 14, 1948.

Togo, HEIHACHIRO, COUNT (1847-1934). Japanese sailor. He was born in Dec., 1847, and trained in the Japanese navy from 1863, seeing action in the Civil War of 1868. In 1873 he entered the British training ship Worcester and spent some time in the R.N. college at Greenwich. Distinguishing himself in the Chinese war of 1894, he became rear-admiral. Promoted vice-admiral in 1900, he was commander-in-chief at the outbreak of the Russo-Japanese War, and performed signal service by destroying the Russian fleet in Port Arthur, Feb. 8-9, 1904, and by defeating Rozhdestvensky's fleet

Count Togo, Japanese sailor

at the battle of Tsushima, May 27, 1905. He was given the British Order of Merit in 1906. In 1912 he became admiral of the fleet. He died May 29, 1934. *Consult* Lives, R. V. C. Bodley, 1935; C. Ogasawara, Eng. trans. J. and T. Inouye, 1935.

Togoland (Fr. Togo). Dist. of W. Africa. It is administered by the U.K. and France under United Nations trusteeship. Bounded W. by the Gold Coast Colony, N. by French Upper Senegal and Niger Territory, E. by Dahomé, and S. by the Gulf of Guinea, it consists of a strip of territory extending about 320 m. from N. to S. and 140 m. from W. to E. in the broadest part, with a coast-line of about 33 m. The total area is 34,934 sq. m.; the British (W.) zone, 13,041 sq. m. in extent, does not touch the coast. The coastal region is flat and marshy, with many lagoons. Behind the coast the land rises gradually to a plateau of c. 1,200 ft. high, with hills up to 3,600 ft.

The principal rivers are the Volta, which forms the boundary between Togoland and the Gold Coast Colony, with its tribes, the Oti and Kulukpene, and the Monu, Haho, Sohio, and the Todschie rising in the central range. With the exception of that of the Volta, most of the river beds are dry during the dry season. In the S. of Togoland the rainfall is deficient. There are forests yielding some good timbers, notably teak and mahogany, but much of the land is infertile scrub. The chief products are palm-oil, cocoa, maize, rubber, copra, cotton, and coffee. Tobacco is grown to some extent in British Togoland.

The est. pop. is 1,310,000, including less than 1,000 Europeans. Pop. of British zone is est. at 390,000. The peoples in the S., among whom the Ewe and Ashanti are most numerous, use 30 different languages; those in the N., of Hamitic origin, make use of 16.

British Togoland is divided into two sections, the northern being attached administratively to the Northern Territories of the Gold Coast, the southern to the Gold Coast Colony. French Togoland is under a commissioner, and has one representative in the national assembly, two in the council of the republic, and sends one delegate to the assembly of the French Union.

Rlys. connect Lome, the chief port and capital, with Atakpame and Blitta to the N., 103 m.,

Palime for Misahöhe to the N.W., 72 m., and along the coast with Anecho, formerly Little Popo, 27 m. All three rlys. are in French Togoland. Numerous roads, some 2,700 m. in total length, and unsurpassed in W. Africa, act as feeders to the rlys. In addition to Lome (pop. 27,908, including 475 Europeans), the chief centres are Misahöhe, Kpandou, Atakpame, Kete-Kratchi, Sokode, Mangu, and Togo, all important trading stations. Ports are Lome, Porto Seguro, and Anecho.

HISTORY. In July, 1884, Dr. Nachtigal, acting on behalf of the German govt., signed a treaty with M'lapa, king of Togo, and hoisted the German flag at Bagida on July 5. From that date the country was administered by the Germans as a protectorate, the natives being treated with considerable severity.

In Aug., 1914, following the outbreak of the First Great War, the Germans surrendered unconditionally to French and British forces. Great Britain and France divided the country between them, Sept., 1920, receiving the approval of the League of Nations and a League mandate July, 1922. During the Second Great War, French Togoland remained under Vichy administration until in Nov., 1942, the governor-gen. of French W. Africa declared for Darlan (q.v.). The closing of the boundary between British and French Togoland during 1940-42 produced a number of administrative difficulties, since the Ewe tribe lives on both sides of the boundary. After the war Togoland continued to be administered by France and Great Britain, under United Nations trusteeship from 1946. An Anglo-French standing consultative commission for Togoland formed in 1948 decided to allow both local produce and the inhabitants to move freely across the boundary; coordination of educational and medical services was also agreed on, as well as economic exchanges. *Consult* Official reports of the British sphere of Togoland, annually; *Togoland Handbook*, H.M.S.O., 1920; *Le Togo*, Gen. Maroix, 1938.

Tojo, HIDEKI (1884-1948). Japanese soldier and statesman. Son of Eikyo Tojo, a well-known strategist of the Russo-Japanese War, 1904-05, he was born in Tokyo, and educated at the military staff college there. After the First Great War he studied strategy in Germany as military attaché. At home he was promoted

inspector-gen. of army air training, 1938, and did much to organize Manchuria. War minister in the

Hideki Tojo,
Japanese soldier

Kono cabinet, he succeeded as prime minister on Oct. 17, 1941, shortly before Japan's entry into the Second Great War, and was given dictatorial powers. In 1944 he assumed additional duties as chief of the general staff, but on the fall of his cabinet on July 18 he relinquished that post also. Arrested as a war criminal by U.S. forces, Sept. 11, 1945, he was brought to trial in Tokyo after an attempt to shoot himself. Condemned to death, Nov. 12, 1948, he was hanged Dec. 23.

Tokat. Town of Asiatic Turkey. Situated on the Toranti Su, about 50 m. N.W. of Sivas, it is the capital of Tokat vilayet. It was once a great centre of trade, and still has industries of importance, manufacturing leather and copper ware. In its neighbourhood are deposits of iron and coal. Tokat was the scene of an Armenian massacre in 1895, and suffered similarly during the First Great War. It has Roman tombs and ruins of an old Byzantine castle, crowning a hill which dominates the town. Pop., town, 22,390; vilayet, 342,244.

Tokay. Town of Hungary, in the co. of Zemplén. It stands at the confluence of the Bodrog and Theiss (Tisza), 43 m. N.N.W. of Debreczen, and is the market for the celebrated Tokay wine, produced on the vine-clad slopes of the Hegyalja, a hill ridge which lies to the N.W. The town has rly. connexion with Miskolcz and Nyiregyhaza.

Tokay. Hungarian wine produced in the neighbourhood of Tokay. A sweet, delicious white wine, it owes its peculiar qualities both to the hot climate and to the mode of preparation. "Essence" or imperial Tokay is made from the juice of over-ripe grapes, expressed by their own weight, and is a liqueur wine of the highest quality, having a fine flavour, rich bouquet, and elegant greenish colour; it contains some 8 p.c. of alcohol. Ausbruch, made from a mixture of dried ordinary grapes, ranks next, and has about 14 p.c. of alcohol.

Token. Numismatic term for any redeemable coin circulated at

a higher value than that of the metal it contains. All silver and bronze coins now minted in Great Britain are tokens protected from depreciation by limitations as to legal tender. Lack of legal small change in England caused the use of illegal leaden tokens early in the 15th century. Elizabeth licensed the city of Bristol to issue copper tokens. Leaden tokens were again in use during the reign of James I, but the mass issues by tradesmen and others took place in the three periods 1648-72, 1787-99, and 1811-15, including latterly silver and gold tokens.

The Token Acts of 1817-18 finally stopped the private minting of currency. Attempts to evade the Acts were made in Ireland, and as late as 1830-31 some Manx tokens were coined. In British possessions overseas, spasmodic issues by traders occurred between the dates of the Carolina halfpenny of 1694 and the Christchurch, N.Z., penny of 1881. Collectors of tradesmen's copper tokens should remember that the later issues were mingled with huge quantities of imitation tokens. *See* Coinage; Numismatics.

Tokyo. Capital of Japan, and of a dept. of the same name. Situated on the S.E. coast of Honshu, in the prov. of Musashi, the city lies on Tokyo Bay and on both banks of the river Sumida. It is the terminus of several rlys. Formerly called Yedo or Jeddo, it was renamed Toyko (Eastern city) in 1868. With a pop. of 6,778,804 in 1940, it was the third largest metropolis in the world.

Tokyo proper lies to the W. of the river. It is almost surrounded by water, and is intersected by canals. Bridges connect it with the E. part of the city across the river. The city proper contained many temples, notably the temple of Hachiman, the war god, and the Gohyaku-Rakan-ji temple of 500 images. Here also were the palaces of the daimios, demolished after this class of territorial nobles was suppressed following the revolution of 1868. Many trees adorned Tokyo's streets. Parks included those of Ueno to the N.E., containing zoological gardens and a museum, and Shiba to the S.W.

Tokyo proper is divided into wards. The castle or palace of the emperor, a handsome structure in Japanese style dating from 1888 and seriously damaged in an air raid of May 26, 1945, is built round the site of the former shogun's palace. It occupies the centre of Kojimachi ward, which was the most densely peopled

Tokyo, Japan. 1. Looking west from the Ginza; on the right is the Asahi newspaper building; the circular building beyond is the Nippon theatre. 2. The Ginza, a popular shopping centre, showing bomb damage. 3. The effect on a section of the city of incendiary bombs in the Second Great War

portion of the city, and contained the mercantile quarter, many European buildings, the gov't. buildings, educational establishments, factories, mills, and workshops. The suburbs N., W., and S. of the castle were noteworthy for the number of their temples. Here were the Russian cathedral; the temple of Kwannon, goddess of mercy, one of the most venerable and picturesque in the country;

the military academy; and the military arsenal. In the W. and S.W. lay foreign embassies and legations and the barracks. Electric tramways and an underground rly. provide transport.

The manufacturing interests of Toyko were considerable, and much enlarged during the 1930s and early 1940s by development of war industries; commerce was of small consequence. Printing

and publishing were important many newspapers and journals, some in English, being published. Extensive libraries included the university library and the imperial cabinet library. Tokyo imperial university, founded 1877, took rank before the Second Great War with the principal universities of the world.

Tokyo was founded in the 16th century. It several times suffered

from fire, notably in 1892 when 4,000 houses were burnt down in a morning. The population in 1872 was less than 780,000; by 1920 it was more than 2,000,000. The greater part of the city was destroyed by an earthquake on Sept. 1, 1923, which killed about 30,000. In the rebuilding, which was carried out with remarkable speed, the centre was redesigned to include wide "firebreaker" streets; much of the new building was of steel and concrete construction, such buildings put up earlier having withstood the earthquake shock well, and the city lost its Japanese appearance.

During the Second Great War Tokyo became in the last months the most frequent target of U.S. air attacks in the Pacific. First raided April 18, 1942, by carrier-borne aircraft led by Lt.-Col. Doolittle (*q.v.*), it was not raided again until Nov. 24, 1944, by Superfortresses from bases in captured Saipan, Marianne Is., 1,500 m. away. Raids by land-based and carrier-borne aircraft became thereafter frequent and intense, culminating in two raids on May 23 and 26 in which 4,500 tons and 4,000 tons of incendiaries of a new type were dropped—6 lb. bombs filled with jellied petrol and dropped in 500 lb. clusters. When the Allies reached Tokyo they found 80 p.c. of the city laid waste.

After the surrender of Japan, General MacArthur entered Tokyo at the head of his troops Sept. 8, 1945, and set up here the h.q. of the Allied occupation forces of Japan. The Far Eastern International Tribunal for the trial of Japanese leaders accused of war crimes was set up in Tokyo, May 3, 1946. See Tokyo Trials.

Tokyo Bay OR **YEDO BAY**. Inlet on the S.E. coast of Honshu I., Japan. It extends N. for about 50 m. and on its N.W. shore stands Tokyo. At 10.30 a.m. Tokyo time (2.30 a.m. B.S.T.) on Sept. 2, 1945, hostilities in the Second Great War formally ended when the unconditional surrender of Japan was signed on board the battleship U.S.S. Missouri in Tokyo Bay, which was filled by an armada of Allied naval shipping.

Tokyo Trials. Trial for war crimes of leading Japanese military and political leaders held in Tokyo after the Second Great War. The members of the Far Eastern International Tribunal before which the trial was held were selected by Gen. MacArthur from names submitted by the Allied

signatories to the Japanese surrender and were: Sir William F. Webb, chief justice of Queensland, (Australia), president; Justice E. Stuart McDougall (Canada); Judge Mei Ju-ao (China); Henri Reimburger (France); Bernard Victor A. Roling (Netherlands); Justice Harvey Northcroft (N.Z.); Judge I. M. Zaryanov (U.S.S.R.); Lord Patrick, dean of the faculty of advocates, Scotland (U.K.); Justice John P. Higgins (U.S.A.), whose place was taken in July, 1946, by Maj.-Gen. Myron G. Kramer. The international, and chief U.S., prosecutor was Joseph B. Keenan; chief British prosecutor A. S. Comyns Carr, assisted by Christmas Humphreys; chief Australian prosecutor Justice Mansfield.

The tribunal began its sittings May 3, 1946. Before it were brought 28 men designated as war criminals by the United Nations War Crimes Commission:

Gen. Sadao Araki, war minister and member, supreme war council;
Gen. Kenji Doihara, head of intelligence in Manchuria;

Col. Kingoro Hashimoto, who took part in the sack of Nanking, 1937, and was responsible for attacks on the U.S. gunboat Panay (see Panay Incident) and H.M. gunboats Ladybird and Bee;

F.-M. Shunroku Hata, member, supreme war council and one-time c.-in-c. China;

Baron Kitchura Hiranuma, premier 1939;

Koki Hirota, premier 1936;

Naoki Hoshino, former president of the planning board;

Gen. Seishiro Itagaki, chief of staff, Kwangtung army;

Okonori Kaya, minister of finance under Tojo;

Marquis Koichi Kido, lord keeper of the privy seal;

Gen. Heitaro Kimura, vice-minister of war under Tojo;

Gen. Kuniaki Koiso, premier;

Gen. Iwane Matsui, member, cabinet advisory council, 1938-39, and commandant during the Nanking massacre, 1937;

Yosuke Matsuoaka, foreign minister;

Gen. Jiro Minami, war minister and c.-in-c. Kwangtung army;

Gen. Akira Muto, chief of military affairs bureau, 1939-42, and chief of staff to Yamashita (*q.v.*) in the Philippines;

Adm. Osami Nagano, member, supreme war council;

Takasumi Oka, chief of navy bureau of military affairs, 1940-44;

Shumei Okawa, leading propagandist for "Greater East Asia";

Gen. Hiroshi Oshima, ambassador to Germany, 1938-45;

Lt.-Gen. Kenryo Sato, chief of military affairs bureau, 1942-44;

Mamoru Shigemitsu, foreign minister;

Vice-Adm. Shigetaro Shimada, navy minister under Tojo;

Toshio Shiratori, ambassador to Italy;

Lt.-Gen. Teiichi Suzuki, minister without portfolio under Tojo;

Shigenori Togo, foreign minister under Tojo;

Gen. Hideki Tojo, prime minister at the time of Pearl Harbour;

Gen. Yoshijiro Umezu, vice-minister of war.

The 55 counts of the indictment were divided into crimes against peace, "conventional war crimes," and crimes against humanity. Among them were charges of preparing to wage aggressive war since 1928; military aggression in Manchuria and China; use of poison gas in China; collaboration with Germany and Italy; unprovoked aggression against the U.S.A., Great Britain, the Philippines, Netherlands East Indies, French Indo-China, and Siam; acts of aggression against the Soviet Union; wholesale murder and maltreatment of Allied prisoners of war, and of civilians in areas under Japanese military occupation. All the accused, who were represented by Japanese and U.S. counsel, pleaded not guilty. Keenan opened for the prosecution on June 4, 1946. On April 9, 1947, Okawa was pronounced mentally incapable of standing trial. Matsuoaka died June 27, 1946, Nagano Jan. 5, 1947. All the remaining defendants were found guilty in the judgement read Nov. 12, 1948. Doihara, Hirota, Itagaki, Kimura, Matsui, Muto, and Tojo were sentenced to death, and hanged Dec. 23; Shigemitsu received seven years' imprisonment, Togo 20 years, the rest life sentences. All except Matsui and Shigemitsu were found guilty of conspiracy to wage aggressive war. Matsui was guilty on one count only—doing nothing effective to abate horrors committed by soldiers under his command at Nanking, 1937. Shigemitsu was guilty of waging aggressive war and of failing to investigate treatment of prisoners of war; he was paroled in 1950. Shiratori died June 5, 1949; Togo died July 23, 1950.

Tolbooth. Term originally applied to the booth at a fair in which dues were collected and offenders against fair regulations were detained. From the latter use it came to mean a town prison. The most famous tolbooth was the former prison of Edinburgh, described by Scott in *The Heart of Midlothian*. It stood beside St. Giles's cathedral in the High Street, its oldest parts dating from

Toledo, Spain. 1. Gothic cathedral, from the south-east, showing the graceful 16th-century tower. 2. Alcántara bridge over the Tagus looking towards Alcázar. 3. General view of the city, showing damage sustained during the civil war of 1936-39

the 15th century, and was finally swept away in 1817, its site being marked by a heart let into the causeway. There were tolbooths in other Scottish towns, *e.g.* Selkirk. See Canongate.

Tolbukhin. FYODOR IVANOVICH (1884-1949). Russian soldier, who enlisted in the tsarist army and served in the First Great War. Transferring to the Red army, 1917, he held staff appointments and district commands. In the Second Great War he served in the offensive which destroyed Paulus's 6th German army at Stalingrad. On the S. front in 1943 he regained Taganrog and Melitopol. As commander of the 4th Ukrainian army he joined in the drive through the Crimea that resulted in the recapture of Sevastopol in 1944; and with the 3rd Ukrainian army he isolated Budapest, and advanced through Rumania into Bulgaria, representing Russia at the signing in Moscow of the Allied armistice with Bulgaria, Oct. 28, 1944. Next year he led the offensive into Austria, capturing Vienna on April 13. He was promoted marshal of the Soviet Union, Sept., 1944. His death was announced Oct. 17, 1949.

Toledo. Prov. of central Spain. It is bounded N. by the provs. of Avila and Madrid, W. by Cáceres, E. by Cuenca, S. by Badajoz and Ciudad Real, lying mainly in the basin of the Tagus. An elevated

tableland where not mountainous, in the S. it is largely covered by the Montes de Toledo, and drained by the Tagus, besides the Guadarama and other tributaries. Chief industries are agriculture and stock raising, including draught oxen and fighting bulls, mules, asses, and goats; manufactures of textiles, earthenware, oil, wine and spirits, soap, and guitar-strings. Minerals abound, *e.g.* lead, iron, copper, gold, silver, but are little worked. The capital is Toledo. The area of the prov. is 5,925 sq. m. Pop. 474,001.

Toledo. City of Spain, capital of the prov. of Toledo and formerly of Spain. It stands on the river

Toledo arms

Tagus, 47 m. by rly. S.S.W. of Madrid. To the S.W. are mts., culminating in Rocigalgo, 4,750 ft. Situated on a rocky bluff, encompassed on three sides by the deep gorge of the Tagus, defended by lofty Moorish-Gothic walls, and dominated by the cathedral and the Alcázar, Toledo is one of the most imposing and romantic cities of Spain. It has narrow, tortuous streets flanked by tall houses of dull exterior with huge doorways, and has been likened in turn to an immense convent, prison, fortress, or seraglio. Pop. 27,443.

The cathedral (1227-1493) is a magnificent five-aisled Spanish-Gothic edifice, and has many richly embellished chapels. The castle-palace, though burnt and rebuilt several times, is huge and impressive. Two fine bridges span the deep gorge—the medieval five-arched bridge of San Martin and the Moorish bridge of Alcántara.

The bulwark and centre of Christianity in Spain, Toledo is full of churches of great age, interest, and beauty. Numbers of the old gateways and towers are extant, as are many relics of Moorish art and architecture. The university was suppressed in 1807. There are many convents, an archiepiscopal palace with a well-stocked library, and a 15th century town hall. The manufactures are cloth, ecclesiastical vestments, and cutlery; Toledo sword-blades have been famous from Roman times.

The origin of Toledo is lost in remote antiquity; it was once a stronghold of the Carpetani, a Roman "colonia," a Visigothic capital, a Moorish city, and in 1087 capital of Leon and Castile, its decline dating from 1560, when Philip II selected Madrid as sole capital. Toledo was occupied by the French in 1808. At the outbreak of the Spanish civil war in 1936 Nationalist supporters seized Toledo, and held it for two months until relieved by Franco's troops advancing from the S., Sept. 27.

Toledo. City of Ohio, U.S.A., the co. seat of Lucas co. It stands at the head of Maumee Bay, at the W. end of Lake Erie, and is served by the Pennsylvania and other rlys. and by several steamship lines. Toledo harbour has a shore line of 35 m. and depth of 24 ft. The city supports a symphony orchestra, and in its art museum is a fine collection of Egyptian antiquities. Industrially it ranks second in the state to Cincinnati, making motor vehicles, wagons, bicycles, electrical appliances, glass and bottles, and having factories processing sugar, flour, and coffee. A distributing centre, it receives vast consignments of iron ore, and trades in grain, timber, and soft coal. In 1835 the governors of Michigan and Ohio ordered troops facing each other 10 m. apart to occupy the rich agricultural land which was the site of the future city; and next year Toledo was incorporated as a city of Ohio. Pop. 282,349.

Toledo, COUNCILS OF. Name given to a series of synods, some thirty in number, which met at Toledo, 400-1583. They dealt with many ecclesiastical questions, doctrinal and disciplinary. The most important was that of 1565-66, which regulated the execution of the Tridentine decrees. See Trent, Council of.

Tolentino (anc. *Tolentinum Picenum*). City of Italy, in the prov. of Macerata. It occupies a fine position on the river Chienti, 11 m. by rly. S.W. of Macerata. Its cathedral, San Catervo, was founded in the 13th century, and there are many other churches of architectural interest, enriched with fine frescoes and reliefs. It has a museum, and in the vicinity is the Picene necropolis of the 8th to 4th centuries B.C. The manufactures include silks, woollens, and wine. Here in 1797 a treaty of peace was signed by the pope and Napoleon; and in the neighbourhood the Austrians defeated the Neapolitans under Murat, May 3, 1815. Pop. approx. 14,000.

Toleration. Term applied to state recognition of the right of private judgement, especially in regard to religious doctrine and forms of divine worship. The spirit it represents is often dated from the protest made by a Frenchman, Châtillon, who, writing under the name of Martin Bellius, protested against the act of Calvin in burning Servetus for his opinions on the Trinity. Its growth was due to the gradually increasing influence, in France, of the writings of Mon-

taigne, Descartes, and Bayle, and, in England, of the works of Milton, Roger Williams, Jeremy Taylor, Berkeley, Chillingworth, Robert Barclay, Locke, and J. S. Mill.

Dogmatic systems of religion are necessarily opposed to toleration, which is contested on the ground that heresy is a crime against the soul, and that toleration is but a step towards indifferentism, atheism, agnosticism, and rationalism. The problem is complicated by political and dynastic considerations. In Great Britain the right of private judgement is restricted only by provision for the defence of public decency, morality, and good order, and the liberty of others. See Catholic Emancipation; Disestablishment; Infallibility; Liberty; Nonconformity.

Toleration Act. Passed by the English parliament in 1689 just after the accession of William and Mary. While by no means granting general toleration to dissenters from the Church of England who suffered under the laws passed in the time of Charles II, it allowed those Protestant nonconformists who accepted the doctrine of the Trinity, and were willing to take the oaths of allegiance and supremacy, to hold religious services without molestation, provided this was done with open doors. It did little more, in fact, than repeal the Conventicle Act of 1664.

Tolima. Inland department of Central Colombia. It lies between the Eastern and Central Cordilleras of the Andes. Named from the volcano Tolima (*v.i.*), situated on the N.W. boundary, it holds the upper valley of the Magdalena, with several lakes. The climate is one of great extremes. Minerals include gold, silver, copper, lead, and sulphur. Stock-raising and agriculture are carried on, the principal crops being sugar, cocoa, rice, maize, and tobacco. The capital is Ibagué, and the area 8,874 sq. m. Pop. est. 691,360.

Tolima. Volcanic peak of the Andes, situated on the N.W. frontier of Tolima dept., Colombia. The loftiest mountain in the republic, attaining an alt. of 18,400 ft., it was active in 1829.

Toll. In general, duty paid in consideration of certain privileges or services. The term was applied especially to charges levied for the use of certain roads or bridges, the proceeds being devoted to their construction, improvement, or upkeep. An early English toll was that made for road repairs between Temple Bar and St. Giles's, about 1270. Tolls became general, and

in the 17th century gates or turnpikes were commonly set up to facilitate their collection. The toll-gates remained a familiar feature of main-road travel until well on into the 19th century, but practically all have been removed. Tolls on London bridges were abolished in 1878-79. See Roads.

Toller, ERNST (1893-1939). German writer and dramatist. Born of Jewish parentage, Dec. 1, 1893, he was educated in Germany, and after serving in the First Great War became a revolutionary. He took part in the abortive Munich revolt of 1919, led the independent social democratic party, and was president of the soldiers' and workers' council during the brief Bavarian soviet republic. Sentenced to five years in prison, he there wrote plays and poetry which later gave him European reputation. In Expressionist drama he is known for *Masse-Mensch* (Masses and Men), 1921; and *Maschinenstürmer* (The Machine Wreckers), 1922. Other works were *The Swallow Book*, and *Letters from Prison*. Under the Nazis Toller was deprived of his nationality, and became a refugee in England. He died, by suicide, in New York, May 22, 1939.

Tolley, CYRIL JAMES HASTINGS (b. 1895). English golfer. A Londoner, born Sept. 14, 1895, he went

Cyril Tolley,
English golfer

to University College, Oxford, was a prisoner of war from 1917, and in 1921 went on the stock exchange. He was British amateur golf champion in 1920 and 1929; Welsh, 1921 and 1923; French open champion, 1924 and 1928; played against Scotland every season 1922-30; and often in Walker Cup matches against America up to 1934. In 1925 at Troon he drove a ball 290 yds.

Tolpuddle Martyrs. Name given to six labourers of a village in Dorset who on March 18, 1834, were tried for an offence against the Combination Acts (*q.v.*) and sentenced to transportation to Botany Bay for seven years. The men had formed a "friendly society of agricultural labourers" through which they hoped to press for a weekly wage of 10s., but had neither presented any demand nor gone on strike. The severity of the punishment evoked so many pro-

tests and petitions that in 1836 the rest of the sentence was remitted. A play, *Six Men of Dorset*, by Miles Malleson and H. Brooks, was produced in 1938. *Consult Flame of Freedom*, O. Rattenbury, 1931.

Tolstoy, ALEXEI KONSTANTINOVICH, COUNT (1817-75). Russian poet and dramatist. A distant relative of Leo Tolstoy, he was born at St. Petersburg, Sept. 5, 1817, and began writing verses as a child. He was a happy singer of old-time Russian ballads, and wrote tender and dainty lyrics, which were set to music by Tchaikovsky. As a lyricist he was little touched with the melancholy of so many Russian writers. As a dramatist he was chiefly notable for his historical trilogy, *The Death of Ivan the Terrible*, 1866; *The Tsar Feodor Ivanovitch*, 1868; *The Tsar Boris*, 1870. Of his novels, *Prince Serebrenni* and *The Terrible Tsar* were translated into English. He died Oct. 10, 1875.

Tolstoy, ALEXEI NIKOLAEVICH (1882-1945). Russian writer. A relative of Leo Tolstoy, he was until the revolution Count Alexis Tolstoy. In 1910 he established his reputation as a short story writer, and during the First Great War visited England as a journalist. Back in Russia he published the trilogy translated into English as *The Road to Calvary*, awarded the Stalin prize, 1942. He was president of a special commission set up to inquire into German atrocities during the Second Great War. A play, *Ivan the Terrible*, was produced in 1944, and he was at work on the third part of an ambitious study of Peter the Great when he died Feb. 24, 1945.

Tolstoy, COUNT LEO NIKOLAEVICH (1828-1910). Russian novelist, social reformer, and religious teacher. He belonged to an ancient family ennobled under Peter the Great. He was born on the family estate, Yasnaya Polyana, in the prov. of Tula, Aug. 28 (O.S.), 1828. The boy lost his mother as an infant, and his father when he was nine; and with his brothers and sisters was brought up by relatives. In 1843 at the university of Kazan he shared the frivolous life of his class, but experienced moments of indignation against the idle rich.

Leon Tolstoy

In 1851 he went to the Caucasus, took a commission in the army, and began writing his first story, *The Cossacks*, published in 1863. His first published work was *Childhood*, largely autobiographical, which made a stir on account of the extraordinary literary promise it contained. It was followed by *Boyhood*, and *Youth*. The *Sevastopol Stories*, the first instalment of which appeared in 1854, were based on Tolstoy's personal impressions of the Crimean War, in which he had served. These stories revealed the gifts fully displayed in *War and Peace*.

After a few years of life in St. Petersburg, and two journeys abroad, Tolstoy settled down on his estate as a magistrate, conceiving a scheme for helping the peasantry. In 1861-62 he maintained a school for peasant children at Yasnaya Polyana, and published an educational review. His marriage in 1862 marks the end of the first period of his life and work, which was one of inner growth, leading him to a stern conception of duty towards the peasantry. Some of his best short stories belong to this period. Powerful realism in the rendering of life and character is deepened in Tolstoy's short tales by social problems, by longing to adjust the relations between rich and poor, and the search for the meaning of life.

Two great novels, *War and Peace* (*q.v.*), written in the years 1865-69, and *Anna Karenina* (*q.v.*), 1875-76, are the outcome of Tolstoy's second period, and represent his highest achievements in art. *Anna Karenina* marks the transition to the third period of Tolstoy's life. The substance of the novel is a passionate protest against life deprived of a consciousness of inner duty.

Tolstoy's inner crisis was reached in 1881. Prepared by his previous work and thoughts, he became the great moralist and religious teacher that he was to the end. Passing from inner despair which brought him to the verge of suicide, he found peace in the teaching of Christ, and evolved the fundamental principle of his new faith that "the Kingdom of God is within you," that God is love, and that the meaning of life is the conformity to the principle of love.

The chief works containing his moral and religious teachings are: *My Confession*; *On Life*; *What I Believe*; *The Kingdom of God is Within You*; *The Four Gospels*, harmonised and translated; *What*

Are We to Do? Works of fiction containing his teaching are *The Kreutzer Sonata*; *Resurrection*; *The Death of Ivan Ilyitch*, and a number of short stories for the peasants, many based on folklore.

Tolstoy did his utmost to conform in his own life to his teaching, to make it simple, and adjust it to the life of the peasant. In the last year of his life he carried out a long-cherished dream of abandoning his comfortable home, and disappearing among the peasants. He actually set out to go away on Oct. 28, 1910, but fell ill and died at a railway station on Nov. 7. His widow died on Nov. 4, 1919. Yasnaya Polyana, which had been turned into a Tolstoy Museum, was desecrated and almost destroyed in the Second Great War, when it was in the German occupied area.

Bibliography. Tolstoy: the Grand Mujik, G. H. Ferris, 1898; Tolstoy, the Man and Artist, D. Morjovsky, 1902; Tolstoy: the Man, E. A. Steiner, 1904; *Reminiscences*, I. L. Tolstoy, 1914; Tolstoy, *His Life and Writings*, E. Garnett, 1914; L. Tolstoy, A. Maude, 1918; *The Tragedy of Tolstoy*, Countess A. Tolstoy, 1933; Count Leo Tolstoy, E. J. Dillon, 1934; Tolstoy, G. Abraham, 1935; Tolstoy and his Wife, Tikhon Polner, Eng. trans. N. Wilden, 1946.

Toltec. Name denoting an ancient culture anterior to the Aztec domination on the Mexican tableland. Early Spanish accounts of a Toltec race, traditionally dating from the 6th century, are largely mythical, but the existence of an advanced pre-Aztec culture is attested by remains at Tollan, Cholula, Teotihuacan, and elsewhere. See *Aztec*; *Maya*; *Mexico*.

Tolu, BALSAM OF. Balsam which exudes from incisions in the trunk of *Myroxylon toluiferum*, grown in New Granada. It is used as an expectorant in chronic bronchitis.

Toluca. Town of Mexico, capital of the state of Mexico. Situated 36 miles W.S.W. of Mexico City and served by the national rlys. of Mexico, its chief features are the state building, the national institute, and the cathedral. In the neighbourhood is Nevada de Toluca, an extinct volcano 15,150 ft. high. Pop. 97,462.

Toluene OR METHYL BENZENE ($C_6H_5.CH_3$). Liquid resembling benzene, obtained as one of the products of distilling coal tar. It was discovered by Pelletier and Walter, two French chemists, and so called from tolu balsam, from which it may be distilled. Toluene is used in the manufacture of explosives and aniline dyes. See *Trinitrotoluene*.

Toluidine ($C_6H_4.CH_3.NH_2$). Colourless oily fluid prepared by reducing nitrotoluene in the same way that aniline is made from nitrobenzene. There are three isomeric toluidines, the ortho-, meta-, and para-toluidine, the first of these being the most important. Orthotoluidine differs from the other toluidines in giving a green colour with ferric chloride and para-diamidobenzene. Paratoluidine is a solid. The toluidines are employed in the manufacture of aniline dyes. See Aniline.

Tomahawk

(Cree, hammer). Name applied to various N. American implements and weapons of the Algonquian tribes. Horn or polished stone celt hatchets were fitted into holed clubs, closely resembling those of the European Stone Age. After the introduction of the modern trade iron hatchet—the popular conception of a tomahawk—the native pattern was retained for ceremonial uses. See American Indians.

Tomato (*Lycopersicon esculentum*). Annual plant of the family Solanaceae. A native of S. America, it was first introduced into England in 1596, and was originally grown as a greenhouse climber for the sake of its red and yellow berries, as they were termed. As the Solanaceae include many poisonous species, the edible properties of the tomato were not at first appreciated in the form of fresh fruit. It became popular in the U.K. only within living memory.

Tomatoes for outdoor culture are raised from seed sown in pots in rich soil in early spring, and forced on in gentle heat. When about two months old, the plants may be removed to a cold frame for hardening off before planting out, which should take place in June. Out of doors they require a position against a warm S. wall, and a soil which has not recently been manured. They should be planted about 1 ft. or 18 ins. apart, staked, and (except in bush varieties) all side shoots should be removed. Salt or nitrate of soda is the best artificial stimulant to apply, and no strong manure should be used. When the fruit will not ripen on the plants, it should be removed and either exposed to the sun in a greenhouse or any sunny window, or wrapped in paper

Tomato. Ripe edible fruits of a cultivated English variety

and placed in a dark place. Tomatoes should not be grown in the same soil or bed for more than three years in succession.

The tomato is one of the most popular vegetables throughout the world, and huge quantities are grown, both commercially and in gardens. Almost 200 varieties exist. Eaten raw, cooked or canned, made into purées, soups, sauces, tomato juice, "cocktails," etc., it is a rich source of vitamin C and perhaps the commonest flavouring for canned fish and other processed foods. An important export of the Channel Is., S. France, etc., in England it thrives under glass especially at Worthing and in the Lea valley.

Tomb (Gr. *tymbos*; cf. Lat. *tumulus*, mound). Place of burial, usually implying an artificial construction intended to guard the dead from disturbance at the hands of ill-doers. The word is also used in a general sense, like grave, for the state after death. See Architecture; Burial Acts; Burial Customs; Petra; Sepulchre.

Tombac. Name given to a variety of brass. Also called Muntz or patent metal, it was invented by G. F. Muntz in 1832, and contains about 40 p.c. of zinc and 60 p.c. of copper. It has a full yellow colour.

Tombola. Lottery game. It is popular in France and the southern states of the U.S.A., as well as in the Royal Navy and at garden fêtes in England. Each entrant is provided with a card containing certain numbers, prizes being awarded to the holders of cards on which all numbers have been drawn.

Tombolo. Bar or sandbank connecting an island with the mainland. Tombolos are formed by the growth of spits from the island towards the mainland, with the sweeping of sand around the island by waves. The sandbank on the protected side of the island

gradually develops until it connects with the shore deposits of the coast itself.

Tom Brown's Schooldays. Story by Thomas Hughes, first published in 1857. Depicting life at Rugby school under Arnold, it is regarded as the classic English school story. Its avuncular style and racy descriptions of games make palatable its clear Christian preaching. In 1861 a sequel, Tom Brown at Oxford, proved less successful.

Tomelloso. Town of Spain, in the prov. of Ciudad Real. It is the centre of a rich agricultural district and carries a large trade in cereals and fruit. Terminus of a branch rly., it lies 72 m. S.E. of Toledo. Pop. 22,800.

Tomi. Town on the Black Sea, about 100 m. S. of the mouth of the Danube, 70 m. S.S.W. of the Danube delta. It is almost the same place as the modern Constanta, Rumania. Tomi was the place of exile of the poet Ovid when he had incurred the displeasure of Augustus. Here he wrote the latter portion of the *Fasti*, the *Tristia*, and the *Letters from Pontus*, expressing his discontent at having to live in such a remote and inhospitable place.

Tomini OR GORONTALO GULF. Inlet penetrating the N.E. coast of the island of Celebes, Indonesia, for 235 m. At its entrance it is 65 m. wide, gradually widening to nearly 100 m. It is traversed by the equator; and is navigable.

Tomintoul. Highest village (1,160 ft.) in the Scottish Highlands. It is in Banffshire, 10 m. S.E. of Grantown-on-Spey, in a district of numerous streams encircled by moors. Angling and shooting are available for visitors. There is an impressive R.C. church.

Tom Jones. Novel by Fielding, published in 1749, its full title being *The History of Tom Jones, a Foundling*. Generally accepted as its author's greatest work, and one of the finest stories in English, fascinating by its sense of reality, it has been summed up as an epic of the healthy average life of the healthy average man. Frequently coarse in phrasing and incident, the story is one of the fullest renderings in 18th century fiction of contemporary English life and manners.

Tomlinson, GEORGE (b. 1890). English politician. Born at Rish-ton, Lancs, March 21, 1890, he was educated at the Wesleyan day school there. A cotton-weaver from the age of 12, he entered politics as a trade unionist, becom-

ing a Lancashire county councillor in 1931. Elected Socialist M.P. for Farnworth in 1938, he was parl. secretary to the ministry of Labour 1941-45. During 1945-47 he was minister of Works, then became minister of Education.

Tomlinson, HENRY MAJOR (b. 1873). English writer. He first came into prominence as a member

H. M. Tomlinson,
English writer

of the staff of the *Morning Leader*, 1904, later working on the *Daily News* and acting during the First Great War as war correspondent in France and Belgium. He also became known for books with a nautical background. *The Sea and the Jungle*, 1912; *Old Junk*, 1918; *London River*, 1921, were all received well, but it was with *Gallion's Reach*, 1927, that he was acclaimed as first-rate in his own element. This book won the *Femina-Vie Heureuse* prize. All *Our Yesterdays*, 1930, a poignant study of the First Great War, achieved great success, and *The Snows of Helicon*, 1933, was a departure from sea and river. Later works included *The Turn of the Tide*, 1945; *Morning Light*, 1946.

Tommy Atkins. Popular term for a British private soldier, usually contracted to Tommy (plur. *Tommies*). It was derived from a specimen enlistment form in which the blanks were filled up *pro forma*, and the name Thomas Atkins appeared as that of the imaginary recruit. The equivalent French nickname in 1915 was *poilu*; the American in the Second Great War was G.I.

Tommy Gun. Popular name for the weapon described under *Thompson Automatic Rifle*.

Tompion, THOMAS (1638-1713). English clockmaker. Born at Northhill, Beds, he left his father's forge to set up as a young London watchmaker in Water Lane, Blackfriars. Exploiting Hooke's new balance spring for watches and anchor escapement for clocks, and Barlow's striking-work and cylinder escapement, he raised a hitherto undistinguished craft to a high level, treating movement as more important than exterior casing. His first fine watch, made for Charles II, brought him royal favour and a commission from the French dauphin. Examples of Tompion's art are to be seen at

Buckingham Palace, in many museums and country houses, and in wayside taverns, still in perfect working order. A small one-year striking clock, now in private ownership, made for William III at a cost of £1,500, still strikes the hours and quarters. George Graham, inventor of the dead beat escapement, was Tompion's favourite pupil.

Tom Sawyer, ADVENTURES OF. Story by Mark Twain, first published in 1876. Full of rollicking humour, this story of an American boy and his chum Huckleberry Finn (*q.v.*) gives a delightful picture of American village life in the mid-19th century, and has taken its place among the best novels dealing with boys. There have been two notable film versions, one seen in 1932 with Jackie Coogan as Tom, the other in 1938.

Tomsk. City of W. Siberia, R.S.F.S.R. Capital of a region of the same name, it stands on the Tom, a tributary of the Ob, and a branch line of the Trans-Siberian rly., about midway between Omsk and Krasnoyarsk. Vehicles and aircraft are produced, candles, soap, and spirits prepared, and there is a carrying trade on the river, mostly agricultural products

Tomsk, Siberia. General view showing the Timirjasev Prospekt

and the lead, copper, and iron yielded by the region. Tomsk university dates from 1888. Pop. 141,215.

Tom Thumb. Title of a fairy story by Charles Perrault (*q.v.*). It tells of the adventures of a man no bigger than his father's thumb. The name has frequently been given to dwarfs, the best known being Charles Sherwood Stratton (1838-83), or General Tom Thumb. He was born at Bridgeport, Conn., and was exhibited in England by Barnum in 1844, and again in 1857; on the first visit, 2 ft. high and dressed in adult attire, he appeared, by command, before Queen Victoria. He subsequently grew to 40 ins. In 1863 he married Lavinia Warren, another dwarf.

Tom Thumb. Charles S. Stratton and his bride, Lavinia Warren

He died at Middlesborough, Mass., in 1883. His widow (d. 1919) married Count Magri, the Italian "Tom Thumb," 37 ins. high, who died Nov. 1, 1920. See *Dwarf*.

Ton. Measure of weight and capacity. The British ton is 20 cwt. of 112 lb. or 2,240 lb. avoirdupois. The U.S. ton, or the short ton, is 2,000 lb. and the corresponding hundredweight is 100 lb.; when the British measure is used in the U.S.A. it is called the long ton. The metric ton is 2,204.6

lb. The term is also used to express a given amount of timber, gravel, coke, lime, etc., e.g. a load or cubic yard of gravel is a ton. The word ton is related to tun (*q.v.*), a cask or barrel, from which is derived tonnage (*q.v.*).

Tonale. Alpine pass in N. Italy. It lies almost mid-

way between the Ortler Spitz and Mt. Adamello and connects the valley of the Noce, a tributary of the Adige, in the Trentino, with the valley of the Oglio, Val Camonica. It rises to 6,181 ft. and carries a road between railheads at Malé and Edolo.

Tonalite. Group of plutonic igneous rocks akin to diorite. They consist chiefly of quartz, orthoclase, plagioclase, hornblende, and biotite. Tonalite resembles dark granite in general appearance, and is so called from its occurrence, near Tonalé (*v.s.*) in the Alps.

Tonawanda. City of New York, U.S.A., in Erie co. It stands on the Niagara river, 10 m. by rly. N. of Buffalo, and is served by the International and the New York Central

riys. and the Erie canal. Settled in 1808, Tonawanda became a city in 1903. It is a rly. centre, has a harbour accommodating lake steamers, and makes office furniture and motor boats. There are Polish, Syrian, and Italian workers in a pop. of approx. 13,000.

Tonawanda, NORTH. City of New York, U.S.A., in Niagara co. It stands on the Niagara river, opposite Tonawanda, and is served by the Erie and other rlys. and the Erie Canal. A bridge across Tonawanda Creek connects it with the twin city. A large trade in lumber and iron is carried on; manufactured products include nuts and bolts, gas engines, and furniture; and the Wurlitzer plant produces most church organs and mechanical pianos in the U.S.A. Settled in 1809, North Tonawanda was incorporated in 1865, and became a city in 1897. Pop. 20,254.

Tonbridge. Market town and urban dist. of Kent. It stands on the Medway, here crossed by a stone bridge, 29 m. S.E. of London, and is a rly. junction. The chief buildings are the public school (v.i.) and the church of SS. Peter and Paul, restored in 1880. The gateway of the castle remains, and the Chequers Inn is a timbered building of the 16th century. Industries are printing, tar distilling, chemical production, saw milling, and making cricket balls. The council owns sports and recreation grounds, and there are boat-ing facilities. Tonbridge grew up around the castle, which, built by Richard, earl of Clare, about 1100, remained a stronghold until the time of the Civil War. Pop. approx. 20,000.

Tonbridge School. English public school in Kent. Its foundation in 1553 was due to Sir Andrew Judd, lord mayor of London in 1550, and it was then a grammar school for boys of the neighbourhood. Its endowment, consisting largely of property in London, in the 19th century it developed into a large public school. It has classical and modern sides, and science and engineering are taught. The governing body is the Skinners'

Company (q.v.). *Consult* History, D. C. Somervell, 1947.

Tondern. Town of Denmark, in Jutland. Once a seaport, it now stands 8 m. from the coast on the Widane, its port being Hoyer. There is a trade in horses and agricultural produce. Being in Slesvig, Tondern was part of Denmark until 1864. From 1864 to 1918 it was Prussian, being restored to Denmark after the peace treaty of 1919. Pop. 6,778.

Tone. Term used in various senses. In music it is strictly an interval, the notes of which have vibrations in the proportion of either 8-9 (major) or 9-10 (minor). (See Mode.) The word is also a synonym for quality, e.g. the tone of a violin. In an analogous sense tone in painting stands for the general colour of a picture.

Tone or TONEGAWA. River of Honshu Island, Japan. One of the most important arteries in the country, it flows E.S.E. through a succession of lagoons and enters the Pacific at Choshi after a course of 173 m. River steamers connect Choshi with Tokyo by means of a distributary, the Edogawa, which enters Tokyo Bay.

Tone, THEOBALD WOLFE (1763-98). Irish patriot. Born in Dublin, June 20, 1763, the son of a coach-

ernment to send several small raiding expeditions, which all miscarried. Tone held a commission

T. Wolfe Tone,
Irish patriot

in one of those, and the ship which he was aboard was compelled to surrender to an English squadron near Lough Swilly. Tone was taken prisoner, and sentenced to be hanged, but anticipated his fate by cutting his throat, dying Nov. 19, 1798. See *United Irishmen. Consult* Autobiography, ed. R. B. O'Brien, 1893; *Life Story*, A. de Blacam, 1935.

Tong. Name of several parishes in England. Tong, in Shropshire, 3 m. E. of Shifnal, is associated in fiction with the Little Nell of Dickens's *Old Curiosity Shop* (consult *A History of Tong*, Shropshire, G. Griffiths, 1894), and is famous for its Perpendicular church, S. Bartholomew's, founded about 1410, restored 1892, containing a 16th century chapel with fan-vaulted roof and tombs of the Vernon, Pembridge, Stanley, and other families. The existing Tong Castle dates from 1785. Tong, or

Tonge, in Kent, 2 m. W. by N. of Sittingbourne, is notable for its church, S. Giles's, restored 1883, which has a 13th century tower and a 14th century roof. Tong, in the W. Riding of Yorks, is 8 m. S.E. of Leeds.

Tonga Islands. British protectorate in the S. Pacific Ocean, more usually known as

Tonbridge, Kent. Ruined gateway of the Norman castle, built during the reign of Henry I and much enlarged in the 15th century

maker, and educated at Trinity College, Dublin, he was called to the bar, but preferred to devote his energies to politics. Under the influence of the ideas of the French Revolution he formed the soc. of United Irishmen in 1790.

Arrested for treason, Wolfe Tone was allowed to leave the United Kingdom, and made his way from America to Paris, where in 1796 he persuaded the French government to undertake the Irish expedition under Hoche which ended in failure. In 1798 Tone again persuaded the French gov-

the Friendly Islands (q.v.).

Tongaland, AMATONGALAND, OR MAPUTALAND. Dist. in the N. of Natal. It borders upon Zululand, Swaziland, and Mozambique. In 1890 it was proclaimed part of Zululand; in 1895 a British protectorate was declared over the territory, and in 1897 it was incorporated with Natal. Its area is about 1,200 sq. m., and the pop. is about 13,000. The Amatongas are also settled on the N. side of the Portuguese frontier, fixed by the Anglo-Portuguese Convention of June 11, 1891. See Natal.

Tonbridge School
arms

Tonbridge arms

Tongariro. Extinct volcanic cone, in North Island, New Zealand. Near Lake Taupo, it rises to 6,140 feet. Here is a national park.

Tongking. Historic name of N. Vietnam. Formerly a province of the kingdom of Annam, it became a French protectorate in 1883-85. It comprises the lower portion of the basin of the Hong-Kiang, and lies between China and Central Vietnam (Annam), with 40,430 sq. m. The N. is mountainous, where the forest yields teak; the S., comprising the delta of the Hong-Kiang and the shores of the Gulf of Tongking, is flat, marshy, and frequently flooded. Rice, sugar, tobacco, ramie, tin, coal, and silk are the principal products. Hanoi (*q.v.*) is the capital. There is a rly. from Hanoi to Saigon. Pop. 9,920,000. See Indo-China.

Tongking, GULF OF. Arm of the S. China Sea. It is 300 m. by 150 m., and receives the waters of the Hong-Kiang. The island of Hainan blocks half the mouth between the Kwangtung peninsula and the Annam coast.

Tongres or TONGEREN. Town of Belgium, in the prov. of Limburg. It lies on the river Geer, 18 m. by rly. N. of Liège, and is a rly. junction. There are industries in wood, paper, umbrellas, brewing, pottery, tiles, and tanning. The church of Notre Dame, a 4th century foundation, dates mainly from the 13th century, and has an earlier chapter house of note. The town's name comes from the German tribe called by the Romans the Tungri. It has suffered many sieges and much destruction. Sacked by Normans in 822, it was captured by French armies in 1672, 1703, 1746, and 1794, when it remained in French hands until 1814. Pop. est. 11,500.

Tongue. Muscular organ placed on the floor of the mouth. The base of the tongue is connected with the

Tongue. Upper surface of the human organ, showing papillae and adjacent parts

hyoid bone, the epiglottis, the pillars of the soft palate, and the pharynx. The organ is covered with a mucous membrane with numerous papillae distributed over the anterior two-thirds of the upper surface.

These are of three varieties: circumvallate, eight or ten in number, placed in a V-shaped line at the back of the tongue, and from 1/20th to 1/12th of an in. across; fungiform, scattered mainly over the sides and top; and conical or filiform, scattered over the whole of the upper surface.

The sense of taste is situated chiefly in the circumvallate and fungiform papillae, while the conical or filiform papillae have mainly a mechanical function. Minute structures known as taste-buds are found in the circumvallate papillae and scattered over the posterior third of the tongue and palate. These contain gustatory cells surrounded by minute nerve fibres.

The tongue is supplied by three nerves: the lingual, which conveys tactile sensation; the glossopharyngeal or nerve of taste; and the hypoglossal, which is distributed to the muscles. The mucous membrane on the under surface of the tongue is smooth and thin. In the central plane it forms a fold, the *frenum linguae*. The tongue has important functions in connexion with mastication, deglutition (swallowing), and articulation. The surface of the tongue gives much information to the physician. It is dry in fever and acute illness; it is furred in many types of gastro-intestinal disorder. Cancer and syphilitic involvement are the worst diseases of the tongue. See Anatomy; Glossitis; Hyoid Bone.

Tonic. Any remedy which restores tone to a depleted bodily system or organ. The term is necessarily vague and covers also treatment not making use of drugs. Strychnine and the phosphates may be cited as tonics for the nerves; dilute hydrochloric or nitric acid for the stomach; while arsenic and iodide are known as alteratives, because they change in some subtle way the general chemistry of the body. Tonics are less frequently prescribed than they were, as they may produce a false sense of well-being.

Tonic. In music, the name of the key-note. Its effect is so conclusive that the chord built upon it ends almost all compositions.

Tonic Sol Fa. System of writing music in a letter notation. It was first used in teaching sight reading to children by

Elizabeth Glover of Norwich, but John Curwen, a nonconformist minister, was so struck with its basic soundness and simplicity that he devoted his life with singular success to improving and systematising the method. Greeted at first with much ridicule and opposition from staff-notationists, its principles are now recognized as sound, and its use has become extensive, especially in teaching sight singing.

It takes as its basis the major scale and the tonal relationships of the notes thereof. These are named Doh, Ray, Me, Fah, Soh, Lah, Te, and Doh, the key being stated. The minor scale is taught as an adjunct of the major, and is called the Lah mode. Sharpened notes always have the vowel "e," e.g. the raised fourth is called Fe: flattened notes have the vowel "a" (pron. aw), so that the lowered seventh is Ta. In modulation, bridge tones are used, and the Doh changed according to circumstances. A chart called the modulator shows all these bridge tones. The complications of time notation are largely swept away by a complete system of time-names borrowed from the Galin-Paris-Chevé method, thus enabling the permutations of beat values to be practised vocally. All measures are made of equal spacing. Although Tonic Sol Fa has its limitations, it has indubitably played a large part in the diffusion of musical knowledge. See Aretinian Syllables; Notation.

Tonic Sol Fa College. Institution founded in 1863 by the Rev. John Curwen to conduct examina-

Tonic Sol Fa. Central portion of modulator, keys in F, C, & G. Modulator extends from C flat to C sharp. By courtesy of J. Curwen & Sons, Ltd.

tions and to provide music-teaching on Tonic Sol Fa lines, though the staff notation is also used. Incorporated in 1875, it has offices at 9, Queensborough Terrace, London, W.2. It holds classes, especially for the training of teachers, and grants certificates, as well as the diplomas of associateship, licentiate, and fellowship. In 1944 the name was changed to Curwen Memorial College.

Tonk. City and former state of India, now in the union of Rajasthan. The state comprised several detached areas in the E. of Rajputana, one of which is almost entirely surrounded by Madhya Bharat. In 1817 the nawab disbanded his army on the condition that the Indian government confirmed him in the sovereignty of his possessions, some of which are 250 m. apart. Area 2,543 sq. m. Pop. 353,687.

Tonk city is 55 m. S. of Jaipur on the Banas-Chambal plateau, at an elevation of 1,500 ft. Pop. 39,700.

Tonka Bean or **TONGVIN BEAN** (*Dipteryx odorata*). Evergreen tree of the family Leguminosae, native

Tonka Bean. The flowers and leaves of this evergreen tree

of Guiana. It is about 60 ft. in height, and has alternate leaves divided into five or six leaflets. The violet-purple flowers are clustered, and are succeeded by short pods containing a single fragrant bean, which is used for scenting snuff, sachet powders, etc.

Tonks, HENRY (1862-1937). British painter. Born at Solihull, he was educated at Clifton, and adopted the medical profession, becoming in turn house physician and surgeon at London Hospital and house surgeon at the Royal Free Hospital. Then he studied painting under Fred Brown at Westminster school of art, and when Brown was made Slade professor of fine art at University College, Tonks became his assistant at the Slade school, succeeding to the chair in 1917 and remaining until 1930. Among his pupils

were Orpen, Chesterton, and Augustus John. Associated with the New English art club from 1891, he painted characteristically The Knitting Party, The Bird Cage, and Saturday Night in the Vale. His Self-Portrait, and other works, are at the Tate Gallery. He died Jan. 8, 1937. *Consult Life, J. Hone, 1939.*

Tonle Sap. Lake of Cambodia, Indo-China. It acts as a regulator of the Mekong. During the wet monsoon it has an area of 120 sq. m. and a depth of 50 ft., receiving flood waters of the Mekong through the Me Sap. In the dry season it shrinks to some 80 sq. m. and a depth of 2 ft. About 30,000 people are occupied in the extensive fisheries. When the depth permits, navigation is maintained between Saigon and Battambang.

Tonnage. Term used to describe the measurement of the capacity, or volume, of a ship expressed in units of 100 cu. ft., the unit of such volume being called a ton measurement. The nautical ton is derived from the tun, a measure of liquid capacity equivalent to 252 galls. Originally a wine measure, this was used in the Mediterranean, where carrying capacity of medieval ships was rated according to the number of 252-gall. casks of wine they could stow. Four filled tuns weighed approx. one ton avdp.

By international agreement, ships are measured to specific tonnages for registration and identification, and to form a basis for the payment of charges levied by harbour, pilotage, canal, and lighthouse authorities. Among principal measurements, dead-weight tonnage is the weight in tons avdp. of cargo, passengers, fuel, and stores carried by a fully laden ship; this is the difference between the weight of a vessel and its machinery and the weight of the ship and contents when laden. Capacity tonnage is the total internal capacity of a ship below the main deck. Gross tonnage is the sum of capacity tonnage and all enclosed spaces above the main deck. Net or registered tonnage is gross tonnage less the capacity of non-cargo or non-passenger load earning space. Freight tonnage is the total cubic capacity available for cargo, and is expressed in tons of 40 cu. ft., that figure being assumed equivalent to one ton avdp. Displacement tonnage represents the ship's laden weight in tons avdp.; it is so called because fixed by calculating the weight of the water

displaced by the ship when immersed to its loadline.

Tonnage and Poundage. Customs duties formerly levied at the English ports. The duty was imposed on every tun of imported wine and at twelve pence on every pound's worth of other goods passing into or out of the country. An early form of this was raised by agreement in 1347, and the proceeds went to the crown, nominally for purposes of defence. In 1373 parliament granted the crown the right of raising it for a limited period, from the time of Edward IV for the sovereign's lifetime. In 1628 Charles I claimed the raising of tonnage and poundage as his right, although it had not been granted by parliament. The duty was granted to Charles II in 1680, and made perpetual under Anne, but was abolished under George III, 1787, when excise and customs were organized on a new basis. *See Customs.*

Tonnage Dues. Charges paid by vessels on entering port. They are calculated upon the registered net tonnage of a ship, this being its gross tonnage less allowances for the space occupied by the machinery, etc. They are devoted to the upkeep of the harbours and the maintenance of buoys, lights, etc. Tonnage dues are also charged upon ships passing through the Suez, Panama, and other canals. *See Panama Canal; Suez Canal.*

Tono-Bungay. Novel by H. G. Wells, published 1909. It presents a comprehensive study of the then contemporary English social scene, in the form of the personal narrative of George Ponderevo. Tono-Bungay is the name of a patent medicine invented and marketed by Ponderevo's uncle, a small chemist, to whom it brings fortune and power, and ultimately bankruptcy and death.

Tonometer. Contrivance for the exact measurement of musical pitch. As originally constructed by its inventor, J. H. Scheibler, it consisted of 52 tuning-forks laboriously corrected by counting the beats, and by comparison with the results obtained from the monochord, so as to provide an accurately tuned scale from any given pitch. This device is no longer in existence, but there is one with 56 forks, which also belonged to Scheibler. The value of each of these forks was given by A. J. Ellis in the *Journal of the Society of Arts*, March 5, 1880.

Tönsberg. Fortified seaport of Norway, in Vestfold co. It stands on an arm of Oslo Fjord, 71 m.

by rly. S. of Oslo. One of the oldest settlements in Norway, it has special interests in the Arctic whale and seal fishery. Jarlsberg is a ruined fortress and royal residence in the neighbourhood. Pop. 11,388.

Tonsil (Lat. *tonsilla*, a stake). Name of two prominent rounded glandular organs situated between

TONSIL. Diagram showing position of tonsils at back of the mouth

the pillars of the soft palate at the back of the mouth. The tonsils consist mainly of lymphoid tissue, and are covered with mucous membrane. They are often removed when the seat of septic infection, especially in children; and because they are often associated with adenoids (*q.v.*). Unhealthy tonsils in the adolescent or adult are usually the result of septic material draining into them from the roots of the teeth.

Tonsillitis. Inflammation of the tonsils, through their invasion by micro-organisms. When accompanied with suppuration within and around the tonsil, the condition is known as quinsy. Treatment consists in the administration of a purge, a hot carbolie gargle, and the sulphur group and penicillin, which dispose of the germs causing the inflammation. Hot fomentations on the neck and throat often give relief. When suppuration occurs, incision is necessary.

Chronic hypertrophic tonsillitis occurs in weakly children, often in association with adenoids. The tonsils are enlarged, breathing through the nose is restricted, and the child usually breathes with the mouth open. In mild cases, change of air, administration of iron and cod-liver oil, and painting the tonsils with glycerine or tannic acid may possibly be sufficient. If these measures are not successful, the tonsils should be removed by dissection, together with the adenoids, an operation which is not attended with much risk.

Tonson, JACOB (c. 1656–1736). English publisher. He started business at the Judge's Head, Chancery Lane, London, in 1678, moved later to Gray's Inn Gate, where his brother Richard had opened a

bookshop in 1676, and then to the Shakespeare's Head in the Strand. He became printer of parliamentary votes, was secretary of the Kit-Cat Club, and is remembered as publisher of Milton's *Paradise Lost*, Rowe's *Shakespeare*, and works by Dryden, Addison, and Steele. Retiring in 1720, he died April 2, 1736. His nephew, Jacob Tonson II (d. 1735), was his partner after 1712, and his great-nephew, Jacob Tonson III (d. 1767), later carried on the business.

Jacob Tonson, English publisher

Tonsure (Lat. *tondere*, to shear). In eccles. usage, the ritual shaving of the head, or a part of the crown, as a sign of admission to the clerical state and preliminary to taking holy orders. As a mark of the clergy it dates probably from the late 5th century, though it was used by the monks at an earlier date. The Roman, or S. Peter's, tonsure was of the whole head, except a narrow circle of hair; the

Tonsure of old Roman type

Eastern, or S. Paul's, of the whole head; the Celtic, or S. John's, the head in front of a line drawn from ear to ear. In practice, it is usual for only a small circle on the crown of the head to be shaven. See Monasticism.

Tontine. Method of life insurance. It owes its name to an Italian banker, Lorenzo Tonti. The main idea is that a number of persons contribute to a fund with which property is bought; the income is portioned between them, but as each one dies his share is divided between the others until the whole is enjoyed by the last survivor. In 1689 a loan was raised in France by a tontine. A number of persons paid 300 livres each, and the survivor of them received ultimately an income of 73,500 livres. After this there were a number of private tontines in France. In Great Britain, towards the close of the 19th century, the govt. raised money by means of tontines, and the idea also found favour in the U.S.A. R. L. Stevenson used the idea in *The Wrong Box*.

Tooke, JOHN HORNE (1736–1812). English politician. Son of

John Horne, a London tradesman, he was born June 25, 1736, and educated at Westminster, Eton, and S. John's College, Cambridge. Ordained in 1759, he held the cure of New Brentford, 1760–73. Entertaining strong political views, he became an adherent of John Wilkes, with whom, however, he quarrelled in 1771. The same year he agitated for and obtained the printing of parliamentary reports. In 1777 his acknowledged sympathy with the N. American colonists was punished by fines and imprisonment. He assumed the name of his friend and patron, William Tooke, in 1782.

Acquitted of a charge *John Horne Tooke* of high treason brought about by his sympathy with the French Revolution, 1794, he was elected M.P. for Old Sarum in 1801, but was excluded by an Act passed immediately after, disqualifying the clergy from sitting in parliament. He died March 18, 1812.

In addition to sundry political tracts, Tooke published a philological work, *Epea Pteroenta*, or the *Diversions of Purley*, 1786–1805. *Consult* Lives, J. A. Graham, 1898; M. C. Yarborough, 1927.

Toole, JOHN LAWRENCE (1832–1906). British comedian. Born in London, March 12, 1832, he was

J. L. Toole

educated at the City of London school, and was for a time employed by a wine merchant. In 1852 he made his first stage appearance in *The Spitalfields Weaver* at Dublin. In 1854 came his début in London—at St. James's Theatre—and by 1859 he was the leading comedian at The Adelphi. During 1869–74 he was at The Gaiety; then, after a visit to the U.S.A., he became proprietor of the Folly Theatre, which, as Toole's, had a successful period during 1882–93. One of the best of his later parts was in *Walker*, London, 1892. Toole retired in 1893, and died at Brighton, July 30, 1906. *Consult* his *Reminiscences*, 1889.

Tooley Street. London thoroughfare. It runs S.E. from London Bridge to St. Saviour's

Dook. Near the bridge is S. Olave's church, founded about 1300, rebuilt 1737-39, and restored after a fire in 1843. Near the junction with Queen Elizabeth Street is the grammar school of S. Olave and S. Saviour, for boys, founded 1671, and rebuilt 1835, 1850, and 1892-96, with a branch school for girls in New Kent Road. The name of the street, which was the scene of a great fire on June 22, 1861, and a serious air raid incident, Nov., 1940, when a German bomb fell on a shelter, causing many fatal casualties, is a corruption of St. Olave's Street. (See Olaf II.) The thoroughfare is famous for a story by Canning of "the three tailors of Tooley Street," who began a petition to the house of commons, "We, the people of England."

Tool Steel. Strictly speaking, steel used for tools. So-called tool steels are, however, also used for other purposes, e.g. springs to stand high temps. Such steels have a high carbon content, carbon tool steels containing up to about 1.4 p.c., to give hardness and resistance to abrasion. If required to retain hardness at elevated temps., as in steels for high-speed tools, other additions, e.g. tungsten, chromium, vanadium, cobalt, are made. The steels are manufactured in small quantities from carefully selected iron, e.g. Swedish iron. After casting into small ingots, the steels are hot-forged to break up the cast structure, hardened by quenching, and tempered. See Steel.

Tooth. One of the hard structures in the jaws of animals. Anatomically and functionally it is described under Teeth.

Toothache. Pain associated with diseases of the teeth, most often due to caries or decay. When nothing is involved but the dentine, which lies beneath the enamel or hard exterior covering of the tooth, the pain is not very severe, but if decay is extended to the deeper pulp of the tooth, the pain may be intense. Inflammation and swelling of the gums are often present in addition. The only satisfactory treatment is to have the tooth stopped, with or without killing the nerve, or if decay is too far advanced, to have it extracted. The pain may be relieved by placing a small piece of cotton-wool in the cavity of the tooth, soaked in camphorated chloroform, or, in severe cases, a strong solution of carbolic acid. If the latter is used, care must be taken to avoid touching the lips

or gums with the carbolic acid. See Caries; Dentistry; Teeth.

Tooth-Mutilation. Dental disfigurement effected under social sanction among primitive peoples,

Tooth-Mutilation as practised by Batwa pygmies
American Field Museum, Chicago

especially in Africa and S.E. Asia. An artifice designed to improve on nature, having an amuletic origin, it became a mode of personal decoration and ornament, or a means of marking superiority to despised peoples, and unlikeness to monkeys and dogs. Effected by extraction, chipping, filing to a point or a notched edge, inlay, colouring, and deflection, it often forms an essential element in the rites of initiation into adult life. It is widespread in negro Africa.

In S.E. Asia, under Malay influence, filing, as practised by the Borneo Dyak, Philippine Bagobo, and Javanese, is often associated with or replaced by inlaid brass wire, gold studs, or gemstones. This custom existed in ancient Mexico and Peru: a skull unearthed in Ecuador had gold disks in five incisors. The blackening prevalent in Indo-China and elsewhere, a secondary result of betel-chewing, is sometimes enhanced by other vegetable dyes. At some Australian initiation rites, one lower incisor is knocked out.

Tooth Ornament. In architecture, a decorative design consisting generally of a row of small sculptured four-leaved flowers, embedded in a hollow moulding (q.v.). Probably of Eastern origin, it became a favourite decoration of the Romanesque and E.E. styles. See Dog-tooth Ornament.

Toothwort (*Lathraea squamaria*). Perennial root parasite of the family Orobanchaceae, native of Europe and Asia. It has a thick fleshy white rootstock whose rootlets are attached to those of its victim, chiefly hazel. The stout whitish stems are from four to ten ins. high, with broad

pinkish scales in lieu of leaves, which are folded back upon themselves, enclosing several chambers whose walls are studded with stalked glands. The function of these glands is not definitely known, but it is thought that they help in secreting water. The purple-tinged flowers are also fleshy, and crowded on a one-sided spike. See Root Parasites.

Tooting. Dist. of S.W. London, forming from 1950 part of the bor. constituency of Wandsworth Central. Partly residential and partly industrial, it is divided into Upper Tooting or Tooting Bec, and Tooting Graveney or Lower Tooting. Tooting Graveney and Tooting Bec commons, 63 acres and 154½ acres respectively, were acquired for the public in 1873-75, and now form a large open space under the control of the L.C.C. The place was named Totinges in the 8th century, probably from the Saxon name Tota. The parish church of S. Nicholas was put up in 1833 on the site of the old Saxon building of that name mentioned in Domesday; it has been enlarged, but has still monuments belonging to the early church. Holy Trinity church, 1855, serves part of Tooting Bec, which was named after land given to the abbey of Bec in the time of William the Conqueror. In the district are Lambeth and Streatham cemeteries, S. Clement Danes almshouses, Springfield and Tooting Bec mental hospitals, Grove fever hospital, and Wandsworth infirmary. It is served by trams, buses, rly., and underground rly. Defoe is believed to have preached in Tooting. Pop. 38,175.

Toowoomba. City of Queensland. It is the chief inland place on the Darling Downs, 1,920 ft. alt., 100 m. W. of Brisbane on the main rly. to Sydney. The "gateway of the west" and a notable health resort, it is an agricultural centre, with butter, cheese, and bacon factories, foundries, and rly. works. Pop. 33,326.

Toparé. Modern name for Pollanarua, an ancient capital of Ceylon. It is situated in the N. Central prov. about 60 m. N.E. of Kandy, and was the capital between 769 and 1235. Most of the ruins belong to the period 1153-86, the reign of Prakrama Bahu I, who fortified the place and built a palace, monastery, and other public buildings near the artificial lake Toopawewa.

Topaz (Gr. *topazos*). A mineral; aluminium fluosilicate. Yellow, green, blue, or red in

Tooth Ornament in architecture

colour with a glassy lustre, it yields fine varieties which are valued as gem stones. It is found in gneiss or granite and associated metalliferous veins, and is frequently associated with tinstone, tourmaline, mica, beryl, etc. The deep orange yellow topazes are most valued, and the finest stones have been found in the Ural Mts. and Brazil. Some Brazilian stones become pink on heating and are used in cheap jewellery. Many so-called topazes are really only yellow varieties of quartz. See Precious Stones.

Tope (*Galeus canis*). Species of small shark. It is found in most of the tropic and temperate seas, and often occurs round the British coasts. It is about six ft. long and is grey on the back and whitish beneath. It spends most of its time on the bottom of the sea, feeding on fish, crustaceans, and echinoderms. See Shark.

Tope. In Buddhist architecture, a dome-shaped monument, solidly built, for the preservation of relics. Topes may have a polygonal, round, or square base, and are generally crowned by a finial (*q.v.*), called a tee. Those in Ceylon are called *dagobas*; the Ambustella Dagoba, Mihintala, is one of the most famous. When a dagoba has a definite commemorative purpose, it is known as a Stupa. Topes are usually enclosed within a stone railing or other barrier.

Topeka. Capital and third largest city of Kansas, U.S.A. The co. seat of Shawnee co., it stands on the Kansas river, 65 m. W. of Kansas City, and is served by the Atchison, Topeka, and Santa Fé rly. and other systems. Washburn College is the chief educational institution. The American home is symbolised by a huge terra-cotta sculpture over the door of the state capitol (1924). The Loan Association Building is notable. Topeka has extensive rly. workshops, flour mills, machine shops, and foundries, and manufactures butter and woollen goods. Organized in 1854, it became the capital in 1861. Its city charter was granted in 1881. Pop. 67,833.

Topelius, Zachris (1818-98). Finnish author. Born Jan. 14, 1818, he was educated at Helsingfors (Helsinki). For a time he edited the Helsingfors News, in which many of his early stories and poems appeared, and was professor of history at his own university, 1853-78. His works include nature stories for children, translated into

English as *Whisperings in the Wood*; a series of historical tales; *Stories of the Surgeon*, 1858-67, also translated; a play, *After Fifty Years*; and poems. He died at Helsingfors, March 13, 1898. His collected works appeared at Stockholm in 30 vols., 1899-1910.

Topheth or **TOPHET**. Word allied in sense to the Heb. Sheol, and the Gr. Gehenna and Hades. It is applied to the Valley of Hinnom (2 Kings 23, v. 10), where idolatries were practised, and where later the refuse of Jerusalem and the bodies of animals and criminals were burned. An expression of abhorrence, its literal meaning is spittle or spitting, and it is used as a synonym for Hell (*q.v.*).

Topiary (Lat. *topiarius*, landscape gardener). The practice of clipping and cutting trees and shrubs into regular forms, human figures, animals, peacocks, cups and saucers, etc. Modern custom confines topiary work to solitary specimens, often grown in tubs, and specially trained; but at some country mansions, notably Levens Hall in Westmorland, and Elvaston in Derbyshire, whole topiary gardens of mature trees, in some instances over 100 years old, are maintained. The trees which lend themselves most readily to clipping are box, yew, and holly. Topiary clipping needs an accurate eye and a steady hand, as a false move of the shears will often spoil the symmetry of a tree for a whole season. See Terrace Garden.

Toplady, AUGUSTUS MONTAGUE (1740-78). English hymn writer. Born at Farnham, Surrey, and educated at Westminster School and Trinity College, Dublin, he was ordained in 1762, and in 1768 exchanged the living of Harford for that of Broad Hembury, Devon. A

A. M. Toplady,
English hymn-writer

convicted Calvinist, he embodied his views in *The Historic Proof of the Doctrinal Calvinism of the Church of England*, 1774, and engaged in bitter controversy on the subject with John Wesley. He also wrote sacred poems, but is remembered only for hymns, including the world-famous *Rock of Ages*, first published in the *Gospel Magazine* in 1775. The story is that he was inspired to write this while shelter-

Topiary. A hawthorn bush clipped to a life-size design of a horse. Top, two trees, each more than 100 years old, cut with a series of independent rings

ing from a storm in a cleft of limestone rock at Burrington Combe in the Mendips. Toplady died Aug. 14, 1778.

Topography (Gr. *topos*, place; *graphein*, to write). Art or practice of geographical description, i.e. giving the situation, natural features, buildings, etc., of a country; also describing rivers, mountains, etc. Books containing this information are known as *gazetteers*. See Geography; Maps.

Topolobampo. Seaport of Mexico, on the Gulf of California, in the prov. of Sinaloa. It is served by the Southern Pacific rly. and is rapidly being made into a first-class shipping base with the natural advantages of its position on Topolobampo Bay. The district is famous as a sportsman's paradise. Pop. 10,000.

Topolski, FELIKS (b. 1907). Polish-born British artist. Born Aug. 14, 1907, he studied painting at Warsaw academy of art, and contributed cartoons to Polish periodicals. He settled in England in 1935, when he published *The London Spectacle*; became a skilled draughtsman and painter; and was appointed an official war artist, depicting scenes from the battle of Britain. As a cartoonist he had a lively sense of the grotesque that made his pen and wash drawings popular. He illustrated

Feliks Topolski,
British artist

editions of Bernard Shaw's plays *Geneva*, *In Good King Charles's Golden Days*, and *Pygmalion*. He is represented at the British Museum and the Tate Gallery.

Topsail. In a square-rigged ship, the sail next above the lowermost one on the mast. Modern ships have often an upper and a lower topsail. *See Ship*; *Spinnaker*.

Tor. Striking, and sometimes fantastic, tabular, or pillow-shaped rocky elevation. Found typically in granite regions which have been long exposed to weathering, tors number some 170 on Dartmoor, the highest being High Wilhays and Yes Tor (over 2,000 ft.).

Torah (Heb. *ha-torah*, law). Term applied in the Jewish religion to the Pentateuch. There are two torahs recognized in Hebrew teaching: the Mosaic torah or written law, as embodied in the Pentateuch; and the oral torah, embodied in the Mishna (q.v.). *See Hebrew Religion*; *Pentateuch*; *Talmud*.

Torbanite. Shaly rock which will yield oil on heating and which is related to the boghead coals, cannel, etc. The organic matter is characterised by a preponderance of algal remains mixed with plant debris. Torbanite derives its name from the Torbanehill estate in the Lothians of Scotland, where it was first worked. Important deposits occur in S. Africa, Brazil, New South Wales, Nova Scotia, and New Brunswick.

Torbernite or **COPPER URANITE.** In mineralogy, a hydrated phosphate of copper and uranium, sometimes containing a little arsenic. This is a brilliant green mineral found in scaly or foliaceous crystals, often associated with uraninite, the chief source of uranium. Torbernite is always a secondary alteration product of primary uranium-bearing minerals.

Tor Bay. Almost semicircular inlet on the S.E. coast of Devon, England. It is $\frac{1}{2}$ m. across between Hope's Nose and Berry Head, and penetrates $3\frac{1}{2}$ m. inland. On its shores are Torquay, Paignton, and Brixham, where the prince of Orange landed, Nov. 5, 1688. Except when the E. wind blows, the bay provides safe anchorage and is frequented by yachts. *See Brixham*; *Paignton*; *Torquay*.

Torc or **TORQUE** (Lat. *torquis*, necklace). Personal ornament of one or more metal bars or bands, spirally twisted. Devised by the early Persians and Scythians, twisted necklets come sparingly from Bronze-Age lake-dwellings; similar gold armlets occur in Scotland (Moor of Rannoch; Urquhart).

In the early Iron Age they became a national ornament of the Celts. Manlius removed one from a vanquished Gaul, whence the family name *Torquatus* (q.v.). The finest and most varied are Irish. Toro is also the name of a mt. and waterfall in the Killarney dist., Eire.

Torcello. Italian islet of the Adriatic Sea. It is 6 m. N.E. of Venice in the Venetian Lagoon. In the town, formerly the ancient seaport of Altinum, is the former Byzantine cathedral of Santa Maria Assunta. Founded in the 7th century and rebuilt in the 9th century, this contains valuable 12th century mosaics. Another interesting building is the 12th century church of S. Fosca. *See Venice*.

Torch. Piece of twisted wood or other combustible material soaked in an inflammable substance and, when kindled, carried by hand as a portable light (*see Link*). The modern equivalent is a cylindrical metal or plastic case fitted with bulb and battery (one or more dry cells in series, giving a voltage of 2.5-3.5). Some torches are fitted with adjusters to emit light beams up to 100 ft.

Toreador (Sp. *toro*, bull). Name given to a Spanish bull-fighter. It refers more especially to the mounted picador, as distinct from a torero, who fights on foot. *See Banderillero*; *Bull-fighting*.

Torgau. German town, in the Land of Saxony-Anhalt, after 1945 in the Russian occupation zone. It is 30 m. N.E. of Leipzig, on the left bank of the navigable Elbe. A castle, Torgow, is first mentioned in 973. Here are the late Gothic church of S. Mary (1479-1526) with the tomb of Luther's wife; the castle church (1544), first house of worship built for Protestants; a Renaissance town hall (1563-65); and the Hartenfels palace, one of Germany's most impressive Renaissance dwellings, with a collection of Saxon antiquities. Mainly residential before 1939, Torgau had some industry connected with ceramics, glass, engineering, oil, and paper. The Saxon electors made it their residence in 1456; in 1530 Luther signed the Torgau articles; and in 1760 Frederick II here defeated the Austrians (v.i.). Strongly fortified, Torgau was in Napoleon's hands 1810-13. Here the Allied armies invading Germany from E. and W. had their first meeting April 25, 1945, when U.S. patrols met elements of the Russian 58th Guards div. Pop. 18,000.

Torgau, BATTLE OF. Victory gained by Frederick the Great over the Austrians in the Seven Years' War, Nov. 3, 1760. Daun, the Austrian commander-in-chief, had concentrated 64,000 men and 400 guns in an entrenched camp at Torgau, and Frederick determined to attack with his force of 45,000. His plan for taking the camp in rear miscarried, and he made little progress till sunset, when his last reserves broke the Austrian line and caused a retreat. The Prussian casualties, which numbered 13,120, as compared with 11,260 on the Austrian side, included many more killed.

Tormentil (*Potentilla erecta*). Perennial herb of the family Rosaceae. A native of Europe,

Tormentil. Leaves and flowers of this perennial herb

W. Siberia, and the Azores, it has a stout, almost tuberous rootstock which is of an astringent quality and used for tanning. The stems are long, very slender, and hairy. The leaves are divided into three, or rarely five, oval wedge-shaped leaflets, and the yellow flowers have four, occasionally five, petals.

Tormes. River of W. Spain. Rising in the Sierra de Gredos, in Avila prov., it flows first N. and then W., passing Salamanca, and effects a junction on the Portuguese frontier with the Douro, of which it is a left bank trib., after a course of c. 150 m. *See Salamanca*.

Tornado. Violent and destructive local atmospheric whirl, giving winds which have been est. to exceed 200 m.p.h. on occasion. Its area averages only a few hundred ft. in diam. Tornadoes are associated with thundery conditions, the most characteristic feature being a funnel-shaped cloud hanging from the under surface of a heavy cumulonimbus cloud, and reaching to the ground. The column is rendered visible by the condensation of water vapour in it. Within the tornado

Tornado. The funnel-shaped whirl of this destructive phenomenon seen at Peshawar, April, 1933

By courtesy of W. Placents

there is generally heavy rain or hail and thunder and lightning; its passage is accompanied by a loud rumbling sound. In the N. hemisphere the direction of rotation of the whirl is counter-clockwise and its rate of travel about 30-40 m.p.h. from the N.E.; in the S. hemisphere the motion is reversed and the direction S.E. In this, the most destructive of all meteorological phenomena, the violence of the upward currents of air causes the uprooting of trees, the removal of roofs from houses, and the lifting of animals

and heavy objects. Although often not lasting more than half an hour, tornadoes have been known to derail a train and destroy a village.

Tornadoes are most frequent in the late afternoon in spring and summer, in the central plain of the Mississippi region. The average annual number of "twisters," as they are termed, reported in the U.S.A. during 1916-45 was 143. Similar whirlwinds occur in Australia; over the sea they are called waterspouts. In W. Africa the name is applied to a totally different phenomenon, that of the line squall associated with the front of a thunderstorm. See Squall; Waterspout; Wind.

Torneå. River of Lapland. Rising in the Torneå lake, about 30 m. E. of Narvik, it flows generally S.E., forms the boundary between Sweden and Finland, and after a course of 250 m. discharges into the Gulf of Bothnia.

Toronto. City of Canada, the capital of the prov. of Ontario. It stands on a bay of Lake Ontario, to the N. of the mouth of the Niagara river, in York co., 333 m. by rly. S.W. of Montreal. It is served by the C.P.R. and C.N.R., and from here steamers go regularly to various Canadian and American ports, the water communications with both E. and W. being extensive. There is a system of electric rlys. in the streets. Toronto has a frontage of about 10 m. on the lake. According to some authorities the name means, in Indian speech, a place of meeting; according to others, trees in the water.

Buildings include those of the government of Ontario; the city hall, a fine, large Romanesque edifice, with an enormous clock tower; law courts in Osgood Hall; public library; and art museum, housed in the Grange. The legislature has a fine block in Queen's Park. There are R.C. and Anglican cathedrals, and many other modern churches. The Bank of Commerce building is the tallest skyscraper in the British Commonwealth, and Toronto contains the Commonwealth's largest hotel.

Educational institutions include the university of Toronto (*v.i.*),

Toronto, Canada. 1. Anglican cathedral of St. James, built in 1858. 2. Provincial Legislative building which stands in Queen's Park. 3. The City Hall, in Romanesque style. 4. The city skyline viewed across Union Station, seen right foreground

and among other colleges and schools Upper Canada College (1829) is the chief. The business and older part of Toronto centres around Yonge Street, while suburbs have grown up on the slopes rising from the lake. It is a banking and distributing

Toronto arms

centre, and has a number of manufactures for which power is obtained from Niagara and the Gattineau river. There is a fine harbour and a good deal of shipping, also a sea-plane base. At Malton is an important airport. Fronting the lake is the National Exhibition Park of 240 acres, the scene of the Canadian national exhibition, held annually since 1879, except for the war years. Centre Island, in the bay, is a pleasure resort.

Toronto was founded in 1794, its first name being York, on the site of a fort erected by the French in 1749. Little more than a small hamlet set in a swamp, it was popularly known as Muddy York. Since 1797 it has been the capital of Ontario. In 1812-14 it was twice taken and damaged by the Americans. In 1834, when the pop. was 10,000, it became a city, but population really began to increase from 1871. In the 30 years between 1881 and 1911 it rose from 96,000 to 376,000; in 1941 it reached 667,000; and the 1950 estimate was 900,000. Toronto is governed by a mayor and a city council.

Toronto, UNIVERSITY OF. Canadian university. It originated in 1827, when a royal charter was granted for King's College to serve as an educational centre for

Upper Canada. In 1842 it began work, and in 1887 it was reorganized as a teaching university, University College providing the education. Victoria, Trinity, and St. Michael's Colleges were added to it. The university buildings are in Queen's Park. It specialises to some extent in the latest developments of engineering and medical research. After the Second Great War the number of students passed 17,000.

Torpedo. Longitudinal section of a Whitehead automobile torpedo; top, diagram showing mechanism for regulating depth of submersion

Torpedo OR **ELECTRIC RAY** (Lat. *torpere*, to be numb). Genus of fishes of the family Torpedinidae, nearly related to the skates and rays. See Electric Fish.

Torpedo (Lat. *torpere*, to be numb). A self-propelled cigar-shaped vessel of steel carrying a charge of high explosive, and used as a weapon by warships and naval aircraft. It was devised by Whitehead in 1868, and is in effect a small submarine, in four main sections: the head, which contains the charge and firing mechanism; the body,

the nose when it strikes the target. It is fitted with a safety appliance to prevent explosion before the torpedo has run some distance, and a flooding device to sink it if it misses its target. Where compressed air is the basis of propulsion, its power can be increased by heating with petrol or oil flame. The engine drives two propellers, which revolve in opposite directions. There is a small steering engine, the steering being controlled by a gyroscope, the movement of which brings the steering engine into operation and corrects any deflection from the predetermined course.

In the British navy there are two standard sizes of torpedo, the 18-in. used by aircraft and small vessels, and the 21-in. carried in larger ships. The efficient range may be as much as 25,000 yds., but increased range necessarily involves some decrease in speed. As compared with a projectile from a gun, a long-range torpedo may be said to travel slowly, taking perhaps four mins. to reach a target 6,500 yds. away, against five secs. by a shell. While the torpedo is approaching the target may alter course, zigzag, or adopt other manoeuvres to avoid the attack. On the other hand, the torpedo strikes below water, where the ship is

Toronto. Plan of the central districts of the capital city of Ontario

weakest, and may explode a magazine. It took about a dozen torpedoes to destroy the Japanese battleships *Musashi* and *Yamato* of 64,000 tons.

A 21-in. torpedo weighs about $1\frac{1}{2}$ tons, its length being 22 ft. During the Second Great War the Japanese used 24-in. torpedoes in their destroyers, with some success. From aircraft, torpedoes are discharged by launching gear, the aircraft coming down almost to the surface before releasing the torpedo.

A torpedo propelled by electricity leaves no visible wake, but it has less range and speed. In the 20th cent. the torpedo had a marked effect on naval tactics, ships being compelled as a general rule to fight at distances outside the range of the torpedo. In the Second Great War the belligerents developed an acoustic torpedo which "homed" on to its target. A diaphragm in the head of the torpedo picked up the vibration of the target's propellers, this operating relays which so set the torpedo's rudder that the missile moved in the direction of the sound. Acoustic torpedoes were generally fired to follow a criss-cross pattern along the estimated track of the target, thereby improving the chances of a hit.

So-called human torpedoes were introduced by the Italian navy early in the Second Great War and were later adopted by all the belligerents. Approx. the same size and shape as an ordinary torpedo, the human torpedo was driven by electric batteries and navigated by a crew of two wearing self-contained diving suits and sitting astride the hull. It was used at night and approached its target submerged so that only the crew's heads were above water. When close to its target, the torpedo dived under the ship, where the crew detached the warhead, fixed it to the bottom of the enemy hull, set a time fuse, and then navigated the body of the craft clear of the target area.

Human torpedoes were first used by the Italians in 1940 against British ships in Alexandria harbour. They were used by the R.N. in Jan., 1943, to attack Axis shipping in Palermo harbour. The German human torpedo consisted of a cylindrical hull with an 18-in. torpedo suspended from either side. The hull accommodated a pilot who navigated the weapon to within striking distance, the torpedoes were released, and the hull returned to base.

Midget submarines, a development of the human torpedo, were introduced in the war by the Japanese, who first used them in the attack on Pearl Harbour. On Sept. 22, 1943, British midget submarines made a successful attack on the German battleship *Tirpitz* (*q.v.*) in Alten Fjord. British midget submarines were 40 ft. long, carried a crew of four, had a range of 50 m., and fired a single torpedo through a tube in the nose.

From 1939 to 1945 British naval losses from torpedo attack from the air, on the surface, and under water, included three battleships, one battle cruiser, six aircraft carriers, and 11 cruisers.

The torpedo is the main weapon of the submarine.

H.M.S. *Vernon*, the R.N.'s principal torpedo school, is a shore instructional and experimental establishment concerned with all under-water weapons.

Francis E. McMurtrie

Torpedo, AERIAL. Torpedo released from aircraft against shipping. In the Second Great War the term was erroneously applied to the parachute bomb (*q.v.*) dropped by aircraft on ground targets.

Torpedo Boat. Originally a small craft of relatively high speed driven by steam engines and designed primarily to attack other ships with torpedoes. Introduced in 1873, it was superseded by the destroyer (*q.v.*) and had become obsolete before the First Great War. Its place is now occupied by the motor torpedo boat (*q.v.*). Hundreds of these vessels served during the Second Great War with British coastal forces. Craft with similar characteristics in the German navy were known as S-boats (*Schnellboote*), erroneously referred to in the U.K. as E-boats (*q.v.*). French motor torpedo boats are termed *redettes torpilleuses à moteurs*; those of Italy were called *motosiluranti* (Ms). In the French and Italian navies destroyers of less than 1,000 tons are classed as sea-going torpedo boats. See *Light Coastal Forces*.

Torpedo Net. Strong steel-meshed net, formerly carried out from the side of a warship by booms as a protection against torpedo attack. This method of defence was finally discarded by warships during the First Great War as cumbersome and ineffective, but was revived in improved form during the Second Great War for merchant ships in convoy. Net of a similar kind are still in

use as part of the boom (*q.v.*) defences of bases and harbours.

Torpex. Powerful explosive consisting of a mixture of RDX, TNT, and aluminium powder. Developed during the Second Great War as a filling for mines and torpedoes, it was the most effective under-water explosive used.

Torphichen. Village and parish of W. Lothian, Scotland. It is 3 m. S.S.W. of Linlithgow, and grew round a hospital or preceptory of the Knights of S. John of Jerusalem, of which there are still some ruins. The parish church is built on the site of the nave of the preceptory church. The principal industries are coal mining and brick-making. Here was born Henry Bell, designer of the steamboat *Comet*.

Torpid. Bumping races on the river for crews representing colleges of Oxford university. Unlike the Summer Eights, but like the Lent Races at Cambridge, they are not open to oarsmen of certain attainments. Traditionally they begin on a Thursday in Feb. and extend over six afternoons.

Torquatus, TITUS MANLIUS IMPERIOSUS (4th century B.C.). Hero of ancient Rome. His name *Torquatus* was derived from the torc which he took from the neck of a gigantic Gaul whom he defeated in single combat in 361. His victory, won with his colleague P. Decius Mus, over the Latins at Mt. Vesuvius in 340 finally settled the question of Roman or Latin supremacy. In this campaign a son of *Torquatus*, disobeying the orders of the consuls against single combats, met and vanquished a Latin noble. He bore the spoils to his father, but the stern old Roman had him put to death for disobedience. *Torquatus* was twice dictator and thrice consul.

Torquay. Mun. bor., seaport, and watering-place of Devon, England. On the S. coast, it stands on hills above Tor Bay and is 26 m. due S. of Exeter, having connexion with that city by rail and bus. Its mild climate attracts visitors throughout the year. For them there are theatres,

Torquay arms

gardens with sub-tropical plants, and other attractions, as well as facilities for yachting, golfing, and bathing; there are excursions to Brixham, Cockington, Dartmoor and Totnes, and trips in Tor Bay.

The modern buildings include the town hall, museum, and several

Torquay, Devon. View looking westward across the harbour with Waldon Hill on the right

churches, of which S. John's is the most notable, while there are several hospitals. The town has some interesting remains, among them the ruins of Tor Abbey and S. Michael's chapel, an Early English building. In Kent's Cavern (*q.v.*) have been found remains of prehistoric man. The old church at S. Mary Church, now a suburb, was almost destroyed by bombing in the Second Great War; another is at Tor Mohun. There is a trade in coal and stone, and marble and terra-cotta are worked, but the chief occupation is catering for visitors.

Known at first as Tor or Torre—the latter name now applies to a suburb, with remains of a Premonstratensian abbey—Torquay grew in the 19th century from a small fishing village to a considerable town. It was made a bor. in 1892 and gives its name to a bor. constituency. The council maintains medicinal and swimming baths. Pop. 59,000. See Paignton.

Torque. In engineering, a force applied in such a way as to tend to cause rotation. It is measured by the moment of the force applied to a body subject to torsion.

In electrical engineering, torque is the force exerted at the periphery of an armature or rotor of an electric motor when it is energised. Torque is measured in foot-lb. and a torque of 100 foot-lb. is produced when at the periphery of an armature or a rotor with a radius of one foot a force of 100 lb. is exerted. D.C. and three-phase A.C. motors are said to have a uniform torque; that of a single-phase A.C. motor is less uniform. The starting torque is the force exerted by the armature or rotor to overcome inertia, etc.

In aeronautics, torque denotes the tendency of an aeroplane to

rotate round the airscrew shaft caused by the resistance of the air to the rotation of the airscrew. See Torc.

Torquemada, JUAN DE (1388–1468). Spanish theologian and cardinal. Born at Valladolid, he studied in Paris, and joined the Dominican order, of which he became prior. His *Meditationes*, first printed in Rome in 1467, were several times reprinted. He upheld the authority of the pope, and at the council of Constance he proposed the dogma of the Immaculate Conception. Made a cardinal in 1439, he died Sept. 24, 1468.

Torquemada, TOMAS DE (1420–98). Spanish inquisitor. The son of the lord of Torquemada, he was born at Valladolid, where he entered the Dominican order as a boy. He refused preferment time and again, but was made prior of the monastery at Segovia, where he remained for 22 years. The fame of his learning and humility soon spread abroad, and Torquemada was appointed confessor to the Infanta Isabella, over whom he soon established complete domination. When Isabella became queen, 1474, Torquemada retained his position and became confessor also to her husband, Ferdinand. His obsession growing against heretics, Moors, and Jews, in 1478 he persuaded Ferdinand and Isabella to revive the Inquisition in Spain, where it had largely fallen into disuse. The institution was approved by a papal bull, and Torquemada, setting up his first tribunal in Seville, 1481, was two years later appointed sole inquisitor-general over all Spanish dominions.

Thenceforth for 13 years Spain suffered a reign of terror. Almost immediately protests were made both to the sovereigns and to the

pope. The former were pleased, however, with the vast stream of wealth deriving from fines and confiscations, while the latter was at first ambitious to acquire some proportion of the booty. Torquemada during his persecutions probably condemned over 2,000 persons to death by burning. By 1496 the extermination of unbelievers had become an obsession, but his actions in disposing of the wealth brought in led to reprimands from both court and pope. Meanwhile Torquemada had been attacking Moors and Jews on a larger scale. By urging the sovereigns to prosecute the war against the Moors with the greatest severity, he was responsible for their final defeat and the capture of Granada, 1492; the same year he persuaded the sovereigns to promulgate decrees banishing from Spain every Jew who did not embrace Christianity within four months, and forbidding Christians to have dealings with unconverted Jews. According to Prescott, over 160,000 Jews quitted Spain, and the country fell into commercial ruin from which it never recovered. Torquemada continued his persecution until his death, Sept. 16, 1498, at Avila, where he was buried. In his last years he had gone always in fear of his life, and had always been escorted by a body-guard of some 150 men.

Torquemada's persecutions are the greatest blot upon the history of Spain and of the R.C. Church. But the pope and the Spanish sovereigns must bear their share of responsibility. Attempts have been made to present his character in a saintly light and to convict him of no more than mistaken zeal; they fail because Torquemada was notoriously despotic and cruel and delighted in his office. His name has become the symbol for diabolical cruelty. Consult T. et l'Inquisition, De Molènes, 1897; Torquemada, H. G. de Saint-Amand, 1910; T. and the Spanish Inquisition, R. Sabatini, 1913.

Torre Annunziata. Town of Italy, in the prov. of Naples. It stands at the S. base of Mt. Vesuvius, on the Gulf of Naples, and is a rly. junction 13 m. S.E. of Naples. It has a harbour, with a fishery and coasting trade, a state arms factory, ironworks, and manufactures of macaroni and paper. The town has often suffered from the eruptions of the volcano. Pop. approx. 25,000.

Torre del Greco. Seaport of Italy, in the prov. of Naples. It stands on the Gulf of Naples, 8 m.

by rly. S.E. of Naples. Situated at the S.W. foot of Mt. Vesuvius, it is built chiefly of lava on the solidified flow of 1631, when the larger portion of the old town was destroyed. Lava streams did much damage in 1737, 1794, and 1861, as also did the earthquake of 1857. There are shipbuilding yards, lava quarries, coral-polishing works, and fisheries of tunny, sardines, and oysters. The rich volcanic soil of the district yields much fruit. Pop. approx. 35,000.

Torrens. Inland lake of S. Australia. It occupies the N. portion of the Great Valley of South Australia and is 90 m. N. of Spencer Gulf, 130 m. long and 20 broad, and 80 ft. above sea level. It was discovered by Eyre in 1840. It is but a mud flat covered with a few ins. of water after heavy rain.

Torrens, SIR ROBERT RICHARD (1814-84). Australian statesman. Born at Cork and educated at

Sir Robert Torrens,
Australian
statesman

Trinity College, Dublin, he emigrated to South Australia in 1840. Collector of customs next year and colonial treasurer in 1852, he was elected to the first parliament three years later and became

prime minister in 1857. He then introduced the Torrens Act, which provided for the conveyance of property by registration instead of by the cumbersome methods then in vogue, and spent the next few years travelling through Australia to explain its working. On retiring in 1863, Torrens returned to England and was M.P. for Cambridge, being knighted in 1872. He died at Falmouth, Aug. 31, 1884.

Torreón. City of Mexico. It is in the state of Durango, and is 220 m. W. of Monterey. It is a rly. junction, the seat of important smelters and cotton and flour mills, and the centre of the district producing most of the cotton raised in Mexico. Torreón is connected by road with Monterey and Chihuahua and thence with Mexico City. Here in 1914 the forces of Villa defeated those of Carranza's government. In the neighbourhood are gold, silver, and copper mines. Pop. 87,765.

Torre Pellice (Fr. La Tour). Town and summer resort of Italy, in the prov. of Turin. It stands at the foot of the Cottian Alps, in one of the Vaudois valleys, 10 m. by rly. S.W. of Pinerolo and 34 m.

S.W. of Turin. It manufactures cotton, cloth, and silk. There are a church and college here of the Waldenses, who made the town their headquarters for centuries.

Torres Strait. Sea passage between Cape York Peninsula, Queensland, and Papua, New Guinea. It is about 90 m. in width, and contains numerous islands ranging from patches of sand or coral, some as much as 50 sq. m. in area. The larger islands, chief of which is Thursday Island (*q.v.*), are inhabited; some of the islets are used by the natives as fishing stations or gardens. About 1890 the strait became celebrated as a pearling ground; the natives were badly treated by pearl-hunters. The Queensland government intervened, and established a staff of protectors who, with the assistance of missionaries, checked the abuses and improved the condition of the natives. In addition to pearls and pearl shell the Strait yields *bêche de mer* (*q.v.*) in large quantities. Navigation through the tidal rips and among the coral reefs is difficult and dangerous, natives being the best pilots. The Strait was discovered by Torres in 1606.

Torres Vedras. Town of Portugal. It is situated on the river Sizandro, 24 m. N.W. of Lisbon, is the centre of a vine-growing dist., and has hot sulphur baths and a Moorish castle. Many Latin inscriptions point to its Roman occupation, but the name *Turres Veteres*, or old towers, is medieval. It was captured from the Moors in 1149, and soon became important, the Cortes meeting here in 1441.

It was from here that Wellington's famous lines stretched to the Tagus. The threefold lines consisted of 114 forts strongly built and enclosed, and linked together by entrenchments and inundations, converting 500 sq. m. of mountainous country, lying between the Tagus and the sea, into a gigantic entrenched camp. After the campaign of 1810 Wellington, closely pursued by Masséna, withdrew behind the tremendous barrier formed by the first of these lines, and the French were brought to a complete standstill. During the winter of 1810 Masséna held on before the lines with great tenacity, but in March, 1811, he fell back before Wellington, who pursued him until on May 5 he was able to turn him out of Fuentes d'Onoro. Here there was an engagement in the civil war of 1846. Pop. 8,700.

Torrey, JOHN (1796-1873). An American botanist. Born in New York, Aug. 15, 1796, he early came

under the influence of Amos Eaton, a natural history pioneer in America. In 1836 he was appointed botanist to New York state; from 1838 he was issuing the earlier part of his *Flora of North America*, and in 1843 his *Flora of New York State*. Torrey's name is commemorated in the coniferous genus *Torreyia*. He died March 10, 1873.

Torrey, REUBEN ARCHER (1856-1928). American preacher. Born at Hoboken, Jan. 28, 1856, he was educated at Yale, and in 1878 became a Congregational minister. After some years in Minneapolis, he went in 1889 to Chicago, where until 1908 he was superintendent of the Moody Bible Institute. Torrey assisted Moody in his evangelistic work, and became known as a revivalist. During 1902-03 he toured round the world, and 1903-05, with C. M. Alexander, conducted mission services throughout Great Britain. In 1912 he was made dean of the Bible Institute at Los Angeles. He died Oct. 27, 1928.

Torricelli, EVANGELISTA (1608-47). Italian scientist. Born Oct. 15, 1608, he studied mathematics in Rome, and there became fascinated by the work of Galileo, whom he aided in the preparation of his *Discorsi*. Torricelli succeeded Galileo, on the latter's death in 1642, in the chair of philosophy and mathematics at Florence. His experiments on atmospheric pressure led to his balancing the weight of a column of mercury against the pressure of the atmosphere, and so discovering the principle of the barometer. The space above the mercury in a barometer is still called the Torricellian vacuum. He died Oct. 25, 1647.

Torridge. River of England, in Devon. It rises 4 m. S.E. of Hartland Point and flows S.E., E., and N.W. to join the Taw estuary in Bideford Bay. See Bideford.

Torridon, LOCH. Fjord inlet on the W. coast of Scotland, in the co. of Ross and Cromarty. Torridon village is at the head of the loch, and near it is Torridon deer forest with an area of 18 sq. m.

Torridonian Sandstone. Group of sedimentary rocks found in N.W. Scotland, Iona, and Islay. Coarse feldspathic sandstone or arkose is the dominant member, but breccias, conglomerates, and shales also occur. The Torridonian lies unconformably on the Lewisian gneiss, and is itself overlain by unconformable lower Cambrian. It is therefore of pre-Cambrian age. It contains wind-polished pebbles, and was probably deposited under cold desert conditions.

Named after Loch Torridon, it forms many of the high mountains around that loch, as well as Suilven, Canisp, Stack Polly, etc. See Pre-Cambrian.

Torrid Zone. Climatic zone surrounding the earth and extending from the tropic of Cancer to the tropic of Capricorn, *i.e.* over 47° of lat. Except when the sun is at the two tropics, it is overhead at noon twice a year; at other times its midday elevation is never less than 43° . The diurnal variations of temp. in this zone are therefore more pronounced than the seasonal, although there is a tendency over the year for a double maximum and double minimum, especially at the equator. There is a distinct wet and dry transition in the rainfall distribution. According to this astronomical sub-division of the earth, the zones between $66\frac{1}{2}^{\circ}$ (*i.e.* Arctic and Antarctic Circles) and $23\frac{1}{2}^{\circ}$ are designated the temperate zones, and those polewards of the polar circles, the polar zones. The basis for this zonal treatment of climates is the dependency of temp. upon incoming solar radiation, and hence in turn upon lat. Considerable modification of this elementary classification is necessary in practice. See Climate; Tropic; Zone.

Torrigiano OR TORREGIANO, PIETRO (1470–1522). Florentine sculptor. He studied at Florence, where, after an affray with Michelangelo his fellow-student, he was obliged to leave the city. He went to Rome, where he was employed by Pope Alexander VI, and served as a soldier under Caesar Borgia: he found his way to England about 1508, and executed the tomb of Henry VII in Westminster Abbey, and other works. He died in Spain, having been imprisoned by the Inquisition.

Pietro Torrigiano,
Florentine sculptor

Torrington. Mun. bor. and market town of Devon, England. Standing on a hill above the Torridge, 7 m. S.S.E. of Bideford. it has a rly. station. The parish church of S. Michael was blown up by the explosion of 80 barrels of gunpowder in 1646, rebuilt in 1651, and restored in 1884. One of its

Torrington
arms

Torrington, Devon. Parish church
of S. Michael

earlier incumbents was John Howe (*q.v.*), the Puritan divine. There is a bluecoat school, founded in 1671. The ruins of the castle, built in 1340, were demolished in the 18th century, and near the spot now stands a Waterloo column, erected in 1816. Glove making and agriculture are the principal industries, and there is a milk-canning factory. Near is the battlefield where Fairfax routed the royalists in 1646. Market day, Sat. Pop. 2,913.

Torrington. Bor. in Litchfield co., Conn., U.S.A. On the Naugatuck river, it is 36 m. W. of Hartford by the New York, New Haven, and Hartford rly. A brass industry was founded here in 1834, the centenary of the first settlement, and in 1851 one of the earliest condensed milk factories was opened. Engines, hardware, needles, and woollens are also produced. The town, incorporated since 1887, has a pop. of 26,988.

Torrington, GEORGE BYNG, VISCOUNT (1663–1733). English sailor. Born Jan. 27, 1663, he entered the navy in 1678 and saw considerable service before he sailed in 1684 to the E. Indies, where he took part in several actions against pirates. In 1688, as an

Viscount Torrington,
English sailor

agent of the prince of Orange, he won many of the senior captains of the fleet to the prince's cause. As rear-admiral he commanded the naval operations at the capture of

Gibraltar and took part in the battle of Malaga, 1704. In 1708 he dispersed the Old Pretender's attempted invasion of England. Byng was sent to the Mediterranean to prevent a Spanish invasion of Italy, and totally destroyed the Spanish fleet off Cape Passaro, July 30, 1718. Returning to England in 1720, he was created Viscount Torrington, became first lord of the Admiralty in 1727, and died Jan. 17, 1733.

Earlier there had been an earl of Torrington, Arthur Herbert (1647–1716), also a sailor. He took the invitation of the English peers to William of Orange in 1688, and in 1690 was in command of the English and Dutch fleet beaten by the French off Beachy Head (*q.v.*). He died April 14, 1716.

Torry Research Station. Division of the department of scientific and industrial research. Workers at this station at Aberdeen are concerned with the migration and breeding of edible fish. Members of the staff accompany the fishing fleets to carry out investigations in the subject.

Torsion. In mechanics, the condition produced in a solid body when parallel planes are turned relatively to one another about an axis perpendicular to them both. As long as the material is not stressed beyond its elastic limit by the twisting torque, then the angle of twist displacement, or strain, between two planes of measurement is proportionate to the twisting moment and stress (*see Strain and Stress*). If the distance between the planes of measurement is increased, then the angle of twist increases proportionately. Owing to stress distribution of equal torques over successively smaller areas of cross-section, a thin wire or rod twists proportionately more than its smaller size seems to justify. Thus, if pieces of wire of constant length and identical material are twisted about their axes by equal torques, and the torsional elastic limit is not exceeded, then the angle of twist will vary inversely as the fourth power of the diams. of the wires, *i.e.* if the diam. is halved, the angle of twist is multiplied by 16. The magnitudes of very small torques, such as those produced in a measuring instrument like a galvanometer, are measured by applying the torques to the end of a very thin wire and measuring the angle of twist.

Torsional properties of various materials are measured by standardised torsional tests to deter-

mine their suitability for mechanical applications in which a torque has to be transmitted from one part to another. The commonest example of use of torsional properties is a helical spring. Glass, rubber, steel, and quartz all have good torsional elastic properties.

Torso (Ital.). In sculpture, term for the trunk of a statue of a human figure as distinct from

Torso of the Apollo Belvedere in the Vatican, Rome

head and limbs. It is applied to certain pieces of antique sculpture of which head or limbs are now missing, e.g. the so-called Belvedere torso, in the Vatican; but many later sculptors, notably Rodin, have set themselves to express their powers and their appreciation of the human framework in the modelling or carving of figures from which head and limbs are deliberately omitted, and such a figure is also known as a torso.

Torstenson, LENNART (1603-51). Swedish soldier. Born at Torstena, Aug. 17, 1603, he served under Gustavus Adolphus against the Danes and in Germany, where he had charge of the artillery. After his master's death in 1632 he was one of the Swedish leaders during the Thirty Years War, and in 1641 was made commander-in-chief. His fame rests chiefly on his stupendous victory over the Imperialists at Breitenfeld, Oct. 23, 1642, but he also crushed the Danes in 1643, and at Jüterbog in 1644 inflicted another defeat upon the Imperialists, while in 1645 his army seriously threatened Vienna. Soon after this Torstenson resigned his command, owing to ill-health, was created a count, and in 1648 was appointed governor of W. Sweden. He died April 7, 1651.

Tort (Fr. *tort*, wrong). Term in English law to express a wrongful act, other than a breach of contract or a crime, for which an action for damages will lie at the suit of the person wronged.

Torts may be classified in many ways, but the most convenient, if not the most scientific, is to divide them into (1) wrongful acts which in themselves give rise to an action; (2) wrongful acts which are only actionable if actual pecuniary loss and damage are proved. In (1) damages are not, and in (2) damages are, of the essence of the cause of action.

Not every act, however, that causes damage is necessarily a tort. For example, where A had a water-mill, and his mill stream was fed by percolations running underground from the land of X; and X dug himself a well on his own land so deep as to attract all the percolations, whereby A's mill stream ran dry, A had no cause of action against X. X was merely doing what he had a right to do, viz. to dig a well in his own land, and the fact that his act was damaging to A did not make it any the less lawful.

The principal headings of tort are: (1) Trespass to the property or person. In this case no pecuniary damage need be proved. A man has an absolute right that

Slander of title; (11) Deceit or fraud; and (12) Waste. In a few cases the damages in actions of tort are not confined to the actual loss suffered; but the court or jury may award what are called punitive or exemplary damages.

In the case of a continuing tort, the court may grant an injunction to restrain the continuance thereof, in addition to or in substitution for damages. A threatened tort may sometimes be restrained by injunction. An infant is liable for his torts, though not on his contracts. The law of torts is virtually the same in the U.S.A. and the countries of the British Commonwealth as it is in England, while Scotland has a law very similar.

Torticollis (Lat. *torquere*, to twist; *collum*, neck). Disorder of the neck. See Stiff Neck.

Tortoise. Name given generally to all the land species of the order Testudinata of the reptiles; the aquatic species being known as terrapins and turtles. They are characterised by the fact that the skeleton is partly external and forms a bony box or shell for the animal's protection. None of the tortoises has teeth; but the jaws are cased with horn to form a cutting beak. In most of the land species, the carapace is covered with horny plates, often finely mottled: superior kinds are used for

Tortoise. 1. Species in the London Zoological Gardens, the giant being *Testudo elephantina*, from the Seychelles. 2. Common European tortoise

nobody (except by authority of law) shall touch him or his property. (2) All defamatory libels, and some slanders, are also actionable without proof of damage. (3) Detention or conversion (see Trover) of another's property is also actionable *per se*; and so are (4) False Imprisonment and (5) Malicious Prosecution. (6) Negligence is a tort only where actual damage to the plaintiff is proved; and the same observation applies to (7) Nuisance; (8) Conspiracy; (9) Certain kinds of slander; (10)

tortoiseshell, but the best tortoiseshell is from a species of turtle.

Tortoises are confined to the warmer regions of the world, some six species occurring in S. Europe. They feed mainly on plants, and most of them are about during the day. In the cooler districts they hibernate in the ground during the winter, but in the hotter districts they may be found all the year round. They are renowned for their longevity, especially the giant tortoises. These are now confined to the Galapagos Islands in the S.

Pacific, and to certain islands in the Indian Ocean. They are sometimes between four and five feet long. One example is known to have lived for 127 years, and another lived in captivity for 140 years.

The tortoises of S. Europe (*Testudo graeca*) are from 6 to 10 ins. long, and have the carapace mottled with yellow and black. They are used for food in Italy and Sicily. The females lay about twelve round white eggs, which they bury in sunny spots about the month of June. *Testudo loveridgii*, which was discovered in German E. Africa during the First Great War, is a flattened, soft-shelled tortoise that can inflate itself, and so fix itself in its position as to escape capture. See Animal colour plate; Turtle.

Tortoiseshell. Horny material or scales covering the carapace of the hawksbill turtle. The reptile is one of the marine turtles of the tropics, *Chelone imbricata*, and the tortoiseshell it provides is semi-transparent and mottled in appearance. Up to 8 lb. of shell may be obtained from one turtle, the scales being heated in oil or water and moulded together under pressure. In the 20th century the material has been largely superseded by synthetic plastics. See Turtle.

Tortoiseshell Butterfly. Popular name for two species of butterfly, natives of Europe (including Great Britain) and Asia. The Large Tortoiseshell (*Nymphalis polychloros*) is 2½ ins. across the scalloped wings, which are dull orange-brown, blotched, spotted, and margined with black; on the hind wing five blue crescents unite with the black border. The Small Tortoiseshell (*Aglais urticae*), which is usually less than 2 ins. across the wings, is a much more plentiful and a brighter insect, and the blue crescents margin all the wings. The caterpillars feed upon stinging nettles, and until nearly full-grown an entire brood will feed in company. See Butterfly colour plate.

Tortona (anc. Dertona). Town of Italy. In the prov. of Alessandria, it stands on the river Scrivia, at the base of an eminence crowned by a ruined medieval fortress, 13 m. by rly. E. of Alessandria. Its cathedral dates from 1584, Santa Maria dei Canali from the 9th century. Other prominent buildings are the episcopal palace and the museum. The fortifications, destroyed by the French, are replaced by avenues. Industries are silk-weaving, hat-making, and tanning. Pop. 20,000.

Tortosa (anc. Dertosa). City of Spain. In the prov. of Tarragona, it is built in terraces on an eminence

above the river Ebro, 22 m. from its mouth and 40 m. by rly. S.W. of Tarragona. Encompassed by old and crumbling walls, its dominating feature is the cathedral founded in 1158, rebuilt in the middle of the 14th century, and restored later. From its small harbour it exports wine, oil, corn, fruits, and liquorice, and it has manufactures of majolica, articles made from palm leaves and grass, silk, spirits, etc. A *colonia* under the Romans, it was, as the key of the Ebro, long an object of contention between Moors and Christians. The French captured it in 1811 and held it until 1814. Pop. 35,000.

Torture (Lat. *tortura*). The infliction of severe bodily pain to force persons to confess, give some required information, do or say something contrary to their ordinary beliefs, or as a punishment.

In early times torture was the recognized punishment meted out by the conqueror to his captives. In Greece and Rome slaves were tortured almost as a matter of course to obtain from them evidence in trials. In the 13th century torture of heretics received ecclesiastical sanction by the decree of Pope Innocent IV, and torturing increased until it culminated in the horrors countenanced by the Inquisition. In Europe during the 14th cent. and in England in the 15th torture was widely practised judicially. Part of the common law of most European countries, it was never recognized by English common law. State prisoners in the Tower were often put to the torture, but in 1628 the English judges laid it down that torture as such was illegal. Torture methods in state trials existed till the 17th century in England, and later in France and Germany. See Boot; Cage; Cang; Inquisition; Rack; Thumbcrew.

During the Second Great War, in areas under their occupation, the Germans and Japanese initiated systems of torture, often scientifically devised, which were imitated later in dictatorship countries throughout the world. See Concentration Camp; Gestapo.

Torun (Ger. Thorn). Town in Poland. It stands on the right bank of the Vistula, 90 m. S. of Danzig. Founded in the 13th century by the knights of the Teutonic order, it was an old fortress town. Annexed to Poland in 1454, at the partition of 1793 it reverted to Prussia. Napoleon added it to his new grand duchy of Warsaw, but Prussia recovered it after the congress of Vienna in 1815. By

the treaty of Versailles it was given to Poland. The town was an important member of the Hanseatic league. The town hall, a leaning tower, an ancient castle, and the churches of S. John, S. Mary, and S. James were among its interesting buildings. In the market place stood a colossal bronze statue of Copernicus (1473-1543), who was born here. In the part of Poland occupied by Germany in 1939, it was carried by assault Feb. 1, 1945, by Rokossovsky's 2nd White Russian army after being surrounded and by-passed earlier; the German garrison was wiped out in violent street fighting. Pop. 60,000.

Tory. Name given in Great Britain to a political party. Although the word was used in the time of the Commonwealth, its present use dates from about 1678. The supporters of Charles I and II in Ireland were known as Tories, from an Irish word meaning "come, O king," and, during the debates on the Exclusion Bill, someone applied the term contemptuously to those who opposed that measure. Like Whig, it soon became the designation of a party in the state, and remained so until the middle of the 19th century. Under the influence of Peel and Disraeli, the Tory party became the Conservative and then the Unionist party, though the word Tory continued in popular use. See Conservative; Unionist; United Kingdom; Whig.

Tosca, LA. Five-act play by Victorien Sardou (q.v.). Its scene is laid in Rome in 1800, Tosca being a singer loved by the governor Scarpia. First produced at the Théâtre Porte-St. Martin, 1887, it was played by Sarah Bernhardt in London in 1892, 1897, and 1907, and an English version was given in London, 1889. An opera by Puccini is founded on the play, and was first produced in Rome and London in 1900.

Toscanini, ARTURO (b. 1867). Italian conductor. Son of a tailor, he was born at Parma, March 25, 1867, and studied the 'cello at the conservatoire there. He

Arturo Toscanini,
Italian conductor

toured Italy and S. America as an orchestral player, and began to conduct in Rio de Janeiro, 1886. After organizing and conducting the Turin orchestra, 1893, he became famous for his memory, his

emotional and intellectual grasp of music, and personal magnetism. Conductor at La Scala, Milan, 1898-1908 and 1921-29, he was at the Metropolitan Opera House, New York, 1908-15.

A firm democrat, Toscanini refused to conduct the Italian fascist anthem in 1922, and in 1931 was assaulted by a fascist mob. He conducted at Baireuth, 1930-31, and at Salzburg, 1934-35, but did not appear in Germany after the rise of Hitler. Later he lived chiefly in the U.S.A. where he directed the N.B.C. symphony orchestra from 1937. He returned to La Scala in 1946. He had always done much to introduce the work of composers previously unknown to Italy. He refused to allow encores, and exacted strict obedience from singers and players. *Consult Life, P. Stefan, 1936.*

Tosti, SIR FRANCESCO PAOLO (1846-1916). Italo-British composer. Born at Ortona, April 9,

1846, he studied music at Naples, and taught there until 1869. Encouraged in his early composition by Sgam-bati, he secured a court appointment in Rome, and in 1875 paid his first visit to England. In

Sir Paolo Tosti,
Italo-British com-
poser

By courtesy of
Ricordi & Co.

1880 Tosti became singing teacher to the royal family, and settled in London. He became a naturalised British subject, and was knighted in 1908. He composed numerous sentimental songs which enjoyed great popularity, especially Good-Bye, Ask Me No More, Mother, Vorrei Morire, Parted, and For Ever. He died Dec. 2, 1916.

Tossing the Caber. See Caber.

Tostig (d. 1066). Anglo-Saxon noble. A younger son of Earl Godwin, he was made earl of Northumbria in 1055. His unpopularity, largely due to severity, led to a revolt in 1065, and the earl was declared an outlaw, his brother Harold concurring in this sentence. For some months he lived abroad, taking part in raids on the W. of England. He joined Harold Hardrada, king of Norway, in his invasion of England, and was killed with him at Stamford Bridge, Sept. 25, 1066.

Totalisator. Machine for registering bets on racecourses and greyhound tracks. Invented in Great Britain, it was first installed

for public use at Newmarket in 1930. Basically its principle of design and operation is adapted from the automatic telephone exchange (see Telephony). The all-electric totalisator has two main sections: the ticket-issuing machine; and the indicator, which shows the individual bets on each runner and the total bets on the race. Ticket-issuing machines may be in the main totalisator building or at convenient positions on the course. There is a machine to correspond with each runner on the card, and insertion of the appropriate coin actuates mechanism which automatically prints on a card the runner's name and the time of the race. Tickets are handed in to clerks who register the bets on a keyboard. The bets are then automatically totalled. Each single transaction is recorded on electrical indicators all the time betting is in progress. Immediately the race starts, the recorders are switched off, automatically locking the issuing machines.

At the end of the race the winner's odds are calculated according to the total amount of money laid, and payment is made to backers on production of their betting cards. A "tote" deals with bets from 100 to 400 issuing machines; accepts bets, win or place, on any number of runners up to 80; and gives out tickets at 50 a min. Machines and indicators can be located at any distance up to approx. 2 m. from the main building, with which they are in electrical communication. It takes less than a min. to announce dividends after the race. For the legal aspect, see under Betting, p. 1127.

Totalitarianism. Term coined in the 20th cent. for the theory of govt. which postulates one political party only in a state, and that the governing party. In this conception party and state are one; and the state is entitled to require any service or sacrifice from any person and to deny all private rights if those at the head of the state consider this necessary to advance or safeguard the state. The fundamental idea of this theory is that man exists to serve the state, not the state to serve man. Examples of totalitarian states include fascist Italy, nazi Germany, falangist Spain, and communist Russia. The term is sometimes by extension also applied to a despotism such as that of Shinto Japan. See Anarchism; Fascism; Hitler; Individualism; Mussolini; Nazism.

Totana. Town of Spain, in the prov. of Murcia. It stands among

the S. spurs of the Sierra de Espuña, 27 m. by rly. S.W. of Murcia. It has an aqueduct 7 m. long. There is trade in olives and wine. The pop., 16,100, includes many gypsies.

Totemism. Term used in anthropology in two senses, viz.: (1) A specific magical relation between a group of people, called a totem kin, or sept, and a species of animals, plants, or other objects, individual members of which are called by Europeans totems. (2) A form of social organization in which a tribe is divided into exogamous kins or clans, each related to its own totem species, and believed to consist of blood relatives descended from a single ancestor.

A totem kin and its totem are supposed to aid each other, and a similar relation subsists between the members of a group of people not based on an hereditary principle, e.g. religious or magical societies, or embracing the whole of a tribe, as in S. Africa, and not only a section of it, as in the normal totemic community. But the social side of the organization is not necessarily associated with the magico-religious relation of the human and animal groups. We therefore find "individual totems" (manitu of the Red Indian, tribal), "phratric" and "class" totems

Totemism in Australia. Totem magician dressed to represent a bulb in blossom, working magic to force food bulbs to flower

From *A Cross Australia*, Spencer and Gillen

(Australia), sex totems (Victoria) respected by males or by females only. A singular class are the "linked totems" of Australia, New Guinea, and Melanesia; in place of one totem species each kin has two, three, or more. Conversely, in W. Africa there are totem kins with different totems linked in very close relationship.

Totemism, in the strict sense, is found in Australia, Africa, America, Oceania, and parts of Asia; it has been attributed to the ancient Semites and to people speaking Aryan languages, but the evidence is not universally accepted.

The distinctive features of totemism differ so markedly that no universal features can be enumerated; e.g. some tribes eat their totems ritually, like the Arunta and Edo. The following are some features of totemism; (1) the totem must not be touched, killed, eaten, kept in captivity, or even looked at; (2) the kin claims that its ancestors were transformed totem animals, that its members are reincarnated totem animals, or that the totem has a claim on its gratitude; (3) carvings of totemic animals are set up, or their forms are tattooed on the body of the kinsman; (4) the totem is called a brother; (5) dead members of the animal species are solemnly buried; (6) captive members are bought and freed.

The origin of totemism has been attributed to certain primitive beliefs, such as that (1) the souls of the dead inhabit the totem species; (2) living men's souls are in the totem; (3) conception is due to the spirit part of an animal entering the woman's body; it has also been suggested that the individual totem developed into the kin totem, when a man's children began to respect his sacred animal. Probably some or all of these causes have contributed to building up the complex system; but the difference between the totemism of different areas makes a unitary origin improbable. Magical societies with totem protectors may have been formed on the analogy of the relationship between individual men and animals, but these supposed tutelars are not known to have existed universally; again, the magical cooperative society of Central Australia does not seem to be a stage in the life of a normal totemic tribe.

In some lands, e.g. Samoa, totemism has developed into the worship of certain animals, and in others, e.g. S. Africa, into a form of ancestor worship. Not all animals found associated with gods are or have been

Totnes, Devon. East Gate dividing Fore Street from High Street

totems, nor are the animal forms of a god due to his original totemic character, for animal worship is widely spread, and many species are respected because they are dangerous or useful. There is no reason to suppose that totemism played a large part in the domestication of animals.

Bibliography. Totemism, J. G. Frazer, 1887; Primitive Culture, E. G. Tylor, 1903; The Secret of the Totem, A. Lang, 1905; Marriage, Totemism, and Religion, Lord Avebury, 1911; Totem and Taboo, S. Freud, new ed. 1919.

Tothill Fields. Formerly an open space of Westminster, part of which extended S. from Victoria Street towards the Thames. Its name, variously spelt Tuthill and Tuttle, derives from a mound or hill of outlook near Regency Street, and survives in Tothill Street. Royal solemnities, and jousts, fairs, markets, and duels took place here, and the fields, famous for parsley, served as a playground for the boys of Westminster School, the present playing field of which, in Vincent Square, was in 1793 the site of a bear garden.

Totila (d. 552). King of the Ostrogoths. In 541 he became king and entered at once upon a war with the E. Roman empire, his aim being the recovery of Italy. He took Naples among other exploits, and in 546, after a long siege, he captured Rome. He again took the city, which had been recovered by Belisarius, in 549, after which he conquered Sicily, Sardinia, and Corsica. Once more in Italy, he was defeated by Narses at the battle of Tagina, July, 552, being killed as he tried to escape. Totila's real name, according to his coins, was Baduila.

Totnes. Mun. bor. and market town of Devon, England. Situated on the W. bank of the Dart, 9 m. W.S.W. of Torquay, it is an old town, first chartered in 1206.

Many of the houses overhang to form covered footways. The parish church of S. Mary, built in the 15th century and restored 1886-89, contains a fine rood screen, and carved corporation stalls (1636). Near is the old guildhall. At the upper end of the town are a ruined Norman castle and the old North gate. The grammar school was founded in 1554. Market day, Fri. Pop. 5,750. About 1 m. distant is Dartington Hall (q.v.).

Totnes arms

Totonac. American Indian tribe, mostly in Vera Cruz and Puebla, Mexico. Numbering some 64,000, they descend from a pre-Columbian people who were independent for 650 years until reduced to an Aztec tributary state.

Totonicapan. Town of Guatemala. The capital of a dept. with the same name, it is situated 55 m. W.N.W. of the ruined city of Guatemala. Manufactures include textiles, woodwork, and pottery. Pop. 30,103.

Tottenham. Bor. of Middlesex, England. Bounded N. by Edmonton, S. by Stoke Newington and Hackney, W. by Hornsey and Wood Green, and E. by Walthamstow, it is served by rlys., underground rlys., and buses.

Tottenham arms

Tottenham is a residential and industrial area, giving its name to a bor. constituency. Pop. 129,000.

The parish church of All Hallows, founded in the 12th century, restored 1876, has a fine peal of bells; the Saints' Bell was the alarm bell to the garrison of Quebec taken at the siege in 1759. The brick and stucco High Cross, mentioned in Walton's Compleat Angler, is referred to in a court roll of 1456. Bruce Castle, belonging to the council, where a museum has been established, was once owned by Robert Bruce; it has been frequently reconstructed, and in 1827 passed by purchase to the Hill brothers and was used as a school. One of these brothers was afterwards Sir Rowland Hill. In Tottenham also are a town hall,

central and five branch libraries, open-air bathing pool, 379 acres of open space, Harringay stadium and arena, and the ground of Tottenham Hotspur F.C. (*q.v.*). Seven Sisters Road is named from seven elms that once stood on Tottenham Green. *Consult* History of Tottenham, W. Robinson, 2 vols., 2nd ed. 1840.

Tottenham Court Road. A London thoroughfare. A link between Charing Cross Road and Hampstead Road, it is named after the prebendal manor of Tothill, Tottenham, or Tottenham Court, once belonging to the dean and chapter of S. Paul's cathedral. The manor house stood at its N.W. extremity; and in front of the tea gardens attached to the Adam and Eve inn, into which the house was transformed, Hogarth laid the scene of his March to Finchley. In Tottenham Court Road was Whitefield's Tabernacle (*q.v.*), destroyed by one of the last German rocket bombs, March 25, 1945. The thoroughfare has long been a centre of the furnishing trade.

Tottenham Hotspur. English professional Association football club. It was founded in 1882 by boys associated with a Tottenham Presbyterian school, who first played on Tottenham Marshes, and later acquired an enclosed ground in the neighbourhood. In 1899, four years after professionalism was adopted, they removed to their present ground at White Hart Lane, High Road, Tottenham. The Spurs were elected to the Southern League (later the Third Division of the Football League) in 1896, and remained in it for eleven years. In 1909 they were promoted to the premier division, from which they were relegated in 1915, to go up again in 1920, down 1928, up 1933, and back to the second division 1935-50. In 1901 they won the F.A. Cup for the first time, defeating Sheffield United by three goals to one, after a draw. They won the trophy again in 1921, defeating Wolverhampton Wanderers by one goal to nil.

Totternhoe Stone. In geology, a hard rock band occurring in the lower Chalk near Dunstable, Beds, also in Herts and Cambs. It is locally used as a building stone. *See* Cretaceous.

Tottington. Urban district of Lancs, England. Lying 2½ m. N.W. of Bury, it has two rly. stations. Cotton is spun and woven, while artificial silk manufacture has superseded calico printing. Pop. 6,532.

Touaris or **TROUERIS.** Grecised form of Taurt (*q.v.*), generic name of an Egyptian goddess of childbirth in the ungraceful form of a hippopotamus. Many local names and epithets were also used, such as Apet, Hesamut, Rert, Smet, and Shapuit.

Toucan. In astronomy, a southern circumpolar constellation placed by Bayer near the Lesser Magellanic cloud to the S. of Phoenix.

Toucan. A family of birds (Rhamphastidae) of the sub-order Picidae or woodpeckers. Found

Toucan. Green-billed species of the fruit-eating South American bird

in the forests of central and tropical S. America, they possess gaudily coloured beaks, which, though huge, are thin and light. There are more than 60 species of toucans, and they are very common in the forests of Brazil, notwithstanding the diligence with which the natives kill them for food. They feed mainly on fruit.

Touch. One of the five senses. The special organs which convey impressions of touch to the brain are minute corpuscles and bulbs situated in the skin in close association with the fine filamentous terminations of nerves. These corpuscles are of several varieties, and it seems probable that different forms convey different sensations, some receiving purely tactile stimuli, while others convey sensations of heat or cold or pain. The sensitiveness of the skin to stimulus depends upon the number and variety of the end organs receiving the stimulus, and these vary widely in different parts of the body.

Tactile sensation is most acute over the tip of the tongue. The points of a pair of compasses will be recognized as two points when applied to the tongue, if they are separated by only 1-24th of an inch. On the tip of the forefinger the distance must not be less than 1-12th of an inch before two points are felt; on the palm of the hand 5-12ths; and on the back of the body and many parts of the limbs the separation must be as much as

1 to 2 ins. An area sensitive for one set of impressions is not necessarily equally sensitive for another type of stimulus; for instance, the cheek and forearm are more sensitive to heat than the forefinger: hence the habit of testing the temp. of hot water by dipping the elbow into it.

Anæsthesia is loss of sensation of touch, and may be hysterical or a symptom of various nervous diseases. Hyperæsthesia means excessive sensitiveness to normal stimuli. Paraesthesia is perversion of sensation, a stimulus not producing its usual effect; for instance, a touch is felt as pain. In syringomyelia there is loss of the sensations of pain, heat and cold, while sensation of touch remains.

Touch-me-not. Popular name of a British plant (*Impatiens noli-tangere*), so called because at the slightest touch its seed-pods throw out their seeds. It belongs to the order Balsaminaceae. *See* Balsam.

Touchstone or **LYDIAN STONE.** In mineralogy, a hard black variety of quartz. The stone is used for making a rough approximation to the fineness of gold. The latter rubbed across the stone leaves a streak which is moistened with a mixture of nitric and hydrochloric acids. A comparison of the effect of the mixture on streaks made with alloys whose composition is known enables the expert to determine approximately the fineness of the gold being tested. The stones originally used for this purpose were a bituminous quartz from Lydia in Asia Minor.

Touchstone. Jester in Shakespeare's *As You Like It*. He is described by the exiled duke as one who under the guise of folly shoots his wit. There is little kindness in Touchstone's wit, which results in the discomfiture of rustic characters. But he shows great devotion to Celia and Rosalind when accompanying them into the forest of Arden, where he finds a bride in Audrey.

Touchwood (*Fomes igniarius*). Woody fungus of the family Polyporaceae, very destructive to trees. The visible portion is a hard, hoof-shaped bracket c. 6 ins. wide,

Touchwood growing on a beech trunk

with concentric zones above, ultimately black. The underside is convex and cinnamon-coloured. New growths are added to the margin and underside each spring. Thin slices of the woody material, if ignited, will smoulder until consumed.

Tough Pitch Copper. Term describing the form in which copper is usually marketed. If all the gas is removed from commercial copper, the surface of a cast billet is uneven and the metal is brittle. But if some of the oxygen, introduced to the metal for refining purposes, is left in the copper as Cu_2O , the surface of the cast ingot is flat and the metal is in the highest degree malleable at all temps. It seems that the oxygen locks up the impurities in the metal and renders them harmless.

Tougourt, Touggourt, or Turgurt. Oasis in the Sahara. It is in Algeria, 295 m. S.S.E. of Algiers. In it is the walled town of Tougourt, which trades in the dates that abound in the oasis. There is also a territory of this name; pop. 243,363. See Oasis.

Toul. Town of France. In the dept. of Meurthe-et-Moselle, it is 14 m. W. of Nancy, and stands near the Moselle. The chief building is the church of S. Étienne, famous for its elaborate W. front and cloisters. This was formerly a cathedral. S. Gengoult is a fine Gothic church, also notable for its cloisters, while the hôtel de ville was formerly the bishop's palace. The industries include the manufacture of pottery and lace. Toul was the Roman Tullum Leucorum, and about 350 was made the seat of a bishop. It afterwards became a free city of the Empire. In 1552 it was taken by the French and made into a strong fortress, ranking with Verdun and Metz. It capitulated to the Germans in 1870, but was restored to France at the peace. In German-occupied France from June, 1940, it was liberated by Patton's U.S. 3rd army during a rapid advance to the Moselle in Sept., 1944. Hilaire Belloc's Path to Rome begins at Toul.

Toulon. Town and seaport of France. It stands on a bay of the Mediterranean, in the dept. of Var, 42 m. E.S.E. of Marseilles, with which there is rly. connexion. One of the chief naval stations of France, it is strongly fortified, its defences being on the hills which command the

Toulon arms

Toulon, France. Façade and belfry of the 12th century Romanesque church of S. Marie Majeure, formerly the cathedral

bay. It has a good harbour with five basins, and its dockyards cover 240 acres and can accommodate the largest battleships. Connected with it are a large arsenal and other naval establishments. The town has shipping and steamboat services.

The buildings include the church of S. Marie Majeure, formerly the cathedral. Romanesque in style, it dates from the 12th century and has some fine decorations. In front of the hôtel de ville is a bronze statue representing navigation. Other buildings are the church of S. Peter, hospitals, casino, and a fine modern building for the museum, art gallery, and library. The site of the fortifications has been built upon, and since 1860 the town has been greatly extended to the N. The chief square is the Place d'Armes. Industries include shipbuilding and fishing, and the town has a service of electric tramways. Pop. 125,742.

Toulon, the Roman Telo Martius, was taken by Charles of Anjou in 1259, by the constable of Bourbon in 1524, and by the emperor Charles V in 1536. The port dates from the reign of Henry IV. Outside it the British were defeated in 1744, by the combined French and Spanish fleets. Toulon was occupied in 1793 by the British,

who were forced to retire by the French Republicans, among whom Napoleon was first heard of as an artillery officer.

Toulon lay in unoccupied France under the terms of the Franco-German armistice of June, 1940, and here, under the same terms, a large part of the French fleet was laid up. When, following the Allied landings in French N. Africa, the Germans on Nov. 11, 1942, entered Vichy France they undertook, Nov. 12, that Toulon would not be occupied; but on the 27th, having cut all communications

between that port and the rest of France, (which meant that Admiral Jean de Laborde, the naval commander, never received Pétain's transmission of an order from Von Rundstedt to surrender the fleet), and dropped magnetic mines at the entrance to the port, the Germans entered the Toulon area. De Laborde, in accordance with orders given him at the time of the armistice, immediately gave orders to scuttle his ships, and 230,000 tons of naval shipping, including the 26,000-ton battleship Strasbourg, lay half-submerged in Toulon harbour. The Germans attempted to raise the vessels, but salvage was interrupted by frequent Allied air raids. French forces under Gen. de Lattre de Tassigny advanced to take Toulon after landing to the E. in Aug., 1944. The Germans lost the city on the 26th, surrendering in the fortified peninsulas across the bay on the 28th. The naval base was found destroyed.

Toulouse. Fourth largest city of France, capital of the dept. of Haute-Garonne. It stands on the Garonne in a wide plain, the Gate of Toulouse, 120 m. due W. of Montpellier. Built on both sides of the river, it is a manufacturing and market town, being served by a network of rlys. and waterways, including the Canal du Midi.

The old town is on the right bank of the river; around it on both sides are modern suburbs. Industries

Toulouse arms

include making silk and woollen goods, flour, tobacco, agricultural implements, and boots and shoes, and it is a market for the agricultural produce of Languedoc, and a banking and commercial centre. It has an archbishop.

The cathedral, of various periods, has a choir with 17 chapels. The church of S. Sernin is the largest and one of the finest Romanesque basilicas in existence, and has a fine octagonal tower. The beautiful church of the Jacobins is notable: and so are Notre Dame du Taur, Notre Dame la Blanche, called La Dalbade, and the 18th century Notre Dame la Daurade. The museum of fine arts, occupying a convent built in the 14th century, contains a remarkable collection of pictures, sculptures, antiquities, etc., and there is also the museum of S. Raymond. A square tower, the donjon, was restored in 1880 to hold the city's records. The Château Narbonnais, once the residence of the counts and the seat of the parlement, is now used as law courts. Other buildings are the Capitole, or city hall, the palais de justice, the Hôtel Dieu, and the observatory. Toulouse university, founded about 1230 and once famous as a school of law, has faculties of law, medicine, and science.

There is a fine old 16th century bridge across the Garonne, and two modern ones. The chief squares are the Place du Capitole and the Place Lafayette. Toulouse is a centre of art and learning, still retaining some features of a provincial capital. The academy of floral games, founded in 1923, exists mainly to preserve the language and literature of Languedoc. Pop. 264,411.

The town of Tolosa, which existed before the Romans conquered the district, was the capital of the Visigoths from 419 to 507, when it came under the Franks and was one of their greatest cities. It was famous as the

seat of a powerful family of counts, 778-1271, and a stronghold of the Albigenses, c. 1200. It was united with France in 1271, but remained the capital of the province of Languedoc until the Revolution. Throughout the Middle Ages and afterwards it was a storm-centre, religious strife being responsible for sieges and massacres. Wellington's victory here is described below. Toulouse was a municipality in the 12th century, and for long was governed by consuls. From 1443 it had a parlement, the most important in the S. of France. In unoccupied France under the terms of the Franco-German armistice of June, 1940, Toulouse was occupied by the Germans from Nov. 11, 1942, until liberated by the maquis Aug. 20, 1944.

Toulouse, BATTLE OF. Last action in the Peninsular campaign, fought on April 10, 1814. After defeating Marshal Soult at Orthes, Feb. 27, Wellington followed up his victory by the capture of Bordeaux, March 8, Soult retreating before him towards Toulouse with the intention of acting in union with Suchet's army in Catalonia. Wellington, in close pursuit, crossed the Garonne and attacked Soult on the heights E. of Toulouse, winning a rather doubtful victory at a cost of between 7,000 and 8,000 men. The battle was fought in ignorance of the fact that Napoleon had already abdicated.

Toulouse-Lautrec, HENRI MARIE RAYMOND, COUNT DE (1864-1901). A French painter. Son of Count Alphonse de Toulouse-Lautrec-Monfa, he was born at Albi, Nov. 24, 1864. As a boy he broke both legs, this accident retarding growth and giving him a grotesque appearance. Unwelcome in society, he sought the friendship of painters, studied with Bonnat, and in 1885 met Degas, through whom he discovered his vocation. He became a patron of Montmartre music

halls, his wealth and brilliance attracting artistic celebrities; he sketched Yvette Guilbert, Van Gogh, Wilde, and such night-club favourites as La Goulue. In 1899 his health broke down and he was confined to a sanatorium, dying Sept. 6, 1901. Toulouse-Lautrec depicted with unerring subtlety the night life of bohemian Paris. Drawings, posters, etchings, and lithographs (often on ordinary cardboard) revealed his infallible judgement upon human psychology, and acute observation of frailties and vice. He was unsurpassed in his own line. Most of his sketches are at the Musée d'Albi, but he is represented also at the Luxembourg, Paris, and the Metropolitan Museum, New York.

Toungoo. Dist. and town of Burma, in the Tenasserim division. The dist. lies S.W. of Karenni, along the middle course of the Sittang, and is crossed by the rly. from Rangoon to Mandalay. As rainfall is 150 ins. annually, rice is the only crop. Area 6,172 sq. m. Pop. 474,588. The town is on the right bank of the Sittang and on the rly.

Touraco or **TURACOU.** Alternative name for a family of African arboreal birds, known as the plantain-eaters (*g.v.*).

Touraine. One of the provinces into which France was divided before the Revolution. It is named from Tours, its capital, which was about its centre. The Loire ran through the district, which is still one of the most fascinating parts of France. It was ruled by counts as early as the 9th century, and in the 11th was united with Anjou. It formed part of the kingdom ruled by Henry II of England, but in 1204 was regained by France and made into a duchy. At present it is represented by the dept. of Indre-et-Loire and part of Vienne.

Tourane or **TURANE.** Seaport of N. Vietnam. It was one of the Annamese treaty ports open to European commerce, and is on the China Sea, 50 m. S.E. of Hué. Coal is worked at Nongson in the neighbourhood.

Tourcoing. Town of France. In the dept. of Nord, it is 2 m. N. of Roubaix, which forms with it virtually a single town. Almost on the Belgian border, Tourcoing is a great centre for the manufacture of woollen goods and other textiles, including cotton, and has large mills for spinning and weaving. Carpets, machinery, hosiery, and soap are also pro-

Toulouse, France. Church of S. Sernin showing the unfinished west portal

duced, and there are dyeing establishments and sugar refineries. The buildings include the exchange, churches, schools, etc. The town has been celebrated for wool since the 12th century. After being in Flanders it was taken by France in 1477. Here in 1794 the French defeated the Austrians. Tournai was occupied by the Germans 1914-18 and 1940-44. Pop. 76,080.

Tourist Industry. Business of catering for tourists. In France and Switzerland this became a major industry during the 20th cent., and the money spent by tourists constituted the return for an important invisible export in the national trade of those countries. Until after the Second Great War, Great Britain made little effort to attract foreign visitors, but each year their numbers increased. Between 1933 and 1938 the average number of foreign tourists yearly in the U.K. was 300,000, of whom 100,000 were American, 70,000 French; there were 250,000 dominion and colonial visitors, and 100,000 week-end trippers from France and Belgium. In 1938 the total income from these visitors was £31,000,000, or 80 p.c. of the value of British coal exports.

After the Second Great War, lack of dollar currency led most W. European countries to make elaborate plans to attract tourists, particularly from the U.S.A. In 1947 some 380,000 persons came to Great Britain and spent approx. £20,000,000, excluding air and sea transport fares. The Travel Association and the British tourist and holiday board were the organizations mainly responsible for encouraging them, with posters and brochures for display and distribution abroad. The number of British tourists to foreign countries was severely limited by restrictions placed on the amount of money each individual was permitted to take out of the country. Before the war, British tourists were spending abroad an annual average of £37,000,000.

Tourist Trophy. Name of two road races for mechanically propelled vehicles run in the U.K. The senior event is the T.T. for motor cycles, held in the Isle of Man and first run in 1907. The course is over 37 m. 1,300 yds., starting just outside Douglas; it contains many corners and other hazards, and there are gradients up to 1 in 10.9. Competitors have to complete seven laps, and the race is run in three

separate classes, senior, junior, and lightweight, for machines not exceeding 500, 350, and 250 c.c. respectively, one day being set aside for each class. The motor car event in Ulster is described under Ards Circuit.

Tournai, Belgium. Cathedral of Notre Dame, which dominates the city

Tourmaline. In mineralogy, a complex aluminium borosilicate containing varying proportions of alkaline metals, iron, or magnesium. Many varieties are known, and the mineral may be transparent or opaque, and range from colourless through blue, green, red, and brown to black, with a glassy lustre. Several coloured varieties are highly prized as gemstones.

The common tourmaline is black, and better known as schorl. It is found in fibrous masses, grains, etc., and gives its name to schorl rock with quartz, schorlaceous granite when feldspar is present, etc. Tourmaline is remarkable for being the most dichroic of all gemstones, and is therefore used in types of optical apparatus. The property is made use of in the optical instrument known as the tourmaline tongs. Blue tourmaline, known as indicolite, resembles sapphire; the red variety is known as rubellite or Siberian ruby, many fine specimens being found in Siberia; the green variety from its occurrence in Brazil, as Brazilian emerald; yellow tourmaline, found in Ceylon, is known as peridot; and the colourless variety as achroite. Tourmaline is a common accessory in granites, pegmatites, and adjacent metamorphic rocks; and often found in tin ore veins.

Tournai (Flemish, Doornyk). City of Belgium, in the prov. of Hainault. It lies on the Schelde, 52 m. by rly. W.S.W. of Brussels and 16 m. E. of Lille, and is a busy rly. junction. Industries are carpet making (Brussels carpets),

tanning, quarrying, and those concerned with hosiery, chocolate, chalk, and cement. There is busy river traffic, especially in coal from the Mons coalfield. Tournai is the seat of a bishop, and a military centre.

The cathedral of Notre Dame dominates the city, its central tower surrounded by four others almost as high. The nave and transepts are Romanesque of the 11-12th centuries; the choir is 14th century Gothic. There are many fine sculptures, notably on the N. portal, the main façade, and on capitals in the nave. Other churches of note are those of S. Quentin, 12th century Romanesque but much altered; S. Brice, 12th century, with the tomb of King Childeric; and S. Jacques, Transitional Gothic. The 13th century Pont des Troues over the river and the massive Tour de Henri VIII (1513) are remains of old fortifications. The 12th century belfry with carillon (236 ft.), restored in 1874, is on the Grand Place, where is also the 17th century Renaissance cloth hall, now a museum with antiquities and paintings. Pop. 31,490.

Tournai, the Roman Turnacum, was the Merovingian capital in the 5th century, and became part of the Spanish Netherlands, 1525. Taken by the French, 1745, it was added to the Netherlands, 1748. In the First Great War it was

Tournament. A miniature depicting a 15th century joust, in which also is seen the "tilt," or longitudinal barrier, introduced at this time to preclude direct collision, and reduce the danger of serious injury to the contestants

entered by Germans, Aug. 23, 1914, and retaken after sharp fighting by the British, Nov. 8, 1918.

In German occupation during the Second Great War from May, 1940, Tournai was liberated by the British 2nd army Sept. 3, 1944. At Hertain near by, where the first British armoured car entered Belgium, a memorial column to the B.L.A. was unveiled 1949.

Tournament. Medieval mock combat between mounted men. Named from the tournament, or quick turning, of the horses, it appeared in Europe in the 11th century, and quickly grew in popularity both in France and England, where in the reign of Henry II it became necessary to prohibit tournaments owing to extravagant indulgence in them by the younger nobility. Tournaments were allowed later to be held under royal licence, and a classic account of one at Ashby in the time of Richard I is given in *Ivanhoe*, in which the customs and rules of such assemblies are graphically indicated. Froissart is also a mine of information. The essential feature was the single combat of knight with knight, each striving to unhorse or incapacitate his opponent, the usual weapon being the lance. Sometimes one body of knights fought against another body. Tournaments were arranged for most occasions of public rejoicing. Participation was usually reserved

for those of noble birth, and about the end of the 13th century a new set of rules was embodied in a statute of arms for tournaments, which laid down, among other provisions, that disputes arising out of a tournament were to be settled by a court of honour composed of princes and earls. By the 16th century the tournament had degenerated until it was merely a form of pageant. The term is now applied to many kinds of games contests, e.g. lawn tennis tournament. At Olympia, London, there is normally held in June the Royal Tournament, a display by the British fighting services, dating from 1879. See *Chivalry*; *Eglinton Tournament*; *Knighthood*; *Tilting*; consult also *History of the T.*, F. H. Cripps-Day, 1918.

Tourneur, CYRIL (c. 1575-1626). English dramatist. He saw service in the Netherlands, and was secretary to Sir Edward Cecil in the unsuccessful Cadiz expedition of 1625, on the return of which he was landed with the sick at Kinsale, Cork, where he died, Feb. 28, 1626.

He wrote a satirical poem, *The Transformed Metamorphosis*, and two tragedies, *The Revenger's Tragedy*, printed 1607, inspired by *Hamlet*, and *The Atheist's Tragedy*, 1611, which in the opinion of Gosse "surpass in horror of iniquity and profusion of ghastly innuendo all other compositions of their time." Praised by Lamb, Hazlitt, and Swinburne, the plays and poems of Tourneur were collected and edited by J. Churton Collins, 1878.

Tourniquet. Instrument, the essential part of which consists of a band passing round a limb, by which the blood-vessels can be compressed. It is used to stop bleeding, or to prevent haemorrhage during an operation. See *First Aid*; *Haemorrhage*.

Tours. Town of France. The capital of the dept. of Indre-et-Loire, it stands in the valley of the

Tours arms

Loire, on the left bank, between it and the Cher, and is connected by rly. with Paris, 145 m. to N.E. The Gothic cathedral of S. Gatien, partly destroyed in the Second Great War, had a façade of great beauty and towers 205 ft. in height, crested by cupolas. In a garden behind the cathedral are Roman walls and remains of an amphitheatre. The churches of S. Julien (another wartime casualty), Notre Dame, and S. Saturnin are notable.

Tours, France. Façade of the cathedral of S. Gatien before the Second Great War

S. Martin's is modern. The museum has a fine collection of paintings. Conspicuous features of the town are two towers, forming the only relics of the abbey church which was the shrine of S. Martin, the rest perishing in 1790. Industries include making iron and steel goods, boots and shoes, and machinery. Pop. 80,044.

Tours takes its name from the Turones, whose capital it was. Later it was a Roman city and about 250 was made the seat of a bishop. Its association with S. Martin made it famous ecclesiastically. Its abbey was also notable, and the city thrived on the gifts of the pilgrims who came to the shrine of S. Martin. Near here in 732 the Franks defeated the Saracens. Until the Revolution Tours was the capital of Touraine.

Tourville, ANNE HILARION DE COTENTIN, COUNT DE (1642-1701). French sailor. A Norman, he fought for the Order of Malta against Barbary pirates, and entered the French navy in 1667. On the outbreak of the Dutch war he commanded a vessel attached to the English fleet, was present at Sole Bay, June 7 (N.S.), 1672, and later fought against the Dutch in the Mediterranean, distinguishing himself at the battle of Palermo, 1676. Commander-in-chief of the French navy in 1689, he prosecuted the war against England and gained a barren victory over the earl of Torrington at the battle off Beachy Head, July 10 (N.S.), 1690. Two years later he unsuccessfully engaged the English fleet in the battle of La Hogue. In 1693 he was again in the Mediterranean but was crippled by lack of resources and saw no further action. He died in Paris, May 28, 1701.

Toussaint L'Ouverture (1746-1803). West Indian negro leader. He was born a slave on a plantation in Haiti,

Toussaint L'Ouverture, West Indian negro leader

In 1791, having aided his master with his family to escape, Toussaint took part in the negro insurrection, and in 1794 joined the French republicans. Appointed c.-in-c. of the island by the French

convention in 1797, he drove out French royalists, British, and Spaniards, and brought the island into a state of tranquillity and prosperity. About 1800 he began to work for Haitian independence, and on the re-establishing of slavery by Napoleon refused to obey. He was betrayed to and captured by the French, May 7, 1802, imprisoned without trial, and sent to die in a dungeon at the Fort of Joux, Jura, where the end came on April 27, 1803. Wordsworth addressed him in a noble sonnet. *Pron. Toosan.*

Tovey, JOHN CRONYN TOVEY, 1ST BARON (b. 1885). British sailor who commanded the Onslow

Lord Tovey, British sailor

at Jutland and received the D.S.O. after the First Great War. He had charge of the Rodney during 1932-34, became rear-admiral next year, and at the outbreak of the Second Great War was in charge of British destroyers in the Mediterranean. In 1940 he took over command of the Home Fleet from Sir Charles Forbes, his flagship being King George V, from which he directed the chase and destruction of the German battleship Bismarck (*q.v.*). Admiral of the fleet, 1943, Tovey was given the Nore Command until 1946, and was principal naval A.D.C. to King George VI, 1945-46. Knighted 1941, he was made a peer in 1946.

Tovey, SIR DONALD FRANCIS (1875-1940). British musical scholar and composer. Son of an Eton master, he was born July 17, 1875, and soon showed remarkable musical gifts, mastering counterpoint before he was 10, and composing sonatas before entering Balliol College, Oxford, in 1894. He was a pianist playing chamber music in London, Vienna, and Berlin early in the new century. Appointed in 1914 Reid professor of music at Edinburgh, he held that post until his death, July 10, 1940. In 1935 he was knighted. One of the foremost musical scholars of his time, he raised the status of his subject in the

Sir Donald Tovey, British composer

university and helped to make Edinburgh a centre of musical learning. His quarterly notes for performances by the Reid orchestra were collected into 6 vols. of *Essays in Musical Analysis*. He solved the enigma of the unfinished final number of Bach's Art of Fugue, and wrote a short "companion" to it. On Bach he was an unsurpassed authority. His compositions included chamber works, a cello concerto written for Pablo Casals, and an opera, *The Bride of Dionysus*, produced at Edinburgh, 1929. *Pron. Tuvvy.*

Towcester. Town of Northants, England. It is 9 m. on the rly. S.S.W. from Northampton, and stands on Watling Street. The 11th century church of S. Laurence has a fine Perpendicular tower 90 ft. high. It contains an altar tomb (1448), old brasses and monuments, and some chained black letter books. A town hall in the Italian style is occupied by the rural district council. The Saracen's Head hotel (formerly Pomfret Arms) is referred to in *The Pickwick Papers*. The living of Towcester was held by Boniface VIII in 1294 when he was elected to the papal throne. A Roman station, the place is mentioned in *Domesday* as Tovecestre, a town of importance. It is an agricultural centre. Pop. 2,300. *Pron. Towster.*

Tower. In its widest sense, any structure that is high in proportion to its lateral measurements; in the narrower interpretation, a structure standing on the ground, and rising therefrom without any serious break in its verticality. According to the former definition, towers include the keep, the gateway towers, other projecting parts of a fortified place, the belfry, pagoda, lighthouse, campanile, even the pronounced "skyscraper."

The large Norman church had towers to mark the terminations of the aisles, and often another tower at the intersection of the cross. These were increased in height during the Early English period, the spire was added, and in the Perpendicular style tower and spire together achieve their limit of height and magnificence of decoration. The highest tower in the world, using the word tower in its strictest sense, is the Eiffel Tower in Paris, built of cast and wrought iron in 1889, and nearly 1,000 ft. high. The highest in the U.K. is that of Salisbury cathedral, which, including the spire, is 404 ft. See Babel, Tower of; Belfry; Campanile; Eiffel Tower; Pagoda; Pisa; Round Tower; Spire.

Tower Bridge. Bridge crossing the Thames near the Tower of London. Designed by Sir Horace Jones and Sir J. Wolfe Barry, it was begun April 22, 1886, and opened June 30, 1894, the total cost being more than £1,000,000. It car-

ries a roadway 49 ft. in width, with a central lifting or bascule span of 200 ft. and two side spans each of 270 ft. The total length, in addition to approach viaducts, is 880 ft. The main towers, rising more than 120 ft. from the river piers, consist of steel columns encased in masonry. The side spans are hung from suspension girder-links between the pier and abutment towers, the links at the shore ends being anchored in massed concrete.

Tower Bridge. Diagram showing construction. A, masonry towers enclosing steel piers; B, steel suspension plate chains holding C, the bridge, and D, overhead girders; E, bascules or cantilever roadway sections, shown raised; F, gearing for raising bascules; G, hydraulic operating motors; H, control and operating houses

ries a roadway 49 ft. in width, with a central lifting or bascule span of 200 ft. and two side spans each of 270 ft. The total length, in addition to approach viaducts, is 880 ft. The main towers, rising more than 120 ft. from the river piers, consist of steel columns encased in masonry. The side spans are hung from suspension girder-links between the pier and abutment towers, the links at the shore ends being anchored in massed concrete.

Between the suspension links the ties are carried on two overhead foot bridges between the tops of the towers. The centre or bascule span consists of two cantilever arms which meet in the centre, where they are locked by massive bolts, being hinged upon shafts inside and near the edge of each pier, and extending beyond the shafts inside the piers, where they are heavily weighted to counterbalance the weights of the projecting portions. Their inner ends are fitted with toothed quadrants engaged by gearing and operated by hydraulic machinery. To raise the bridge the centre locking bolts are drawn, the quadrants depressed, and the two leaves rise simultaneously to a vertical position against the towers, allowing 140 ft. between high-water level and the foot bridges. The average time taken by the raising and lowering of the central span is 5 min. When closed, it is 29 ft. 6 ins. above high-water mark.

Signals are provided by semaphores by day and signal lamps by night, to show navigators whether

the bridge is open or shut. The weight of steel and iron in the bridge is nearly 12,000 tons. See

Welch, 1894.

Tower Hamlets. Name given to certain liberties in the vicinity of the Tower of London. They consist of districts in the boroughs of Poplar, Shoreditch, Stepney, and Bethnal Green, and the name is remembered chiefly because, before the Act of 1918, they returned 7 members to parliament, the Hamlets being divided for this purpose into the constituencies of Bow and Bromley, Limehouse, Mile End, Poplar, St. George's in the East, Stepney, and Whitechapel. The name is borne by the Tower Hamlets cemetery.

Tower Hill. High ground N.W. of the Tower of London. Here, on the site covered by Trinity Square Gardens, political prisoners were at one time executed. The wooden

scaffold was removed in the middle of the 18th century. Notable executions were those of More, Surrey the poet, Protector Somerset, Sir T. Wyatt, Stafford, Laud, Monmouth, Derwentwater, Kilmarnock, Balmerino, and on April 9, 1747, Simon Lord Lovat, the last to be beheaded in England. Lady Raleigh lodged on Tower Hill while her husband was a prisoner. Here William Penn was born and Otway died here. The adjacent quadrangle is used for open-air meetings and popular demonstrations. Tower Hill is also the name of an Underground rly. station, formerly called Mark Lane.

Tower of London. Ancient fortress, palace, and prison on the left bank of the Thames, one-third of a mile below London Bridge. It covers 13 acres. Apart from a section of Roman wall, its oldest structure is the White Tower or keep, built by Gundulf, William the Conqueror's bishop-architect, in 1078-80. This is 90 ft. high, 107 ft. N. to S. by 118 ft. E. to W., has three storeys, with exterior walls 15 ft. thick, and is divided by a 7 ft. wall running N. and S., while another wall running E. and W. sub-divides the E. division. On the first floor is Queen Elizabeth's armoury, originally the sub-crypt of S. John's chapel, one of the finest Norman chapels in England, 55½ ft. long, 31 ft. wide, and 32 ft. high. Underneath the S. staircase some children's bones found in Charles II's time were identified as remains of Edward V and his brother; they were removed to Westminster Abbey in 1678.

Other towers are Middle Tower, beneath which the visitor passes on entering the precincts; Bell Tower, so called from the alarm bell which formerly hung in the turret; S. Thomas's Tower, over Traitors' Gate, the old waterway entrance for prisoners; Garden or Bloody

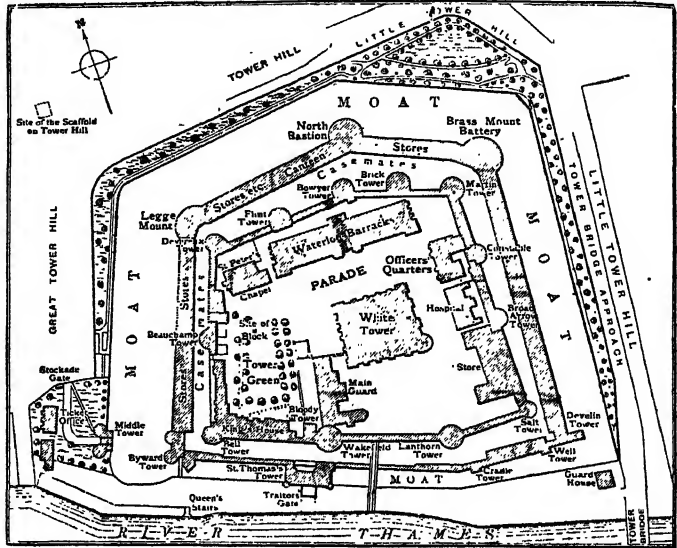

Tower Hill, London. Site of the scaffold, now Trinity Square Gardens, where many political prisoners of the 16th and 17th centuries were beheaded

Tower; Wakefield Tower, where the crown jewels are kept; and Beauchamp Tower. The palace, which stood between White Tower and the river, was pulled down by Cromwell. The refreshment room is on the site of the Lion Tower, where the royal menagerie was kept from the 13th century until 1834. N. of Tower Green, once a churchyard, also the site of a scaffold, is the church of S. Peter ad Vincula.

The Tower is surrounded by a moat, drained in 1843, between which and Tower Hill are gardens, and has Tower Wharf on the river front. Waterloo Barracks, to the N. of the White Tower, serve for the garrison. The corps of Yeomen Warders of the Tower wear the same picturesque Tudor uniforms as the Beefeaters (*q.v.*). In addition to the major, or resident governor, are the constable and lieutenant. The building has been repeatedly added to or altered, notably in the time of Henry II and Edward I. In the Second Great War the precincts received 15 H.E. and three flying bombs, which killed 23 people. Three out of every four American soldiers in England visited the Tower. See *Armoury illus.*; consult *Histories of the Tower*, W. H. Dixon, 1869; Lord Ronald Gower, 1901; R. Davey, 1910; W. G. Bell, 1921.

Town (A.S. *town*, hedge, enclosure). Originally the name given to the primitive settlement of the community surrounded by a hedge. As population grew and commerce developed, a town became distinguished from a village. In England the distinction was popular rather than precise and legal, except in the boroughs and cities. It was based merely on size and importance, on the development of industries, and on the growth of markets. The circumstances which caused some villages to outstrip

Tower of London. Plan of the ancient buildings and barracks

their neighbours and to become social and economic centres were various. Crossroads, fords, bridges across rivers, seaports, and harbours attracted settlers and favoured intercourse. Monasteries

gathered communities round them; feudal castles required an urban population for their maintenance and equipment; royal palaces became centres of population. See *Borough*; *City*; *Municipality*.

TOWN AND COUNTRY PLANNING

John Mumford, formerly Director of the Town and Country Planning Association

Some account of early town planning and its later development into town and country planning, with particular reference to the U.K. and some notes on reconstruction, after the Second Great War, on the Continent. See also Barlow Report; Coventry; London; Netherlands; Scott Report; Ulthwaite Report

Probably one of the strongest early factors leading to the planning of urban communities was the need to adopt the best patterning of houses, streets, and boundary fortifications for defence. Joined to this elementary need for safety was the need people felt for the added warmth and variety of living in communities. Banded together they felt themselves more

secure from the perils of man, nature, and the supernatural. The very word civilization means town-life, and town-life has formed the main source of the growth both of the arts and of industrial life.

The builders of the ancient cities of Egypt, Mesopotamia, and the Indus valley left a lasting im-

pression on town-form, but it fell to the Greeks and Romans to establish patterns which are plainly recognizable today. The Greek philosophers, notably Plato and Aristotle, had significant remarks to make on the form of the town, necessary limitations to its size, and its relation to a surrounding agricultural region. Both the grid-iron and radial patterns stem from Greek and Roman times.

It is often claimed that William the Conqueror built the first post-Roman planned town in England at Winchester, but the heyday of English town-planning came in medieval times. Unlike its more turbulent Continental neighbours, England, protected by its surrounding seas, could early afford to allow its towns to develop on a more spacious pattern dictated by methods of gov't. and economic organization, rather than by the necessity of building houses close together inside "impregnable" city walls. On the Continent the conditions of an uncertain life early forced kings and rulers to impose

Tower of London from the air. The buildings constituting the Tower can be identified from the plan at top of page. The narrow belt of trees beyond the drained moat is a public garden

legal directives concerning the building of towns. In Sweden, for example, there was a general town-law as early as 1350.

More's Utopia (1515-16) contained an early hint of the 20th cent. garden city idea. The 54 cities of Utopia were 20 m. or so apart, with a predetermined relation between town and country, the farmers coming into the city at monthly intervals and the townsmen being skilled in husbandry. A vigorous opponent of suburban sprawl, specifying that if a city grows beyond capacity the Utopians "fill up the lack in other cities," More also anticipated Howard, Lewis Mumford, and other social theorists of the 20th cent. by making his Utopians insist that city children should have access to the country.

The 16th and 17th cents. in England saw successive enactments from Elizabeth onwards aimed at prohibiting the suburban expansion of London by throwing a green girdle round London. The

Town and Country Planning. Architectural models of the proposed town at Harlow, Essex, as it will appear from the air. Planned by Frederick Gibberd, F.R.I.B.A., under the New Towns Act, 1946, it will replace the existing town. Top, the proposed town centre, from the north. In the foreground is the radial road from London to Cambridge, and beyond, left, the main sports area. The civic centre, on top of the hill, is connected to the market and business buildings by shopping streets. Lower picture, the proposed civic centre

present strangled state of London is an ironic commentary on mankind's cupidity in the intervening centuries.

Between the 17th and 19th cents., planned towns both small and great arose in Europe. For example, Karlskrona in Sweden was born of the necessity for a Swedish naval port in the S. Baltic during the war of 1675-79, when Sweden had to fight for her life against eight hostile powers. In its plan this town has been called "more Roman than Rome itself." At the other end of the scale comes Paris, rebuilt under Napoleon III's orders to the magnificent radial plan of Haussmann from a vast insanitary huddle of narrow, twisted streets and tumbledown houses. In

England the 18th and early 19th cents. witnessed the architectural and planning glories of Bath, Cheltenham, and Brighton, while in the U.S.A., Maj. Pierre Charles l'Enfant left in Washington, planned in 1791, a fine example of adequate planning of streets and open spaces.

Suddenly the picture changed—most notably in England. With the rise of the great English industries the need came to house the thousands of workers attracted, by the wages offered, to the factories. Mile after mile of mean streets of houses almost totally without light, air, water, or sanitation clustered as closely as possible round the noisy, smoking mills. Year after year the balance of urban and rural life grew more distorted, while the

rapid rise in the birth rate increased still more the congestion in each dwelling.

But the light of planning was not entirely extinguished even in the 19th cent. James Silk Buckingham and Robert Owen furthered plans to bring back sanity to English town-life; but Ebenezer Howard's *Tomorrow: A Path to Peaceful Reform*, 1898 (called in subsequent eds. *Garden Cities of Tomorrow*), produced the first effective attempt to halt chaotic expansion of English cities and towns. Starting from the necessity of dispersing people from the overcrowded cities, Howard conceived of a balanced community working, playing, and living to the full in an urban framework of light and air and culture where a permanent green belt banished unplanned overgrowth for ever. With the cooperation of Raymond Unwin, F. J. Osborn, and others Howard saw his ideas take physical shape in Letchworth, and Welwyn Garden City. His influence was also seen in the creation of Hampstead Garden Suburb and Wythenshawe, and in the common acceptance of twelve houses to the acre as the suitable maximum density in suburban development.

In 1909 Great Britain passed her first Planning Act and took a first fumbling step towards planning administration. While voluntary bodies such as the town and country planning association were gathering together all the amateur enthusiasts for planning, professional planners, architects, engineers, and surveyors banded together in the town planning institute, the world's first professional planning body.

Despite new Planning Acts in 1925 and 1932, however, the face of the U.K. continued to change for the worse. Between 1919 and 1939 four and a half million houses were built, and London spread ever outwards until it seemed that only the sea could halt its growth. By the time the Restriction of Ribbon Development Act, 1935, was passed there was already speculative housing built along the new motor roads.

When the Second Great War started, building stopped, and bombing cleared, or partially cleared, many highly congested areas. In order to take advantage of this situation when the war should be over, three committees were set up; they published the results of their consideration in the Scott report on land utilisation in rural areas; the Uthwatt report on compensation and betterment; and the Barlow report on the distribution of the industrial pop.

The Town and Country Planning Act, 1944, gave power to local authorities to purchase compulsorily "blitzed" areas and associated areas of bad and out of date development. Schemes were formulated for the replanning and rebuilding of London, Plymouth, Exeter, Coventry, Manchester, and many other cities and towns. By 1948, Coventry and Plymouth had begun their proposed reconstruction. The Town and Country Planning Act of 1947, which came into operation on July 1, 1948, transferred primary responsibility for planning from 1,440 local authorities to 145 C.C.'s and co. bors., which were in turn made responsible through 11 regional offices of the ministry of Town and Country Planning (*v.i.*) to the minister himself. Every executive authority was bound by law to produce a development plan of its area within three years of the coming into force of the Act, the plan being subject to necessary revision every five years. The Act also transferred the "development value" of land to the state: *i.e.* land had to change hands at its

value for its existing use, and not at a price representing any value which might have been deemed to have accrued to it through expectation of another use. As a corollary, anybody wishing to develop his land for a new use had to pay a development charge to the state representing the difference between its value after its use had changed and its existing use value. For practical purposes the existing use value of land was taken roughly as its value as farming land of the appropriate quality. As practical illustrations, if agricultural land was used for building houses, or if a house was transformed into a shop, a development charge arose. Before the passing of the 1947 Act, a local authority had frequently been unable to say "no" to an undesirable use of a particular piece of land because it could not afford to pay the inflated price it would have carried when the authority's wish to purchase it became known. The Act prevented such inflation. But the Act recognized that hardship might result from these provisions if land had already acquired a potential high value and a sum of £300,000,000 was set aside to meet cases of hardship. The central land board was set up to levy development charges, and to assess claims made on the £300,000,000 fund. Assessment was to be completed in five years, and payment made in 1953.

New Towns in the U.K.

The New Towns Act of 1946 was designed to establish a legal framework for the setting up of new towns, each of c. 60,000 pop., to accommodate the surplus populations of the overcrowded centres of London, Manchester, etc., in new self-contained communities. By the autumn of 1948 several sites had been decided on, *e.g.* in Herts Stevenage, Hemel Hempstead, Welwyn Garden City with Hatfield; in Essex Harlow; in Sussex Crawley. Two new towns had been designated in Scotland, and a new town for miners was under construction at Peterlee (*q.v.*). The New Towns Act laid it down that the towns were to be developed by public corporations.

Town and country planning in the U.K. also embraces the setting up of national parks, the best siting of training areas for the services, the creation of a national policy for the location of industry, and special questions such as the development of extractive industries in areas of special amenity. In any dispute between the citi-

zen and a planning authority, the minister must hold a public inquiry if called upon to do so, and must give a decision based upon the full evidence and upon the report of his inspector. More than a third of such appeals made up to 1948 were allowed. The range of these inquiries is very wide, covering replanning of a city, the establishment of a new town, and appeals affecting one individual.

European Reconstruction

On the continent of Europe, available information showed that the greatest efforts towards planned reconstruction were being made in the eastern half, where the devastation caused by the Second Great War had been heaviest. In Poland, for instance, the ministry of reconstruction had to recreate 14,000 industrial plants completely destroyed out of a pre-war total of 23,000. Warsaw (*q.v.*), 99 p.c. devastated, produced a plan which owed much to the plan for Manchester. All the land in the city was transferred to municipal ownership, and three chains of residential districts were designed around a new university and business centre. By 1948 large white blocks of flats were in course of construction. In Czecho-Slovakia, work on a new town called Litvínov, designed to house 70,000 miners and their families, was started, the population to be drawn from scattered derelict mining villages. In Greece, seven experimental settlements were built in the most severely damaged towns.

"Panoramic planning" — the satisfactory grouping of buildings over several square miles — was a feature in Russia of the replanning of cities like Moscow. In general, Russian ideas on neighbourhoods, densities, and amenities, seemed to be moving towards those of the U.K., with increased appreciation of the small family house instead of blocks of flats. While grandiose planning schemes were projected, people, especially in the Ukraine, where all housing for areas covering many square miles had been swept away in the fighting, were urged and helped to build new houses for themselves. Three separate plans were made for a new Berlin, one, the Zehlendorfer plan, having been started two days after the surrender. Little, however, had been done to put them into effect up to 1948.

In the Netherlands, the rebuilding of Rotterdam took first place in city reconstruction. A plan prepared by the Dutch during the

occupation was formally approved in 1946. Even more urgent was the reconstruction of Walcheren (*q.v.*) and repair of damage due to flooding of new towns and farmhouses in N. Holland. The reclamation of the former Zuyder Zee, slowed down but never stopped during the Second Great War, continued.

In France Auguste Perret published an intricately geometrical and traditional plan for the rebuilding of Le Havre, and rebuilding of other wrecked towns was gradually undertaken; in Marseilles an enormous block of flats designed by Le Corbusier to house 15,000 people allowed for a density of 2,000 people per acre.

A problem confronting town and country planners of all lands is the choice and training of the planners of the future, for the day of the pioneer-planner, trained as architect, engineer, or surveyor, is passing, and planning must become a profession in its own right. A govt. committee was appointed in the U.K. in 1943 to consider the problem. The univs. of Durham, London, Edinburgh, Liverpool, and others established major courses in planning.

As scientist, the town planner must continually review standards of density, layout, and grouping. He must be able to assess the work of the economist, the geologist, and the building technician. In cities he must find new answers to such varied questions as how best to get the maximum of sun and air into lofty city blocks, how most economically to satisfy man's demand for warmth, and how to create the right pattern for contemporary communal living. In the country he must seek to create a pattern of interdependence of town, village, and open countryside, and to satisfy the recreational needs of the city dweller and of the villager without disrupting that pattern.

As artist the planner must be able to create whole new towns which are aesthetically satisfying. He must blend nature and art so as perpetually to refresh the soul of man as he goes about the task of earning a livelihood.

Town and Country Planning, MINISTRY OF. British govt. dept. It derived from the Minister of Town and Country Planning Act, Feb. 5, 1943, under which a minister was appointed with the duty of "securing consistency and continuity in the framing and execution of a national policy with regard to the use and development of land." To him were transferred all functions previously vested in the minister of Works and Planning (whose title was altered to minister of Works) and, as appropriate, those of any other ministers, relating to the use and development of land. The act also established a commission to exercise these functions under a new ministry. W. S. Morrison (*q.v.*) was the first minister of Town and Country Planning, 1943-45.

Town Clerk. Chief officer of a borough or county borough. He is both secretary and legal adviser of the council, and has therefore to inform it when necessary of the duties imposed on the members, and to draw their attention to any act proposed which either conflicts with those duties or exceeds the council's powers. He communicates officially on behalf of the council with central and with other local authorities, and these communicate through him with the council. A town clerk must be a barrister or a solicitor.

Town Council. Popular name for the administrative body which manages the affairs of a city or town. There are city councils, borough councils, urban district councils, and, in Scotland, burgh councils. See Borough; England (Local Government); Franchise; Local Government; Scotland (Administration).

Towneley, CHARLES (1737-1805). British collector. Born at Towneley Hall, near Burnley, Oct. 1,

Charles Towneley,
British collector
From a bust by
Nollekens

1737, he studied ancient art in Rome and Florence and, with the assistance of Gavin Hamilton and others, amassed a fine collection of marbles and terracottas, drawings, MSS., bronzes, gems

and coins. After his death in London, Jan. 3, 1805, the marbles, terracottas, and bronzes were bought by the British Museum.

Towneley Plays or MYSTERIES. Collection of early dramatic pieces. Probably made about the close of the 14th century, they were preserved in the library of Towneley Hall, Lancs. There are 32 pieces presenting the Bible story, from the Creation to Doomsday, in a familiar and sometimes broadly humorous fashion. At Sotheby's on Feb. 8, 1922, the MS. went to Dr. Rosenbach of Philadelphia for £3,500. The Towneley Mysteries were printed for the Surtees Society, 1836. Consult History of English Dramatic Literature, A. W. Ward, 1899.

Town Hall. Building where the administrative business of a city or town is carried on. The term city hall is less frequently used. Almost every town has its town hall, although some are known as municipal buildings, while in others, *e.g.* the city of London, the older term guildhall is retained. There are rooms for the meetings of the town council, and for the various departments of its work. Many town halls include a large assembly hall that is let out for public meetings, etc.

The French and Belgian equivalent of the town hall is the *hôtel de ville*. Those in Paris and Lyons are modern, but there are fine old ones at Rouen, Compiègne, and elsewhere. Those of Belgium, especially Bruges, Brussels, and Antwerp, are notable. In Germany and Austria the Rathaus is the town hall.

Townshend, MARQUESS. English title borne by the Townshend family since 1787. The founder of the family was Sir Roger Townshend, created baronet in 1617. His younger son, Sir Horatio, was made a baron in 1661, being raised to viscount in 1682. His heir is noticed below. The 4th viscount, George, a distinguished soldier, in 1787 was created Marquess Townshend. The title passed to his grandson George, who on dying in 1855 was succeeded by his cousin John. Charles (b. May 13, 1916) became 7th viscount in 1921.

Townshend, CHARLES TOWNSHEND, 2ND VISCOUNT (1674-1738). British politician. The eldest son of Horatio, Viscount Townshend, he came into the title in 1687. Educated at Eton and King's College, Cambridge, with Robert Walpole as companion, and brought up in Tory principles, he soon became prominent in the house of lords

as a Whig. After some diplomatic experience in the Netherlands, he was chosen in 1714 a secretary of state, and became one of the leading ministers of George I. In Dec., 1716, he left office, but returned in 1720 as president of the council. He was a secretary of state 1721-30, his brother-in-law, Walpole, being his chief colleague. This peer, who died at Raynham, June 21, 1738, was known as Turnip Townshend, from his interest in agriculture. His grandson, Charles Townshend (1725-67), was the chancellor of the exchequer who in 1766 imposed taxes on the American colonists.

2nd Viscount
Townshend,
British politician

Townshend, Sir Charles Vere Ferrers (1861-1924). A British soldier. Born Feb. 21, 1861, grandson of Lord George Townshend, he entered the Royal Marines, and saw service in the Suakin operations and in the Nile expedition. In 1896 he transferred to the Indian Staff Corps, and in 1891 accompanied the expedition against the Hunza and Nagar tribes. He first came into prominence by his gallant defence of Chitral (q.v.), for which he was awarded the C.B. He was at Atbara and Khartum, 1898, and in the S. African War.

Sir Charles
Townshend,
British soldier

In 1900 he was transferred to the British army (Royal Fusiliers). He became major-general, commander of a territorial division, and in 1913 returned to India. Early in 1915 he was sent to Mesopotamia at the head of a division, and after gaining several victories, had to retreat to Kut, which he defended for five months. Taken prisoner after its fall, Townshend was interned in Prinkipo Island.

Townshend was knighted, 1916, and resigned from the army, 1920. That year he was returned to parliament as independent member for Wrekin, joining the Conservatives in 1922. He died May 18, 1924. See Ctesiphon; Kut; Mesopotamia Campaign; consult his Campaign in Mesopotamia, 1920.

Township or Vill. Territorial division of Anglo-Saxon and medie-

val England. In pre-Conquest times the township (A.S. *tūnscepe*) was the area occupied by the inhabitants of an enclosed homestead or village. Later it was applied to the community of inhabitants of a manor or parish within a hundred (q.v.). In the U.S.A. a township is a sub-division of the county, with varying powers of local govt.

Townsville. Seaport and city of N. Queensland. It stands on Cleveland Bay, 832 m. by rly. N.W. by N. of Brisbane. Its harbour serves as outlet for the sugar-growing area of the N. and the pastoral districts of the N.W. There are meat factories and rly. workshops. Townsville was raided by Japanese aircraft in Feb. and Sept., 1942. Pop. 34,233.

Towton, BATTLE OF. Conflict in the Wars of the Roses. It was fought in a snowstorm on Palm Sunday, March 29, 1461, between Yorkists, nominally under young Edward IV. and Lancastrians. Towton is a parish near the Great North Road, midway between York and Leeds. The Lancastrians, nearly 60,000, had behind them the river Cock, but the weather blew in their faces, allowing the less numerous Yorkists to do deadly execution with arrows. About half the former army either perished in the battle or were drowned trying to escape across the stream, and some 8,000 dead Yorkists were afterwards counted. This was one of the bloodiest battles ever fought in England.

Towy. River of Wales. It rises among the hills that divide Cardiganshire from Radnorshire, and flows mainly S.W. until it falls into Carmarthen Bay at Llanstephen. Its length is 66 m., and Carmarthen is the chief town on its banks.

Towyn. Urban dist. and watering-place of Merionethshire, Wales. It stands on Cardigan Bay, 12 m. N. of Aberystwyth, and has a rly. station. The old inland village has been developed into a seaside resort with a broad esplanade, and there are facilities for boating and golf. The church has a nave dating from the 11th century. Pop. 3,802.

Toxicology (Gr. *toxikon*, poison). Science pertaining to poisons (q.v.) and poisoning.

Toxoid or ANATOXIN. Toxin or poison produced by germs, rendered harmless but still capable of immunising men and animals. Diphtheria toxoid is a solution of the products of growth of the diphtheria bacillus (*Corynebacterium diphtheria*) so modified as to be non-poisonous but able to induce immunity against the disease.

Toxophilite (Gr. *toxos*, bow; *philos*, loving). Lover of archery. The Royal Toxophilite Society was founded in 1781, and long had grounds situated in Regent's Park, London. Its headquarters are now at 1, Albion Mews, London, W.2.

Toy (Du. *tuig*, tool; *speltuig*, toy). Plaything for children. Toys are older than civilized man, for archaeologists have unearthed prehistoric toys, of which the doll is symbolic as a personal possession suggesting for the child the adult life of its surroundings. The little girl, wishing to be like her mother, wants a doll and doll's house. Imitating his father, the small boy would be hunter, soldier, or craftsman; miniature weapons like sword and gun, drum and trumpet, tools, materials, and machines have been his playthings.

The importance of the toy in the development of the child mind has been recognized by educationists from Plato and Aristotle to Froebel and Montessori. The picture-alphabet, the box of coloured bricks, and other furniture of the contemporary kindergarten classroom, instil an appreciation of beauty and develop the constructive sense. The toy industry consults the child psychologist and the teacher as well as the artist.

The high-precision instruments used in mass-production of toys are surprisingly costly. Press-tools and jigs required to produce the prototype of a single design of toy motor car cost £16,000 in 1945. The tool needed for a tiny doll's-house chair in plastic cost £600. On the other hand, the simplicity of the home-made toy, created at small material cost, may leave nothing unsupplied to the child's pleasure. The Nursery School Association, London, has evolved instructional models for nursery school teachers from the most elementary materials: railway locomotives from cotton reels and empty tins, dolls from rags or scraps of brushwood, brightly coloured necklets from cherry and plum stones, trees from fir cones, even scooters and cradles from oddments of plywood.

Toys are indeed still made by hand in all parts of the world, often by children themselves in the classroom. But the toy-making industry is well organized and progressive, especially in the U.K. and the U.S.A. British toy exports in 1947 reached a value of £2,961,246. There are more than 400 important toy factories in the U.K., mostly in and around London, in the home counties, the Birmingham, North-

ampton, Liverpool, and Manchester districts, S. Wales, and N. Ireland. A British toymakers' association was founded in 1944. The number of insured persons registered as skilled workers in the trade in 1948 was 23,400—10,000 men and 13,400 women. Canada has also a flourishing industry, and good beginnings have been made in Australia and S. Africa. Some foreign countries tend to specialise in accordance with their natural resources. Sweden and Czechoslovakia, having ample timber, manufacture chiefly wooden toys. From France and Italy, centres of the silk and rayon industries, come beautifully dressed dolls. The U.K. excels in the creation of mechanical toys, especially models of limousines, trucks, locomotives, and ships, in all sizes, having displaced Germany whose mechanical toys (mainly from Nuremberg) before 1914 were sold throughout the world. See Doll. Leopold Spero

Toynbee, ARNOLD (1852-83). British social reformer. Born in London, Aug. 23, 1852, son of a distinguished surgeon, he was educated at Pembroke and Balliol Colleges, Oxford. Closely studying economics and sociology as well as religion and philosophy, he became a vital influence in the social movement of his time. He lectured to working class audiences in different parts of the country and associated himself with the Rev. Samuel Barnett (*q.v.*), then vicar of S. Jude's, Whitechapel, in work among the poor in the East End of London. A pioneer of personal service, he aimed at uniting all classes in one society. He died at Wimbledon, March 9, 1883. *Consult* his *Industrial Revolution in England*, with *Memoir* by B. Jowett, 7th ed. 1906; *Life*, F. C. Montague, 1889.

Toynbee, ARNOLD JOSEPH (b. 1889). British historian. A nephew of Arnold Toynbee (*v.s.*), he was born April 14, 1889, and educated at Winchester and Balliol College, Oxford, being fellow and tutor of his college during 1912-15. Later he held various govt. appointments, and was professor of Byzantine and modern Greek language, literature, and history at London university, 1919-24. In 1925 he became director of studies in the

royal institute of international affairs, and research professor of international history in London university. Toynbee wrote much on Greek and Turkish matters, but his reputation must rest on the massive *Study of History*, Vols. I-III, 1934, Vols. IV-VI, 1939; he published an abridged version of the work in 1946. His first wife was Rosalind, daughter of Gilbert Murray.

Toynbee Hall. University settlement in London. Inspired by the work of and named after the elder Arnold Toynbee (*q.v.*), it was opened in Commercial Street, Whitechapel, with the Rev. S. A. Barnett as wardens, in 1884, the first institution of its kind in the world. It came into existence at a moment when public interest had been deeply

stirred by the writings on the London poor of Besant, G. R. Sims, Andrew Mearns, and others. Here university men, who went into residence in order to take part in social work, soon created a centre of popular education and recreation. Toynbee Hall was closely connected with the investigations of Charles Booth and Lord Beveridge (*q.v.*). Offshoots of Toynbee Hall are the Whitechapel art gallery, the John Benn hostel, the children's country holiday fund, the workers' educational association, the workers' travel association, and the children's theatre.

During the German air raids on London in the Second Great War Toynbee Hall organized concerts in the shelters and at the weekenders was thrown open to shelterers who wished to write or read or to enjoy good music.

Toy. Old and modern playthings of Europe and Asia. 1. Rag doll stuffed with papyrus, 3½ ins., Egypto-Roman, 3rd cent. B.C. 2. Mounted cavalier, 18 ins., German, early 17th cent. 3. Korean shadow-play figure. 4. Modern Indian toy on wheels. 5. Modern Chinese mechanical figure. 6. Bone guillotine, French, late 18th cent.

Although damaged, it accommodated some 1,500 evening students and had schools of drama, music, and painting. Its interests included reconstruction in E. London and the welfare of old age pensioners. See *Settlement*, *Social*.

Trabzon. Vilayet of Asiatic Turkey. It extends along the S. shore of the Black Sea from Vice in the E. to the Kizil Irmak in the W. It is mostly mountainous and heavily forested, but there are many fertile valleys and plateaux which produce good crops of wheat and barley. Timber is valuable; the mineral wealth is little developed. Formerly familiar as Trebizond, the vilayet has an area of 16,671 sq. m. and a pop. of 396,673.

Trabzon (anc. Trapezus). City of Turkey, capital of the vilayet of the same name. Situated on the Black Sea, 570 m. E. of Istanbul,

A. J. Toynbee, British historian

it is on a small plateau between two valleys. Its Byzantine walls still stand. Formerly a great commercial centre, its importance declined when a rly. was built from Batum to Baku, though Trabzon continued to export fruit, nuts, tobacco, hides, and skins. It was a Greek colony founded by Sinōpē; here Xenophon and the Ten Thousand reached the sea after their historic retreat. In A.D. 1204 it became the capital of the empire of Trebizond, under which name it was long known. The Turks took it in 1461. It was in Russian hands from 1916 to 1918. Its population was much reduced in 1895 by a massacre of Armenians. Pop. est. 50,000.

Trace Element. Any chemical element of which minute quantities are required for the healthy growth of plants and animals. If sheep are fed on pasture grown on soil which (as in parts of Australia) entirely lacks cobalt, they suffer from a deficiency disease known as pining (enzootic marasmus); the addition of as little as 0.08 to 0.1 parts in a million of cobalt to their fodder eliminates the symptoms. Similarly, manganese is a trace element for cereals and peas, boron for sugar beet, iodine and iron for humans.

Tracer. Type of projectile containing a squib-like device that discharges smoke and sparks through its base to render visible its course of flight. Tracer shells are seldom larger than 40-mm. calibre, and their principal use is in anti-aircraft firing. Tracer bullets are used in air-to-air and ground-to-air firing at night, one being inserted in every fifth link of the ammunition belt. See *Bullet*.

Tracer Element. Any comparatively rare isotope used to follow the passage of an element or its compound through some biological (or other) process. Thus if radio-active carbon-14 is incorporated in organic molecules fed or injected into an animal its progressive distribution can be followed with geiger counters and photographic emulsions. Similarly nitrogen-13 can be used to trace the metabolism of proteins, sodium-24 of salt, etc. Where the tracer element is not radio-active (e.g. deuterium or oxygen-18) its detection requires more complicated methods of physical analysis. Tracer elements have also shown the spontaneous migration of individual nuclei through a metallic crystal lattice.

Tracery (Fr. *tracer*, to trace). In architecture, the ornamental

stonework of a Gothic window which followed the grouping of lancet windows in twos and threes under a single arch. The term is also applied to the corresponding decoration of a wood panel. The earliest form of tracery was known as plate tracery. In the 12th century this was a circle or quatrefoil introduced into the tympanum below the covering arch. Geometrical tracery possessed symmetrical forms such as trefoils, cinquefoils, quatrefoils, and circles. Flowing tracery followed, and late in the 14th century began to give way to the more vertical and stronger bars of the Perpendicular period, and with the Renaissance tracery disappeared. See *Architecture*; *Gothic Architecture*; *Perpendicular*.

Trachea or WINDPIPE. Nearly cylindrical tube which extends from the lower

Trachea. A. Arytenoid cartilage. B. Bronchi. C. Cricoid cartilage. E. Epiglottis. H. Hyoid bone. T. Thyroid cartilage. TR. Membranous part of trachea

veins which carry the blood.

Tracheotomy. Operation of opening the trachea in the neck to allow passage of air to the lungs when breathing is difficult or arrested by some obstruction in the air passages above the trachea. The operation is most frequently required in oedema of the larynx, with tumours, or when foreign bodies obstruct the air passages, but the development of anti-toxins has rendered it hardly ever necessary in diphtheria.

After the windpipe has been opened in the neck a metal tube is passed through to allow respiration.

Trachodon. Restoration of the extinct reptile which lived in N. America in the Cretaceous period. By courtesy of the American Museum of Natural History

Trachodon (Gr. *trachys*, rough; *odus*, tooth). Extinct fossil dinosaur found in the Upper Cretaceous deposits. It resembled an iguanodon (*q.v.*) in appearance, with a broad spatulate snout. Remains have been found in Wyoming and Montana.

Trachoma. Contagious disease of the conjunctiva or membrane covering the front of the eye and inner surface of the eyelids. See *Conjunctivitis*.

Trachonitis. Mountainous N. dist. of ancient Palestine. It extended from the Sea of Galilee N.E. towards Damascus, and from the time of the emperor Trajan formed part of the Roman prov. of Arabia.

Trachyte. In geology, a type of lava with a chemical composition similar to syenite. It is mainly orthoclase and albite feldspar with small amounts of mica, amphibole, or pyroxene. Parallelism of the minerals due to flow and absence of quartz are characteristic. Potash and/or soda content of trachytes is usually high compared with other lavas having a similar percentage of silica. See *Igneous Rocks*.

Tract. Brief written treatise, generally of a hortatory or propagandist nature. The word is an abbreviation of the older form, *tractate*, from Latin *tractatus*, a treatise. It has come to be used more especially of short papers on religious themes published in the form of leaflets or pamphlets; but was formerly used of more important publications, e.g. Milton's *Tractate on Education*. Wycliffe wrote many vigorous tracts in support of his movement, and at the Reformation tracts were a favourite weapon of controversy

on both sides. The Puritans, from the Marprelate controversy (*q.v.*), were great tract-writers, and there is a large tract literature, religious and political, of the Civil War period. The Bangorian controversy (*q.v.*) produced many tracts. See Oxford Movement; Pamphlet.

Tractarianism. Alternative name for the Oxford Movement (*q.v.*). Its method of propaganda by means of a series of Tracts for the Times, 1833-41, gave its leaders and followers the name of Tractarians.

Traction Engine. Steam locomotive for hauling trailers along roads. This is the oldest type of mechanically propelled vehicle; the first was built in 1769 by Jules Cugnot, a French army officer, for towing guns.

Traction Engine. Steam-driven road locomotive, oldest road vehicle, and primarily used for hauling machinery and other heavy equipment
By courtesy of Ransomes, Ltd.

The engine had a speed of $2\frac{1}{2}$ m.p.h., but was too unreliable for practical use, and eventually the boiler exploded, killing the inventor. In Great Britain, Murdock in 1782, Watt in 1784, and Symington in 1786 built steam traction engines, but the first actually to run was Trevithick's in 1803. This attained a speed of 9 m.p.h., but bad roads led to its being abandoned. In 1870 came the Aveling all-gear-driven traction engine, from which all later types developed.

The steam traction engine has a locomotive-type boiler with the engine mounted horizontally, and its cylinders at the smoke-box end, and the side plates of the firebox shell extended upwards to carry the crank and gear shafts. Compounding, introduced by Foden in 1887, became standard. In all essentials the traction engine is similar to the locomotive, except that it runs on roads and its front wheels are steerable. Traction engines have been built weighing 20 tons and able to haul 70 tons. Too slow ordinarily for the road, they have been

replaced to a large extent by the faster and more manoeuvrable tractor (*v.i.*). Their principal remaining uses are for hauling showmen's equipment and towing harvesting machinery. Agricultural traction engines have a driving mechanism for operating threshing machines.

Tractor. Mobile power unit used on roads for hauling trailers or on farms for drawing agricultural machinery. It is powered by an ignition internal combustion engine, a compression internal combustion engine (Diesel), or an electric motor. Tractors, as distinct from traction engines (*v.s.*), which are steam-driven, were introduced early in the 20th century; some have three or four wheels, others caterpillar tracks.

The wheeled tractor has a very short wheel base, while the rear wheels, to which the drive is transmitted, are large and originally had steel "spuds" on the outer circumference. When travelling on metalled roads, the rear wheels were covered with steel hoops to prevent damage

to the roads. Nowadays the tendency is to fit heavy, ribbed pneumatic tires, which do not damage road surfaces and provide a good grip. The front wheels are smaller in diameter and steerable. Four-wheeled tractors do both road and farm work. On the road they can haul loads up to 50 tons, and on farms draw as many as a dozen ploughshares. Most farm tractors are fitted with a belt pulley, by means of which the vehicle can be used as a power plant to drive circular saws, threshing machines, pumps, and other stationary machinery. In Great Britain, the U.S.A., and the U.S.S.R., tractors are rapidly replacing horses for farm work. Smaller models are used on rly. platforms and in factories. Self-propelled excavators, bulldozers, cranes, and other heavy construction plant are tractors with special bodies; while another specialised type is the mechanical horse, used principally by rlys. to mechanise vehicles originally designed for horse traction. See Caterpillar Tractor; Farm illus. p. 3261; Ploughing; Tank.

Tractrix OR TRACTORY. Curve invented by Huygens, in which the distances along the different tan-

Tractrix. $L'N'$, LN , are equal tangents from the curve to $X'OX$

gents from their points of contact to their intersections with a fixed line are all equal. The curve has four branches, and is asymptotic to the fixed line. It is the path described by a heavy particle pulled along by a flexible string moving along a straight line attached to a point which does not pass through the particle. The surface produced by revolving a tractrix about its asymptote has constant negative curvature and is called a pseudosphere.

Tract Societies. Associations for disseminating Christian teaching by the publication of tracts and cheap literature. The Society for Promoting Christian Knowledge, the first of the British tract societies, was followed in 1750 by the Society for Promoting Religious Knowledge, and the Religious Tract Society. See United Society for Christian Literature.

Tracy, SPENCER (b. 1900). American film actor. Born at Milwaukee, April 5, 1900, he was edu-

Spencer Tracy, American film actor

cated at Wisconsin university, and studied for the stage at the A.A.D.A. He first went on the New York stage in 1922 as a robot in R.U.R. In films from 1930, beginning with *Up The River*, he looked like becoming a comedian, but developed into an actor of rugged sincerity with a great following during 1936-39, especially after *Fury*, and San Francisco. As a Portuguese seaman in *Captains Courageous*, and a priest in *Boys Town*, his performances won academy awards. In *Stanley and Livingstone* he played another memorable rôle as Stanley, then turned mostly to social comedies. In 1949 he was in *Edward, My Son*.

Trade (O.E. *trædan*, to tread). Word used chiefly in two senses:

(a) a skilled craft, *e.g.* carpentry, plumbing, tailoring, learned gradually, often through apprenticeship, as a means of livelihood; and (b) the exchange of goods, buying and selling. In this second sense trade is a part of commerce, which includes also insurance, banking, transport, and other services ancillary to trade.

The history of trade and of trading is an important aspect of the history of civilization. Most improvements in communications and much geographical discovery have resulted from the desire to extend trade; and trading alone has made available the variety of commodities essential to any sort of civilization. In this respect, trade between different climatic regions has special interest.

Trade may be divided into (a) home trade (which includes wholesaling and retailing, *i.e.* shop-keeping), and (b) overseas trade (which includes, for the U.K., trade within the Commonwealth as well as trade with foreign countries). The U.K. relies on her overseas trade for much of her raw material and food, selling in exchange manufactured goods.

Volume of trade varies with the prosperity of communities. The recurrent boom and slump which characterised world trade after the industrial revolution is called the trade cycle; some economists believe that govt. planning can prevent this. *See* Balance of Trade; Barter; Exports; Imports; Free Trade; Protection.

Trade, BOARD OF. British govt. dept. responsible for advising on British home and export trade, observing trends in the production of raw materials and home-produced goods, and negotiating trade agreements within the Commonwealth and with foreign govts. The board of trade originated in a committee of the privy council set up in 1631 "to take into consideration the true causes of the decay of trade and scarcity of coyne within the kingdom." In 1650 the committee became a council of trade for the encouragement of industry and the care of "foreign plantations." The committee consisted of 70 members with a president, secretary, and two clerks. In the reign of Charles II, the council was made responsible for the rules relating to navigation and shipping; a function the board of trade continued to perform until a ministry of Shipping was set up in 1916 (absorbed later into the ministry of Transport). In 1696 the council received the title board

of trade. Abolished in 1782, it was revived two years later. In 1786, the archbishop of Canterbury was made a member of the board which, however, ceased to meet as a committee after the Napoleonic wars. The tradition of periodic meetings was kept up, but only the president and vice-president attended them. In 1853 the board's minute book was discontinued, and the vice-president ceased to exist, being replaced by a parl. secretary.

During the Second Great War, the scope and powers of the board of trade were greatly expanded and it exercised direct control over raw materials and manufactured goods. It became responsible for curtailing consumer production, fair distribution of the production allowed, and the diversion of raw materials to munitions. The board of trade issued licences for the purchase or export of controlled manufactures. The board was also responsible for the issue of clothing coupons.

The board of trade is the regulating body for the application of Acts of parliament as they affect industry, and deals with the Insurance and Companies War Damage Act, the Patent Act, and the Bankruptcy Act. It also deals with the policy and administration of British industry in respects not covered by the ministries of Supply, Air, and Civil Aviation. After the Second Great War, the board of trade was concerned with the re-conversion of industry to peacetime production, for home and export markets. *See* Board of Trade Journal.

Trade Bank. Bank founded specially to assist traders by making advances on the security of their stock and business prospects. It can usually lend money with greater freedom than do the ordinary banks, taking risks which are not permissible to the latter. *See* Banking.

Trade Board. Name of committees set up in the U.K. to fix wages in specified industries. Trade boards were established by an Act of 1909, in four trades specified in the Act, tailoring, box-making, lace-finishing, and chain-making, in which sweating (*q.v.*) was prevalent. In 1913 the Act was extended to include confectionery-making, food-preserving, shirt-making, hollow-ware-making (tin boxes, etc.), embroidery manufacture, and certain kinds of laundry work. An Act of 1918 empowered the minister of Labour to constitute a trade board in any industry where the minister "is of opinion that no adequate

machinery exists for the effective regulation of wages throughout the trade, and that accordingly having regard to the rate of wages prevailing in the trade or in part of the trade, it is expedient that the Act should apply to that trade."

The first Act was passed following agitation against sweated trades towards the end of the 19th cent., an inquiry by a select committee of the house of lords in 1890, the formation of the anti-sweating league in 1906, and a report by a select committee of the house of commons on home work. A trade board consisted of an equal number of employers and employed, with a small number of nominated members. Boards worked usually by districts. At first under the board of trade, in 1917 they were transferred to the ministry of Labour, by which the members were appointed. If many women employees were concerned, at least one of the appointed members must be a woman. A trade board (1) must fix a minimum rate or minimum rates for time work; and (2) might fix general minimum piece rates, special minimum piece rates, a guaranteed time rate, a piecework basic time rate. When fixing a rate, a trade board must advertise the rate in the London Gazette and, when appropriate, in the Edinburgh Gazette, and must notify every employer in the trade whose name and address were known. The employer must exhibit a copy of the notice in his works where employees might read it. Two months were allowed for objections. Where trade board minimum rates applied, appropriate records of the rates paid must be kept by the employer. Payment of the proper rates could be enforced by the courts. Agricultural wages boards, similar to the trade boards, were set up by the Agricultural Wages (Regulation) Acts of 1924 and 1940. The Road Haulage Wages Act of 1938 and the Catering Wages Act of 1943 both laid down legal procedure for the regulation of wages and working conditions. *See* Wages Council.

Trade Disputes Acts. British Acts of parliament. The first, passed in 1906, followed the Taff Vale Judgement (*q.v.*). It allowed peaceful picketing, and declared that trade union funds were not liable for damages.

A decision of the high court at the time of the general strike of 1926 held to be illegal "sympathetic" strikes by bodies of workers not directly concerned in a dispute. The Trade Disputes and Trade

Unions Act, 1927, passed to prevent another general strike, declared illegal any strike or lock-out which (1) had any object other than the furtherance of a trade dispute within the trade or industry in which the strikers were engaged, and (2) was designed to coerce the govt., either directly or by inflicting hardship upon the community. This Act was repealed by the Trade Disputes and Trade Unions Act, 1946, which declared that the law should be as if the 1927 Act had never been passed. *See* General Strike.

Trade Mark. Name or distinctive device used in relation to goods for the purpose of indicating a connexion in the course of trade between the goods and the person having the right to use the mark either as proprietor or registered user. A certification trade mark is a mark adapted to distinguish in the course of trade goods certified by any person in respect of origin, material, manufacture, quality, accuracy, or other characteristic.

In the U.K. a register of trade marks is kept at the patent office, London, and is divided into two parts. Part A marks must be either a name represented in some particular manner or a signature; or a word which must be either (a) invented, or (b) have no direct reference to the character or quality of the goods and must not be a geographical name or surname, or (c) be adapted to distinguish the goods; or some other distinctive mark adapted to distinguish the goods of the proprietor. Part B marks are required merely to be capable of distinguishing the goods. Marks registered in Part A are absolutely protected, but registration in Part B is only *prima facie* evidence that the person on the register has the exclusive right to use the mark. When an invented word has become so well known in respect of certain goods that use of it in connexion with other goods would indicate that they are made by the owner of the mark, the word may be registered as a defensive mark in respect of goods even though the owner of the mark has no intention of using the mark on these goods or of making those goods at all.

The law concerning trade marks in the U.K. is contained principally in the Trade Marks Acts of 1905 and 1919 and the Merchandise Marks Act, 1926.

Trade Name. Common term for a proprietary name applied to a particular product of a particular manufacturer which may not be

applied to any similar product made by another manufacturer. Examples are Bakelite, Cellophane, Dictaphone, Perspex, Technicolor. When such names are used elsewhere in this Encyclopedia they are enclosed in inverted commas.

Trades Council. Local permanent committee in the U.K. of delegates from various trade unions represented in a neighbourhood. Formation of these councils started in 1858, and by 1861 they existed in London, Glasgow, Sheffield, Liverpool, and Edinburgh; many of them started as strike committees. Their original object was to render advice or assistance to one another, in inter-union affairs as well as in disputes with employers; they came also to play a substantial part in promoting interest among trade unionists in local and national politics. The Trades Union Congress (*v.i.*) was called into being by trades councils.

Trades Union Congress. The voluntary association of British trade unions for the formulation of policy. National conferences of trade unions were summoned by the Glasgow trades council, 1864, and the Sheffield trades council, 1867; but the first trades union congress is counted as that summoned by the Manchester and Salford trades council in 1868, which represented 118,367 mem-

bers. In 1871 the congress was called in London to consider projected legislation that would have made criminal virtually any usual method of combination by workers; it elected a parl. committee to watch legislation and administration affecting labour, and to work for legislation recommended by the T.U.C., which thereafter met annually except in 1914. In 1923 the parl. committee was replaced by the general council, which was given power to act for the T.U.C. between meetings as well as simply to keep watch.

Membership in 1900 was 1½ m., in 1919 more than 5½ m., in 1930 3½ m., in 1946 more than 6½ m. with 187 affiliated unions. From 1893 the Socialist element became predominant in the congress. From 1894 trades councils were expelled from representation at its meetings, participation in which was thereafter confined to members of trade unions. The Scottish trades union congress, representing unions operating in Scotland only, was founded in 1897. Similar bodies have been created in many other countries. *See* American Federation of Labour; *Confédération Générale de Travail*; *Congress of Industrial Organizations*; *Trade Disputes Acts*; *Trades Council*. *Consult* The British Trades Union Congress, W. J. Davis, 1910-16.

TRADE UNIONS: ORIGIN & FUNCTIONS

Lord Citrine, Gen. Secretary T.U.C., 1926-46

The story of trade unions from their origins in England in the early 19th century is here told. See also Bevin, E.; Burns, John; Combination Laws; Hardie, J. K.; Mineworkers, National Union of; National Unions; Tillet, B.; Trade Disputes Acts; Trades Union Congress

Trade unions are permanent associations of workers formed for the purpose of maintaining and improving wages and salaries, reducing hours of work, and dealing with the general working conditions of members. Associations or combinations of workpeople with some of the characteristics of trade unions existed long before the industrial revolution in the latter part of the 18th century. But the regulation of wages and of the hours and conditions of employment could not legally be the subject of collective bargaining under the medieval system. Numerous Acts of parliament then in operation were avowedly designed to safeguard the interests of workers, and parliament resented any attempt to interfere by combined action. Combinations, whether of employers or workers, were forbidden, to preserve the

theoretical impartiality of the law, but the introduction of new methods of manufacture changed all that. The use of machinery, driven first by water power, then by steam, and involving considerable capital cost, transformed industries and trades hitherto conducted as domestic handicrafts. It ushered in the system of wage labour and factory production, separated the employers and the workers into distinct classes (capital and labour), and completed the breakdown of the existing legal system of labour regulation.

Some of the early trade unions originated in efforts to maintain the Tudor system, by which wages were subject to periodical assessments and fixed by justices of the peace, and terms of employment, apprenticeship arrangements, hours of labour, and other minor details

of industrial life were prescribed by legislation. The earliest anti-combination laws were directed against trade societies formed by the workpeople. Throughout the 18th cent. Acts of parliament multiplied, which made it a criminal offence for two or more workmen to combine to secure an increase of wages or any other change in the terms of their employment. Thirty-four Acts, dealing with the regulation of labour, and prohibiting combinations of working people, had been placed on the statute book in the course of several centuries. They were a powerful weapon against the wage earners' attempts to form trade unions throughout the 18th cent., during which both statesmen and employers tended to accept, in their crudest form, the teachings of contemporary economists who held that rates of wages must be determined by the supply and demand for labour in every industry and trade. This doctrine of freedom from legal or other restraint rested on the assumption that if every man was allowed to work out his own salvation without interference, all would be equitable in the end. It overlooked the defencelessness in competition of thousands of workers, thrown out of work by the new machinery, who were without any power to resist the conditions imposed by employers. This philosophy was current in the years that saw the destruction of the traditional defences of the wage earners, by the break up of the old trade guilds and of the Tudor system of wage-fixing by justices of the peace and state regulation of industry and trade.

Legalisation of Trade Unions

The injustice of leaving the workpeople unprotected by the state, and, at the same time, of denying them the protection of trade union organization, led in the first quarter of the 19th cent. to a strong agitation for the repeal of the combination laws, conducted by Francis Place and Radical members of parliament, assisted by leaders of trade unions. Their repeal, in 1824, marked the beginning of the trade union movement. Under section 2 of the 1824 Act it was provided that journeymen workmen or others who entered into any combination to increase wages, fix wage rates, alter working hrs., or change conditions of employment should not be made liable under any indictment or prosecution for conspiracy, or for any other

criminal proceedings or punishment whatever under the common or statute laws. Notwithstanding the 1824 Act, modified in the following year, the legal status of trade unions remained ambiguous, and much subsequent legislation was necessary to define their powers, functions, and responsibilities.

Trade unions are not the creation of Acts of parliament. What parliament did by enactments from 1824 onwards was to give unions legal recognition, and to attribute to them certain legal rights and duties. Some of these rights are enjoyed by no other bodies, as they relate specifically to the action of trade unions in the furtherance of trade disputes.

Consolidation and Affiliation

Trade union organization developed rapidly after 1824 among craftsmen and skilled operatives, in industries and trades brought into existence by science and invention. Unions grew stronger and more numerous, and then began the consolidation of smaller unions of craftsmen in national amalgamations, such as the amalgamated society of engineers, formed in 1851, the amalgamated society of carpenters and joiners, 1860, and societies in the printing, clothing, and textile trades.

Trade union organization spread among miners and workers in the iron, steel, and other heavy industries, in the rly. service and agriculture and among the so-called unskilled workers. Organization in these industries and services was stimulated by the activities of local federations of unions, called trades councils, and by the creation, in 1868, of the Trades Union Congress (g.v.). The growth of the trade union movement can be measured by the expansion of the T.U.C. and its influence in public affairs.

During the First Great War there was a threefold increase in the aggregate membership, reaching in 1920 rather more than 6½ m. in 215 affiliated unions. In the inter-war years, marked by severe industrial depression and widespread unemployment, trade union membership declined to just over 3½ m. in 1933. From then membership rose steadily until during the Second Great War it exceeded 6½ millions in 1945.

Some unions are not affiliated to the T.U.C. because they are ineligible; others, until the repeal in 1946 of the Trade Disputes Act of 1927, were legally debarred from membership. Some are

associations of employers, registered with, or certified by, the registrar of friendly societies as being trade unions. Annual returns compiled by the chief registrar of friendly societies showed in 1946 a total of rather more than 8,000,000 members in 946 trade unions. Many of these were small organizations; 531 had fewer than 500 members each. Sixteen unions, each with a membership of more than 100,000, account for three-fifths of the total membership of all unions.

Trade unions of workers, which were not formed on any preconceived plan, vary considerably. They cater for every class of worker, including not only manual workers of every grade, and skilled operatives and every category of craftsman, but also technicians, supervisory and administrative workers, professional workers, including artists and public entertainers, and members of the learned professions. From the historical standpoint the craft unions hold a foremost place, as the original trade societies which came into existence in the early days of the industrial revolution. Side by side with them are industrial unions which cater for every worker within the industry they purport to organize.

Principal Functions

Throughout their existence trade unions have performed two main functions: (1) collective bargaining in fixing wages, working hrs., and conditions of employment, and (2) provision of trade and friendly benefits, e.g. cash allowances to their members during periods of unemployment and sickness. As the unions developed their organization, they evolved broader conceptions of their functions, and although all unions do not function on identical lines, their activities have come to include, in addition to negotiation of wages, hrs., and conditions of labour and payment of benefits, (a) formulation of industrial policy; (b) recruitment of non-members; (c) general protection of members in their employment; (d) collection of contributions; (e) educational work; and (f) general service to members.

Collective bargaining often involves elaborate research, and may entail such work as the preparation of evidence for submission by the T.U.C. or by the unions to a royal commission or a govt. committee of inquiry. Industrial negotiations have been affected in method by the operation of con-

ciliation machinery such as joint industrial councils and arbitration tribunals. State machinery exists for the avoidance and settlement of trade disputes, established under the Industrial Courts Acts, 1919, and earlier legislation, such as the Conciliation Act of 1896. Under this legislation the ministry of Labour and National Service is vested with power to intervene in trade disputes with a view to settlement by methods of conciliation, investigation, and, finally, voluntary arbitration.

To prevent stoppages in essential trades during the Second Great War the Condition of Employment and National Arbitration Orders, 1940-42, established a national arbitration tribunal as a result of a joint recommendation from the British employers' confederation and the T.U.C. to deal with disputes not settled by normal joint negotiation between employer and union. An employers' and a workers' panel were set up, one member selected from each with three permanent members constituting the tribunal, whose decisions were binding on both parties. Many awards were made by this tribunal. This was the first measure of compulsory arbitration to which the trade unions gave their assent.

The trade unions have always been somewhat chary of the regulation of wages and conditions by legal means, and the existence in many industries of joint statutory bodies whose function is to lay down minimum standards of wages and working conditions was necessitated by the weak organization in these trades and by the prevalence of low wages and "sweating" of the workers. (See Trade Board; Wages Council.)

Influence on Politics

The trade unions maintain relationships with both the political Labour movement and the Co-operative movement, through the national council of Labour, a joint composite body representing the T.U.C. general council, the national executive of the Labour party, the administrative committee of the parl. Labour party, and the Co-operative union.

The origins of the Labour party and the Co-operative movement are closely associated with the trade union movement, all deriving historically from the teaching of Robert Owen (*q.v.*). Owen, a philanthropic manufacturer, advocated the principles of cooperative industry, and sought to practise them in his own business. He inspired, after the repeal of the com-

bination laws, the establishment of a grandiose working-class organization called the grand national consolidated trade union which set out to unite all the unions in one national body. The Labour representation committee, founded 1900 in furtherance of a resolution adopted by the T.U.C., was the beginning of the parl. Labour party. The membership and financial resources of the Labour party are derived mainly from trade unionists, who contribute to a separate political fund of their unions.

Membership of Joint Bodies

In many ways, the unions act as part of the state's administrative machinery, and perform many advisory and consultative functions. In the administration of the state health and unemployment insurance, until the change brought into the system in 1948, trade union approved societies played a great part by assisting in collecting contributions of insured members and paying benefits. Most consultative and advisory relationships with govt. depts. and employers are the responsibility of the T.U.C. Joint bodies exist upon which the T.U.C. general council directly, and also, frequently, trade unions individually or in groups, are represented. It was, indeed, a direction from the coalition cabinet to all govt. depts. during the Second Great War that they must consult the T.U.C. and the unions concerned on all matters which primarily affected the workers. The T.U.C. is represented on dozens of joint bodies, many at cabinet level, dealing with *e.g.* industrial production, commodity price regulation, rly. rates, recruitment and distribution of nurses and midwives, export guarantees, overseas trade, colonial labour, medical questions, national savings, cinematograph films; and is associated with many cultural, health, welfare, recreational, and social institutions.

Trade union functions have been enlarged under the guidance of the T.U.C. in pursuit of a policy of accepting wider responsibilities, corresponding to the importance of the position the workers hold in the life of the country. This view of trade union responsibilities has led to closer association with the central bodies of employers, the federation of British industries, and the British employers' confederation. It has caused the T.U.C. also to play a leading part in the work of international bodies concerned with economic and in-

dustrial matters, *e.g.* the international labour organization of the League of Nations and the world federation of trade unions.

An old and socially valuable function of the trade unions, the provision of cash benefits for members in times of sickness, unemployment, old age, and death, continues to form a part of trade union work, notwithstanding the development of state social insurance. Unions render an essential service also to their members in dealing with claims for compensation, and most unions maintain legal officers to advise their members. Through the T.U.C., and through individual unions, too, a great deal of educational work is carried on through weekend and summer schools, and lecture courses in connexion with the London School of Economics and for residential students at Ruskin College, Oxford.

Trade Union, INTERNATIONAL ORGANIZATIONS OF. The international federation of trade unions, founded 1901 by representatives of the trade union movement from seven countries, including the U.K. had as its object the collection and exchange of information. By 1913, twenty national bodies with a membership of 8,000,000 were affiliated.

After the First Great War, the I.F.T.U. was reconstituted with h.q. in Berlin. Destruction of trade unionism in Italy (under Mussolini) and Germany (under Hitler), followed by the Second Great War, reduced its activities to nil. It dissolved itself Dec. 14, 1945, following the creation of the world federation of trade unions in Oct., 1945. Consultative status was conceded to the W.F.T.U. by the I.L.O. in 1948.

Differences between Communist and non-Communist groups within the W.F.T.U. arose over the attitude to be adopted to the European Recovery Programme (*q.v.* in N.V.), and in Jan., 1949, the British T.U.C., the U.S. congress of industrial organizations, and the Dutch federation of trade unions withdrew from membership, followed by the trade union bodies of Australia, Norway, New Zealand, Belgium, Switzerland, Sweden, Iceland, and Luxemburg. On Dec. 7, 1949, representatives of more than 46,000,000 workers in 53 non-Communist countries set up the international confederation of free trade unions, with h.q. in Brussels. In March, 1950, U.N.E.S.C.O. and the I.L.O. gave this body consultative status.

Trade Wind. Name given to the persistent winds which represent the circulation of air at the E. and equatorial sides of the great permanent anticyclones of sub-tropical regions. Trade winds blow inwards, from the N.E. in the N. hemisphere and from the S.E. in the S. hemisphere, towards the equatorial belt. The term originated in the nautical phrase to blow trade, i.e. to blow in a regular track or with constant direction. Regularity or constancy are their marked characteristics; their discovery is usually credited to Columbus. The trade winds were of great importance to the sailing ship, and, in the 19th cent., Maury's investigations, by means of data collected by ships, resulted in a considerable saving in time in many oceanic passages.

The trade wind belts extend over 1,000–1,500 m. of lat. both N. and S. of the equator, with the exception of the N. Indian Ocean, which is subject to the monsoon (*q.v.*). With the doldrums they move N. and S., over about 5° of lat. following, with some lag, seasonal changes in the sun's declination. Although remarkable for their steadiness, particularly in the Atlantic, they are not perfectly so, day-to-day variations being dependent upon the position and intensity of the oceanic anticyclones. The average speed of the N.E. and S.E. Atlantic trades is 9.4 m.p.h. and 12.6 m.p.h. respectively. In both hemispheres the trades are strongest in spring, i.e. April on the N. and Sept. in the S.

Since the trade winds transfer air from higher to lower lats., the accompanying weather is brisk and invigorating, and the sky generally almost cloudless. Off cold-water coasts in the S.E. belts, e.g. S.W. Africa, Chile, Peru, California, foggy conditions are frequent, the fog being carried landwards by the locally deflected winds. At higher levels the trade wind undergoes a complete reversal in direction, then being called the anti-trade. Upper air observations suggest that the height at which the reversal takes place varies with season and lat. See Map; Rainfall; Wind.

Trading Estate. Name given to sites bought by the British govt. under the Special Areas Act, 1934, and the Distribution of Industry Act, 1945, in the so-called development areas. On these estates, which were run by govt. financed cos., private firms were encouraged to set up light

industries new to the neighbourhoods. The original development areas, N.E. England, S. Wales, and Scotland, had been primarily heavy industry districts where unemployment was severe between the two Great Wars; in Cumberland, added later, war industry developed during the Second Great War had to be replaced. Wrexham, N. Wales, and St. Helens and Wigan, Lancs, were brought into the scheme in 1946. Some royal ordnance factories were among works taken over as trading estates after the Second Great War. The estates, planned to give employment to more than 100,000 workers, were well supported by industrialists. See Depressed Areas.

Trading with the Enemy. This subject is covered under the heading Enemy.

Traducianism (Lat. *traducere*, to bring across). In theology, the doctrine that the soul of a child is produced by the soul of the parents as an act of natural generation. The opposite doctrine is creationism, according to which a soul is created by God for every human being immediately at birth.

Trafalgar, BATTLE OF. Fought on Oct. 21, 1805, between the British and the combined French

rangements previously made with his officers, divided his force into two columns which he proposed to drive at different points through the enemy's line. This manoeuvre, though foreseen by Villeneuve, was successfully carried out. Collingwood, leading the lee (or starboard) line of 15 ships in the Royal Sovereign, broke through ahead of the 15th ship from the enemy's rear, while Nelson, leading the weather-line in the Victory, made a second breach immediately astern of the Bucentaure, the hostile flagship, after feinting as if to engage the van. The Victory had made the signal to prepare for battle at 6.22 a.m., but it was noon before the first shot was fired. The Bucentaure opened on the Victory at a range of $1\frac{1}{2}$ m., but no answer was returned until the latter was passing under and within 30 ft. of the French ship's stern, when every gun on the broadside, double or treble shotted, was discharged as it came to bear. In this single broadside 400 of the enemy were killed or wounded. By 1.30 the action was at its height, scattered groups of ships being fiercely engaged down the whole line. A few minutes before this Nelson received his mortal

wound, from a musket-shot fired from the main-top of the Redoubtable. By 3 o'clock the issue was decided, and the French and Spanish ships that were in a condition to do so were endeavouring to make their escape. Two hours later the fighting ceased.

Fifteen enemy ships were taken or destroyed, and of the 18 that got away two were wrecked on Oct. 24 and four taken by Sir R. Strachan on Nov. 3. No British ships were lost, and the casualties were only 449 killed and 1,242 wounded. Tactically Nelson's masterpiece, Trafalgar is one of the world's decisive naval actions, as it ended Napoleon's threat of invasion. Consult The Campaign of Trafalgar, J. S. Corbett, 1910.

Trafalgar Estates Act. Passed by the British parliament in 1947 to put an end to the perpetual annuity of £5,000 granted by parliament in 1806 to the

Trafalgar. Sketch depicting Nelson's plan for driving his force through the combined enemy fleets at two points
Courtesy of The Daily Telegraph

and Spanish fleets off Cape Trafalgar, which is a low headland in Cadiz prov., Spain, about 30 m. N.W. of the Strait of Gibraltar. The British fleet under Nelson consisted of 27 ships of the line mounting 2,138 guns, and was opposed to a Franco-Spanish force of 33 sail, with 2,640 guns, commanded by Villeneuve.

The enemy was sighted in the early morning, steering due N. in a confused line ahead formation, and Nelson, in accordance with ar-

Rev. William Nelson (brother of Lord Nelson) and his descendants in recognition of Nelson's victory at Trafalgar.

Trafalgar Square. London open space on the N. side of Charing Cross. A memorial of Nelson's last victory, it was begun in 1829 and completed 1867, modified from designs by Sir Charles Barry. Its central feature is the Nelson Column, 145 ft., by W. Railton, surmounted by a statue, 18 ft., by E. H. Bailey, with bas-reliefs of Nelson's battles at the base, by Woodington, Carew, Ternouth, and Watson, and four couchant bronze lions by Landseer. Artesian wells supply fountains, which, with busts on the N. wall, form a memorial to Jellicoe and Beatty. There are statues of George IV, Havelock, and Sir C. Napier. On the N. terrace wall are official standards of length; at the S.E. corner is an entrance to the Bakerloo tube rly. Scene of many historic and popular demonstrations, the square occupies part of the site of the village of Charing. Here were the royal mews of Chaucer's day, and later the rookery called Porridge Island. The highway surrounding the square is a traffic roundabout. *See* Charing Cross; Column; London; National Gallery; S. Martin-in-the-Fields.

Traffic Signals. Devices for controlling the movement of road vehicles and pedestrians. Traffic signals are either temporary or permanent. The former include diversionary notices; warning signals, oil or electric red lamps to mark temporary obstructions; or manually operated colour-light signals to control traffic along roads under repair. Among types of permanent traffic signals are illuminated road beacons, usually set on islands, with the object of keeping vehicles in a line; unlit signals of the Belisha beacon type; studs to mark pedestrian crossings; central lines or studs to divide traffic lanes; and electrically operated automatic signals to control vehicle and pedestrian traffic at busy corners and cross-roads.

Colour-light signalling was introduced in 1918, when congestion on Fifth Avenue, New York, became too acute for point-duty policemen. A series of signal towers was placed down the centre of the street, each carrying red, green, and white electric lights operated by hand. These were replaced by two-colour automatic lights on posts at street corners, controlled by time switches.

The first traffic lights in England were put up at Leeds in 1923; the first in London at the junction of St. James's Street and Piccadilly in 1926. These were originally manually, but later automatically, operated. Whereas the lights in the U.S.A. and France have a two-colour phase, red and green, those in British Commonwealth countries work on a cycle of four light changes: red (stop); red and amber simultaneously (prepare to start but do not move); green (go straight ahead, or to left or right); amber (prepare to stop). The length of the total light cycle varies between the limits of 30 and 120 secs.

There are four principal systems of time-operated colour-lights; synchronous, red overlap, limited progressive, and flexible progressive. All have a predetermined cycle of operation, the switching on and off of lights being governed by a clock. Synchronous lights show the same colour at any one moment at all intersections along the whole street, so that all change at once. The red overlap system allows traffic from a main road into a side street with the minimum disturbance to through traffic. Limited progressive lights are so timed at each road intersection that alternate lights are synchronous. In the flexible progressive system, signals change according to the irregular spacing of street crossings and volume of cross traffic.

The cycle of light changes is often controlled as required by the vehicles themselves passing over detector pads surfaced with rubber, the pads being in pneumatic or electrical contact with a control box. When the lights have been altered by a vehicle, they remain at the colour shown for a predetermined period. Vehicle-operated lights are usually installed where traffic is irregular.

Most automatic traffic light systems incorporate an additional green light, called a filter, which permits vehicles to turn off into side streets while the red light remains against the through stream. At some pedestrian crossings, manually operated lights allow pedestrians to halt traffic for a limited period governed by a time switch. Experiments have also been made with lights operated by vehicles interrupting the beam from a photo-electric cell. *See* Signals colour plate.

Trafford Park. District of Manchester. It is about 2 m. W. of the city proper, with a rly.

station. The hall here was long the seat of the De Trafford family. Bordering the Manchester Ship Canal, the estate was purchased by a company and cut up into sites for warehouses and factories, and works have been erected here. *See* Manchester; Manchester Ship Canal; Old Trafford.

Tragacanth. Gum-like exudation obtained by incision of a species of the shrub *Astragalus*, found native in Asia Minor. It occurs in thin, white or yellowish flakes, and is used in medicine as a demulcent, and as a means of temporarily suspending insoluble powders in mixtures. *See* Gum.

Tragedy (Gr. *tragos*, goat; *ōde*, song). Originally a hymn or choral ode sung at the festival held in honour of Dionysus among the ancient Greeks. The reason for the appellation remains uncertain. The most plausible explanation is that a goat, the destroyer of vines, was sacrificed to the wine god during the singing of the ode.

As defined by Aristotle, tragedy is a representation of an action that is weighty, complete, and of a due magnitude, effecting through pity and terror a purgation of the like passions in the mind of the spectators; and Professor Tyrrell explains this purgation as broadly indicating that the feelings should be rightly excited about something which is their proper object, and that those feelings should ultimately be allayed artistically. Modern tragic art too often neglects the due allaying of the passions aroused, leaving the spectator as it were isolated upon a peak where no voice of hope or comfort can reach him, and appalled with the immensity of the tragic situation.

It was otherwise with Greek tragedy, which, while telling the old story of sin and suffering, and showing men ever in the hands of chance and fate, yet taught that God is good. Behind the inexorable destiny it never failed to see the cosmic order and the divine justice of man's incurring penalty for failure in or breach of that duty which preserves the very stars from wrong.

Tragedy, according to George Eliot, consists in the terrible difficulty of the adjustment of our individual needs to the dire necessities of our lot, partly as to our natural constitution, partly as sharers of life with our fellow-beings. A good tragic subject, she declares, must represent a possible, sufficiently probable, not a common action; and to be really

Tragopan. The Horned Pheasant, *Pucrasis satyrus*, native of the central and eastern Himalayas

tragic, it must represent irreparable collision between the individual, with whom we sympathise, and the general, of which we recognize the irresistible power; the tragedy consisting in the struggle involved, and often in the entirely calamitous issue in spite of a grand submission.

To the criticism that it is almost a mockery to tell an individual crushed by such a collision to seek his own happiness, since the nearest approach to well-being that can be made in such a case is through large resignation and acceptance of the inevitable, George Eliot replies that that is not all that is left. Love, pity, constituting sympathy, and generous joy with regard to the lot of our fellow men, come in, enormously enhanced by wider vision of results, and by an imagination actively interested in the lot of mankind generally; and these feelings become piety—i.e. loving, willing submission, and heroic Promethean effort towards high possibilities, which may result from our individual life.

So she arrives at the purgation insisted on by Aristotle as an essential of tragedy. Man cannot be utterly blind to the results of duty, since that cannot be duty which is not already judged to be for human good. To maintain the contrary is to say that mankind have reached no inductions as to what is for their good or evil. The art which leaves the soul in despair is laming to the soul, and is denounced by the healthy sentiment of an active community. Consolation is to be found in conviction of the importance of individual deeds and of the all-sufficiency of the soul's passions in determining sympathetic action. See Comedy; Drama; consult also *The Tragic Drama of the Greeks*, A. E. Haigh, 1896; *The Idea of Tragedy*, W. L. Courtney, 1900; *Tragedy*, A. H. Thorndike, 1908; *The Language of Tragedy*, M. E. Prior, 1947.

Tragopan OR **HORNED PHEASANT** (*Pucrasis*). Genus of game birds. They include five species, found only in the Indian sub-continent and China, and are famed for the brilliance and beauty of their plumage. They occur in bamboo plantations and in dense coverts on the hills. The males indulge in elaborate displays in the breeding season.

Traherne, THOMAS (c. 1637–74). English mystic poet and prose writer. The son of a Hereford shoemaker, he was educated at Brasenose College, Oxford, and in 1657 became rector of Credenhill, near Hereford, and afterwards chaplain at Teddington to Sir Orlando Bridgeman, lord keeper of the seals. Traherne died Sept. 27, 1674. He left two MSS., one of mystical poems, the other comprising four prose Centuries of Meditations, each in 100 paragraphs. Both MSS. were discovered on a bookstall and edited and published by Bertram Dobell, in 1903 and 1908 respectively.

Of the school of Herbert and Vaughan, Traherne is raised to ecstasy by considering the influence of natural beauty on character; but he has more than either of sheer joy in existence, while he is equally devout. Some passages in the third of the Centuries, notably the one beginning "The corn was orient and immortal wheat," have never been surpassed for magnificence of style. A biography by G. Wade appeared in 1945.

Traill. Town of British Columbia, Canada. On the Columbia river, it is 48 m. S.W. of Nelson on the C.P.R. Less than 2 m. away is Tadanac, home of the largest non-ferrous metallurgical plant in the British Commonwealth; also of a fertiliser factory. Pop. 9,392.

Traill, HENRY DUFF (1842–1900). British author and journalist. Born at Blackheath, Aug. 14,

Henry D. Traill, British author

1842, the son of a barrister, he was educated at Merchant Taylors' school and St. John's College, Oxford. He became a barrister and in 1871 a civil servant, but also gave time to journalism. A contributor to many daily and weekly journals, he became in 1897 the editor of *Literature*. His books include *The New Lucian*, 1884, two volumes of *Essays*; and, among

biographies, *Sterne*, 1882; *William III*, 1888; *Strafford*, 1889; *Salisbury*, 1891; *Franklin*, 1896; and *Cromer*, 1897. Traill died in London, Feb. 21, 1900.

Traill, WILLIAM ACHESON (1844–1933). An Irish engineer. After working with the geological survey, he produced a scheme for a hydro-electric tramway at the Giant's Causeway, Antrim. There was considerable opposition, but the scheme was eventually adopted, the tramway being opened Sept. 3, 1883, the first of its kind in the world. Traill died July 6, 1933.

Train Bands. Bodies of English citizen soldiers. They were first constituted in the reign of James I, partly on the old fyrd system, partly on a voluntary basis. They took a prominent part on the parliamentary side in the Civil War, and in consequence were abolished by Charles II after the Restoration. See *Fyrd*; *Militia*.

Train Ferry. Service of vessels specially constructed for the transport of railway trains across water. Such vessels are known as train ferry ships or boats. The advantages of such a service are the great saving of time, labour, and expense effected by running the trains on board and off again and so avoiding the necessity of discharging their freight, and loading it on to an ordinary vessel, and reversing the process at the end of the voyage. Some ferry ships are designed to transport rly. cars only, the locomotive being left behind and replaced by another on the other side. By others locomotives are also transported.

Training College. Institution at which teachers are trained; also called a normal school. Such colleges are of many types: (a) for men, for women, for both sexes; (b) for those of one religious faith only; (c) for training teachers to work with certain types of pupil, e.g. infants, the blind, the deaf; or to work in certain kinds of school, e.g. technical. Some, such as Borough Road (Isleworth) and St. Mark and St. John (Chelsea), were established in the mid-19th cent. by religious societies to staff their elementary schools. Emergency training colleges (more than 50 in 1948) were set up by the ministry of Education and local education authorities as a consequence of the Education Act, 1944. At the permanent colleges (more than 80 in 1948) the ordinary course takes two years, usually with a possibility of an additional year

to enable a candidate to sit for a university degree. Most students at emergency colleges follow a one-year course with two years of supervised study during a probationary period of practical teaching. Training teachers is an important function of English universities. *See* Education; Froebel System; Teaching.

Training Ship. British ship employed in training youths for the royal and merchant navies. There are several of these at different ports of the U.K., *e.g.* Devonport (*q.v.*), Greenhithe. Naval cadets have a period in a training cruiser before going to the fleet as midshipmen. *See* Britannia.

Trajan (A.D. 53-117). Roman emperor, 98-117. Marcus Ulpius Trajanus, a Spaniard of Italica,

Trajan,
Roman emperor

near Seville, was born Sept. 18, 53. He achieved rapid distinction in the Roman armies in Spain and Syria, and was in command of forces on the Rhine when the emperor Nerva wisely selected him as his colleague and successor, and with that end in view formally adopted him in 97. On Nerva's death Trajan became emperor. His high character and great military talents were matched by his administrative ability; at no period was the government of the Roman empire and its provinces better conducted.

Although a mistaken conception of the political meaning of the Christian faith led him to sanction measures for its repression, the almost universal praise of the great emperor was hardly qualified except by the historians of the persecuted sect; and Trajan himself forbade any hunting down of Christians, only requiring that those who were persistently defiant should be punished. He was the first emperor who deliberately set himself to extend the Roman dominion, and during 101-105 he thoroughly subjugated the trans-Danubian territory of Dacia, which corresponds roughly to the modern Rumania. Later he led an expedition to the east for the subjection of Armenia and in the hope of extending the bounds of the empire by further conquests beyond the Euphrates; but after taking the Parthian capital Ctesiphon in 115 he was forced to retreat, and the Jews in the eastern

provinces rose in revolt. Trajan died Aug. 8, 117, at Selinus in Cilicia, and his policy of expansion was at once reversed by his successor Hadrian. Trajan's deeds were commemorated on the celebrated pillar in Rome. *See* Hadrian; Rome.

Trajectory. Term applied in ballistics, and especially in gunnery, to the curve described by a projectile during its passage from the muzzle to the first point of impact. Theoretically this curve should be a parabola, but in practice a number of forces change the course of the projectile. The principal of these are varying densities of the strata of the air, and force and direction of wind. The study and consequent calculation of the effect of these factors is part of the theory of ballistics (*q.v.*). *See* Guns; Howitzer.

Tralee. Seaport, co. town, and market town of Kerry, Eire. It stands near the mouth of the river Lee, on Tralee Bay, with which it is also connected by a ship canal. Tralee is a station and junction on the Eire state rlys., 21 m. N.W. of Killarney, and a narrow gauge rly. runs to Dingle. The trade consists chiefly in exporting butter and grain, and importing coal and timber. The scenery in the neighbourhood is remarkably fine, and there are interesting historical remains, including the cathedral of Ardfort and a round tower at Rattoo. The town grew up round a monastery and had a castle. It became a corporate town after 1603, and until 1800 sent two members to the Irish parliament. It was represented separately in the parliament of the U.K. 1832-85. For local govt. it has an urban dist. council. Pop. 10,285. Tralee Bay, an opening of the Atlantic, is about 6 m. wide at the entrance, and has a length of 12 m.

Tramecourt. Town and wood of France. In the dept. of Pas-de-Calais, the town is 16 m. E. of Montreuil, and slightly S.E. of Fruges. Near Agincourt, the wood was prominent in that battle, the duke of York's right wing resting on it. To the N. of the wood is a cemetery, where 5,800 French are said to have been interred. *See* Agincourt.

Trammel Net. A kind of fishing net. It consists of three nets, fixed to stand upright in the water parallel to each other. The innermost of the three is twice the length and twice the height of the outer two, and is of a smaller mesh. Fish swimming through the larger

meshes carry with them a fold of the inner net, and thus become enclosed in a pocket from which escape is impossible. This net is usually worked by putting it down towards evening off a rocky coast, and taking it up on the following morning. Among the fish usually caught in the trammel net are red mullet and bass. *See* Fisheries.

Tramp. Literally, something that is trodden. It has come to be used for a homeless person who walks from place to place, and for a walk. Another tramp is a plate of iron worn by diggers under the hollow of the foot to save the sole. A tramp steamer is one that makes short voyages from one port to another, carrying such casual cargo as can be obtained. *See* Vagrancy.

Tramway. Means of transport in which vehicles run on rails laid on public roads. Tramways developed directly from the rails laid around coal mines towards the end of the 18th cent. to enable the horse-drawn loads of coal to be increased. The system of horse-drawn cars on rails was first adapted for passenger transport in New York in 1832. Passenger horse-trams first appeared in the U.K. in the 1860s. Steam-driven trams were first introduced at Birmingham in the 1880s, and were seen in some other English cities and towns. The steam engine was a separate unit, the passenger car being a trailer. Dirty both for travellers and for the general public using the streets, they were soon superseded by electric trams, though they were still to be seen in some British towns in 1905, and in Paris as late as 1913.

Electric trams were known in Germany in the 1880s, and the first line in the U.K. was opened at Blackpool, 1885; the first overhead system at Leeds, 1891. In the first quarter of the 20th cent. electric tramways were in evidence in all populous urban communities, and formed an exceedingly popular mode of transport. In 1925 over 14,000 trams were running in Great Britain. By 1947 this figure had fallen to below 8,000, and the peak figure of 2,700 route miles of track (1920) to 1,000 m. in 1947. With the increase of motoring, tram tracks themselves, as well as the restricted movement they imposed on the trams, became recognized as a nuisance, and at times a danger. The greater mobility of the motor bus and trolley bus made them more serviceable (as well as more comfortable) vehicles of public transport in all but the most

Tramway. The first London tramcars passing Marble Arch, from a print of 1861. Left, a London County Council cable tramcar on Streatham Hill, 1900

densely populated centres. Also the relaying of track, necessary every few years, was expensive; and the unsightliness of the overhead trolley equipment contributed to the decline of the tram's popularity.

On the other hand, neither motor bus nor trolley bus can cope as adequately as the tram with the heavy passenger traffic in large towns and cities, on main routes to and from the industrial and commercial centre. Although by 1939 Bristol had scrapped its admittedly old-fashioned tramways, and they had almost disappeared from the London area N. of the Thames, it was still found in such centres as Birmingham, Manchester, Sheffield, Leeds, Edinburgh, and Glasgow—as in S. London—that trams remained the most economical means of carrying heavy loads of workers, especially if the tram service was adequately supplemented by motor buses. Manchester, however, scrapped its trams in 1949, and S. London began to do the same in 1950.

The three main methods of propelling tramways are by underground cable, by underground electric conduit, and (the most usual) by overhead trolley in contact with conductor wires. In all these methods the power is transmitted from a central power station,

the slot, to grip or release the cable as required by the driver. The underground electric conduit system also necessitates a roadway slot, and the tram carries a sliding contactor. In the overhead system the tram makes contact with the overhead conductor wires either by a trolley, attached by a springy boom or pole to the top of the vehicle, and running along the underside of the wires, or by a collector bow. The overhead wires have to be supported at intervals of about 50 yds. (at closer intervals when rounding curves), usually by steel poles sunk 5 or 6 ft. into the ground. The round copper wires are supported by long "ears" to which their upper halves are soldered. The electric current returns through the rails.

The tramcars themselves have two types of chassis, or truck: the single truck with four wheels, and the bogie with a four-wheeled swivelling truck at each end. There are two motors, each of which drives one pair of wheels through reduction gear. The motors are carried on frames hinged at one end to the car axle, while the other rests upon springs. The h.p. of tramcars ranges up to 50. The cars are almost always arranged to run either way, the control apparatus being duplicated

at either end of the car. The apparatus consists of electric controller, handbrake, and emergency brake. The controller turns the current on and off, varies the pressure passing to the motors, and reverses direction. It has two handles, one for stopping and starting, the other for reversing. The usual form of emergency braking is by shoe brakes close to the rails, controlled by either hand gear, compressed air, or magnetic attraction. For ordinary stops, brake-shoes are fitted to the wheels.

Tram rails are rolled from best steel in lengths up to 60 ft. They are laid in a bed of concrete at least 6 ins. deep, the two rails being connected by crossbars at intervals, while the road between them is made up level with granite setts or wood blocks laid in cement or pitch. The rail joints are usually welded. The gauge varies from 3 ft. 6 ins. to 4 ft. 8½ ins. See *Electric Traction* and illus. p. 3001; also *Bogie* illus.

Trance. Condition of insensibility resembling sleep, from which, however, the individual cannot be roused, and which is not due to disease or injury of the brain. When associated with rigidity of the muscles, the term *cataplexy* (*q.v.*) is employed. Trance is a rare condition and probably most often arises from hysteria; though it can be induced hypnotically. It has been said that the condition may be mistaken for death, but the retention of bodily warmth and evidences of continuing circulation and respiration make a correct diagnosis possible.

Tranent. Police burgh and parish of E. Lothian, Scotland. It is 10 m. E. of Edinburgh, on the main road to Dunbar, with a rly. station, and is in the centre

of a colliery district which gives employment to the town. The parish church contains interesting monuments. The ruins of Waterfa'side Castle are in the neighbourhood. Pop. 4,526.

Trani (anc. Turenium). Coast town of S.E. Italy on the Adriatic Sea. It is in the prov. and 25 m. by rly. W.N.W. of Bari. The 12th century cathedral has a notably high tower, famous bronze doors, and one of the largest crypts in the world. The Normans took the place, then a busy seaport, in 1073, and during the Crusades trade increased. The harbour is now filled up, but there is trade in wine, olive oil, nuts, and figs.

Tranquebar. Harbour of Madras state, India, on the Coromandel coast, in Tanjore dist. It was formerly a Danish settlement on the sea front of the Cauvery delta. The English church was built by the Danes in 1620 and the New Jerusalem church in 1717. Tranquebar was sold to the English E. India co. in 1845. Pop. 19,000.

Transandine Railway. S. American railway. It gives communication between the rlys. of Argentina and those on the W. slope of the Andes. Finished in 1910, it runs from Mendoza, 2,520 ft. above sea level and 651 m. W.N.W. of Buenos Aires, to Santa Rosa de los Andes, 2,723 ft. above the sea and about 90 m. E.N.E. of Valparaiso, its length being 155 m. At its highest point under the Uspallata Pass it attains an elevation of 10,521 ft., about 6,700 ft. higher than the St. Gotthard. It is on the metre gauge, though the rlys. it connects are of 5 ft. 6 ins. gauge. Owing to the steepness of the gradients the Abt rack system had to be adopted for a total length of nearly 22 m.—seven sections on the Argentine side, and six on the Chilean. Nine tunnels are in Argentine territory, and 26 in Chilean, the summit tunnel, 3,463½ yards, being divided between the two countries.

In 1948 another Transandine line was completed, a project carried out jointly by the two countries, between Salta in Argentina and Antofagasta in Chile.

Transcarpathian Ukraine. Name applied to Ruthenia (q.v.) after its absorption by Ukraine (q.v.) S.S.R. See also Carpatho-Ukraine.

Transcaucasia. Region lying S. of the Caucasus Mts. It is sometimes included within the continent of Europe, but is more

precisely regarded as the N.E. of Asia Minor. In 1922 there was established the Transcaucasian S.F.S.R., a union of the republics of Armenia, Azerbaijan and Georgia. In 1936 each of these three was raised to the status of a constituent republic of the U.S.S.R. See separate entries.

Transcendental (Lat. *transcendere*, to overstep). Philosophical term used by the Schoolmen to denote a concept of wider application than the Aristotelian categories. The form transcendent was also used. Kant, however, distinguished them, applying "transcendent" to that which is connected with matters entirely beyond experience; "transcendental" to the principles of the pure understanding, the *a priori* and necessary conditions of experience. That which is transcendental goes for him beyond empiricism, but is not transcendent, i.e. does not pass the bounds of human knowledge.

Transcendentalism. Name applied to any philosophical system which recognizes *a priori* conditions of experience. It is specially associated with a movement in New England about 1830–50, led by Emerson, Ripley, Alcott, etc. Insisting on the dominance of intuition over reason, it was vaguely inspired by German idealism. A revolt against American Puritanism, it developed theologically into Unitarianism and mysticism, and socially and economically into Socialism, while strengthening the anti-slavery movement and literary romanticism. See Brook Farm; Emerson.

Transcona. Town of Manitoba, Canada, 6 m. E. of Winnipeg, on the C.P.R. and C.N.R. The railway shops of the latter are located here; also a creosoting plant. Pop. 5,495.

Transcription (Lat. *trans*, across; *scribere*, to write). Act of transferring writing from one book to another. The writing thus transferred is called a transcript. In music, transcription is the arrangement of a piece of music in a manner different from its original form, often with additional points of treatment, as in Liszt's piano transcriptions of some of Schubert's songs. The word is also used for longhand copies from shorthand notes, and for records of broadcast programmes translated into other languages.

Transept (Lat. *trans*, across; *septum*, enclosure). In architecture, the transverse portion of any building lying across the main

body of that building. In the Christian basilica it was the part immediately next to the apse, the ends of its length being projected somewhat beyond the breadth of the nave and aisles. As the point of intersection was moved farther away from the apse, and the cruciform church was evolved by projecting the transept on both sides of the main building, it became usual to speak of each wing as a transept. The transept became common in the Middle Ages, and almost universal in the Gothic period. The crossing is often surmounted by a spire, tower, or dome. Single transepts are the more common, but double transepts are found in England and Germany, the English style being on the scheme of the archbishop's or Passion cross, with both arms east of the nave. In Germany the double transept was connected with the double choir, one at each end of the church.

Transfer. In law, to convey, to pass property of any kind from one owner to another. Land is transferred by deed; chattels are transferred by deed, or by delivery, or on a sale, by the appropriation of the goods to the contract. Shares in companies are transferred by deed of transfer, completed by an entry in the company's books. Govt. stocks are transferred in England by an entry in the books of the Bank of England. See Conveyancing; Land Registration.

Transfiguration, FEAST OF THE. Commemoration by the Christian Churches of the event described in Matt. 17 Mark 9, and Luke 9. According to the Scripture narratives, Christ appeared, revealed in His divine glory as Son of God, in the company of Moses and Elias (Elijah), before Peter, James, and John. The event (see also 2 Pet. 1) is supposed to have taken place at night on Mt. Hermon or Mt. Tabor, hence the name Feast of Tabor used in the Greek Church. Observed in the East as early as the 8th century, its general observance, on Aug. 6, is said to have been enjoined by Calixtus III in memory of the deliverance of Belgrade from the Turks.

Transformer. Electrical device for changing alternating current from one voltage to another, stepping up or stepping down as required. A transformer is the simplest of converting devices, since it has no moving parts, consisting essentially of two sets of coils or windings. The primary winding is supplied with A.C.

Transformer. Core and coils of a 60,000 k.V.A. 3-phase transformer for 132,000-33,000 volt service
Courtesy of British Thomson-Houston

thus setting up an alternating magnetic field which cuts the conductors of the secondary winding and, by electro-magnetic induction, sets up an E.M.F. in the secondary (Fig. 1).

In order to get the best possible magnetic linkage between primary and secondary, it is usual to use a laminated iron core. To obtain the maximum amount of magnetic flux for a given magnetising current, the core is continuous, i.e. it forms a closed magnetic circuit in one of two ways (Fig. 2). In the core type of transformer the coils surround the iron core; in the shell type, the coils are surrounded by the iron circuit. Owing to difficulties in construction, the shell type is not liked in large units, and the core type is in more general use. The most perfect core from the

ate legs, but half of each winding is distributed on each leg—one winding surrounding the other. Three-phase transformers have usually three or five legs. High frequency transformers, such as are used in radio work, are usually made without iron cores. Another type of transformer which is becoming popular in radio is the dust core, in which the coils are embedded in a container filled with a highly magnetic ferrous powder.

The ratio between the voltages at the primary and secondary terminals is theoretically exactly equal to the ratio of the number of turns in each winding. Thus a transformer having 1,000 primary and 100 secondary turns would have a 10 to one transformation ratio and, if the primary were supplied at 1,000 volts, the secondary would give 100 volts. The currents in each winding would vary

must be threaded by hand. Rectangular cores are preferred, when the coils can be wound on formers or supports, and dropped into place over the legs of the core; by interleaving laminations, magnetic leakage is reduced to a minimum. Two-leg cores (Fig. 2a) are usual for single-phase transformers. The coils are not arranged with the primary and secondary on separate

the primary winding (neglecting the small losses) would be one amp. at 1,000 volts.

The actual number of turns is a matter for the designer. Although a transformer stepping down from 1,000 to 100 volts has a 10 to one ratio, it would not be suitable for stepping down from 5,000 to 500 volts or from 50 to 5 volts. There are limits to the ratio which can be obtained, although at least one transformer has been built for laboratory work in Great Britain to step up from 3,300 volts to 1,000,000 volts. The range of ordinary transformers is large, ranging from units of about five volt-amps. output for mains-operated electric bells to 75,000 kVA for the grid. Above about five to 10 kVA transformers are usually immersed in an oil-filled tank, to assist in insulation and cooling. Although the efficiency of a transformer is the highest (over 98 p.c.) of any form of converting plant, the losses in a large transformer represent much heat, and it therefore has further air or oil cooling arrangements.

Auto-transformers represent an ingenious method of saving copper by combining primary and second-

ary windings (Fig. 3), so that the low-voltage winding is, in effect, tapped across a portion of the high-voltage winding. The action should not be confused with that of a potential divider resistance on D.C.; it gives a true transformer action, and is capable of stepping-up or down. It is valuable where the ratio is comparatively low; for high ratios the saving in winding is negligible and the chief disadvantage (that the low-voltage winding is not electrically separate from the high-voltage and may thus be at a considerable potential to earth) outweighs any saving.

Direct-connected voltmeters cannot be used on very high voltages, and voltage or potential transformers are used to convert the supply voltage (say 11,000 or 33,000 volts) to 110 volts at the secondary winding, the voltmeter being wound for 110 volts, but (since the transformer maintains its ratio accurately) calibrated to read primary voltage. In the same way, ammeters are provided with a five-amp. winding, and operated from a current transformer connected in series with the load. The

point of view of magnetic leakage is one without joints, such as a ring core built up of annular stampings. This, however, introduces difficulties in winding, since each turn

inversely, i.e. if the current taken by the secondary load was 10 amps. at 100 volts, the current taken by

simplest form consists of a ring core with secondary turns wound round it, the whole being slipped over the conductor in which the current to be measured flows, thus acting as a single-turn primary.

E. B. Watton, A.M.I.E.E.

Transformer Oil. Oil used for cooling the windings of large electrical transformers. Circulation of the oil is sometimes by convection, but in large machines pumping is necessary. The oil must remain in the machine for long periods without inspection and may be subject to extremes of atmospheric temp. Its viscosity should always remain low enough for ready flow, and there must be no formation of sludge and acidic products which might hinder circulation and attack the metal parts of the machine and the electrical insulation. The oil is a light lubricating distillate which has been rigorously refined with fuming sulphuric acid.

Transfusion. Term applied to the transference of blood from one person to another. The subject is covered under the heading Blood, p. 1226.

Trans-Iranian Railway. Railway in Persia. It extends from Bandar Shah, on the Caspian Sea, to Bandar Shahpur, on the Persian Gulf, and has a total length of 872 m. Begun in 1927, it was completed in 1938 at a cost of £30,000,000. There are 225 tunnels and 852 bridges on the route, but the line, of standard 4 ft. 8½ ins. gauge, is mostly single track, and the steep gradient and winding course through the mts. restrict speed to 20 m.p.h. The rly. was a vital link in the supply of western materials to Russia in the Second Great War, when large quantities of British engines and rolling stock were used. A branch line was built to link the rly. with Transcaucasia, and in 1947 plans were made to extend it to Tabriz.

Transire (Lat., to go over or across). In shipping, a document used in the coasting trade. It is issued at the custom house of the port of departure to the master of the ship. It describes the goods and their destination, and gives other particulars about the ship.

Transit Circle. Astronomical instrument for ascertaining the time of star transits across the meridian. Invented by Olaus Römer in 1690, it consists essentially of a telescope movable in the plane of the meridian, and supported on two pillars which are respectively E. and W. of it. A

more complicated instrument, the meridian circle, measures star declinations as well as right ascensions. For this purpose there is fixed on one side of the telescope a circle which denotes its movement in the plane of the meridian, and which is read by microscopes fixed to one of the supporting pillars. On the other side of the telescope is a circle which is used for moving it.

The N. celestial pole lies somewhere in the meridian, and if it were exactly marked by the pole star, that object would lie immovable in the meridian. Then, when another star, the position of which it was desired to determine, was also in the meridian, the star's north polar distance would be ascertained by reading the angular distance on the micrometer circle. The pole star not precisely marking the celestial pole, the distance from the zenith is observed of a circumpolar star when it passes above the pole, and also when it passes below the pole. Half the sum of these distances gives the zenith distance of the pole itself. When this is known, the position of the celestial equator, which is 90° away from it, is also known; as well as that of the zenith distance of the equator. Hence there are four points from which angular distances can be measured on the transit circle (a) from the zenith, (b) from the celestial pole, (c) from the celestial equator, and (d) from the horizon, which is 90° from the zenith.

In this way by reckoning in distances from the celestial equator, is obtained celestial declination. Right ascension is reckoned from the celestial meridian which passes through the point occupied by the sun at the vernal equinox or the "first point of Aries." Delicate observations are necessary for precision. The micrometer circle of the Greenwich transit instrument is read in six different parts of the limb by microscopes. The recorded zenith distance is the mean of these recordings.

Right ascension was formerly determined by noting the precise instants, by the standard sidereal clock of the observatory, at which the star crossed each of several symmetrically disposed wires in the eyepiece, and taking the mean. This method leads to serious errors due to personal equation, by which one observer may estimate transits systematically early, and another systematically late. Nowadays the observer uses an impersonal micrometer, in

which a movable wire is kept bisecting the star image as it crosses the field of view. An electric signal is given automatically as the wire reaches certain positions in the field, and these signals are timed against the standard clock. See Telescope.

Transition. In architecture, the passing from one style to another, and the style of building during the period of passing. The transition periods between Romanesque and Gothic, and Gothic and Renaissance, may be named. The Tudor style in England represents the transition from English Gothic to English Renaissance.

Transjordan. Arab kingdom of S.W. Asia, of which the official name, adopted 1949, is the Hashimite Kingdom of Jordan. It covers an area of 34,750 sq. m. and has an estimated—because largely nomadic—pop. of c. 340,000, of whom c. 300,000 are Arab Muslims, c. 30,000 Arab Christians. The remainder are chiefly Circassians descended from settlers of the 1880s. The capital is Amman (pop. 45,000). Es Salt has some 17,500 inhabitants; none of the other towns, e.g. El Kerak, Ma'an, Irbid, has more than 5,000.

Most of the country consists of a chalk plateau of an average height of 2,600 ft. with, in the S., mts. rising to 4,600 ft., cut by numerous *wadis*, river-beds only temporarily carrying water, most of it to the river Jordan or the Dead Sea; at an average distance of 30 m. E. of a particularly deep-cut and long *wadi* linking that sea with the Gulf of Aqaba runs, from Damascus via Amman to Medina, the Hejaz rly. E. of that line the land is partly steppe, but mostly desert, with a pronounced desert climate and nearly permanent drought.

Such agriculture as there is is confined to that part of Transjordan W. of the Hejaz rly. There isolated date palm oases, some grain (wheat, millet, barley, maize) leguminous plants, tobacco, and the vine thrive. The average temp. rarely falls even in winter below 50° F., and stands at 86° and more for long periods.

About 30 p.c. of the pop. is semi-nomadic, about 13 p.c. nomadic; these two groups live almost exclusively on and with their livestock: camels, horses, sheep, and goats which are always on the move in order to find food on the meagre steppe. The remaining 57 p.c. pop. is settled. The only industry is the traditional handicrafts practised chiefly by the women;

but there is potash in the Dead Sea, and in 1947 a company was granted exclusive rights for 75 years of boring for petroleum in the S. Transport, once attended by risk of death from thirst in crossing the desert towards Mesopotamia, was simplified by the building of motor roads totalling 372 m. in 1944. The building of the road from Haifa to Bagdad across Transjordan gave great impetus to the growth of the town of Irbid.

Administration is by a king assisted by a small cabinet and a parliament, consisting of a lower house of 20 deputies, elected by manhood suffrage, and an upper house of 10 nominated by the king. For administrative purposes the country is divided into the desert area and five dists., Ajlun, Amman, Belqa, Karak, and Ma'an. Its armed forces consist of the Arab Legion (*q.v.*), numbering about 8,000, which combines military with police duties, and the Transjordan frontier force (*v.t.*), comprising 700 Transjordan and Palestinian Arabs. Education in the western sense scarcely exists.

Transjordan was a foundation member of the Arab League (*q.v.*). Her application for membership of the United Nations in 1946 was refused owing to the exercise of the veto by Russia.

HISTORY. Transjordan as such dates from the breakup of the Turkish empire after the First Great War, but it covers states of great antiquity which have left such traces as the tombs and temples cut out of the living rock at Petra, about 12 m. N.W. of Ma'an, in late Hellenic style, and the crusaders' castles at Kerak, Shobek, and Amman. The Nabataean state, first mentioned by Asurbanipal in the 7th cent. B.C., which almost coincided with Transjordan, existed until, in A.D. 106, it was vanquished by Trajan and embodied with the Roman prov. of Arabia, later Arabia Petraea; its capital was Petra (*q.v.*). That part of the country between the Lake of Tiberias and the Dead Sea was, under the name Peraea, from 4 B.C. to A.D. 39 the tetrarchy of Herod Antipas (*q.v.*). During the crusades most of Transjordan was from 1099 to 1187 included as the lordship of Montreal or Oultrejourdain in the kingdom of Jerusalem, part of it so remaining until 1291. Under Turkish rule, it became part of Syria. During the First Great War Turkish-German forces had to withdraw from the Sinai peninsula and from Es Salt, to secure a defence line for Palestine. The area

was placed under British mandate as part of Palestine in 1920.

In 1923 the U.K. recognized Transjordan as a separate country, with Abdullah (*q.v.*) as ameer, provided a constitutional govt. was set up. Recognition was embodied in an agreement of Feb. 20, 1928, ratified by both, Oct. 31, 1929. A new treaty signed March 22, 1946, ratified June 7, recognized Transjordan as a sovereign, independent state. Abdullah assumed the title of king, May 25. He played a leading part in the Arab-Jewish conflict in Palestine, 1947 onwards, and on April 23, 1950, annexed the Arab Legion-occupied area of Palestine. See Arab League; Arab Legion; Palestine in N.V. *Consult* History of Transjordan and its Tribes, F. G. Peake, 2 vols., 1934; Transjordan, A. Konikoff, 1946.

Transjordan Frontier Force. Military formation established by the Anglo-Transjordan agreement of 1928. The force has a peacetime complement of 700 and is at the disposal of the British govt. in the event of war affecting British protective liabilities to Transjordan. Normally it is engaged in the prevention of smuggling. Men are recruited from Arabs, Circassians, Druses, Armenians, etc. In 1941 the force took part in the Allied campaign in Syria.

Transkeian Territories. Part of the Cape prov., S. Africa. Broadly speaking, they include all that part otherwise known as Kaffraria (*q.v.*), extending from the Great Kei river N.E. to the frontier with Natal, and thus taking in Tembuland, Pondoland, and Griqualand East, but excluding Elliot and Maclear dists. In a more restricted sense Transkei comprises Fingoland and Galekaland dists. and the Idutywa reserve. The chief magistrate of the territories, residing at Umtata, exercises some authority under the ministry for native affairs. The climate is excellent for agriculture and sheep raising, but development is backward. Scenery is delightful near the coast, and inland wildly impressive. See Kaffraria.

Translation (Lat. *trans*, over; *latum*, carried). Literally, the act of moving across. The word is used for the act of turning passages from one language into another. In an ecclesiastical sense it means the transfer of a bishop from one see to another and also for the removal of the bones of a saint from one place to another, e.g. the feast of the translation of S. Martin is kept on July 4.

Transloy, LÉ. A village of France, in the dept. of Pas-de-Calais. It lies midway between Péronne and Bapaume. Here during the First Great War fighting took place in the British Somme offensive of 1916. It was entered by the British, March 17, 1917, after the retreat of the Germans to the Hindenburg Line. Retaken by the latter in March, 1918, it was finally recovered by the Allies in the autumn advance. See Somme, Battles of the.

Transmigration of the Soul. Doctrine of the passage of the soul from one body to another. According to this theory the soul, proceeding from God, passes through a succession of states before returning to God. Of ancient origin, the theory enters into much philosophy and poetry as well as theology, and is found in a crude state among some savage races. See Reincarnation; Metempsychosis.

Transom (Lat. *transtrum*). Beam or bar of wood, stone, or metal laid horizontally across a

Transom in architecture

door or window. With a window it serves to divide the upper and lower lights.

Transparent Print. Paper impression laid on glass and so treated with varnish that when held before a light it becomes transparent. It

was the invention of Edward Orme, who in 1887 published an essay on the process. The prints, being cheap, sometimes took the place of painted glass.

Transplanting. Horticultural process. This is a constantly recurring task, and the welfare of the plants depends on its being so carried out as to cause the least damage to the roots. Seedlings of innumerable plants are raised in spring, and before they become overcrowded they must be transplanted either to prepared outdoor sites or to boxes of soil in which they are set a few ins. apart. The work is best done by thrusting a small handfork into the soil well below the seedling plants. When they are replanted they should be set so that the lowest leaves rest on the soil. In moving herbaceous border perennials, it is sufficient to dig all round them to the depth of the

garden fork and then prise them up. In transplanting trees and shrubs of fair size, a trench 20-24 ins. deep is dug at 2 ft. or so from the stem, and the soil is forked away from beneath the bush, which can then be lifted. The best time to transplant leaf-losing kinds is in Nov. or as soon as most of the leaves have fallen. Evergreens should be moved in Sept.-Oct. or in April-May. It is necessary to water thoroughly after transplanting. If a large tree has to be transplanted, a trench is dug a year previously at about 3 ft. from the stem, and all roots found stretching beyond that are cut off; a special machine is required if the tree is to be moved any distance.

Transport (Lat. *trans*, across; *portare*, to carry). Movement of men and materials. The beginnings of transport were on rivers, and hence the great cities whose origin can be traced back to very early times, e.g. London, Paris, Rome, Alexandria, are situated on a river or near to the sea. The invention of the sail marked a great advance in sea transport; that of the wheel and the building of bridges brought great developments of land transport. Systematic road-making began when water transport was already highly organized. The Romans were first to recognize the strategic value of highways.

Transport conditions throughout the world, by both land and sea, remained virtually unchanged from the fall of the Roman Empire to the end of the Middle Ages. Roads were constructed and improved with the growth of old and the rise of new cities, and maritime and inland water transport increased in importance, but methods and appliances changed little. The large-scale production of coal in the N. of England led to another of the great transport inventions, the tram road, a primitive rly. on which the coal wagons could be hauled by horses from the collieries to points of shipment with less effort than along the highway.

The latter part of the 18th century witnessed the development of the canal system and of the stage coach. During the same period British inventors brought to perfection the steam engine and applied it to, among other things, rlys. The Stockton and Darlington rly. line, opened in 1825, is a landmark as the first public rly. in the world. Rapid development of rlys. and of steamships followed. Electrification is the outstanding rly. development of the 20th century.

The development of rlys. led to the gradual decay of the road as a means of transport. Revival began with the safety bicycle and was immensely stimulated by the invention of the internal combustion engine, parent of the motor car, which, developed originally as a pleasure vehicle, became during the 20th cent. of increasing importance for the conveyance of passengers and merchandise.

The application of the internal combustion engine to heavier than air flying machines produced a 20th century revolution in man's attitude to distance. It became possible to read a London paper in New York within 36 hrs. of its printing; the journey from England to N.Z., occupying many months under sail, reduced to weeks by steamship, could be made in five days by air. Increasing size of aeroplanes gave increasing carrying capacity, so that it was possible in 1948 for the Allies to keep more than two million people in Berlin supplied with food and fuel by air alone over a period of months.

Before the Second Great War transport of goods for other countries in British ships was a major invisible export which helped to balance the cost of imports into the U.K. British losses of shipping during that war, and an immense increase in the tonnage built, owned, and sailed, by the U.S.A., seriously reduced this item in Great Britain's credit account. See *Aeroplane*; *Canal*; *Motoring*; *Railways*; *Roads*; *Ship*.

Transport, Ministry of. British govt. dept. Established in 1919 with Sir Eric Geddes as its first head, this ministry coordinated functions hitherto performed by other depts. It was made responsible for safety measures on road and rail transport systems, and in 1946 became the authority for the control and upkeep of 7,500 m. of major roads in the U.K. In 1941 it absorbed the wartime ministry of Shipping, and being now called the ministry of War Transport, controlled all shipping, rlys., ports, road transport, and highway maintenance. Under it were regional port directors, divisional road engineers, and regional transport commissioners. In 1946 the shipping responsibilities were given back to the board of trade, and the ministry resumed its original title. It is not responsible for the operation of nationalised road and rail transport systems.

Transportation. System of punishment for crime. By it criminals are removed to some penal

settlement outside their own country for a period of years or for life. In England the Vagrancy Act of the reign of Elizabeth first empowered justices to order that certain classes of offenders might be sent beyond the seas, and by the reign of Charles II convicts were regularly transported to America, where they were compelled to labour on the plantations. Transportation to that colony ended with the American War of Independence, and in Jan., 1788, the first batch of convicts landed at Botany Bay in E. Australia.

About 1835 a party was formed in Australia to secure abolition of the system as far as Australia was concerned, and in 1840 the sending of convicts to New South Wales was stopped. Transportation to Van Diemen's Land (Tasmania), which already had penal settlements, continued. The Penal Servitude Act, 1853, finally abolished transportation as a punishment in the U.K. The system is still in existence in other countries.

Transport Command. Operational command of the R.A.F. Formed in 1943 to take over the functions of Ferry Command (*q.v.*), it is divided into four groups with h.q. in the U.K. Duties in war are to supply tugs for towing gliders, operate aircraft for dropping parachute troops, maintain airborne troop formations after they have landed, and act as general carriers to the R.A.F. Transport Command had a major part in the supply of ground as well as airborne forces in Burma, 1944-45, and at the end of the Second Great War in Europe ferried nearly 300,000 ex-prisoners of war to the U.K. It supplied aircraft and crews for Great Britain's share in the air service taking supplies into Berlin during the Russian blockade in 1948. Machines of the command range from twin-engine taxis for four passengers to four-engine 35-ton freighters.

Transporter Bridge. Type of bridge in which a car, suspended from a trolley travelling upon an overhead superstructure, conveys passengers, vehicles, etc., across a waterway. It usually comprises a tower on each shore supporting a suspension or girder bridge. The overhead trolley runs upon rails secured to the bridge girders, and from it the car is suspended by means of steel rods or wire ropes, with adjusting screws, arranged at such angles as to ensure rigidity and prevent swaying of the car; in some cases rigid suspension frames are substituted.

The overhead trolley may be self-propelling, but a more positive drive is obtained by securing it to a hauling rope made of steel wire, and passing round pulleys at each end of the bridge and round a winding drum in a machinery cabin. The hauling rope is actuated by an electric motor or other means. Transporter bridges were first designed by Charles Smith, and the first to be constructed was over the river Nervion, in Spain. Well-known British examples are at Runcorn-Widnes, crossing the Mersey and the Manchester Ship Canal; at Newport, Mon, crossing the Usk. See Bridge illus., p. 1423.

Transport House. Name of the building in Smith Square, London, S.W.1, occupied by the Trades Union Congress (*q.v.*) from 1928, and sometimes used as a synonym for the T.U.C. It was built for the transport and general workers union—hence the name.

Transport Tribunal. Advisory body in Great Britain. It consists of three permanent members appointed by the crown on the joint recommendation of the lord chancellor, the president of the board of trade, and the minister of Transport. Its functions are to regulate matters such as the reasonableness of charges and of conditions as to classification of merchandise, the packing of delicate articles, and what articles may be allowed carriage as passengers' luggage. By the Transport Act, 1947, the former rly. rates tribunal was renamed the transport tribunal, and its jurisdiction was extended.

Transposing Instrument. In music, an instrument which sounds in another key than that in which its music is written. The reason is technical; either the system of keys or the embouchure governing the production of the notes. If the composer is using the key of A flat he would write for the clarinet in B flat, if B, he would write for that in A. The other transposing instruments are the cor anglais, horn, trumpet, and cornet.

Transposition. Act of presenting a piece of music in other than the original key, either by writing it out, or by performing it at sight. The former is exemplified in popular ballads in different keys to suit various voices; the latter is a faculty of most practical musicians, especially conductors, organists, and accompanists. See Organ.

Trans-Siberian Railway. Main rly. of the U.S.S.R. The longest direct line in the world, it was begun in 1891, and, continuing

the existing line from St. Petersburg (Leningrad) and Moscow, was completed from Chelyabinsk in the Urals to Stretensk on the Shilka in 1905. A line from Chita, W. of Stretensk, branches across Manchuria to connect with the sea at Vladivostok. This Manchurian section, then known as the Chinese Eastern rly., was sold by the U.S.S.R. in 1935 to Japan's puppet govt. in Manchukuo and remained under Japanese control until the end of the Second Great War.

After the Russo-Japanese War of 1904-05, a line was begun on the Russian side of the Manchurian border and completed during the First Great War. Besides linking regions of Siberia valuable in mineral and agricultural resources, it had strategic value in the defence of the frontier. In 1929 the Turk-Sib line, running S.E. from Chkalov and S. from Novosibirsk into Soviet Central Asia (Russian Turkistan) was joined to the Trans-Siberian rly. Another branch across Siberia leaves the old line at Nizhne Udinsk, whence it follows the Lena valley for some distance, then runs N. of the Manchurian frontier to Port Soviet on the coast 800 m. N. of Vladivostok.

The length of the Trans-Siberian rly. from the Ural Mts., where it connects with the European Russian system, to Port Arthur on the Manchurian coast or to Vladivostok is nearly 4,000 m.; the total length from Leningrad to either of these termini is approx. 5,430 m.

Transubstantiation (Lat. *trans*, over; *substantia*, substance). In theology, doctrine of the change of the substance of the bread and wine, by consecration at the celebration of the Holy Eucharist, into the true Body and Blood of Christ, only the appearances of the bread and wine remaining. The doctrine is a dogma of the R.C. Church, decreed by Innocent III in 1215, and has its counterpart in the Greek Church, but is rejected by most Protestants. The word is derived from the medieval schoolmen, and its literal interpretation, implying what is called carnal manducation, has led to many superstitions and much bitter controversy. Article XXVIII of the Church of England, while rejecting the word, maintains that the Body and Blood of Christ are present "only after an heavenly and spiritual manner." The Anglo-Catholic view is that Christ's body being now spiritual, the mode in which it becomes the spiritual food of the soul is beyond words or thought. See Consubstantiation; Eucharist; Real Presence.

Transvaal. One of the four provinces of the Union of South Africa. It lies between the rivers Vaal and Limpopo, the Vaal on the S. separating it from the Orange Free State, the Limpopo on the N. from S. Rhodesia. It is also bounded by the Cape Province,

Transvaal arms

Natal, Orange Free State, and on the E. by Portuguese territory and Swaziland. Its area is 110,450 sq. m. Pop. (1946) 4,183,779, of whom 1,041,835 were European, among whom Afrikaners outnumber all other groups together. The chief towns are Johannesburg (324,304), Pretoria (124,512), Germiston (51,744). The native peoples are of Bantu stock, most of them Basutos and Kaffirs.

The greater part of the Transvaal is a continuation of the S. African plateau. In the S.E. between Standerton and Lydenburg is the high veld, with an alt. of 5,000 ft., and culminating in the Mauchberg S.E. of Lydenburg at 8,700 ft. The middle veld is between the Rand and the Vaal. The low veld, below 3,000 ft., provides good pasture. Along the boundary with Mozambique the land lies at between 600 and 1,600 ft.

The chief rivers are the Vaal and the Limpopo, which, with their tribs., drain most of the prov. The former rises in the high veld and flows W. until, just outside Transvaal, it joins the Orange. The Limpopo rises in the Magalies Berg, an isolated ridge W. of Pretoria, and flows in the opposite direction from the Vaal. Its chief tribs. are the Crocodile and the Olifants; it flows into Mozambique and to the Indian Ocean.

The temp. of the S. African plateau, between 20° and 30° S., is tropical in summer despite its alt., but less than tropical in winter. At Johannesburg (5,750 ft.) the mean Jan. (summer) and July temps are 68° F. and 49° F. The difference between day and night temps. is also great (*e.g.* Pretoria has a daily range of 35° F. in Aug.); at midday protection may be necessary against sunburn, following a morning with frost. Rain falls chiefly in summer in the form of heavy thundery showers (*e.g.* at Johannesburg there is, on the average, 33 ins. of rain in the course of 94 days). Only the inland valley of the Limpopo experiences the warm, humid conditions

common in low lat. On the high veld the sunshine totals exceed those of the French Riviera by about 700 hrs. a year.

Very little is known of the early history of the Transvaal. About 1835, Louis Trichard and Hans van Rensburg, who was killed by natives, journeyed from the Cape to the Limpopo river. News reaching the Cape of the boundless possibilities of the new country, emigration began, 1836-37, under the leadership of Potgieter. The Voortrekkers, as they were later called, crossed the Vaal and settled on the banks of the Mooi river at Pochefstroom about 80 m. from the present Johannesburg. Other settlements grew up in Klerksdorp, Lydenburg, and Rustenburg. Each little community professed the dignity, though it lacked the strength, of an independent state. Jealous of each other, they were yet forced to common defensive action against the native tribesmen. Great Britain recognized the independence of the Transvaal govt. in 1852; but in 1877, on the initiative of some of the Boer settlers, Transvaal was annexed. In 1880 the Boers rebelled, defeating the British at Majuba Hill (*q.v.*) in 1881; later that year a convention was signed granting self-govt. under British suzerainty. This was modified in 1884, when the Transvaal was renamed S. African Republic, the U.K. retaining control of external affairs except with the Orange Free State.

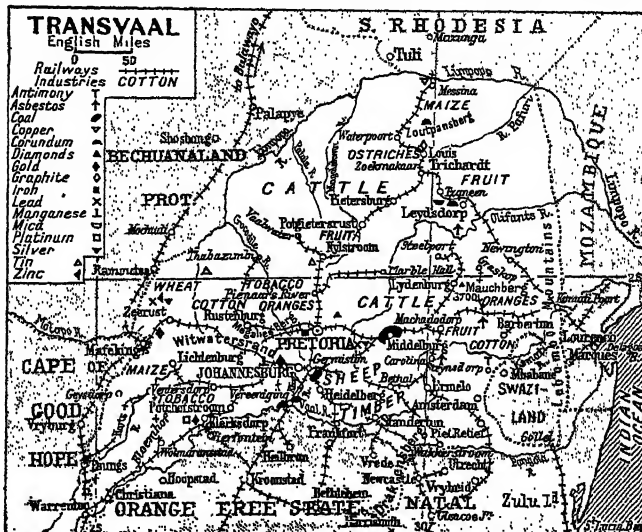

The discovery of gold on the Witwatersrand (1886) led to an influx of miners, prospectors, and speculators who soon outnumbered the Boer settlers. These rapacious newcomers and the Boer farmers, who were not interested in gold, were so antagonistic that the republic could not digest its new inhabitants and their way of life. The antagonism led to the South African War (*q.v.*) and the annexation by Great Britain of the republic, once more under the name Transvaal, on Sept. 1, 1900.

From the peace of Vereeniging (*q.v.*), 1902, the Transvaal was governed as a crown colony by a governor assisted by two nominated councils, one for executive and the other for legislative work, until in 1906 responsible govt. was granted. In 1910 the Transvaal was incorporated into the Union of South Africa.

Output of gold in 1944 was 12,277,288 oz. (£103 m.). The second most valuable mineral product is coal (£84½ m. in 1944). Diamonds valued at £63 m. were

mined in 1944. Near Pretoria is the great Premier diamond mine, largest in the world, where the Cullinan Diamond (*q.v.*) was found. More than seven tons of diamonds were extracted from this mine, but it was closed in 1932 after running for some time at a loss. Reopened in 1948, its new output was negligible. Other mineral products are copper and tin.

739 primary and junior high schools for European scholars; 1,095 state and state-aided schools for coloured, native, and Indian children. Education up to the fifth standard is in the pupil's home language (Afrikaans or English); both languages are taught to every pupil above that standard. See Jameson Raid; Johannesburg; Pretoria; South Africa, Union of;

Transvaal. Map of the South African province founded by Boer farmers in 1836

There are iron and brass foundries; brick, tile and pottery works; soap and candle factories, and other industrial establishments. Stock raising is the chief agricultural industry, cattle and sheep numbering close on 4 m. each, and goats nearly a million. Ostriches are also reared. Chief crops are maize, tobacco, potatoes, barley, oats, coffee, cotton, tea, sugar, and the vine.

On the E. border of Transvaal is the Kruger national park, nearly 8,000 sq. m. in extent, the home of almost every animal known in Africa, from the elephant to the smallest deer.

The provincial govt. is by an administrator appointed for five years by the governor-general of the Union in council, and a council of 64 elected for five years which deals with provincial finance, primary and secondary education, hospitals, roads and bridges, and other matters not pertaining to the Union govt. All ordinances passed by the provincial council are subject to the veto of the governor - general - in - council. Transvaal sends 64 members to the Union house of assembly, eight to the senate. There were in 1944

Voortrekker. Consult History of the Great Boer Trek, H. Cloete, 1899; First Annexation of the Transvaal, W. J. Leyds, 1906; Laws and Customs of the Bapedi of Transvaal, C. L. Harries, 1929; Rand Riches, H. Graumann, 1935; Century of Education in Transvaal, A. K. Bot, 1936; Fifty Golden Years of the Rand, D. Jacobson, 1936.

Transylvania. Province of Rumania. From 1868 until the break up of the Dual Monarchy, Transylvania was a dist. of the kingdom of Hungary—called by the Magyars Erdély—beyond the forest from the wooded heights of the Bihar Mts., which separated it from the Alföld. By the Germans it was called Siebenburgen, the country of the seven strongholds, the church-fortresses such as Hermannstadt (Sibiu), Grosswardein (Nagy Varad), and Klausenburg (Kolozsvár or Cluj). It forms a plateau within the E. curve of the Carpathian Mts., where the rivers have worn out well marked valleys and collect the drainage to the Maros, Szamos, and Aluta (Oltu). Under the Hungarian regime the officials, nobility, and gentry were usually Magyars; with the Szeklers.

an isolated group of people of Magyar origin in the E. Carpathians, they formed a third of the pop. The peasants were chiefly Rumanians, who formed more than half the total pop. Area, approx. 22,312 sq. m.

Transylvania was conquered about 1000 by King Stephen of Hungary, and remained part of that kingdom until the catastrophe at Mohacs in 1526. In 1691 it was again united with Hungary, its ancient privileges being confirmed, and so it remained until 1848. During 1848-60 it was a crownland of Austria; next a province with its own diet and large powers of self-government; and during 1868-1918 again part of Hungary. On Oct. 12, 1918, the Rumanians of Transylvania, the Banat, and other

tirely within Rumania. The steep slopes are on the S. side towards the Danube and are breached only by the river Aluta. The lower slopes are forested, and above the forest are wide plateau-like expanses of summer pasture on which sheep are reared. See *Roten Turm*; Rumania.

Trapani. Prov. of N.W. Sicily, bounded on three sides by the Mediterranean Sea. Along the shores are salt marshes, while the interior is mountainous. The chief products are salt, building-stone, wheat, wine, olive oil, cheese, and fish. The province was the scene of heavy fighting during July, 1943. Its area is 968 sq. m. Pop. est. 400,000.

Trapani (anc. Drepanum), Coast town of N.W. Sicily, capital of the prov. of Trapani. It is 3 m. W. of Monte San Giuliano, 45 m. direct and 121 m. by rly. W.S.W. of Palermo. The celebrated statue, the Madonna of Trapani, is in the old Annunziata pilgrim church near the town. This church escaped damage in the Second Great War, though 13 others were partly or completely destroyed. Coral goods, shell cameos, salt, marble, and alabaster wares are the principal products. Macaroni, wine, fruits, and olive oil are exported. The Carthaginians fortified the place and in 249 B.C. defeated the Romans in a great naval engagement; the port became Roman in 241 B.C. Trapani was the first town to rise against the Bourbons in 1848. During the Allied campaign in Sicily, 1943, Trapani was entered by U.S. troops July 24,

the last part of any importance to fall to the Allies. Pop. 63,540.

Trapezium. In astronomy, four bright stars grouped in a lozenge shape at the core of the Orion nebula. A photograph taken by Huggins in 1888 suggested that they were gaseous stars. It was afterwards found that the chief member of the group was in rapid orbital movement. The stars are of the early helium variety and are intimately associated with the nebula surrounding them. They range from 4.7 to 8.0 in magnitude.

Trapezium and Trapezoid (Gr. *trapeza*, table). In geometry, two four-sided plane figures. In a trapezium no two sides are parallel, and in a trapezoid two sides only are parallel. The definitions are a matter of uncertainty, some geometers interchanging them.

Trapping. The catching of wild animals by mechanical means. Traps comprise many varieties, from the ordinary steel trap with teeth for taking smaller quadrupeds, to the pits and heavy deadfalls for killing or capturing lions, tigers, and other big game. The steel trap for rabbits and similar animals has been an object of criticism, but remains in use.

Another form of snare for small animals is the box-trap, the lid of which falls upon the intruder—a development of the common mouse trap. It is useful for capturing small tree-climbing animals, as it can be placed among the branches.

A method of killing small ground-game outright is that of driving a springy sapling, some six feet in height, into the ground,

Trapani, Sicily. The famous statue of the Madonna of Trapani, hung with jewels and offerings brought by pilgrims from all parts of Italy

Hungarian districts proclaimed their independence of Hungary. At a national assembly convoked by Rumania at Alba Julia (Karlsburg), on Dec. 1, the former voted unanimously for union with Rumania, as did the Saxons of Transylvania in Jan., 1919.

Under the Vienna Award (*q.v.*) of Aug. 30, 1940, Rumania ceded the larger part of Transylvania to Hungary. Russian forces entered Hungarian-occupied Transylvania Aug. 29, 1944; after its liberation was completed, it was replaced, March, 1945, under Rumanian administration. The peace treaty between Hungary and the Allies, 1947, declared the Vienna Award null and void, the whole of Transylvania thus being reincorporated in Rumania.

Transylvanian Alps. S.E. section of the Carpathian Mts. (*q.v.*). They form the S. boundary of the plateau of Transylvania and are en-

Trapping. 1. Heavy deadfall, for large animals. 2. Sapling snare, for killing small game. 3. Box trap for catching alive, showing notched stick for bait. 4. Steel rabbit trap

and bending it backwards by a bar placed across the run of the animal and fixed against a wedge on the other side. A wire noose is suspended from the crosspiece; the quarry hopping along the track runs its head into the noose, and in its struggles to get free dislodges the bar; the sapling then springs upright, forcing the quarry off its feet and choking it.

The pit for ensnaring lions, tigers, and bears is a cavity some eight or ten feet deep, covered over the top with the brushwood and other foliage so as to correspond with the surrounding ground. This covering is arranged so as to collapse under the weight of the animal, which falls into the pit. Sometimes a bait, in the form of a kid or sheep, is placed upon the top. The reverse of this method of trapping is the heavy deadfall. A heavy beam or slab placed upon four stout uprights, or on the top of a built-up enclosure, falls and crushes the intruder as soon as the bait underneath is displaced. It is a criminal offence to set a spring trap to kill hares and rabbits except in a rabbit hole, or to fail to inspect all spring traps for hares and rabbits at reasonable intervals and at least once a day between sunrise and sunset. The same applies to setting on a pole, tree, or cairn any trap likely to injure a wild bird, or attempting to take a wild bird with a hook or similar instrument.

Trappist. Branch of the Cistercian reform of the Benedictine order. It originated at the Cistercian abbey of La Trappe in Normandy, whence it took its name. In 1662 Armand Jean le Bouthillier de Rancé (q.v.), a man of high rank who had been a court chaplain and was the owner of the abbey estates, became converted, retired to the abbey, and in 1664 was elected abbot. He found the community lax and disorganized, and introduced a system of unexampled austerity, the rules imposing strict enclosure, perpetual silence, and rigorous fasting. Trappist monks undertake no outside work, but employ themselves

entirely with the choir offices and manual labour. They now have about sixty houses, including the abbey of Mount St. Bernard, near Leicester. The nuns of this order keep an equally austere rule and have about twenty convents. See La Trappe; Monasticism; consult *Histoire de La Trappe*, L. F. Du Bois, 1824.

Traprain Law. Conical hill, alt. 734 ft., in E. Lothian, Scotland. It stands on the estate of the earl of Balfour, 5 m. E. of Haddington, and Viscount Traprain is the courtesy title of eldest sons of the earls of Balfour. The hill fort is supposed to have been occupied in the Stone Age, and has yielded remains of the Bronze and Iron Ages, as well as a treasury of silverwork unearthed in 1919 and believed to have been cached in the 5th century by Anglo-Saxon pirates or sea raiders.

Trap Rocks. In geology, name given to any dark coloured basic igneous rocks. Trap is practically synonymous with basalt, but the name is one which has no scientific meaning and is gradually being replaced by more definite names.

Trap Shooting. Mode of shooting which embraces two varieties: releasing live pigeons from boxes or traps; and projecting into the air, by means of a spring trap, a clay "bird" or target. The former has been illegal in Great Britain since 1921. See Clay Bird Shooting; Pigeon Shooting.

Traquair. Village and parish of Peeblesshire, Scotland. On the S. bank of the Tweed, it is connected by bridge with Innerleithen across the river. The Quair and other streams flow through the parish, and at the junction of the Quair and the Tweed stands a 17th-century mansion, Traquair House. Near the house is a grove immortalised in Scottish ballad as the Bush abune Traquair. The earldom of Traquair was conferred on John Stewart by Charles I in 1633; the line died with the 7th countess in 1796.

Trasimene (Ital. Trasimeno). Lake of Central Italy, in Umbria, called also lake of Perugia. It lies 12 m. W. of Perugia at an alt. of 844 ft., and is surrounded by hills, that on the N. being known as Monte Gualandro. The lake, 10 m. long by 8 m. wide and 25 ft. deep, has no apparent natural outlet, but is regulated by an artificial channel made 1896-98. The hills are covered with vines and oak and olive trees. All round its borders there was very bitter fighting between the Allied 8th

army and the Germans during June-July, 1944.

On the N. shore was fought the battle of Lake Trasimenus, between the Romans under Flaminius and the Carthaginians under Hannibal, 217 B.C. His movements hampered by a thick mist, and under the mistaken impression that Hannibal was advancing towards Rome, Flaminius entered the defile extending from Monte Gualandro to Passignano on the N. Hannibal had blocked both entrance and exit, and his heavy infantry were posted on a hill in the centre. Attacked on all sides, the Romans were hopelessly entrapped. Thousands were slain, among them the consul.

Tras os Montese é Alto Douro (Port., beyond the mts. and Upper Douro). Inland prov. of Portugal. Situated N. of the Douro, with Spain on the N. and E., it is almost wholly mountainous. Sub-tropical fruits and vines are produced in the fertile valleys. Its area is 4,570 sq. m. Pop. 592,079.

Trastevere (It., across the Tiber) Dist. of Rome. It forms the S. section of the portion of the city across the Tiber on the right bank of the river, on the slopes of the Janiculum. It is connected with the left bank by the Ponte Sisto, Ponte Garibaldi, Ponte Emilio, and other bridges. In the S. is the rly. station. S. Maria in Trastevere was founded by Calixtus I. S. Cecilia in Trastevere, originally the house of the saint, was made a church by Urban I. S. Pietro in Montorio was erected in 1500 for Ferdinand and Isabella on the traditional spot of the martyrdom of S. Peter. See Rome. Pron. Trastervary.

Trau. German name of the Yugoslav town Trogir (q.v.).

Trauma. Medical and psychological term for a sudden injury, shock, or strain which precipitates a disease or neurosis. Sometimes the results of the injury are characteristic, and the chain of cause and effect obvious. But when such an incident produces insensibility, or when repression takes place, it may so upset the weakest point in the system, physical or mental, that it becomes difficult to trace the symptoms back to their precipitating cause. Should this cause be mental, it may be that the starting point of the morbid sequence lies further back than the trauma, possibly in early childhood.

Traunsee OR **TRAUN LAKE.** Lake of Austria, in the Salzkammergut (Upper Danube prov.),

Trappist monk in cowl and hood

also known as Gmundener See. It is $7\frac{1}{2}$ m. long, more than 600 ft. deep, and 1,385 ft. above sea level. The Traunstein on the E. side rises 4,165 ft. almost sheer above the lake level. Gmunden is situated at the N. end.

Travancore. Former Indian state in the extreme S.W. of the Deccan peninsula, now part of Travancore-Cochin. Its marshy, lagoon-fringed coast stretches N.W. from Cape Comorin, whence a 53-m. concrete road runs to Trivandrum, the capital. Cutting off Travancore from Madras are the S. spurs of the Western Ghats, known as the Cardamom Hills. Travancore has been famous since the days of Phoenicia and ancient Rome for its spices, ivory, and sandalwood. Tea and cardamom are grown in the higher ridges; pepper, rubber, ginger, turmeric in the lower. Coconut plantations abound along the coast and backwaters.

The maharaja claims descent from the great Hindu dynasty of Chera. Travancore entered into relations with the British formally by treaties, 1795 and 1805, but in 1684 a British factory had been established at Anjengo (near Trivandrum), where Laurence Sterne's Eliza was born. In 1947, after the transfer of power, Travancore joined the Union of India, and in 1949 formed with Cochin the united state of Travancore-Cochin (total area 9,154 sq. m.; pop. (1950 est.) 8,580,000). Travancore has never been annexed or conquered by a foreign power. The percentage of literacy in Travancore (58 for men and 36 for women) is far higher than for India generally; a university was opened in 1937. Hydro-electric works at Pallisaval supply cheap power to ceramic, rubber, glass, and chemical works. Communications are maintained by 5,200 m. of motor roads, 391 m. of canals, and 100 m. of rly. Medical institutions are mostly state-controlled. Matriarchal traditions give women great freedom and prominence in public life. Area, 7,662 sq. m. Pop. 6,070,018.

Trave. River of Germany, mainly in Holstein. It follows a circuitous course and enters the Baltic Sea at Travemünde, on the Gulf of Lübeck. The lower course has been canalised to serve the port of Lübeck, 10 m. upstream, and to form a Baltic terminus of the canal system of the N. German lowland. See Elbe.

Travel and Holidays Association, BRITISH. Organization to encourage the tourist industry in the U.K., formed in 1950 by an

amalgamation of the former Travel Association of Great Britain and Northern Ireland (founded 1929), and the British Tourist and Holidays board set up by the govt. in 1946. The body is governed by a chairman and 19 members, the chairman and 8 members being nominated by the board of trade. Sir Alexander Maxwell was the first chairman. Its headquarters are at Queen's House, St. James's St., London.

Traveller's Cheque. Form of cheque issued by a bank for some fixed amount, e.g. £10, which may be cashed on presentation in the specified areas by the person named thereon at banks, some hotels, and at the offices of certain travel agencies. The person to whom they are issued pays on receipt and at the same time signs each cheque. When cashed in a country other than that in which it is issued, the cheque brings an equivalent sum in foreign currency at the current rate of exchange.

Travellers' Club. London club founded by Lord Castlereagh and others in 1819. The present clubhouse, 106, Pall Mall, S.W.1, was built from the designs of Sir Charles Barry in 1832. A rule of the club decrees that every member shall have travelled to some place outside the U.K. at least 500 m. in a straight line from London.

Traveller's Joy (*Olematis vitalba*). Climbing shrub of the family Ranunculaceae, a native of Europe, W. Asia, and N. Africa. It is also known as Virgin's Bower, Old Man's Beard, and White Vine. As a rule it scrambles over hedges and thickets, but often when it reaches up into a tree its rope-like stems are of great length. The opposite leaves are divided into three or five long heart-shaped leaflets, and the leaf-stalk is the climbing instrument, taking a turn round

Traveller's Joy. Flowers, buds, and leaves of the British wild clematis

twigs and hardening. The slightly odorous flowers consist of four greenish-white sepals, downy on the under surface. The numerous styles develop long white feathery tails, which in autumn become the old man's beard.

Traveller's Tree (*Ravenala madagascariensis*). Palm-like plant of the family Musaceae. It is a native of Madagascar. The trunk

Traveller's Tree. Tall Madagascan plant, the sheathed leaves of which hold about a pint of water each

is built up of the bases of former leaf-stalks, which sheathe the newer ones. The exceedingly large alternate leaves are arranged in two rows, with long stalks which are greatly dilated at the base and collect quantities of water. Numerous white flowers are clustered in large, boat-shaped spathes. The seeds are edible, and the leaves are useful for thatching.

Travels with a Donkey. Book by Stevenson, published 1879. Its full title being Travels with a Donkey in the Cévennes, it gives a vivid account of a tour by the writer and his beast Modestine in a mountainous and little known part of France. See Stevenson, R. L.

Travers, BENJAMIN (b. 1886). British playwright. He was born at Hendon, Nov. 12, 1886, educated at Beckenham and Charterhouse, and during the First Great War served in the R.N.A.S. and R.A.F. He made his name as a writer of farces when *The Dippers* was produced in 1922. The following, all at the Aldwych Theatre (g.v.) between 1925 and 1933, were by Ben Travers. A Cuckoo in the Nest, Rookery Nook, Thark, Plunder, A Cup of Kindness, A Night Like This, Turkey Time, Dirty Work, A Bit of a Test. He wrote similar shows for other theatres, as well as film scenarios for Ralph Lynn in the mid-1930s, e.g. *Fighting Stock*, *Stormy*

Weather, Pot Luck. Travers played the part of Wang, a coolie, in his own *Banana Ridge*, 1938, and wrote *Outrageous Fortune*, 1947. A vice-president of Somerset cricket club, he was elected prime warden of the Worshipful Co. of Fishmongers in 1946.

Traverse. In architecture, any structure, whether communication gallery, screen, or other barrier, set up across the interior of a building. The term is generally applied to a barrier intended to allow a private passage for ecclesiastical dignitaries or officials across a church or large public building. See Transom.

Traverse. In military engineering, a bank of earth placed in a fire trench perpendicularly to the front in order to stop bullets fired by the enemy from a flank. Traverses also tend to localise the effects of bursting shells.

In gunnery, the term describes the lateral movement of a piece of artillery about its pivot for changing the line of fire.

Traverse City. City of Michigan, U.S.A., the co. seat of Grand Traverse co. It stands at the mouth of the river Boardman on Grand Traverse Bay, an arm of Lake Michigan, 120 m. N. of Grand Rapids, and is served by the Père Marquette and other rlys. It is situated in a fruit growing region, holding an annual national cherry festival; about a million trees in the vicinity have grown from those first planted by Jesuits. It manufactures agricultural implements, furniture, foundry and machine-shop products, lumber products, and baskets. Traverse City was settled in 1850, incorporated in 1881, and received a city charter in 1895. Pop. 14,455.

Travertine OR CALCAREOUS TUFFA. Deposit of calcium carbonate frequently laid down in volcanic regions by hot springs. Often cellular in texture, it has a white or cream colour which recommends it as a decorative stone for the inside of buildings, especially in Italy. As it hardens with exposure it makes non-slip floors and stairs. The stone may be found containing fossil leaves and branches.

Traviata, LA. Opera by Verdi. The libretto by Francesco Maria Piave was based on the younger Dumas's well-known play, *La Dame aux Camélias*. First produced in Venice, 1853, and in London, 1856, it was not a success, but later was accepted as a serious work. The aria, *A fors e lui*, for coloratura soprano, is often sung on the concert platform.

Travnik. Town of Yugoslavia, in Bosnia. It stands on an affluent of the Bosna, 45 m. direct and 58½ m. by rly. N.W. of Serajevo. Most of its inhabitants are Mahomedans; it has two Mahomedan mausoleums, a bazaar, and an ancient citadel. The town was the seat of Turkish viziers of Bosnia, 1700–1852. Occupied by the Germans during the Second Great War, it was bombed by the Allies Jan. 4, 1944. Near by an armoured train was derailed by partisans, Oct. 7, 1943.

Trawler (O.F. *troller*, to go hither and thither). Type of fishing vessel so called because of the large nets or trawls which it uses. The trawler was developed during the 19th century, being originally a sailing vessel of 30 to 100 tons with a cutter or ketch rig. From S.W. England it was introduced to Ramsgate in 1814, Harwich 1828, Hull 1844, and Grimsby 1858. Steam trawlers, first built in 1879, developed into ocean-going ships of 600 tons or more, equipped with refrigerators and operating from Hull and Grimsby to fishing grounds as distant as the White Sea. On the British registry in 1948 were some 9,000 steam and motor vessels with a total tonnage of 264,000. In both Great Wars large numbers were requisitioned by the R.N. as patrol vessels, minesweepers, etc. See Fisheries.

Trawling. Fishing in deep waters by means of trawlers. The net used, termed the trawl, consists of an immense bag, or purse, which may be 80 ft. long. If used by a sailing boat, the mouth of the trawl is kept open by a pole of oak or elm wood, 40 ft. in length; if by a steam trawler, the mouth is opened by two "otter-boards" which, owing to the movement through the water, are forced apart.

In the process of trawling this net is dragged either by the sailing boat or the steam trawler for a given period of time over the bed of the portion of the ocean selected, care being taken to avoid as far as possible such rocky bottoms as would tear the net. At the end of the time decided upon, or after a certain distance has been covered, the net is hauled over the deck and a slipknot loosed, which allows the contents to be emptied out. Fish taken in this way are cod, plaice, turbot, whiting, sole, haddock, brill, skate, hake, gurnards, and ling. A certain number of the fish captured may exhibit bruising to some extent, partly from being dragged along the bottom, and partly owing to the weeds and

stones gathered up in the net with them. The great disadvantage of trawling is the immense destruction it causes among undersized fish which are caught in the net, especially small flat fish, and various experiments have been tried to find some means of allowing these to escape alive. See Fisheries.

Treachery Act. Temporary statute passed by the British parliament in 1940 making it a capital offence for any person to assist the naval, military, or air operations of the enemy, or to impede the forces of the crown, or to endanger life. This applied to any person in the U.K. whether owing allegiance to the crown or not, thus supplementing the law of treason, which does not normally apply to an enemy alien coming over as a spy. Sixteen spies were convicted under this Act before it ceased to be effective in 1946.

Treacle (O. Fr. *triacle*; O. Ger. *thriaka*, balm). Originally a mixture of substances believed to act as a preventive against or antidote to venomous bites. This use of the word is now obsolete, and it is almost exclusively applied to the refined mother liquor (mollasses) left after crystallising out the sugar. The sugar content varies from 40 to 50 p.c.

Treacle Mustard (*Sisymbrium officinale*). Alternative name for the herb of the family Cruciferae, also sometimes called Hedge Mustard (q.v.).

Treadmill. Wheel turned by the weight of a person or persons treading on steps fixed on the periphery. Invented by the Chinese, who used it in drawing water for irrigation, it was formerly used in

Treadmill. Example of the device formerly used as a punishment for criminals

prisons as a means of discipline or as a part of hard labour, the power being sometimes used for turning machinery or grinding corn. The first wheel used in Great Britain was erected in Brixton prison in 1817. The treadmill fell into disuse towards the beginning of the 20th century. *See* Prison and Prison Reform.

Treason (Fr. *trahison*, from Lat. *traditio*, a giving up or surrender). In general, an act of betrayal. The term is particularly applied to acts of betraying, or violation of allegiance to, the sovereign or chief authority of a state. In old English law, two forms were distinguished: high treason, where the act was directed against the crown or supreme authority; and petty or petit treason, where the allegiance violated was one towards some other superior authority, e.g. when a servant killed his master or a wife her husband. The latter was abolished as a form of treason in 1828.

High treason finds its general definitions in the statute of Edward III, 1352. Numerous fluctuating variations of treasonable offences were enacted in Tudor times, and several mitigations have since been made. The chief offences declared treason by the 1352 statute were as follows: compassing the death of the king, his wife, or heir-apparent; violation of the king's wife, daughter, or heir's wife; warring against the king within his realm, whether directly against his person, or on pretext of reforming laws, religion, etc.; overt adhesion to, or aiding and comforting, the king's enemies; counterfeiting the privy seal or the king's money; and slaying the chancellor, treasurer, or justices. Treason under this statute was punished by the traitor being hanged and disembowelled, then beheaded and quartered, attainder and forfeiture following. This penalty was mitigated in 1814 and 1870, and a traitor is now hanged.

Treason-felony was defined by the Crown and Government Security Act, 1848; it covers the offences of seeking to depose the sovereign, making war upon him in order to force a change in laws, intimidating parliament, and encouraging invasion. Certain capital treason offences were thus mitigated into felonies. Misprision of treason is the offence of concealing an act of treason; defined by an Act of 1552, it is punishable by life imprisonment and forfeiture.

The procedure in trials for treason and misprision of treason

was assimilated to that in murder trials by the Treason Act, 1945. The most important alteration was the abolition of the requirement that the treason or misprision must be proved by two witnesses. The same year John Amery was sentenced to death at the Old Bailey for treason during the Second Great War, having pleaded guilty to broadcasting on behalf of Germany, endeavouring to induce British subjects in captivity to fight for Germany against the U.K. and Russia, and making public speeches on behalf of the Axis in France and Belgium during the German occupation of those countries. *See* Joyce, William.

Treasure Island. Adventure story by Robert Louis Stevenson, first published (after appearing serially in *Young Folks*) in 1883. An 18th century story of a search for buried treasure, of piracy, and mutiny, it is a masterpiece of pure narrative. A dramatised version by J. B. Fagan was first seen at the Strand Theatre, London, 1922. There were film versions in 1934 and 1950. *See* Silver, Long John.

Treasure Trove (Fr. *trouver*, to find). Gold or silver, coin, plate, or bullion found hidden in the ground or some other hiding place the owner of which is unknown. By English law such property belongs to the crown; but it is the practice of the Treasury to return to the finder, if he has promptly reported the discovery, any articles not retained for national institutions, and to pay him the value of those retained. Articles are treasure trove only if they have been hidden, not if they have been thrown away. A coroner holds an inquest to decide. Roman law regarded treasure trove as the property of the owner of the land and the finder, who had equal shares in it. This is the law of France, Germany, and certain other countries, although the proportions given to the two parties vary.

Treasury. Dept. of the British govt. responsible for collecting and expending the national revenue. It originated as the dept. of the lord high treasurer, an official who appeared at an early date in the royal household and ranked as the third great officer of state. The office was held by several powerful personages, including Burghley. In 1612 it was put into commission for a time, and it has been in commission without a break since 1714. The last lord treasurer was the duke of Shrewsbury, who replaced the earl of Oxford.

The commission of the Treasury consists of a first lord, the chancellor of the exchequer, three or four junior lords, a parl. and a financial secretary, all being members of the govt. of the day. For some time the business was directed by the first lord of the Treasury, who was also often prime minister, but gradually it passed into the hands of the chancellor of the exchequer. The office of first lord is held by the prime minister, or the leader of the house of commons, who, like the parl. secretary and the junior lords, has nothing to do with financial matters. The parl. secretary acts as the chief whip, the junior lords act as his assistants; the financial secretary is the chief lieutenant of the chancellor of the exchequer. The permanent secretary of the Treasury ranks as the chief official of the civil service.

The national income is paid into the Treasury accounts and the national expenditure paid out on instructions from the Treasury. Until the establishment of the ministry of Labour in 1916 the Treasury controlled the administration of national health insurance. The offices are in Whitehall, London, S.W.1.

In the U.S.A. the dept. of the treasury controls the national finances. Its head, the secretary, is one of the most important members of the cabinet. *See* Budget; Chancellor of the Exchequer; Prime Minister.

Treasury Bill. Document made payable to a specified person, or, if no name is inserted, payable to the bearer, by means of which, since 1877, the British Treasury has financed much of its short-term borrowing. Treasury bills are thus a major item in the country's floating debt. They are repayable at three, six, nine, or 12 months from the date of issue, and issues are made weekly, the total amount being varied. The price paid by purchasers—usually finance houses constituting the London discount market and certain banks—is less than face value, the margin being a discount and representing the interest received by the purchaser for the use of his money for the period for which the bill is issued. The amount varies according to the state of the money market, and in particular according to the interest rate required by the larger banks for loans. Consequently the usual method of placing the bills is for the Treasury to offer a given amount for tender, and to issue bills to the highest bidders. At

the end of Sept., 1948, treasury bills to the value of £4,637 m. were outstanding.

Treasury Deposit Receipt. Document introduced in July, 1940. Such documents are issued by the Treasury to the London clearing banks, the Scottish banks, and to certain Commonwealth central banks in acknowledgement of sums lent on request by those institutions to the Treasury for a period of six months. Originally the rate of interest paid was $1\frac{1}{2}$ p.c. per annum, but in 1945 this was reduced to $\frac{3}{4}$ p.c. per annum. They can be cashed before maturity without loss of interest. During most of the Second Great War they constituted the principal method of Treasury borrowing from the clearing banks, replacing treasury bills; the method was continued later, so that at Sept. 30, 1948, treasury deposit receipts to the value of £1,449 m. were still held by the banks.

Treasury Notes. Name sometimes given to the notes for £1 and 10s. issued by the British Treasury from 1914 to 1928, when replaced by notes issued by the Bank of England. See *Currency Notes*.

Treasury Solicitor. English law official. He is responsible for the enforcement of payments due to the treasury, and is also the king's proctor, the official who intervenes in divorce cases. The treasury solicitor was appointed a corporation sole by the Treasury Solicitor Act, 1876, and he acts as administrator of the personal estate of an intestate which has lapsed to the crown. Until 1908 he was also public prosecutor (*q.v.*).

Treaty (Fr. *traité*, ultimately from Lat. *tractare*, to handle). Formal agreement between two or more responsible govts., by which the terms signed by commissioners are solemnly ratified, the treaty thus becoming operative. In monarchies the sovereign, and in republics the president ratifies a treaty, but in many states legislative bodies, *e.g.* in Great Britain parliament, and in the U.S.A. the senate, must give consent to ratification. Treaties may have a variety of purposes. Thus, a treaty of alliance may be offensive or defensive in character. During the First Great War Italy, though a member of the Triple Alliance, refused to declare war on Germany's side, on the ground that Germany was the aggressor, and was not simply acting in self-defence. Wars are commonly concluded by a peace treaty, in which the terms accepted by the losers are definitely set down.

Commercial treaties are usually designed to improve trade relations by granting reciprocal concessions with regard to the reduction of tariffs on the admission of specified articles or classes of goods into the countries mutually concerned.

Both political and commercial treaties may be concluded for a definite term of years, at the end of which they may be renewed. A treaty often specifies that a period of notice must be given by a party wishing to abrogate it. See Berlin, Congress of; Ryswick; Utrecht; Versailles; Westphalia.

Treaty Port. Name specifically applied to certain ports of China after the Opium War of 1840-42. The terms of the peace treaty signed on the Cornwallis off Nanking included, in addition to the cession of Hong Kong, the opening to British trade of five ports, Canton, Amoy, Foochow, Ning-po, and Shanghai, which were therefore known as treaty ports. Other such ports were opened to the trade of Belgium, France, the Netherlands, Portugal, and the U.S.A. In a series of new agreements between these countries and China, signed between 1943 and 1947, all extra-territorial rights in these ports were relinquished and complete Chinese sovereignty over them recognized. See *China*; *Extraterritoriality*.

Trebbia. River of N. Italy. Rising in the Apennines of Liguria, it joins the Po above the city of Piacenza, after a N.E. course of 58 m. The river is famous in history, for on its banks the Romans under Sempronius were defeated by the Carthaginians under Hannibal, 218 B.C.

Trebelli, ZELIA (1838-92). French operatic singer. Born in Paris, her family name was Gilbert,

Zelia Trebelli,
French singer

and she made her first stage appearance in 1859 at Madrid. She sang with marked success in Germany 1860-61, and played in Lucrezia in London in 1862. She appeared in the U.S.A. in 1878 and 1884, and made her last appearance in London in 1889. Her fine mezzo-soprano voice and her sound musical taste made Trebelli deservedly popular. She died at Étretat, Aug. 13, 1892.

Trebitz (Ger. Trebitsch). Town in Moravia, Czechoslovakia. It is some 18 m. S.E. of Iglaun and 40 m.

E. of Brno. Here, on the banks of the river Iglaun, the Benedictines erected a beautiful abbey in the 13th century. Much of it is still standing, together with the fine gateway. A trade in woollen goods is carried on, and boot and shoe-making are other industries.

Trebitsch, SIEGFRIED (b. 1869). Austrian novelist and dramatist. Born in Vienna, Dec. 21, 1869, he had won a reputation with such novels as *Weltuntergang* (End of the World), 1903, *Das Haus am Abhang* (The House on the Slope), 1906, and a drama *Ein Muttersohn* (A Mother's Darling), 1911, when in 1911 he started to publish authorised German translations of Bernard Shaw's works. His brilliant versions and active propaganda brought success to Shaw's plays in German-speaking lands before he won comparable popularity in the U.K. During 1911-35 ten vols. of Shaw's works appeared in Trebitsch's translation. Shaw translated Trebitsch's play *Frau Gitta's Suhr* under the title *Jitta's Atonement*, 1922; it was produced in 1925 at the Grand Theatre, Putney Bridge. Trebitsch made his home at Zürich.

Trebizond. The vilayet and city of Turkey once familiar as Trebizond are described under Trabzon.

Trebizond, CAPTURE OF. Russian success in the First Great War, April 18, 1916. The town of Trebizond (see Trabzon) was defended by 50,000 Turks, but the Russians forced a crossing of the river.

Treble. Term applied generally to the highest part in a piece of music, but in particular to the child's voice. When singing in parts first began to be practised, the melody was sustained by the tenor (*q.v.*), below which an additional part was placed. The next step was to add a second part above the melody, called the alto or high part. Then came the addition, still higher, of a third part, triplum, which has been corrupted into treble. See *Singing*.

Treble Clef. The G clef on the second line of the staff.

This sign was originally a small g, then later a capital G, which has become conventionalised by engravers into the form shown above.

Trebonius, GAIUS (d. 43 B.C.). Roman soldier and statesman. Tribune of the people, 55 B.C., he introduced a bill to prolong Caesar's command in Gaul and the administration of the provinces allotted to Caesar, Pompey, and Crassus. After receiving many favours from Caesar, who made

him consul in 45, he ungratefully deserted his patron and took part in the conspiracy against him. He was governor of Asia Minor in 44, and in Jan., 43, was slain at Smyrna (now Izmir), by Dolabella (*q.v.*). Trebonius was a friend of Cicero.

Tre Croci (Ital., three crosses). Alpine pass in the Dolomites, N. Italy. It rises to 5,930 ft., and carries the carriage road from Schludersbach to Cortina. It gives fine views of the Ampezzo valley and the snow-clad Marmolata.

Tredegar. Urban dist. and town of Monmouthshire, England. The villages of Pochin, Troedrhigwair, Bedwellty Pits, and Trefil are within the district. Tredegar stands on the river Howy, 24 m. N. of Cardiff. There are four rly. stations in the district: Tredegar, Bedwellty Pits, Sirhowy, and Nantybwlch. Solely industrial, the place owes its existence to the opening of coal mines and the establishment of ironworks. Pop. 19,920. *Pron.* Tredeegar.

Tree (A.S. *tréo*, tree, timber). Woody, perennial, seed-bearing plant, which develops an evident trunk. While Theophrastus (b. c. 372 B.C.) put trees, the most perfect plants, as the first group of his four classes of plants, classification today, looking for evidence of relationship by descent, finds laburnums, peas, and acacias closely related, groups the spurge with the rubber tree, and puts the apple and pear in the same family as spiraea and potentilla. The distinction between tree and shrub is not always clear, for trees growing near their climatic limits may take on a shrubby form; the tree should have a trunk of about 20 ft. before branching, whereas a shrub typically branches from ground level. Among spore-bearing plants tree-ferns alone attain the stature and form of trees. Of the six genera of tree-ferns proper, mostly tropical, some species may reach a height of 50-80 ft., e.g. *Alsophila excelsa*; but their stems are not of true woody structure.

Both the great divisions of seed-bearing plants include trees—the gymnosperms (*q.v.*), embracing the very large group of the coniferae (pine, fir, larch, spruce, etc.), also the cycads (*q.v.*), the gnetums, and the unique remaining representative of the ginkgoales, the maiden-hair tree (*q.v.*), *Ginkgo biloba*. The second great group, angiosperms (*q.v.*), includes all the broad-leaved trees, oak, ash, elm, palm, olive, rubber, etc.

The coniferae, among which are found the oldest living things, also

the largest living structures (see Sequoia), originated in the Palaeozoic era, apparently as mountain trees. They form vast forests growing to the northern tree limit in sub-Arctic regions of Europe, Asia, and N. America (see Taiga) and grow at high alts. even in tropical countries. This large group is evergreen with the exception of the larches (*Larix*), *Pseudolarix*, and *Taxodium*, which are deciduous. Of great economic importance, the pines, spruces, Douglas firs, redwoods, etc., commercially known as softwoods, give excellent timber, while the long fibres and good cellular content of many of them, such as yellow pines, spruce, hemlock, Douglas fir, provide paper-making material.

The angiosperm group is of later origin, dating back, perhaps, to the Jurassic. The group divides into monocotyledons (including palms, yuccas, etc.), and dicotyledons, the most varied, abundant, and typical group, containing the broad-leaved timber trees, or hardwoods, e.g. oak, ash, elm, fruit trees, and forest trees of temperate and tropical climates. Among their products are gums, dyes, waxes, perfumes, fruits (citrus and others), cabinet woods, alkaloids, varnish components; their timbers include teak, black ebony (Diospyros) of tropical Asia and Africa, the hickory of the U.S.A., the varied group known as mahogany, as well as the English oak, etc.

The typical tree may be said to have a root area of about equal size to its branch extension. The disposition of the branches and the position and angle of the leaves are influenced by gravity and by the effect of light itself (see Heliotropism) so that each branch and leaf may receive sufficient light, but in tropical climates be protected from an excess (see Leaf). Yet every tree has a distinct and recognizable shape and formation so that in winter or summer by its outline alone the beech is distinguishable from the oak and the elm from the wych elm.

The effect of forest areas on soil and water supply in a countryside is dealt with under Forestry and Afforestation, and the distribution of the various types of woodland under Forest. For the structure of wood see Phloem; Wood.

Tree, Sir HERBERT BEERBOHM (1853-1917). British actor-manager. The son of an Anglo-German merchant, Julius Beerbohm, he was born in London, Dec. 17, 1853, and educated in England and Ger-

many. After playing as an amateur he made his professional début in London under the stage name of Beerbohm Tree, at the Park Theatre, Camden Town, in 1878. In 1884 came his first great success as the Rev. Robert Spalding in *The Private Secretary*, at the new Prince of Wales's Theatre. Three

Sir Herbert Tree,
British actor

years later he opened in management at the Comedy Theatre, producing *The Red Lamp*, in which he played Paul Demetrius. Shortly afterwards he moved to The Hay-

market and began a long series of successes which included Shakespearean and Sheridan revivals.

The production of *Trilby*, 1895, was another great success. In the acting of Svengali, Tree rose to a height he had not previously attained and seldom reached again. After a tour in the U.S.A., he opened at Her Majesty's, which had been rebuilt, and began the series of successful productions with which his name is associated. They were characterised by their lavish style, which, especially in the Shakespearean plays, was freely criticised by many who considered the beauty of the original lost in Tree's gorgeous setting. His Shakespearean festivals of 1905 and 1911 were, however, well received.

Among the best known parts he played at Her Majesty's were Sir Peter Teazle, in *The School for Scandal*, many times revived; King John, 1899; Bottom, 1900; Herod, 1900; Ulysses, 1902; Falstaff, with Ellen Terry and Mrs. Kendal, 1902; Fagin, in *Oliver Twist*, 1905; Colonel Newcome, 1906; Shylock, 1908; Wolsey, 1910; Drake, 1914; and Micawber and Peggotty, in *David Copperfield*, 1915. In 1916 he made a lecture tour of the U.S.A., and shortly after his return died, July 2, 1917. Tree was knighted in 1909, and on the death of Irving became president of the theatrical managers' association. *Consult* Life, Max Beerbohm, 1920.

He married Helen Maud Holt (1863-1937) in 1883. Born Oct. 5, 1863, she first appeared on the stage at the age of 20, and acted with her husband at the Haymarket, 1887, and in the U.S.A. She remained on the stage after Tree's death, her last appearance being in *Our Own Lives*, 1935. Her best-remembered part was that of

These pictures reveal the characteristic shapes of some of the common trees of Great Britain as seen in summer and winter. Nos. 1-7 show deciduous trees: 1. Oak. 2. Elm, one of the tallest of British trees. 3. Horse

chestnut. 4. Ash. 5. Aspen poplar. 6. Hornbeam. 7. Larch. 8, 9, and 10 show three evergreen trees, whose appearance remains the same in summer and winter: 8. Cedar. 9. Spruce. 10. Scots pine

TREE: SOME OF THE BETTER KNOWN SPECIES SEEN IN GREAT BRITAIN

Lady Teazle in *The School for Scandal*. She scored minor triumphs in the films *Wedding Rehearsal*, and *The Private Life of Henry VIII*. She died Aug. 7, 1937.

Viola Tree (1884-1938), daughter of these two, was born July 17, 1884. She acted in several of her father's Shakespearian productions, and later studied singing, playing in Gluck's *Orpheus*, 1910. During her management of the Aldwych Theatre, she was responsible for introducing the Guitry family to the London stage in 1920. Her reminiscences, *Castles in the Air*, appeared in 1926. She died Nov. 15, 1938.

Tree Creeper (*Certhia familiaris*). Small British bird, which derives its name from the habit of

Tree Creeper seeking insects in the bark of a tree

creeping about the bark of trees. It is five ins. long, and its plumage on the upper parts is mottled with dark brown, yellowish brown, and white. The wings are brown, barred with white and yellow, and tipped with white; the tail is reddish brown, and the breast is whitish. The beak is long, curved, and slender, and is used for extracting small insects and their eggs from crevices in the bark.

Tree Fern. Various species of fern of the genera *Alsophila*, *Cyathea*, *Dicksonia*, etc. Their rootstock grows so far out of the ground as to constitute a spurious trunk consisting mainly of the bases of former fronds. Some of them are as tall as palms, which they much resemble in the barestem and wide-spreading crown of fronds, each frond in some species being 30 ft.

Tree Fern. Fronds and spurious trunk of *Alsophila phalerata*, a species of palm-like fern

long. They are natives of tropical and temperate regions. *See* Fern.

Tree Frog. Family of frogs, arboreal in habit. There are about 150 species, and they may be recognized by the adhesive disks on the toes which enable them to cling to the leaves and stems of trees. Usually green in colour, and difficult to distinguish when at rest among the foliage, they spend

Tree Frog. The European species, *Hyla arborea*
W. S. Berridge, F.Z.S.

all their time in the trees, except in cold or very dry weather, when they hide in mud or under stones, and in the breeding season, when most of them visit the water for spawning. One species (*Hyla arborea*) is common in Central and S. Europe, and has become naturalised locally in the Isle of Wight. It is a very expert climber, and hunts among the foliage for insects, grubs, and spiders. *See* Frog; Protective Colouring colour plate.

Tree Kangaroo (*Dendrolagus*). Genus of arboreal kangaroos, found only in Australia and New Guinea.

Tree Kangaroo. Black species of the arboreal kangaroo found in Australia and New Guinea

There are about seven species, black or dark grey in colour, with the front and hind limbs nearly equal in length, thus differing markedly from the ground kangaroos. They feed mainly on fruit and ferns.

Tree Mallow (*Lavatera arborea*). Shrub of the family Malvaceae, a native of the European coasts. It forms a stout, erect, woody stem

five or six feet high, and its large, roundish leaves are cut into from 5 to 9 lobes with toothed edges.

Tree Mallow. Leaves and flowers of the shrub; inset, single flower

The glossy, purple flowers, much like those of mallow and hollyhock, are 1½ ins. across.

Tree Shrew (*Tupaia*). The family of the arboreal shrews, found only in India and Malaya. In general appearance they

Tree Shrew. Squirrel-like arboreal mammal of India and Malaya

rather resemble small squirrels, but have the typically long muzzle of the shrews. They feed upon insects and fruit.

Tree-Worship. Ritual veneration of trees. The worship may be addressed to the trees themselves, because of their mysterious powers, or to the deities, departed souls, or non-human spirits deemed to have in them their casual or permanent abode. Associated with individual trees or a whole species, it pervades the primitive culture of all tree-bearing regions.

Whatever may have been the emotional attitude towards trees of primeval Stone-Age hunters, Neolithic man, who accomplished tree-felling and the systematic harvesting of edible fruits, established mystical relations with trees as animate objects affecting his daily life. Many factors concurred in these developments, from the Semitic recognition of the reproductive principle, exemplified in the date-palm, to the Egyptian conception that incense-yielding trees possessed the power of animating the dead. In

early Mesopotamian art a sacred tree is portrayed between two worshippers, a piece of symbolism which passed into Hellenic, Byzantine, and other art.

Sacred juju trees stand in every W. African negro village, and in S. India similar aboriginal cults prevail. In Bengal plantains ensnathed in women's clothing are objects of worship. Libations and animal sacrifices are other ritual usages. The consultation of tree oracles, such as the oak of Dodona, the oak cult of the Druids, and the reverence of Bo trees in India and Ceylon, exemplify special forms.

Modern European folklore and custom furnish many survivals, as in such ineradicable usages as the maypole, the Christmas-tree, and the mistletoe bough. *See* Anthropology; Asherah; Dryad; *consult* The Sacred Tree, in Religion and Myth, J. H. Philpot, 1897.

Trefoil (*Trifolium*). Genus of leguminous plants, the leaf of which consists of three leaflets. *See* Clover; Shamrock.

Tregaron. Town of Cardiganshire, Wales. It is on the Brenig, 10 m. N.E. of Lampeter, and has a rly. station. It was formerly a borough and a market town, but its privileges as a parliamentary borough were taken away in 1742, and soon the market was discontinued. Tregaron is now chiefly a holiday resort, with excellent fishing for salmon and trout and within easy reach of the wooded beauty around the Teifi Lakes, Strata Florida Abbey, and Devil's Bridge waterfall. Pop. 6,216.

Tréguier. Seaport of France. In the dept. of Côtes-du-Nord, it stands on the river of the same name about 6 m. from the English Channel, and 11 m. E.N.E. of Lannion. There is a station on a branch rly. The chief building is the cathedral, a fine edifice of the 14th and 15th centuries, for the town was the seat of a bishop from about 900 to 1790. Fishing is carried on. Renan was a native of Tréguier.

Treharris. Township of Glamorgan, Wales. Included in the co. bor. of Merthyr Tydfil, it lies 14 m. N. of Cardiff, in a colliery district, and has a rly. station. Pop. 7,440.

Treinta y Tres (Spanish, 33). Uruguayan department. With an area of 3,682 sq. m., it is bounded E. by Lake Mirim; N. by the dept. of Cerro Largo, W. by Durazno and Florida, S. by Lavelleja and Rocha. It is drained by the Olimar and tributaries. The capital, with the same name, is on the rly. 158 m. N.E. of Montevideo. The name commemorates an ex-

plot of 33 patriots who rose against the Brazilian authorities in 1825. Pop., dept., 68,850; town, 21,500.

Treitschke, HEINRICH VON (1834-96). German historian and publicist. Born at Dresden, Sept. 15, 1834, he studied at various German universities, and obtained an appointment at Leipzig university in 1857. In 1863 he moved to Freiburg and later to Kiel and

H. von Treitschke,
German historian

Heidelberg. His writings and speeches at this time were fiery appeals for the foundation of a German kingdom. He entered the Reichstag in 1871, but retired in disgust in 1888. Meanwhile he had become professor of politics at Berlin, and gained a reputation for his virile and eloquent lectures which consistently supported his doctrine that Germany would inevitably become the dominating and model state of Europe; and he commended war as a means of fulfilling that destiny. For 15 years he inculcated this lesson into tens of thousands of youths. His later years were embittered by the growth of socialism and the influence of Nietzsche. He died in Berlin April 28, 1896. His chief work is his *History of Germany*, 5 vols. (Eng. trans., 1915-19); but his ideas are best illustrated in *Politics*, 2 vols. (Eng. trans., 1916). In the early days of the First Great War his name and works aroused interest among British people earnestly seeking some explanation of Germany's aggressive attitude. *Consult* Life and Works, A. Hausrath, Eng. trans., 1914.

Trelawny, EDWARD JOHN (1792-1881). British adventurer. Of an old Cornish family, he was born Nov. 13, 1792. He entered the navy, but soon deserted and wandered about the world, even taking to piracy. He is remembered chiefly as the friend of Shelley and Byron, whom he met

Edward Trelawny,
British adventurer
After Stearn

first in Italy in 1822. He superintended the cremation of Shelley and then went to Greece with Byron, but left him to join a band of insurgents fighting for Greek

independence. Trelawny's later years were spent in England, where in spite of being a liar on the grand scale he was a distinguished figure in society. He died at Sompning, Sussex, Aug. 13, 1881. Trelawny wrote *Adventures of a Younger Son*, 1835; and *Recollections of the Last Days of Shelley and Byron*, 1858. Both works throw some light on these poets. *Consult* The Friend of Shelley, H. J. Massingham, 1930.

Trelawny, SIR JONATHAN (1650-1721). English prelate. Son of a Cornish baronet, he was born at Pelynt, the family seat, March 24, 1650, and educated at Westminster and Christ Church, Oxford. He was ordained in 1673, and after 12 years, having meantime succeeded

Sir J. Trelawny,
English prelate

to the baronetcy, was appointed bishop of Bristol. In 1688 he was translated to Exeter, and in 1707 to Winchester, where he finished the rebuilding of Wolvesey Palace. Trelawny was one of the seven bishops who resisted James II. He died July 19, 1721. The baronetcy fell to his brother. The song with the old refrain, And Shall Trelawny Die, was written in the 19th century by R. S. Hawker, but the refrain had been sung both when the bishop was in prison and when his grandfather suffered a like fate in the time of Charles I.

Trelawny of the Wells. A comedy by Pinero, first produced at the Court Theatre, London, Jan. 20, 1898. This well constructed comedy became one of the most popular pieces of its time. The Trelawny of the title is Rose Trelawny, a young actress of the Bagnigge Wells theatre. This part was originally played by Irene Vanbrugh. Another leading character is based on the dramatist Tom Robertson (*qv.*). There were many revivals, e.g. at the Duke of York's Theatre, 1910; Kingsway Theatre, 1915; Old Vic, 1925 and 1938.

Trelew. Town in the Chubut territory of Argentina. One of the most important places in Patagonia, it was founded by Welshmen. It lies 43 m. by rly. S. of Puerto Madryn, being the junction for Rawson, in the heart of a sheep-rearing district. Pop. 7,000.

Treloar, SIR WILLIAM PURDIE (1843-1923). British business man and philanthropist. Born in Lon-

don, Jan. 13, 1843, he was educated at King's College school. He became a member of the corporation of the City of London in 1880, and a l d e r m a n, 1892. He was sheriff, 1899-1900, and then knighted. In 1906 he was elected lord

Sir William Treloar,
Lord Mayor of London
Downey

Principal of the firm of Treloar & Sons, carpet merchants, he founded the Lord Mayor Treloar cripples' hospital and college at Alton and Hayling Island. He wrote Ludgate Hill, Past and Present, 1881; Wilkes and the City, 1917; A Lord Mayor's Diary, 1920. He died Sept. 6, 1923.

Tremadoc Series. In geology, a group of rocks occurring at the top of the Cambrian (*q.v.*) system. They are typically found at Tremadoc, Carnarvonshire, and can be traced to Crickieth, Arenig, and Cader Idris. They consist mainly of slates, mudstones, and shales.

Trematodes. Order of parasitic worms which affect the vertebrates, including man. They are most often found in the intestines, liver, lungs, or bladder. The liver fluke (*q.v.*) of sheep is a common form.

Tremolite. In mineralogy, one of the amphiboles of the tremolite-actinolite series. Tremolite is a calcium magnesium silicate containing hydroxyl. Fibrous varieties form commercial asbestos in part, while fine-grained compact varieties of tremolite or actinolite form nephrite, a variety of jade (*q.v.*). These minerals occur in metamorphic rocks.

Tremolo (Ital., trembling). Musical effect attained on bowed instruments by a rapid iteration of a note indicated thus:

and on the pianoforte by the alternation of two or more notes, thus: In singing it is held to be a vice.

Tremor (Lat., a trembling). Involuntary rhythmic oscillations of part of the body, due to alternate contraction and relaxation of a group of muscles and the opposing muscles. Tremor may be the result of fatigue or emotion, or be a manifestation of neurasthenia, or result from chronic poisoning, etc.

The term is also applied to minute but perceptible movements of the ground as a result of a small local shock or a main earthquake at some distance. Only the rapid movements can be felt, later oscillations being slower and too small to be detected; e.g. the earthquake originating near Ghent on June 11, 1938, was felt in Great Britain for a few seconds. Disturbances of the ground may cause a continuous trembling effect.

Tremulant. Mechanical device for simulating in the organ the effect of the tremolo (*q.v.*). It consists of a small box, having a weight valve upon a spring. This is attached in such a way as to interfere with the pressure of the wind supply when the requisite stop handle is drawn, thus producing a pulsating effect, the frequency of which can be regulated. Use is generally confined to solo stops.

Trench (Fr. *trancher*, to cut). Narrow cut made in the earth. In its agricultural sense, trenching means digging trenches in the soil to facilitate the growth of vegetables and crops. This is done on a large scale with a trench plough. Trenches for burying water mains, electric cables, etc., are cut by mechanical excavators.

In military engineering, a trench is an excavation made to protect troops from enemy fire and at the same time enable the occupants themselves to fire. Such excavations have from earliest times been used in the defence of camps and as part of fixed fortifications, but not until the First Great War did the trench become the principal feature of military operations. Then elaborate systems were involved, the front line trenches having behind them lines of support trenches, joined by communication trenches. Dug-outs accommodated troops, and more permanent entrenchments were sometimes made of concrete. The mobile operations of the Second Great War rendered elaborate entrenchments unnecessary; but temporary slits in the ground gave protection against artillery or air bombardment during an advance. See Fortification; Tactics; Trench Warfare.

Trench, RICHARD CHENEVIX (1807-86). British divine and author. Born in Dublin, Sept. 9, 1807, he was educated at Harrow and Trinity College, Cambridge. He was curate to Samuel Wilberforce and rector of Itchenstoke before being made professor of divinity at King's College, London, in 1846. In 1856 he received the deanery of Westminster, and from

1864 was archbishop of Dublin, his term of office covering the disestablishment period. He resigned in 1884 and died in London, March 28, 1886. Trench is remembered by his books on philology, The Study of Words, 1851, and English Past and Present, 1855.

Trenchard, HUGH MONTAGUE TRENCHARD, 1ST VISCOUNT (b. 1873). British administrator. Born Feb. 3, 1873, he went into the army in 1893, and was with the I.Y. in the S. African War. Awarded the D.S.O. in 1906, he commanded the N. Nigeria

regiment (W.A.F.F.) during 1908-13, and in the First Great War held command at the central flying school. In the closing months he was in charge of the independent air force in France. Chief of air staff and an air marshal from 1919, he was promoted, 1927, marshal of the R.A.F., of which he was the virtual creator. As commissioner of the metropolitan police force 1931-35, Trenchard provoked much comment by the radical reforms he instituted, notably when he set up a police college at Hendon. Knighted in 1918, he was raised to the peerage in 1930, and became viscount 1936. He was a trustee of the Imperial War Museum, 1937-45. See Police; Royal Air Force.

Trench Fever. Disease first observed at the end of 1914, among troops serving on the western front in the First Great War. From that time onwards it was prevalent in the British, French, and German armies, and also occurred on the Italian and Russian fronts. It was an infectious disease, probably due to the louse-borne *Rickettsia quintana*. The form seen in the early months of the war was characterised by an abrupt rise of temp., the fever lasting four to six days, and then subsiding without other signs or symptoms appearing. From about 1917 onwards, the fever was more prolonged. A third type was characterised by relapses at intervals of two or three days. The more important symptoms were headache, pain in the shins or in other parts of the body, rash on the skin, and mild inflammation of the conjunctiva of the eye. Serious complications were rare. The mobile character of the Second Great War, and the use of the newly discovered insecti-

cide, D.D.T., prevented similar disease in that war.

Trench Warfare. Method of conducting hostilities peculiarly associated with the First Great War. Entrenchment was, of course, an old defensive device (see Fortification), and "digging in" was resorted to in the siege of Sevastopol during the Crimean War, as well as in the S. African War and in Manchuria. In the S. African War the Boers evolved a kind of trench, usually cut in a hillside, in which a man could stand upright or nearly so with protection from any but directly overhead fire. But never were trenches so developed as a permanent line of battle as during the four years of the First Great War, when from the retreat of the Germans from the Marne to the Aisne in Sept., 1914, to the eve of the victorious Allied advance, Aug., 1918, both sides on the western front were compelled to base all their tactics on the maintenance of an effective trench system, a system which threatened a permanent stalemate. On both sides the trenches became semi-permanent habitations, and considerable care was devoted to their construction, together with that of the accompanying dug-outs. German trenches, especially in the Somme region and throughout the Hindenburg Line, were usually far more elaborately constructed than any on the Allied side. In the winter of 1914-15, especially in the N. sections of the line, the British trenches were often many inches deep in water, which was sometimes waist-high.

The protracted occupation of trenches on so elaborate a scale led to special forms of warfare, ranging from long-distance pounding of trenches with heavy artillery to the interchange of shells from trench mortars, discharges of grenades by hand and rifle, mining and counter-mining, and trench raids. The British ministry of munitions had a special trench warfare department. But none of the tactics listed above ever promised to eliminate or override an opponent's trench system and thereby end the stalemate. That was left to the tank (*q.v.*) to achieve.

The Second Great War, in which all armies were more mobile, saw no such permanent development, the trench falling back to its old place as a means of no more than temporary cover.

Trenck, FRANZ, BARON VON DER (1711-49). Austrian soldier. Born at Reggio, Jan. 1, 1711, he entered

the Imperial service, but was obliged to leave after four years' service. Entering the Russian service he again fell into disgrace, was court-martialed, degraded and imprisoned at Kiev. In the War of the Austrian Succession he raised a Slavonian regiment at his own expense and was accused of plundering and other crimes, and condemned to death. By Maria Theresa's intervention the case was revised and Trenck was imprisoned. He died in the fortress of Brünn, Oct. 14, 1749.

Trenck, FRIEDRICH, BARON VON DER (1726-94). German adventurer. Born Feb. 16, 1726, at Königs-

Baron von der Trenck, German adventurer

berg, a cousin of Franz, Baron von der Trenck (*v.s.*), he entered the army and had before him the prospect of a brilliant career when King Frederick II of Russia caused him in 1743 to be imprisoned in the fortress of Glatz, for having a love affair with the Princess Amelia. He escaped, 1746, and entered the Austrian service, but returned to Prussia in 1754, and was again imprisoned for ten years. He was eventually released at the request of the Empress Maria Theresa. Returning to Paris, he was accused in 1794 of being an agent of foreign powers, and was guillotined on July 25 of that year. His autobiography was published in 1787, and an English version, ed. P. Murray, in 1927.

Trengganu. State of the Malay peninsula. It came under British protection by treaty with Siam in 1909 and in 1948 became part of the federation of Malaya (*q.v.*). It lies N.E. of Pahang and E. of Kelantan, between a mountain ridge (Temiang, 4,082 ft.; Mandi Angin, 4,794 ft.; and Patoh, 2,041 ft.) and the shore of the China Sea, and is drained by the Besut, Trengganu, Dungun, and Cherol. Tin, wolfram, copra, and black pepper are exported. Kuala Trengganu is the capital. Area is 5,050 sq. m. Pop. 226,400.

Trenčín or **TRENČÍN**. Town in the Slovakia division of Czechoslovakia; formerly in the kingdom of Hungary. Situated on the Vág

Baron von der Trenck, Austrian soldier

E. of the White Carpathians, it is an important rly. and road junction on the routes into Slovakia from Moravia and Galicia. The town formerly had a mixed pop. of Slovaks, Magyars, and Germans. Pop. est. 11,000.

Trent. River of England, the third longest in the country. It rises in Staffordshire on Biddulph Moor, and flows mainly in an easterly, but towards the end in a northerly, direction through Staffordshire, Derbyshire, Nottinghamshire, and Lincolnshire to the Humber, which it enters near Alkborough. Its length is 180 m., and it drains an area of 4,000 sq. m. The chief tributaries are the Sow, Penk, Tame, Dove, Soar, Erewash, Derwent, and Idle; towns on its banks are Stoke, Burton, Nottingham, and Newark.

The Trent has a bore called the aegir (eagre). It is navigable for barges as far as Burton, and there is a fair amount of traffic between Gainsborough and its mouth. It is connected by the Trent and Mersey and Grand Union canals with the Lancashire and Birmingham districts, while other canals link it up with Derby, Lincoln, Grantham, and other places. The river is navigable for 45 m. from its junction with the Ouse. Large barges can go as far as Nottingham. Trent junction is a rly. station just outside Long Eaton, where the lines to Nottingham and Derby branch. Here is Trent College, a public school on C. of E. lines, founded in 1866. See Humber; Nottingham.

Trent or **TRIENT**. German and historic name of Trento, capital of Trento prov., Italy. Up to 1919 in S. Tirol, Austria, it stands on the left bank of the Adige, 76 m. N.W. of Venice. Probably founded by the Etruscans, it became the Roman Tridentum. Here between 1545 and 1563, the council of Trent held its meetings in the church of Santa Maria Maggiore. During the Napoleonic Wars the dist. was for a time in Italian occupation. Prominent among the public buildings are the white marble cathedral and the palace of the prince-bishops. Industries include marble quarrying and the making of pottery, playing-cards, and wines. Pop. 61,015.

During the First Great War the offensive of General Diaz against the Austrians, which began in the fourth week of Oct., 1918, in the Monte Grappa and Middle Piave areas, and at the end of the month on the Asiago Plateau, was extended to the whole Trentino area, from the Astico on the S.E. to the Stelvio Pass on the

Trent, Italy. View of this town in Trentino-Alto Adige, showing the river Adige
